Item Novus et Vetus Orbis; in eo quod utrique orbes versus septentriones lati sunt et exporrecti, versus austrum autem angusti et acuminati.

Item instantiae conformes nobilissimae sunt frigora intensa in media (quam vocant) aeris regione, et ignes acerrimi qui saepe reperiuntur erumpentes ex locis subterraneis; quae duae res sunt ultimitates et extrema; naturae scilicet frigidi versus ambitum coeli, et naturae calidi versus viscera terrae; per antiperistasin, sive rejectionem naturae contrariae.

Postremo autem in axiomatibus scientiarum notatu digna est conformitas instantiarum. Veluti tropus rhetoricae, qui dicitur Praeter Expectatum, conformis est tropo musicae, qui vocatur Declinatio Cadentiae. Similiter, postulatum mathematicum, ut quae eidem tertio aequalia sunt etiam inter se sint aequalia, conforme est cum fabrica syllogismi in logica, qui unit ea quae conveniunt in

conforme est cum fabrica syllogismi in logica, qui unit ea quae conveniunt in medio. Denique multum utilis est in quamplurimis sagacitas quaedam in conquirendis et indagandis conformitatibus et similitudinibus physicis.

XXVIII.

Inter praerogativas instantiarum, ponemus septimo loco Instantias Monodicas; quas etiam Irregulares sive Heteroclitas (sumpto vocabulo a grammaticis) appellare consuevimus. Eae sunt, quae ostendunt corpora in concreto, quae videntur esse extravagantia et quasi abrupta in natura, et minime convenire cum aliis rebus ejusdem generis. Etenim instantiae conformes sunt similes alterius, at instantiae monodicae sunt sui similes. Usus vero instantiarum monodicarum est talis qualis est instantiarum clandestinarum: *viz.* ad evehendam et uniendam naturam ad invenienda genera sive communes naturas, limitandas postea per differentias veras. Neque enim desistendum ab inquisitione donec proprietates et qualitates, quae inveniuntur in hujusmodi rebus quae possunt censeri pro miraculis naturae, reducantur et comprehendantur sub aliqua forma sive lege certa: ut irregularitas sive singularitas omnis reperiatur pendere ab aliqua forma communi; miraculum vero illud sit tandem solummodo in differentiis accuratis et gradu et concursu raro, et non in ipsa specie: ubi nunc contemplationes hominum non procedant ultra quam ut ponant hujusmodi res pro secretis et magnalibus naturae, et tanquam incausabilibus, et pro exceptionibus regularum generalium.

Exempla instantiarum monodicarum sunt, sol et luna, inter astra; magnes, inter lapides; argentum vivum, inter metalla; elephas, inter quadrupedes; sensus veneris, inter genera tactus; odor venaticus in canibus, inter genera olfactus. Etiam S litera apud grammaticos, habetur pro monodica; ob facilem compositionem quam sustinet cum consonantibus, aliquando duplicibus, aliquando triplicibus; quod nulla alia litera facit. Plurimi autem faciendae sunt hujusmodi instantiae; quia acuunt et vivificant inquisitionem, et medentur intellectui depravato a consuetudine et ab iis quae fiunt plerunque.

XXIX

XXIX.

Inter praerogativas instantiarum, ponemus loco octavo Instantias Deviantes; errores scilicet naturae, et vaga, ac monstra: ubi natura declinat et deflectit a cursu ordinario. Differunt enim errores naturae ab instantiis monodicis in hoc; quod monodicae sint miracula specierum, at errores sint miracula individuorum. Similis autem fere sunt usus; quia rectificant intellectum adversus consueta, et revelant formas communes. Neque enim in his etiam desistendum ab inquisitione donec inveniatur causa hujusmodi declinationis. Veruntamen causa illa non exurgit ad formam aliquam proprie, sed tantum ad latentem processum ad formam. Qui enim vias naturae noverit, is deviationes etiam facilius observabit. At rursus, qui deviationes noverit, is accuratius vias describet. Atque in illo differunt etiam ab instantiis monodicis, quod multo magis instruant praxin et operativam. Nam novas species generare arduum admodum foret; at species notas variare, et inde rara multa ac inusitata producere, minus arduum. Facilis autem transitus est a miraculis naturae ad miracula artis. Si enim deprehendatur semel natura in variatione sua, ejusque ratio manifesta fuerit, expeditum erit eo deducere naturam per artem quo per casum aberraverit. Neque solum eo, sed et aliorsum; cum errores ex una parte monstrent et aperiant viam ad errores et deflexiones undequaque. Hic vero exemplis non est opus, propter eorundem copiam. Facienda enim est congeries sive historia naturalis particularis omnium monstrorum et partuum naturae prodigiosorum; omnis denique novitatis et raritatis et inconsueti in natura. Hoc vero faciendum est cum severissimo delectu, ut constet fides. Maxime autem habenda sunt pro suspectis quae pendent quomodocunque a religione, ut prodigia Livii: nec minus, quae inveniuntur in scriptoribus magiae naturalis, aut etiam alchymiae, et hujusmodi hominibus; qui tanquam proci sunt et amatores fabularum. Sed depromenda sunt illa ex gravi et fida historia, et auditionibus certis.

XXX.

Inter praerogativas instantiarum, ponemus loco nono Instantias Limitaneas; quas etiam Participia vocare consuevimus. Eae vero sunt, quae exhibent species

etiam Participia vocare consuevimus. Eae vero sunt, quae exhibent species corporum tales, quae videntur esse compositae ex speciebus duabus, vel rudimenta inter speciem unam et alteram. Hae vero instantiae inter instantias monodicas sive heteroclitas recte numerari possunt: sunt enim in universitate rerum rarae et extraordinariae. Sed tamen ob dignitatem seorsim tractandae et ponendae sunt; optime enim indicant compositionem et fabricam rerum, et innuunt causas numeri et qualitatis specierum ordinariarum in universo, et deducunt intellectum ab eo quod est, ad id quod esse potest.
Harum exempla sunt: muscus, inter putredinem et plantam; cometae nonnulli, inter stellas et meteora ignita; pisces volantes, inter aves et pisces; vespertiliones, inter aves et quadrupedes; etiam

‘Simia quam similis turpissima bestia nobis;’

et partus animalium biformes et commisti ex speciebus diversis; et similia.

XXXI.

Inter praerogativas instantiarum ponemus decimo loco Instantias Potestatis, sive Fascium (sumpto vocabulo ab insignibus imperii), quas etiam Ingenia, sive Manus Hominis appellare consuevimus. Eae sunt opera maxime nobilia et perfecta, et tanquam ultima in unaquaque arte. Cum enim hoc agatur praecipue ut natura pareat rebus et commodis humanis; consentaneum est prorsus, ut opera, quae jampridem in potestate hominis fuerunt (quasi provinciae antea occupatae et subactae), notentur et numerentur; praesertim ea quae sunt maxime enucleata et perfecta: propterea quod ab istis proclivior et magis in propinquo sit transitus ad nova et hactenus non inventa. Si quis enim ab horum contemplatione attenta propositum acriter et strenue urgere velit, fiet certe ut aut producat illa paulo longius, aut deflectat illa ad aliquid quod finitimum est, aut etiam applicet et transferat illa ad usum aliquem nobiliorem.
Neque hic finis. Verum quemadmodum ab operibus naturae raris et inconsuetis erigitur intellectus et elevatur ad inquirendas et inveniendas formas, quae etiam illorum sunt capaces, ita etiam in operibus artis egregiis et admirandis hoc usu-

venit; idque multo magis; quia modus efficiendi et operandi hujusmodi miracula artis manifestus ut plurimum est, cum plerunque in miraculis naturae sit magis obscurus. Attamen in his ipsis cautio est adhibenda vel maxime, ne deprimant scilicet intellectum et eum quasi humo affigant.

Periculum enim est, ne per hujusmodi opera artis, quae videntur velut summitates quaedam et fastigia industriae humanae, reddatur intellectus attonitus et ligatus et quasi maleficiatus quoad illa, ita ut cum aliis consuescere non possit, sed cogitet nihil ejus generis fieri posse nisi eadem via qua illa effecta sunt, accedente tantummode diligentia majore et praeparatione magis accurata.

Contra, illud ponendum est pro certo: vias et modos efficiendi res et opera, quae adhuc reperta sunt et notata, res esse plerunque pauperculas; atque omnem potentiam majorem pendere et ordine derivari a fontibus formarum, quarum nulla adhuc inventa est.

Itaque (ut alibi diximus) qui de machinis et arietibus, quales erant apud veteres, cogitasset, licet hoc fecisset obnixe atque aetatem in eo consumpsisset, nunquam tamen incidisset in inventum tormentorum igneorum operantium per pulverem pyrium. Neque rursus, qui in lanificiis et serico vegetabili observationem suam et meditationem collocasset, unquam per ea reperisset naturam vermis aut serici bombycini.

Quocirca omnia inventa, quae censeri possunt magis nobilia (si animum advertas), in lucem prodiere, nullo modo per pusillas enucleationes et extensiones artium, sed omnino per casum. Nihil autem repraesentat aut anticipat casum (cujus mos est ut tantum per longa saecula operetur), praeter inventionem formarum.

Exempla autem hujusmodi instantiarum particularia nihil opus est adducere, propter copiam eorundem. Nam hoc omnino agendum; ut visitentur et penitus introspiciantur omnes artes mechanicae, atque liberales etiam (quatenus ad opera), atque inde facienda est congeries sive historia particularis, tanquam magnalium et operum magistralium et maxime perfectorum in unaquaque ipsarum, una cum modis effectionis sive operationis.

Neque tamen astringimus diligentiam, quae adhibenda est in hujusmodi collecta

Neque tamen astringimus diligentiam, quae adhibenda est in hujusmodi collecta, ad ea quae censentur pro magisteriis et arcanis alicujus artis tantum, atque movent admirationem. Admiratio enim proles est raritatis; siquidem rara, licet in genere sint ex vulgatis naturis, tamen admirationem pariunt.

At contra, quae revera admirationi esse debent propter discrepantiam quae inest illis in specie collatis ad alias species, tamen si in usu familiari praesto sint leviter notantur. Debent autem notari monodica artis, non minus quam monodica naturae; de quibus antea diximus. Atque quemadmodum in monodicis naturae posuimus solem, lunam, magnetem, et similia, quae re vulgatissima sunt sed natura tamen fere singulari: idem et de monodicis artis faciendum est.

Exempli gratia; instantia monodica artis est papyrus; res admodum vulgata. At si diligenter animum advertas, materiae artificiales aut plane textiles sunt per fila directa et transversa; qualia sunt pannus sericus, aut laneus, et linteus, et hujusmodi: aut coagmentantur ex succis concretis; qualia sunt later, aut argilla figularis, aut vitrum, aut esmalta, aut porcellana, et similia; quae si bene uniantur splendent, sin minus, indurantur certe, sed non splendent. Attamen omnia talia, quae fiunt ex succis concretis, sunt fragilia, nec ullo modo haerentia et tenacia. At contra, papyrus est corpus tenax, quod scindi et lacerari possit; ita ut imitetur et fere aemuletur pellem sive membranam alicujus animalis, aut folium alicujus vegetabilis, et hujusmodi opificia naturae. Nam neque fragilis est, ut vitrum; neque textilis, ut pannus; sed habet fibras certe, non fila distincta, omnino ad modum materiarum naturalium: ut inter artificiales materias vix inveniatur simile aliquod, sed sit plane monodicum. Atque praeferenda sane sunt in artificialibus ea quae maxime accedunt ad imitationem naturae, aut e contrario eam potenter regunt et invertunt.

Rursus, inter ingenia et manus hominis, non prorsus contemnenda sunt praestigiae et jocularia. Nonnulla enim ex istis, licet sint usu levia et ludicra, tamen informatione valida esse possunt.

Postremo, neque omnino omittenda sunt superstitiosa, et (prout vocabulum sensu vulgari accipitur) magica. Licet enim hujusmodi res sint in immensum obrutae grandi mole mendaciorum et fabularum, tamen inspiciendum paulisper si forte subsit et lateat in aliquibus earum aliqua operatio naturalis; ut in fascino, et

subsit et lateat in aliquibus earum aliqua operatio naturalis, ut in fascino, et fortificatione imaginationis, et consensu rerum ad distans, et transmissione impressionum a spiritu ad spiritum non minus quam a corpore ad corpus, et similibus.

XXXII.

Ex iis, quae ante dicta sunt, patet quod quinque illa instantiarum genera de quibus diximus (viz. instantiarum conformium, instantiarum monodicarum, instantiarum deviantium, instantiarum limitanearum, instantiarum potestatis) non debeant reservari, donec inquiratur natura aliqua certa (quemadmodum instantiae reliquae, quas primo loco proposuimus, nec non plurimae ex iis quae sequentur, reservari debent); sed statim jam ab initio facienda est earum collectio, tanquam historia quaedam particularis; eo quod digerant ea quae ingrediuntur intellectum, et corrigant pravam complexionem intellectus ipsius, quem omnino necesse est imbui et infici et demum perverti ac distorqueri ab incursibus quotidianis et consuetis.

Itaque adhibendae sunt eae instantiae tanquam praeparativum aliquod, ad rectificandum et expurgandum intellectum. Quicquid enim abducit intellectum a consuetis, aequat et complanat aream ejus ad recipiendum lumen siccum et purum notionum verarum.

Quin etiam hujusmodi instantiae sternunt et praestruunt viam ad operativam; ut suo loco dicemus, quando de Deductionibus ad Praxin sermo erit.

XXXIII.

Inter praerogativas instantiarum ponemus loco undecimo Instantias Comitatus, atque Hostiles; quas etiam Instantias Propositionum Fixarum appellare consuevimus. Eae sunt instantiae, quae exhibent aliquod corpus sive concretum tale, in quo natura inquisita perpetuo sequatur tanquam comes quidam individuus: aut contra, in quo natura inquisita perpetuo fugiat atque ex comitatu excludatur, ut hostis et inimicus. Nam ex hujusmodi instantiis formantur

propositiones certae et universales, aut affirmativae aut negativae; in quibus subjectum erit tale corpus in concreto, praedicatum vero natura ipsa inquisita. Etenim propositiones particulares omnino fixae non sunt, ubi scilicet natura inquisita reperitur in aliquo concreto fluxa et mobilis, *viz.* accedens sive acquisita, aut rursus recedens sive deposita. Quocirca particulares propositiones non habent praerogativam aliquam majorem, nisi tantum in casu migrationis; de quo antea dictum est. Et nihilominus, etiam particulares illae propositiones comparatae et collatae cum universalibus multum juvant; ut suo loco dicetur. Neque tamen, etiam in universalibus istis propositionibus exactam aut absolutam affirmationem vel abnegationem requirimus. Sufficit enim ad id quod agitur, etiamsi exceptionem nonnullam singularem aut raram patiantur.

Usus autem instantiarum comitatus est ad angustiandam affirmativam formae. Quemadmodum enim in instantiis migrantibus angustiatur affirmativa formae; *viz.* ut necessario poni debeat forma rei esse aliquid quod per actum illum migrationis inditur aut destruitur; ita etiam in instantiis comitatus angustiatur affirmativa formae; ut necessario poni debeat forma rei esse aliquid quod talem concretionem corporis subingrediatur, aut contra ab eadem abhorreat; ut qui bene norit constitutionem aut schematismum hujusmodi corporis non longe abfuerit ab extrahenda in lucem forma naturae inquisitae.

Exempli gratia; sit natura inquisita Calidum. Instantia comitatus est flamma. Etenim in aqua, aere, lapide, metallo, et aliis quamplurimis, calor est mobilis, et accedere potest et recedere: at omnis flamma est calida, ita ut calor in concretione flammae perpetuo sequatur. At instantia hostilis calidi nulla reperitur apud nos. Nam de visceribus terrae nihil constat ad sensum; sed eorum corporum quae nobis nota sunt nulla prorsus est concretio quae non est susceptibilis caloris.

At rursus, sit natura inquisita Consistens. Instantia hostilis est aer. Etenim metallum potest fluere, potest consistere; similiter vitrum; etiam aqua potest consistere, cum conglaciatur: at impossibile est ut aer unquam consistat, aut exuat fluorem.

Verum de instantiis hujusmodi propositionum fixarum supersunt duo monita,

quae utilia sunt ad id quod agitur. Primum, ut si defuerit plane universalis affirmativa aut negativa, illud ipsum diligenter notetur tanquam non-ens; sicut fecimus de calido, ubi universalis negativa (quatenus ad entia quae ad nostram notitiam pervenerint) in rerum natura deest. Similiter, si natura inquisita sit aeternum aut incorruptibile, deest affirmativa universalis hic apud nos. Neque enim praedicari potest Aeternum aut Incorruptibile de aliquo corpore eorum quae infra coelestia sunt, aut supra interiora terrae. Alterum monitum est, ut propositionibus universalibus, tam affirmativis quam negativis, de aliquo concreto, subjungantur simul ea concreta quae proxime videntur accedere ad id quod est ex non-entibus: ut in calore, flammae mollissimae et minimum adurentes; in incorruptibili, aurum, quod proxime accedit. Omnia enim ista indicant terminos naturae inter ens et non-ens; et faciunt ad circumscriptiones formarum, ne gliscant et vagentur extra conditiones materiae.

XXXIV.

Inter praerogativas instantiarum, ponemus loco duodecimo ipsas illas Instantias Subjunctivas, de quibus in superiori aphorismo diximus: quas etiam Instantias Ultimitatis sive Termini appellare consuevimus. Neque enim hujusmodi instantiae utiles sunt tantum, quatenus subjunguntur propositionibus fixis; verum etiam per se, et in proprietate sua. Indicant enim non obscure veras sectiones naturae, et mensuras rerum, et illud Quousque natura quid faciat et ferat, et deinde transitus naturae ad aliud. Talia sunt, aurum, in pondere; ferrum, in duritie; cete, in quantitate animalium; canis, in odore; inflammatio pulveris pyrii, in expansione celeri; et alia id genus. Nec minus exhibenda sunt ea quae sunt ultima gradu infimo, quam quae supremo; ut spiritus vini, in pondere; sericum, in mollitie; vermiculi cutis, in quantitate animalium; et caetera.

XXXV.

Inter praerogativas instantiarum, ponemus loco decimo tertio Instantias Foederis sive Unionis. Eae sunt, quae confundunt et adunant naturas, quae existimantur

esse heterogeneae, et pro talibus notantur et signantur per divisiones receptas. At instantiae foederis ostendunt operationes et effectus, quae deputantur alicui ex illis heterogeneis ut propria, competere etiam aliis ex heterogeneis; ut convincatur ista heterogenia (quae in opinione est) vera non esse aut essentialis, sed nil aliud esse quam modificatio naturae communis. Optimi itaque sunt usus ad elevandum et evehendum intellectum a differentiis ad genera; et ad tollendum larvas et simulachra rerum, prout occurrunt et prodeunt personatae in substantiis concretis.

Exempli gratia: sit natura inquisita Calidum. Omnino videtur esse divisio solennis et authentica, quod sint tria genera caloris; *viz.* calor coelestium, calor animalium, et calor ignis; quodque isti calores (praesertim unus ex illis comparatus ad reliquos duos) sint ipsa essentia et specie, sive natura specifica, differentes et plane heterogenei: quandoquidem calor coelestium et animalium generet et foveat, at calor ignis contra corrumpat et destruat. Est itaque instantia foederis experimentum illud satis vulgatum, cum recipitur ramus aliquis vitis intra domum ubi sit focus assiduus, ex quo maturescunt uvae etiam mense integro citius quam foras; ita ut maturatio fructus etiam pendentis super arborem fieri possit, scilicet ab igne, cum hoc ipsum videatur esse opus proprium solis. Itaque ab hoc initio facile insurgit intellectus, repudiata heterogenia essentiali, ad inquirendum quae sint differentiae illae quae revera reperiuntur inter calorem solis et ignis, ex quibus fit ut eorum operationes sint tam dissimiles, utcunque illi ipsi participent ex natura communi.

Quae differentiae reperientur quatuor: *viz.* primo, quod calor solis respectu caloris ignis sit gradu longe clementior et lenior; secundo, quod sit (praesertim ut defertur ad nos per aerem) qualitate multo humidior; tertio (quod caput rei est), quod sit summe inaequalis, atque accedens et auctus, et deinceps recedens et diminutus; id quod maxime confert ad generationem corporum. Recte enim asseruit Aristoteles causam principalem generationum et corruptionum, quae fiunt hic apud nos in superficie terrae, esse viam obliquam solis per zodiacum; unde calor solis, partim per vicissitudines diei et noctis, partim per successiones aestatis et hyemis, evadit miris modis inaequalis. Neque tamen desinit ille vir id

quod ab eo recte inventum fuit statim corrumpere et depravare. Nam ut arbiter scilicet naturae (quod illi in more est) valde magistraliter assignat causam generationis accessui solis, causam autem corruptionis recessui; cum utraque res (accessus videlicet solis et recessus) non respective, sed quasi indifferenter, praebeat causam tam generationi quam corruptioni; quandoquidem inaequalitas caloris generationi et corruptioni rerum, aequalitas conservationi tantum ministret. Est et quarta differentia inter calorem solis et ignis, magni prorsus momenti: *viz.* quod sol operationes suas insinuet per longa temporis spatia, ubi operationes ignis (urgente hominum impatientia) per breviora intervalla ad exitum perducantur. Quod si quis id sedulo agat, ut calorem ignis attemperet et reducat ad gradum moderatiorem et leniorem (quod multis modis facile fit), deinde etiam inspergat et admisceat nonnullam humiditatem, maxime autem si imitetur calorem solis in inaequalitate, postremo si moram patienter toleret (non certe eam quae sit proportionata operibus solis, sed largiorem quam homines adhibere solent in operibus ignis), is facile missam faciet heterogeniam illam caloris, et vel tentabit vel exaequabit vel in aliquibus vincet opera solis, per calorem ignis. Similis instantia foederis est resuscitatio papilionum ex frigore stupentium et tanquam emortuarum, per exiguum teporem ignis; ut facile cernas non magis negatum esse igni vivificare animantia quam maturare vegetabilia. Etiam inventum illud celebre Fracastorii de sartagine acriter calefacta, qua circundant medici capita apoplecticorum desperatorum, expandit manifeste spiritus animales ab humoribus et obstructionibus cerebri compressos et quasi extinctos, illosque ad motum excitat, non aliter quam ignis operatur in aquam aut aerem, et tamen per consequens vivificat. Etiam ova aliquando excluduntur per calorem ignis, id quod prorsus imitatur calorem animalem; et complura ejusmodi; ut nemo dubitare possit quin calor ignis in multis subjectis modificari possit ad imaginem caloris coelestium et animalium.

Similiter sint naturae inquisitae Motus et Quies. Videtur esse divisio solennis atque ex intima philosophia, quod corpora naturalia vel rotent, vel ferantur recta, vel stent sive quiescant. Aut enim est motus sine termino, aut statio in termino, aut latio ad terminum. At motus ille perennis rotationis videtur esse coelestium

proprius; statio sive quies videtur competere globo ipsi terrae; at corpora caetera (gravia quae vocant et levia, extra loca scilicet connaturalitatis suae sita) feruntur recta ad massas sive congregationes similium; levia sursum, versus ambitum coeli; gravia deorsum, versus terram. Atque ista pulchra dictu sunt.
At instantia foederis est cometa aliquis humilior; qui cum sit longe infra coelum, tamen rotat. Atque commentum Aristotelis de alligatione sive sequacitate cometae ad astrum aliquod jampridem explosum est; non tantum quia ratio ejus non est probabilis, sed propter experientiam manifestam discursus et irregularis motus cometarum per varia loca coeli.
At rursus alia instantia foederis circa hoc subjectum est motus aeris; qui intra tropicos (ubi circuli rotationis sunt majores) videtur et ipse rotare ab oriente in occidentem.
Et alia rursus instantia foret fluxus et refluxus maris, si modo aquae ipsae deprehendantur ferri motu rotationis (licet tardo et evanido) ab oriente in occidentem; ita tamen ut bis in die repercutiantur. Itaque, si haec ita se habeant, manifestum est motum istum rotationis non terminari in coelestibus, sed communicari aeri et aquae.
Etiam ista proprietas levium, nimirum ut ferantur sursum, vacillat nonnihil. Atque in hoc sumi potest pro instantia foederis bulla aquae. Si enim aer fuerit subter aquam, ascendit rapide versus superficiem aquae, per motum illum plagae (quam vocat Democritus), per quam aqua descendens percutit et attollit aerem sursum; non autem per contentionem aut nixum aeris ipsius. Atqui ubi ad superficiem ipsam aquae ventum fuerit, tum cohibetur aer ab ulteriore ascensu, per levem resistentiam quam reperit in aqua non statim tolerante se discontinuari: ita ut exilis admodum sit appetitus aeris ad superiora.
Similiter sit natura inquisita Pondus. Est plane divisio recepta, ut densa et solida ferantur versus centrum terrae, rara autem et tenuia versus ambitum coeli; tanquam ad loca sua propria. Atque loca quod attinet, (licet in scholis hujusmodi res valeant) plane inepta et puerilis cogitatio est, locum aliquid posse. Itaque nugantur philosophi cum dicant quod, si perforata esset terra, corpora gravia se sisterent quando ventum esset ad centrum. Esset enim certe virtuosum plane et

efficax genus nihili, aut puncti mathematici, quod aut alia afficeret, aut rursus quod alia appeterent: corpus enim non nisi a corpore patitur. Verum iste appetitus ascendendi et descendendi aut est in schematismo corporis quod movetur, aut in sympathia sive consensu cum alio corpore. Quod si inveniatur aliquod corpus densum et solidum, quod nihilominus non feratur ad terram, confunditur hujusmodi divisio. At si recipiatur opinio Gilberti, quod magnetica vis terrae ad alliciendum gravia non extendatur ultra orbem virtutis suae (quae operatur semper ad distantiam certam, et non ultra), hocque per aliquam instantiam verificetur; ea demum erit instantia foederis circa hoc subjectum. Neque tamen occurrit impraesentiarum aliqua instantia super hoc certa et manifesta. Proxime videntur accedere cataractae coeli, quae in navigationibus per Oceanum Atlanticum versus Indias utrasque saepe conspiciuntur. Tanta enim videtur esse vis et moles aquarum quae per hujusmodi cataractas subito effunditur, ut videatur collectio aquarum fuisse ante facta, atque in his locis haesisse et mansisse; et postea potius per causam violentam dejecta et detrusa esse, quam naturali motu gravitatis cecidisse; adeo ut conjici possit, corpoream molem densam atque compactam in magna distantia a terra fore pensilem tanquam terram ipsam, nec casuram nisi dejiciatur. Verum de hoc nil certi affirmamus. Interim in hoc et in multis aliis facile apparebit, quam inopes simus historiae naturalis; cum loco instantiarum certarum nonnunquam suppositiones afferre pro exemplis cogamur.

Similiter sit natura inquisita Discursus Ingenii. Videtur omnino divisio vera, rationis humanae et solertiae brutorum. Attamen sunt nonnullae instantiae actionum quae eduntur a brutis, per quas videntur etiam bruta quasi syllogizare: ut memoriae proditum est de corvo, qui per magnas siccitates fere enectus siti conspexit aquam in trunco cavo arboris; atque cum non daretur ei intrare propter angustias, non cessavit jacere multos lapillos, per quos surgeret et ascenderet aqua ut bibere posset; quod postea cessit in proverbium.

Similiter sit natura inquisita Visibile. Videtur omnino esse divisio vera et certa, lucis, quae est visibile originale et primam copiam facit visui, et coloris, qui est visibile secundarium et sine luce non cernitur, ita ut videatur nil aliud esse quam

imago aut modificatio lucis. Attamen ex utraque parte circa hoc videntur esse instantiae foederis; scilicet, nix in magna quantitate, et flamma sulphuris; in quarum altera videtur esse color primulum lucens, in altera lux vergens ad colorem.

XXXVI.

Inter praerogativas instantiarum, ponemus loco decimo quarto Instantias Crucis; translato vocabulo a Crucibus, quae erectae in biviis indicant et signant viarum separationes. Has etiam Instantias Decisorias et Judiciales, et in casibus nonnullis Instantias Oraculi et Mandati, appellare consuevimus. Earum ratio talis est. Cum in inquisitione naturae alicujus intellectus ponitur tanquam in aequilibrio, ut incertus sit utri naturarum e duabus, vel quandoque pluribus, causa naturae inquisitae attribui aut assignari debeat, propter complurium naturarum concursum frequentem et ordinarium, instantiae crucis ostendunt consortium unius ex naturis (quoad naturam inquisitam) fidum et indissolubile, alterius autem varium et separabile; unde terminatur quaestio, et recipitur natura illa prior pro causa, missa altera et repudiata. Itaque hujusmodi instantiae sunt maximae lucis, et quasi magnae authoritatis; ita ut curriculum interpretationis quandoque in illas desinat, et per illas perficiatur. Interdum autem Instantiae Crucis illae occurrunt et inveniuntur inter jampridem notatas; at ut plurimum novae sunt, et de industria atque ex composito quaesitae et applicatae, et diligentia sedula et acri tandem erutae.

1. Exempli gratia; sit natura inquisita Fluxus et Refluxus Maris, ille bis repetitus in die atque sexhorarius in accessibus et recessibus singulis, cum differentia nonnulla quae coincidit in motum lunae. Bivium circa hanc naturam tale est. Necesse prorsus est ut iste motus efficiatur, vel ab aquarum progressu et regressu, in modum aquae in pelvi agitatae, quae quando latus unum pelvis alluit, deserit alterum; vel a sublatione et subsidentia aquarum e profundo, in modum aquae ebullientis et rursus subsidentis. Utri vero causae fluxus et refluxus ille assignari debeat, oritur dubitatio. Quod si recipiatur prior assertio,

necesse est ut cum sit fluxus in mari ex una parte, fiat sub idem tempus alicubi in mari refluxus ex alia. Itaque ad hoc reducitur inquisitio. Atqui observavit Acosta, cum aliis nonnullis (diligenti facta inquisitione), quod ad litora Floridae et ad litora adversa Hispaniae et Africae, fiant fluxus maris ad eadem tempora, et refluxus itidem ad eadem tempora; non contra, quod cum fluxus fit ad littora Floridae, fiat refluxus ad littora Hispaniae et Africae. Attamen adhuc diligentius attendenti, non per hoc evincitur motus attolens, et abnegatur motus in progressu. Fieri enim potest, quod sit motus aquarum in progressu, et nihilominus inundet adversa littora ejusdem alvei simul; si aquae scilicet illae contrudantur et compellantur aliunde, quemadmodum fit in fluviis, qui fluunt et refluunt ad utrumque littus horis iisdem, cum tamen iste motus liquido sit motus in progressu, nempe aquarum ingredientium ostia fluminum ex mari. Itaque simili modo fieri potest, ut aquae venientes magna mole ab Oceano Orientali Indico compellantur et trudantur in alveum Maris Atlantici, et propterea inundent utrumque latus simul. Quaerendum itaque est, an sit alius alveus per quem aquae possint iisdem temporibus minui et refluere. Atque praesto est Mare Australe, Mari Atlantico neutiquam minus, sed potius magis latum et extensum, quod ad hoc sufficere possit.

Itaque jam tandem perventum est ad instantiam crucis circa hoc subjectum. Ea talis est: si pro certo inveniatur, quod cum fit fluxus ad littora adversa tam Floridae quam Hispaniae in Mari Atlantico, fiat simul fluxus ad littora Peruviae et juxta dorsum Chinae in Mari Australi; tum certe per hanc instantiam decisoriam abjudicanda est assertio quod fluxus et refluxus maris, de quo inquiritur, fiat per motum progressivum: neque enim relinquitur aliud mare aut locus, ubi possit ad eadem tempora fieri regressus aut refluxus. Commodissime autem hoc sciri possit, si inquiratur ab incolis Panamae et Limae (ubi uterque Oceanus, Atlanticus et Australis, per parvum Isthmum separantur), utrum ad contrarias Isthmi partes fiat simul fluxus et refluxus maris, an e contra. Verum haec decisio sive abjudicatio certa videtur, posito quod terra stet immobilis. Quod si terra rotet, fieri fortasse potest ut ex inaequali rotatione (quatenus ad celeritatem sive incitationem) terrae et aquarum maris, sequatur compulsio

violenta aquarum in cumulum sursum, quae sit fluxus: et relaxatio earundem (postquam amplius cumulari non sustinuerint) in deorsum, quae sit refluxus. Verum de hoc facienda est inquisitio separatim. Attamen etiam hoc supposito, illud aeque manet fixum, quod necesse sit fieri alicubi refluxum maris ad eadem tempora quibus fiunt fluxus in aliis partibus.

Similiter, sit natura inquisita posterior ille motus ex duobus quos supposuimus, videlicet motus maris se attollens et rursus subsidens; si forte ita acciderit ut (diligenti facto examine) rejiciatur motus alter, de quo diximus, progressivus. Tum vero erit trivium circa hanc naturam tale. Necesse est ut motus iste, per quem aquae in fluxibus et refluxibus se attollunt et rursus relabuntur, absque aliqua accessione aquarum aliarum quae advolvuntur, fiat per unum ex his tribus modis; vel quod ista aquarum copia emanet ex interioribus terrae et rursus in illa se recipiat; vel quod non sit aliqua amplior moles aquarum, sed quod eaedem aquae (non aucto quanto suo) extendantur sive rarefiant, ita ut majorem locum et dimensionem occupent, et rursus se contrahant; vel quod nec copia accedat major nec extensio amplior, sed eaedem aquae (prout sunt tam copia quam densitate aut raritate) per vim aliquam magneticam desuper eas attrahentem et evocantem, et per consensum, se attollant et deinde se remittant. Itaque reducatur (si placet) jam inquisitio (missis duobus illis motibus prioribus) ad hunc ultimum; et inquiratur si fiat aliqua talis sublatio per consensum sive vim magneticam. Atqui primo manifestum est universas aquas, prout ponuntur in fossa sive cavo maris, non posse simul attolli, quia defuerit quod succedat in fundo; adeo ut si foret in aquis aliquis hujusmodi appetitus se attollendi, ille ipse tamen a nexu rerum, sive (ut vulgo loquuntur) ne detur vacuum, fractus foret et cohibitus. Relinquitur, ut attollantur aquae ex aliqua parte, et per hoc minuantur et cedant ex alia. Enimvero rursus necessario sequetur ut vis illa magnetica, cum super totum operari non possit, circa medium operetur intensissime; ita ut aquas in medio attollat, illae vero sublatae latera per successionem deserant et destituant.

Itaque jam tandem perventum est ad instantiam crucis circa hoc subjectum. Ea talis est: si inveniatur quod in refluxibus maris aquarum superficies in mari sit

arcuata magis et rotunda, attollentibus se scilicet aquis in medio maris et deficientibus circa latera, quae sunt litora; et in fluxibus eadem superficies sit magis plana et aequa, redeuntibus scilicet aquis ad priorem suam positionem; tum certe per hanc instantiam decisoriam potest recipi sublatio per vim magneticam, aliter prorsus abjudicanda est. Hoc vero in fretis per lineas nauticas non difficile est experiri; videlicet utrum in refluxibus versus medium maris, mare non sit magis altum sive profundum quam in fluxibus. Notandum autem est, si hoc ita sit, fieri (contra ac creditur) ut attollant se aquae in refluxibus, demittant se tantum in fluxibus, ita ut littora vestiant et inundent.

2. Similiter, sit natura inquisita Motus Rotationis spontaneus; et speciatim, utrum Motus Diurnus, per quem sol et stellae ad conspectum nostrum oriuntur et occidunt, sit motus rotationis verus in coelestibus, aut motus apparens in coelestibus, verus in terra. Poterit esse instantia crucis super hoc subjectum talis. Si inveniatur motus aliquis in oceano ab oriente in occidentem, licet admodum languidus et enervatus; si idem motus reperiatur paulo incitatior in aere, praesertim intra tropicos, ubi propter majores circulos est magis perceptibilis; si idem motus reperiatur in humilioribus cometis, jam factus vivus et validus; si idem motus reperiatur in planetis, ita tamen dispensatus et graduatus ut quo proprius absit a terra sit tardior, quo longius celerior, atque in coelo demum stellato sit velocissimus: tum certe recipi debet motus diurnus pro vero in coelis, et abnegandus est motus terrae; quia manifestum erit, motum ab oriente in occidentem esse plane cosmicum et ex consensu universi, qui in summitatibus coeli maxime rapidus gradatim labascat, et tandem desinat et extinguatur in immobili, videlicet terra.
Similiter, sit natura inquisita Motus Rotationis ille alter apud astronomos decantatus, renitens et contrarius Motui Diurno, videlicet ab occidente in orientem; quem veteres astronomi attribuunt planetis, etiam coelo stellato, at Copernicus et ejus sectatores terrae quoque; et quaeratur utrum inveniatur in rerum natura aliquis talis motus, an potius res conficta sit et supposita, ad compendia et commoditates calculationum, et ad pulchrum illud, scilicet de

expediendis motibus coelestibus per circulos perfectos. Neutiquam enim evincitur iste motus esse in supernis verus et realis, nec per defectum restitutionis planetae in motu diurno ad idem punctum coeli stellati, nec per diversam politatem zodiaci, habito respectu ad polos mundi; quae duo nobis hunc motum pepererunt. Primum enim phaenomenon per anteversionem et derelictionem optime salvatur; secundum per lineas spirales; adeo ut inaequalitas restitutionis et declinatio ad tropicos possint esse potius modificationes motus unici illius diurni, quam motus renitentes aut circa diversos polos. Et certissimum est, si paulisper pro plebeiis nos geramus (missis astronomorum et scholae commentis, quibus illud in more est ut sensui in multis immerito vim faciant, et obscuriora malint), talem esse motum istum ad sensum, qualem diximus; cujus imaginem per fila ferrea (veluti in machina) aliquando repraesentari fecimus.
Verum instantia crucis super hoc subjectum poterit esse talis. Si inveniatur in aliqua historia fide digna, fuisse cometam aliquem vel sublimiorem vel humiliorem qui non rotaverit cum consensu manifesto (licet admodum irregulariter) motus diurni, sed potius rotaverit in contrarium coeli; tum certe hucusque judicandum est posse esse in natura aliquem talem motum. Sin nihil hujusmodi inveniatur, habendus est pro suspecto, et ad alias instantias crucis circa hoc confugiendum.

3. Similiter, sit natura inquisita Pondus sive Grave. Bivium circa hanc naturam tale est. Necesse est ut gravia et ponderosa vel tendant ex natura sua ad centrum terrae, per proprium schematismum; vel ut a massa corporea ipsius terrae, tanquam a congregatione corporum connaturalium, attrahantur et rapiantur, et ad eam per consensum ferantur. At posterius hoc si in causa sit, sequitur ut quo propius gravia appropinquant ad terram, eo fortius et majore cum impetu ferantur ad eam; quo longius ab ea absint, debilius et tardius (ut fit in attractionibus magneticis); idque fieri intra spatium certum; adeo ut si elongata fuerint a terra tali distantia ut virtus terrae in ea agere non possit, pensilia mansura sint, ut et ipsa terra, nec omnino decasura.
Itaque talis circa hanc rem poterit esse instantia crucis. Sumatur horologium ex

iis quae moventur per pondera plumbea, et aliud ex iis quae moventur per compressionem laminae ferreae; atque vere probentur, ne alterum altero velocius sit aut tardius; deinde ponatur horologium illud movens per pondera super fastigium alicujus templi altissimi, altero illo infra detento; et notetur diligenter si horologium in alto situm tardius moveatur quam solebat, propter diminutam virtutem ponderum. Idem fiat experimentum in profundis minerarum alte sub terra depressarum, utrum horologium hujusmodi non moveatur velocius quam solebat, propter auctam virtutem ponderum. Quod si inveniatur virtus ponderum minui in sublimi, aggravari in subterraneis, recipiatur pro causa ponderis attractio a massa corporea terrae.

4. Similiter, sit natura inquisita Verticitas Acus Ferreae, tactae magnete. Circa hanc naturam tale erit bivium. Necesse est ut tactus magnetis vel ex se indat ferro verticitatem ad septentriones et austrum; vel ut excitet ferrum tantummodo et habilitet, motus autem ipse indatur ex praesentia terrae; ut Gilbertus opinatur, et tanto conatu probare nititur. Itaque huc spectant ea, quae ille perspicaci industria conquisivit. Nimirum quod clavus ferreus, qui diu duravit in situ versus septentriones et austrum, colligat mora diutina verticitatem, absque tactu magnetis: ac si terra ipsa, quae ob distantiam debiliter operatur (namque superficies aut extima incrustatio terrae virtutis magneticae, ut ille vult, expers est), per moram tamen longam magnetis tactum suppleret, et ferrum exciret, deinde excitum conformaret et verteret. Rursus, quod ferrum ignitum et cadens, si in extinctione sua exporrigatur inter septentriones et austrum, colligat quoque verticitatem absque tactu magnetis: ac si partes ferri in motu positae per ignitionem, et postea se recipientes, in ipso articulo extinctionis suae magis essent susceptivae et quasi sensitivae virtutis manantis a terra quam alias, et inde fierent tanquam excitae. Verum haec, licet bene observata, tamen non evincunt prorsus quod ille asserit.
Instantia crucis autem circa hoc subjectum poterit esse talis. Capiatur terrella ex magnete, et notentur poli ejus; et ponantur poli terrellae versus orientem et occasum, non versus septentriones et austrum, atque ita jaceant; deinde

superponatur acus ferrea intacta, et permittatur ita manere ad dies sex aut septem. Acus vero (nam de hoc non dubitatur) dum manet super magnetem, relictis polis mundi, se vertet ad polos magnetis; itaque quamdiu ita manet, vertitur scilicet ad orientem et occidentem mundi. Quod si inveniatur acus illa, remota a magnete et posita super versorium, statim se applicare ad septentriones et austrum, vel etiam paulatim se eo recipere, tum recipienda est pro causa, praesentia terrae; sin aut vertatur (ut prius) in orientem et occidentem, aut perdat verticitatem, habenda est illa causa pro suspecta, et ulterius inquirendum est.

5. Similiter, sit natura inquisita Corporea Substantia Lunae: an sit tenuis, flammea, sive aerea, ut plurimi ex priscis philosophis opinati sunt; an solida et densa, ut Gilbertus et multi moderni, cum nonnullis ex antiquis, tenent. Rationes posterioris istius opinionis fundantur in hoc maxime, quod luna radios solis reflectat; neque videtur fieri reflexio lucis nisi a solidis.
Itaque instantiae crucis circa hoc subjectum eae esse poterint (si modo aliquae sint) quae demonstrent reflexionem a corpore tenui, qualis est flamma, modo sit crassitiei sufficientis. Certe causa crepusculi, inter alias, est reflexio radiorum solis a superiore parte aeris. Etiam quandoque reflecti videmus radios solis temporibus vespertinis serenis a fimbriis nubium roscidarum, non minori splendore, sed potius illustriori et magis glorioso, quam qui redditur a corpore lunae; neque tamen constat eas nubes coaluisse in corpus densum aquae. Etiam videmus aerem tenebrosum pone fenestras noctu reflectere lucem candelae, non minus quam corpus densum. Tentandum etiam foret experimentum immissionis radiorum solis per foramen super flammam aliquam subfuscam et caeruleam. Sane radii aperti solis, incidentes in flammas obscuriores, videntur eas quasi mortificare, ut conspiciantur magis instar fumi albi quam flammae. Atque haec impraesentiarum occurrunt, quae sint ex natura instantiarum crucis circa hanc rem; et meliora fortasse reperiri possunt. Sed notandum semper est, reflexionem a flamma non esse expectandam, nisi a flamma alicujus profunditatis; nam aliter vergit ad diaphanum. Hoc autem pro certo ponendum, lucem semper in corpore aequali aut excipi et transmitti, aut resilire.

6. Similiter, sit natura inquisita Motus Missilium, veluti spiculorum, sagittarum, globulorum, per aerem. Hunc motum Schola (more suo) valde negligenter expedit; satis habens, si eum nomine motus violenti a naturali (quem vocant) distinguat; et quod ad primam percussionem sive impulsionem attinet, per illud, (quod duo corpora non possint esse in uno loco, ne fiat penetratio dimensionum,) sibi satisfaciat; et de processu continuato istius motus nihil curet. At circa hanc naturam bivium est tale: aut iste motus fit ab aere vehente et pone corpus emissum se colligente, instar fluvii erga scapham aut venti erga paleas; aut a partibus ipsius corporis non sustinentibus impressionem, sed ad eandem laxandam per successionem se promoventibus. Atque priorem illum recipit Fracastorius, et fere omnes qui de hoc motu paulo subtilius inquisiverunt: neque dubium est, quin sint aeris partes in hac re nonnullae; sed alter motus proculdubio verus est, ut ex infinitis constat experimentis. Sed inter caeteras, poterit esse circa hoc subjectum instantia crucis talis; quod lamina, aut filum ferri paulo contumacius, vel etiam calamus sive penna in medio divisa, adducta et curvata inter pollicem et digitum exiliant. Manifestum enim est, hoc non posse imputari aeri se pone corpus colligenti, quia fons motus est in medio laminae vel calami, non in extremis.

7. Similiter sit natura inquisita motus ille rapidus et potens Expansionis Pulveris Pyrii in flammam; unde tantae moles subvertuntur, tanta pondera emittuntur, quanta in cuniculis majoribus et bombardis videmus. Bivium circa hanc naturam tale est. Aut excitatur iste motus a mero corporis appetitu se dilatandi, postquam fuerit inflammatum; aut ab appetitu mixto spiritus crudi, qui rapide fugit ignem, et ex eo circumfuso, tanquam ex carcere, violenter erumpit. Schola autem et vulgaris opinio tantum versatur circa priorem illum appetitum. Putant enim homines se pulchre philosophari, si asserant flammam ex forma elementi necessitate quadam donari locum ampliorem occupandi quam idem corpus expleverat cum subiret formam pulveris, atque inde sequi motum istum. Interim minime advertunt, licet hoc verum sit, posito quod flamma generetur, tamen posse impediri flammae generationem a tanta mole, quae illam comprimere et

suffocare queat; ut non deducatur res ad istam necessitatem de qua loquuntur. Nam quod necesse sit fieri expansionem, atque inde sequi emissionem aut remotionem corporis quod obstat, si generetur flamma, recte putant. Sed ista necessitas plane evitatur, si moles illa solida flammam supprimat antequam generetur. Atque videmus flammam, praesertim in prima generatione, mollem esse et lenem, et requirere cavum in quo experiri et ludere possit. Itaque tanta violentia huic rei per se assignari non potest. Sed illud verum; generationem hujusmodi flammarum flatulentarum, et veluti ventorum igneorum, fieri ex conflictu duorum corporum, eorumque naturae inter se plane contrariae; alterius admodum inflammabilis, quae natura viget in sulphure; alterius flammam exhorrentis, qualis est spiritus crudus qui est in nitro; adeo ut fiat conflictus mirabilis, inflammante se sulphure quantum potest (nam tertium corpus, nimirum carbo salicis, nil aliud fere praestat, quam ut illa duo corpora incorporet et commode uniat), et erumpente spiritu nitri quantum potest, et una se dilatante (nam hoc faciunt et aer, et omnia cruda, et aqua, ut a calore dilatentur), et per istam fugam et eruptionem interim flammam sulphuris, tanquam follibus occultis, undequaque exufflante.

Poterant autem esse instantiae crucis circa hoc subjectum duorum generum. Alterum eorum corporum quae maxime sunt inflammabilia, qualia sunt sulphur, caphura, naphtha, et hujusmodi, cum eorum misturis; quae citius et facilius concipiunt flammam quam pulvis pyrius, si non impediantur: ex quo liquet appetitum inflammandi per se effectum illum stupendum non operari. Alterum eorum quae flammam fugiunt et exhorrent, qualia sunt sales omnes. Videmus enim, si jaciantur in ignem, spiritum aqueum erumpere cum fragore antequam flamma concipiatur; quod etiam leniter fit in foliis paulo contumacioribus, parte aquea erumpente antequam oleosa concipiat flammam. Sed maxime cernitur hoc in argento vivo, quod non male dicitur aqua mineralis. Hoc enim, absque inflammatione, per eruptionem et expansionem simplicem vires pulveris pyrii fere adaequat; quod etiam admixtum pulveri pyrio ejus vires multiplicare dicitur.

8. Similiter sit natura inquisita, Transitoria Natura Flammae, et Extinctio ejus Momentanea. Non enim videtur natura flammea hic apud nos figi et consistere,

momentanea. Non enim videtur natura flammea hic apud nos agere et consistere; sed singulis quasi momentis generari, et statim extingui. Manifestum enim est in flammis, quae hic continuantur et durant, istam durationem non esse ejusdem flammae in individuo, sed fieri per successionem novae flammae seriatim generatae, minime autem manere eandem flammam numero; id quod facile perspicitur ex hoc, quod, subtracto alimento sive fomite flammae, flamma statim pereat. Bivium autem circa hanc naturam tale est. Momentanea ista natura aut fit remittente se causa quae eam primo genuit, ut in lumine, sonis, et motibus (quos vocant) violentis; aut quod flamma in natura sua possit hic apud nos manere, sed a contrariis naturis circumfusis vim patiatur et destruatur.

Itaque poterit esse circa hoc subjectum instantia crucis talis. Videmus flammas in incendiis majoribus, quam alte in sursum ascendant. Quanto enim basis flammae est latior, tanto vertex sublimior. Itaque videtur principium extinctionis fieri circa latera, ubi ab aere flamma comprimitur et male habetur. At meditullia flammae, quae aer non contingit sed alia flamma undique circumdat, eadem numero manent, neque extinguuntur donec paulatim angustientur ab aere per latera circumfuso. Itaque omnis flamma pyramidalis est basi circa fomitem largior, vertice autem (inimicante aere, nec suppeditante fomite) acutior. At fumus angustior circa basin ascendendo dilatatur, et fit tanquam pyramis inversa; quia scilicet aer fumum recipit, flammam (neque enim quispiam somniet aerem esse flammam accensam, cum sint corpora plane heterogenea) comprimit.

Accuratior autem poterit esse instantia crucis ad hanc rem accommodata, si res forte manifestari possit per flammas bicolores. Capiatur igitur situla parva ex metallo, et in ea figatur parva candela cerea accensa; ponatur situla in patera, et circumfundatur spiritus vini in modica quantitate, quae ad labra situlae non attingat; tum accende spiritum vini. At spiritus ille vini exhibebit flammam magis scilicet caeruleam, lychnus candelae autem magis flavam. Notetur itaque utrum flamma lychni (quam facile est per colorem a flamma spiritus vini distinguere; neque enim flammae, ut liquores, statim commiscentur) maneat pyramidalis, an potius magis tendat ad formam globosam, cum nihil inveniatur quod eam destruat aut comprimat. At hoc posterius si fiat, manere flammam eandem numero, quamdiu intra aliam flammam concludatur nec vim inimicam

aeris experiatur, pro certo ponendum est.
Atque de instantiis crucis haec dicta sint. Longiores autem in iis tractandis ad hunc finem fuimus, ut homines paulatim discant et assuefiant de natura judicare per instantias crucis et experimenta lucifera, et non per rationes probabiles.

XXXVII.

Inter praerogativas instantiarum ponemus loco decimo quinto Instantias Divortii; quae indicant separationes naturarum earum quae ut plurimum occurrunt. Differunt autem ab instantiis quae subjunguntur instantiis comitatus; quia illae indicant separationes naturae alicujus ab aliquo concreto cum quo illa familiariter consuescit, hae vero separationes naturae alicujus ab altera natura. Differunt etiam ab instantiis crucis; quia nihil determinant, sed monent tantum de separabilitate unius naturae ab altera. Usus autem earum est ad prodendas falsas formas, et dissipandas leves contemplationes ex rebus obviis orientes; adeo ut veluti plumbum et pondera intellectui addant.
Exempli gratia: sint naturae inquisitae quatuor naturae illae, quas Contubernales vult esse Telesius, et tanquam ex eadem camera; *viz.* calidum, lucidum, tenue, mobile sive promptum ad motum. At plurimae inveniuntur instantiae divortii inter ipsas. Aer enim tenuis est et habilis ad motum, non calidus aut lucidus; luna lucida, absque calore; aqua fervens calida, absque lumine; motus acus ferreae super versorium pernix et agilis, et tamen in corpore frigido, denso, opaco; et complura id genus.
Similiter sint naturae inquisitae Natura Corporea et Actio Naturalis. Videtur enim non inveniri actio naturalis, nisi subsistens in aliquo corpore. Attamen possit fortasse esse circa hanc rem instantia nonnulla divortii. Ea est actio magnetica, per quam ferrum fertur ad magnetem, gravia ad globum terrae. Addi etiam possint aliae nonnullae operationes ad distans. Actio siquidem hujusmodi et in tempore fit, per momenta non in puncto temporis, et in loco, per gradus et spatia. Est itaque aliquod momentum temporis, et aliquod intervallum loci, in quibus ista virtus sive actio haeret in medio inter duo illa corpora quae motum

cient. Reducitur itaque contemplatio ad hoc; utrum illa corpora quae sunt termini motus disponant vel alterent corpora media, ut per successionem et tactum verum labatur virtus a termino ad terminum, et interim subsistat in corpore medio; an horum nihil sit, praeter corpora et virtutem et spatia? Atque in radiis opticis et sonis et calore et aliis nonnullis operantibus ad distans, probabile est media corpora disponi et alterari: eo magis, quod requiratur medium qualificatum ad deferendam operationem talem. At magnetica illa sive coitiva virtus admittit media tanquam adiaphora, nec impeditur virtus in omnigeno medio. Quod si nil rei habeat virtus illa aut actio cum corpore medio, sequitur quod sit virtus aut actio naturalis ad tempus nonnullum et in loco nonnullo subsistens sine corpore; cum neque subsistat in corporibus terminantibus, nec in mediis. Quare actio magnetica poterit esse instantia divortii circa naturam corpoream et actionem naturalem. Cui hoc adjici potest tanquam corollarium aut lucrum non praetermittendum: *viz.* quod etiam secundum sensum philosophanti sumi possit probatio quod sint entia et substantiae separatae et incorporeae. Si enim virtus et actio naturalis, emanans a corpore, subsistere possit aliquo tempore et aliquo loco omnino sine corpore; prope est ut possit etiam emanare in origine sua a substantia incorporea. Videtur enim non minus requiri natura corporea ad actionem naturalem sustentandam et devehendam, quam ad excitandam aut generandum.

XXXVIII.

Sequuntur quinque ordines instantiarum, quas uno vocabulo generali Instantias Lampadis sive Informationis Primae appellare consuevimus. Eae sunt quae auxiliantur sensui. Cum enim omnis interpretatio naturae incipiat a sensu, atque a sensuum perceptionibus recta, constanti, et munita via ducat ad perceptiones intellectus, quae sunt notiones verae et axiomata; necesse est ut, quanto magis copiosae et exactae fuerint repraesentationes sive praebitiones ipsius sensus, tanto omnia cedant facilius et foelicius.

Harum autem quinque instantiarum lampadis, primae roborant, ampliant, et rectificant actiones sensus immediatas; secundae deducunt non-sensibile ad

rectificant actiones sensus immediatas; secundae deducunt non sensibile ad sensibile; tertiae indicant processus continuatos sive series earum rerum et motuum quae (ut plurimum) non notantur nisi in exitu aut periodis; quartae aliquid substituunt sensui in meris destitutionibus; quintae excitant attentionem sensus et advertentiam, atque una limitant subtilitatem rerum. De his autem singulis jam dicendum est.

XXXIX.

Inter praerogativas instantiarum ponemus loco decimo sexto Instantias Januae sive Portae: eo enim nomine eas appellamus quae juvant actiones sensus immediatas. Inter sensus autem manifestum est partes primas tenere Visum, quoad informationem; quare huic sensui praecipue auxilia conquirenda. Auxilia autem triplicia esse posse videntur: vel ut percipiat non visa; vel ut majore intervallo; vel ut exactius et distinctius.

Primi generis sunt (missis bis-oculis et hujusmodi, quae valent tantum ad corrigendam et levandam infirmitatem visus non bene dispositi, atque ideo nihil amplius informant) ea quae nuper inventa sunt perspicilla; quae latentes et invisibiles corporum minutias, et occultos schematismos et motus (aucta insigniter specierum magnitudine) demonstrant; quorum vi, in pulice, musca, vermiculis, accurata corporis figura et lineamenta, necnon colores et motus prius non conspicui, non sine admiratione cernuntur. Quinetiam aiunt lineam rectam calamo vel penecillo descriptam, per hujusmodi perspicilla inaequalem admodum et tortuosam cerni: quia scilicet nec motus manus, licet per regulam adjutae, nec impressio atramenti aut coloris revera aequalia existant; licet illae inaequalitates tam minutae sint ut sine adjumento hujusmodi perspicillorum conspici nequeant. Etiam superstitiosam quandam observationem in hac re (ut fit in rebus novis et miris) addiderunt homines: *viz.* quod hujusmodi perspicilla opera naturae illustrent, artis dehonestent. Illud vero nihil aliud est quam quod texturae naturales multo subtiliores sint quam artificiosae. Perspicillum enim illud ad minuta tantum valet: quale perspicillum si vidisset Democritus, exiluisset forte, et modum videndi atomum (quem ille invisibilem omnino

affirmavit) inventum fuisse putasset. Verum incompetentia hujusmodi perspicillorum, praeterquam ad minutias tantum (neque ad ipsas quoque, si fuerint in corpore majusculo), usum rei destruit. Si enim inventum extendi posset ad corpora majora, aut corporum majorum minutias, adeo ut textura panni lintei conspici posset tanquam rete, atque hoc modo minutiae latentes et inaequalitates gemmarum, liquorum, urinarum, sanguinis, vulnerum, et multarum aliarum rerum, cerni possent, magnae proculdubio ex eo invento commoditates capi possent.

Secundi generis sunt illa altera perspicilla quae memorabili conatu adinvenit Galilaeus; quorum ope, tanquam per scaphas aut naviculas, aperiri et exerceri possint propiora cum coelestibus commercia. Hinc enim constat, galaxiam esse nodum sive coacervationem stellarum parvarum, plane numeratarum et distinctarum; de qua re apud antiquos tantum suspicio fuit. Hinc demonstrari videtur, quod spatia orbium (quos vocant) planetarum non sint plane vacua aliis stellis, sed quod coelum incipiat stellescere antequam ad coelum ipsum stellatum ventum sit; licet stellis minoribus quam ut sine perspicillis istis conspici possint. Hinc choreas illas stellarum parvarum circa planetam Jovis (unde conjici possit esse in motibus stellarum plura centra) intueri licet. Hinc inaequalitates luminosi et opaci in luna distinctius cernuntur et locantur; adeo ut fieri possit quaedam seleno-graphia. Hinc maculae in sole, et id genus: omnia certe inventa nobilia, quatenus fides hujusmodi demonstrationibus tuto adhiberi possit. Quae nobis ob hoc maxime suspectae sunt, quod in istis paucis sistatur experimentum, neque alia complura investigatu aeque digna eadem ratione inventa sint.

Tertii generis sunt bacilla illa ad terras mensurandas, astrolabia, et similia; quae sensum videndi non ampliant, sed rectificant et dirigunt. Quod si sint aliae instantiae quae reliquos sensus juvent in ipsorum actionibus immediatis et individuis, tamen si ejusmodi sint quae informationi ipsi nihil addant plus quam jam habetur, ad id quod nunc agitur non faciunt. Itaque earum mentionem non fecimus.

XL.

Inter praerogativas instantiarum ponemus loco decimo septimo Instantias Citantes, sumpto vocabulo a foris civilibus, quia citant ea ut compareant quae prius non comparuerunt; quas etiam Instantias Evocantes appellare consuevimus. Eae deducunt non-sensibile ad sensibile.
Sensum autem fugiunt res, vel propter distantiam objecti locati; vel propter interceptionem sensus per corpora media; vel quia objectum non est habile ad impressionem in sensu faciendam; vel quia deficit quantum in objecto pro feriendo sensu; vel quia tempus non est proportionatum ad actuandum sensum; vel quia objecti percussio non toleratur a sensu; vel quia objectum ante implevit et possedit sensum, ut novo motui non sit locus. Atque haec praecipue ad visum pertinent, et deinde ad tactum. Nam hi duo sensus sunt informativi ad largum, atque de communibus objectis; ubi reliqui tres non informent fere, nisi immediate et de propriis objectis.

1. In primo genere non fit deductio ad sensibile, nisi rei, quae cerni non possit propter distantiam, adjiciatur aut substituatur alia res quae sensum magis e longinquo provocare et ferire possit: veluti in significatione rerum per ignes, campanas, et similia.

2. In secundo genere fit deductio, cum ea quae interius propter interpositionem corporum latent, nec commode aperiri possunt, per ea quae sunt in superficie, aut ab interioribus effluunt, perducuntur ad sensum: ut status humanorum corporum per pulsus, et urinas, et similia.

3 and 4. At tertii et quarti generis deductiones ad plurima spectant, atque undique in rerum inquisitione sunt conquirendae. Hujus rei exempla sunt. Patet quod aer, et spiritus, et hujusmodi res quae sunt toto corpore tenues et subtiles, nec cerni nec tangi possint. Quare in inquisitione circa hujusmodi corpora deductionibus omnino est opus.
Sit itaque natura inquisita Actio et Motus Spiritus qui includitur in corporibus tangibilibus. Omne enim tangibile apud nos continet spiritum invisibilem et intactilem, eique obducitur atque eum quasi vestit. Hinc fons triplex potens ille

et mirabilis processus spiritus in corpore tangibili. Spiritus enim in re tangibili, emissus, corpora contrahit et desiccat; detentus, corpora intenerat et colliquat; nec prorsus emissus nec prorsus detentus, informat, membrificat, assimilat, egerit, organizat, et similia. Atque haec omnia deducuntur ad sensibile per effectus conspicuos.

Etenim in omni corpore tangibili inanimato, spiritus inclusus primo multiplicat se, et tanquam depascit partes tangibiles eas quae sunt maxime ad hoc faciles et praeparatae, easque digerit et conficit et vertit in spiritum, et deinde una evolant. Atque haec confectio et multiplicatio spiritus deducitur ad sensum per diminutionem ponderis. In omni enim desiccatione, aliquid defluit de quanto; neque id ipsum ex spiritu tantum praeinexistente, sed ex corpore quod prius fuit tangibile et noviter versum est: spiritus enim non ponderat. Egressus autem sive emissio spiritus deducitur ad sensibile in rubigine metallorum, et aliis putrefactionibus ejus generis quae sistunt se antequam pervenerint ad rudimenta vitae; nam illae ad tertium genus processus pertinent. Etenim in corporibus magis compactis spiritus non invenit poros et meatus per quos evolet: itaque cogitur partes ipsas tangibiles protrudere et ante se agere, ita ut illae simul exeant; atque inde fit rubigo, et similia. At contractio partium tangibilium, postquam aliquid de spiritu fuerit emissum (unde sequitur illa desiccatio), deducitur ad sensibile tum per ipsam duritiem rei auctam, tum multo magis per scissuras, angustiationes, corrugationes, et complicationes corporum, quae inde sequuntur. Etenim partes ligni desiliunt et angustiantur; pelles currugantur; neque id solum, sed (si subita fuerit emissio spiritus per calorem ignis) tantum properant ad contractionem ut se complicent et convolvant.

At contra, ubi spiritus detinetur, et tamen dilatatur et excitatur per calorem aut ejus analoga (id quod fit in corporibus magis solidis aut tenacibus), tum vero corpora emolliuntur, ut ferrum candens; fluunt, ut metalla; liquefiunt, ut gummi, cera, et similia. Itaque contrariae illae operationes caloris (ut ex eo alia durescant, alia liquescant) facile conciliantur; quia in illis spiritus emittitur, in his agitatur et detinetur: quorum posterius est actio propria caloris et spiritus; prius, actio partium tangibilium tantum per occasionem spiritus emissi.

Ast ubi spiritus nec detinetur prorsus nec prorsus emittitur, sed tantum inter claustra sua tentat et experitur, atque nacta est partes tangibiles obedientes et sequaces in promptu, ita ut quo spiritus agit eae simul sequantur; tum vero sequitur efformatio in corpus organicum, et membrificatio, et reliquae actiones vitales, tam in vegetabilibus quam in animalibus. Atque haec maxime deducuntur ad sensum per notationes diligentes primorum incoeptuum et rudimentorum sive tentamentorum vitae in animalculis ex putrefactione natis: ut in ovis formicarum, vermibus, muscis, ranis post imbrem, *etc.* Requiritur autem ad vivificationem et lenitas caloris et lentor corporis; ut spiritus nec per festinationem erumpat, nec per contumaciam partium coerceatur, quin potius ad cerae modum illas plicare et effingere possit.

Rursus, differentia illa spiritus, maxime nobilis et ad plurima pertinens (viz. spiritus abscissi, ramosi simpliciter, ramosi simul et cellulati; ex quibus prior est spiritus omnium corporum inanimatorum, secundus vegetabilium, tertius animalium), per plurimas instantias deductorias tanquam sub oculos ponitur. Similiter patet, quod subtiliores texturae et schematismi rerum (licet toto corpore visibilium aut tangibilium) nec cernantur nec tangantur. Quare in his quoque per deductionem procedit informatio. At differentia schematismorum maxime radicalis et primaria sumitur ex copia vel paucitate materiae quae subit idem spatium sive dimensum. Reliqui enim schematismi (qui referuntur ad dissimilaritates partium, quae in eodem corpore continentur, et collocationes ac posituras earundem) prae illo altero sunt secundarii.

Sit itaque natura inquisita Expansio sive Coitio Materiae in corporibus respective: *viz.* quantum materiae impleat quantum dimensum in singulis. Etenim nil verius in natura quam propositio illa gemella, ex nihilo nihil fieri, neque quicquam in nihilum redigi: verum quantum ipsum materiae sive summam totalem constare, nec augeri aut minui. Nec illud minus verum, ex quanto illo materiae sub iisdem spatiis sive dimensionibus, pro diversitate corporum, plus et minus contineri: ut in aqua plus, in aere minus; adeo ut si quis asserat aliquod contentum aquae in par contentum aeris verti posse, idem sit ac si dicat aliquid posse redigi in nihilum; contra, si quis asserat aliquod contentum

aeris in par contentum aquae verti posse, idem sit ac si dicat aliquid posse fieri ex nihilo. Atque ex copia ista et paucitate materiae notiones illae densi et rari, quae varie et promiscue accipiuntur, proprie abstrahuntur. Assumenda est et assertio illa tertia, etiam satis certa: quod hoc de quo loquimur plus et minus materiae in corpore hoc vel illo ad calculos (facta collatione) et proportiones exactas aut exactis propinquas reduci possit. Veluti si quis dicat inesse in dato contento auri talem coacervationem materiae, ut opus habeat spiritus vini, ad tale quantum materiae aequandum, spatio vicies et semel majore quam implet aurum, non erraverit.

Coacervatio autem materiae et rationes ejus deducuntur ad sensibile per pondus. Pondus enim respondet copiae materiae, quoad partes rei tangibilis; spiritus autem, et ejus quantum ex materia, non venit in computationem per pondus; levat enim pondus potius quam gravat. At nos hujus rei tabulam fecimus satis accuratam; in qua pondera et spatia singulorum metallorum, lapidum praecipuorum, lignorum, liquorum, oleorum, et plurimorum aliorum corporum tam naturalium quam artificialium, excepimus: rem polychrestam, tam ad lucem informationis quam ad normam operationis; et quae multas res revelet omnino praeter expectatum. Neque illud pro minimo habendum est, quod demonstret omnem varietatem quae in corporibus tangibilibus nobis notis versatur (intelligimus autem corpora bene unita, nec plane spongiosa et cava et magna ex parte aere impleta) non ultra rationes partium 21 excedere: tam finita scilicet est natura, aut saltem illa pars ejus cujus usus ad nos maxime pertinet.

Etiam diligentiae nostrae esse putavimus, experiri si forte capi possint rationes corporum non tangibilium sive pneumaticorum, respectu corporum tangibilium. Id quod tali molitione aggressi sumus. Phialam vitream accepimus, quae unciam fortasse unam capere possit; parvitate vasis usi, ut minori cum calore posset fieri evaporatio sequens. Hanc phialam spiritu vini implevimus fere ad collum; eligentes spiritum vini, quod per tabulam priorem eum esse ex corporibus tangibilibus (quae bene unita, nec cava sunt) rarissimum, et minimum continens materiae sub suo dimenso, observavimus. Deinde pondus aquae cum phiala ipsa exacte notavimus. Postea vesicam accepimus, quae circa duas pintas contineret.

Ex ea aerem omnem, quoad fieri potuit, expressimus eo usque ut vesicae ambo latera essent contigua: etiam prius vesicam oleo oblevimus cum fricatione leni, quo vesica esset clausior: ejus, si qua erat, porositate oleo obturata. Hanc vesicam circa os phialae, ore phialae intra os vesicae recepto, fortiter ligavimus; filo parum cerato, ut melius adhaeresceret arctius ligaret. Tum demum phialam supra carbones ardentes in foculo collocavimus. At paulo post vapor sive aura spiritus vini, per calorem dilatati et in pneumaticum versi, vesicam paulatim sufflavit, eamque universam veli instar undequaque extendit. Id postquam factum fuit, continuo vitrum ab igne removimus, et super tapetem posuimus ne frigore disrumperetur; statim quoque in summitate vesicae foramen fecimus, ne vapor, cessante calore, in liquorem restitutus resideret, et rationes confunderet. Tum vero vesicam ipsam sustulimus, et rursus pondus excepimus spiritus vini qui remanebat. Inde quantum consumptum fuisset in vaporem seu pneumaticum computavimus: et facta collatione quantum locum sive spatium illud corpus implesset quando esset spiritus vini in phiala, et rursus quantum spatium impleverit postquam factum fuisset pneumaticum in vesica, rationes subduximus: ex quibus manifeste liquebat, corpus istud ita versum et mutatum expansionem centuplo majorem quam antea habuisset acquisivisse.

Similiter sit natura inquisita Calor aut Frigus; ejus nempe gradus, ut a sensu non percipiantur ob debilitatem. Haec deducuntur ad sensum per vitrum calendare, quale superius descripsimus. Calor enim et frigus, ipsa non percipiuntur ad tactum; at calor aerem expandit, frigus contrahit. Neque rursus illa expansio et contractio aeris percipitur ad visum; at aer ille expansus aquam deprimit, contractus attollit; ac tum demum fit deductio ad visum, non ante, aut alias.

Similiter sit natura inquisita Mistura Corporum: *viz.* quid habeant ex aqueo, quid ex oleoso, quid ex spiritu, quid ex cinere et salibus, et hujusmodi; vel etiam (in particulari) quid habeat lac butyri, quid coaguli, quid seri, et hujusmodi. Haec deducuntur ad sensum per artificiosas et peritas separationes, quatenus ad tangibilia. At natura spiritus in ipsis, licet immediate non percipiatur, tamen deprehenditur per varios motus et nixus corporum tangibilium in ipso actu et processu separationis suae; atque etiam per acrimonias, corrosiones, et diversos

colores, odores, et sapores eorundem corporum post separationem. Atque in hac parte, per distillationes atque artificiosas separationes, strenue sane ab hominibus elaboratum est; sed non multo foelicius quam in caeteris experimentis, quae adhuc in usu sunt: modis nimirum prorsus palpatoriis, et viis caecis, et magis operose quam intelligenter; et (quod pessimum est) nulla cum imitatione aut aut aemulatione naturae, sed cum destructione (per calores vehementes aut virtutes nimis validas) omnis subtilioris schematismi, in quo occultae rerum virtutes et consensus praecipue sitae sunt. Neque illud etiam, quod alias monuimus, hominibus in mentem aut observationem venire solet in hujusmodi separationibus: hoc est, plurimas qualitates, in corporum vexationibus tam per ignem quam alios modos, indi ab ipso igne iisque corporibus quae ad separationem adhibentur, quae in composito prius non fuerunt; unde mirae fallaciae. Neque enim scilicet vapor universus, qui ex aqua emittitur per ignem, vapor aut aer antea fuit in corpore aquae; sed factus est maxima ex parte per dilatationem aquae ex calore ignis.
Similiter in genere omnes exquisitae probationes corporum sive naturalium sive artificialium, per quas vera dignoscuntur ab adulterinis, meliora a vilioribus, huc referri debent: deducunt enim non-sensibile ad sensibile. Sunt itaque diligenti cura undique conquirendae.

5. Quintum vero genus latitantiae quod attinet, manifestum est actionem sensus transigi in motu, motum in tempore. Si igitur motus alicujus corporis sit vel tam tardus, vel tam velox, ut non sit proportionatus ad momenta in quibus transigitur actio sensus, objectum omnino non percipitur; ut in motu indicis horologii, et rursus in motu pilae sclopeti. Atque motus qui ob tarditatem non percipitur, facile et ordinario deducitur ad sensum per summas motus; qui vero ob velocitatem, adhuc non bene mensurari consuevit; sed tamen postulat inquisitio naturae ut hoc fiat in aliquibus.

6. Sextum autem genus, ubi impeditur sensus propter nobilitatem objecti, recipit deductionem, vel per elongationem majorem objecti a sensu; vel per hebetationem objecti per interpositionem medii talis, quod objectum debilitet,

non annihilet; vel per admissionem et exceptionem objecti reflexi, ubi percussio directa sit nimis fortis, ut solis in pelvi aquae.

7. Septimum autem genus latitantiae, ubi sensus ita oneratur objecto ut novae admissioni non sit locus, non habet fere locum nisi in olfactu et odoribus; nec ad id quod agitur multum pertinet. Quare de deductionibus non-sensibilis ad sensibile, haec dicta sint.
Quandoque tamen deductio fit non ad sensum hominis, sed ad sensum alicujus alterius animalis cujus sensus in aliquibus humanum excellet: ut nonnullorum odorum, ad sensum canis; lucis, quae in aere non extrinsecus illuminato latenter existit, ad sensum felis, noctuae, et hujusmodi animalium quae cernunt noctu. Recte enim notavit Telesius, etiam in aere ipso inesse lucem quandam originalem, licet exilem et tenuem, et maxima ex parte oculis hominum aut plurimorum animalium non inservientem; qui illa animalia, ad quorum sensum hujusmodi lux est proportionata, cernant noctu; id quod vel sine luce fieri, vel per lucem internam, minus credibile est.
Atque illud utique notandum est, de destitutionibus sensuum eorumque remediis hic nos tractare. Nam fallaciae sensuum ad proprias inquisitiones de sensu et sensibili remittendae sunt: excepta illa magna fallacia sensuum nimirum quod constituant lineas rerum ex analogia hominis, et non ex analogia universi; quae non corrigitur nisi per rationem et philosophiam universalem.

XLI.

Inter praerogativas instantiarum ponemus loco decimo octavo Instantias Viae, quas etiam Instantias Itinerantes et Instantias Articulatas appellare consuevimus. Eae sunt quae indicant naturae motus gradatim continuatos. Hoc autem genus instantiarum potius fugit observationem quam sensum. Mira enim est hominum circa hanc rem indiligentia. Contemplantur siquidem naturam tantummodo desultorie et per periodos, et postquam corpora fuerint absoluta ac completa, et non in operatione sua. Quod si artificis alicujus ingenia et industriam explorare et contemplari quis cuperet, is non tantum materias rudes artis atque deinde

opera perfecta conspicere desideraret, sed potius praesens esse cum artifex operatur et opus suum promovet. Atque simile quiddam circa naturam faciendum est. Exempli gratia; si quis de vegetatione plantarum inquirat, ei inspiciendum est ab ipsa satione seminis alicujus (id quod per extractionem, quasi singulis diebus, seminum quae per biduum, triduum, quatriduum, et sic deinceps, in terra manserunt, eorumque diligentem intuitum, facile fieri potest), quomodo et quando semen intumescere et turgere incipiat et veluti spiritu impleri; deinde quomodo corticulam rumpere et emittere fibras, cum latione nonnulla sui interim sursum, nisi terra fuerit admodum contumax; quomodo etiam emittat fibras, partim radicales deorsum, partim cauliculares sursum, aliquando serpendo per latera, si ex ea parte inveniat terram apertam et magis facilem; et complura id genus. Similiter facere oportet circa exclusionem ovorum; ubi facile conspici dabitur processus vivificandi et organizandi, et quid et quae partes fiant ex vitello, quid ex albumine ovi, et alia. Similis est ratio circa animalia ex putrefactione. Nam circa animalia perfecta et terrestria, per exectiones foetuum ex utero, minus humanum esset ista inquirere; nisi forte per occasiones abortuum, et venationum, et similium. Omnino igitur vigilia quaedam servanda est circa naturam, ut quae melius se conspiciendam praebeat noctu quam interdiu. Istae enim contemplationes tanquam nocturnae censeri possint, ob lucernae parvitatem et perpetuationem.

Quin et in inanimatis idem tentandum est; id quod nos fecimus in inquirendis aperturis liquorum per ignem. Alius enim est modus aperturae in aqua, alius in vino, alius in aceto, alius in omphacio; longe alius in lacte, et oleo, et caeteris. Id quod facile cernere erat per ebullitionem super ignem lenem, et in vase vitreo, ubi omnia cerni perspicue possint. Verum haec brevius perstringimus; fusius et exactius de iis sermones habituri, cum ad inventionem latentis rerum processus ventum erit. Semper enim memoria tenendum est, nos hoc loco non res ipsas tractare, sed exempla tantum adducere.

XLII.

Inter praerogativas instantiarum ponemus loco decimo nono Instantias

Inter praerogativas instantiarum ponimus loco decimo nono Instantias Supplementi, sive Substitutionis; quas etiam Instantias Perfugii appellare consuevimus. Eae sunt, quae supplent informationem ubi sensus plane destituitur; atque idcirco ad eas confugimus cum instantiae propriae haberi non possint. Dupliciter autem fit substitutio; aut per Graduationem, aut per Analoga. Exempli gratia: non invenitur medium quod inhibeat prorsus operationem magnetis in movendo ferrum; non aurum interpositum, non argentum, non lapis, non vitrum, lignum, aqua, oleum, pannus aut corpora fibrosa, aer, flamma, et caetera. Attamen per probationem exactam fortasse inveniri possit aliquod medium, quod hebetet virtutem ipsius plus quam aliquod aliud, comparative et in aliquo gradu: veluti quod non trahat magnes ferrum per tantam crassitiem auri quam per par spatium aeris; aut per tantum argentum ignitum quam per frigidum; et sic de similibus. Nam de his nos experimentum non fecimus; sed sufficit tamen ut proponantur loco exempli. Similiter non invenitur hic apud nos corpus quod non suscipiat calidum igni approximatum. Attamen longe citius suscipit calorem aer quam lapis. Atque talis est substitutio quae fit per Gradus. Substitutio autem per Analoga, utilis sane, sed minus certa est; atque idcirco cum judicio quodam adhibenda. Ea fit, cum deducitur non-sensibile ad sensum, non per operationes sensibiles ipsius corporis insensibilis, sed per contemplationem corporis alicujus cognati sensibilis. Exempli gratia: si inquiratur de Mistura Spirituum, qui sunt corpora non-visibilia, videtur esse cognatio quaedam inter corpora et fomites sive alimenta sua. Fomes autem flammae videtur esse oleum et pinguia; aeris, aqua et aquea: flammae enim multiplicant se super halitus olei, aer super vapores aquae. Videndum itaque de mistura aquae et olei, quae se manifestat ad sensum; quandoquidem mistura aeris et flammei generis fugiat sensum. At oleum et aqua inter se per compositionem aut agitationem imperfecte admodum miscentur: eadem in herbis, et sanguine, et partibus animalium, accurate et delicate miscentur. Itaque simile quiddam fieri possit circa misturam flammei et aerei generis in spiritalibus: quae per confusionem simplicem non bene sustinent misturam, eadem tamen in spiritibus plantarum et animalium misceri videntur; praesertim cum omnis spiritus animatus depascat humida utraque, aquea et pinguia, tanquam fomites suos.

utraque, aquea et pinguia, tanquam terminos suos.
Similiter si non de perfectioribus misturis spiritalium, sed de compositione tantum inquiratur; nempe, utrum facile inter se incorporentur, an potius (exempli gratia) sint aliqui venti et exhalationes, aut alia corpora spiritalia, quae non miscentur cum aere communi, sed tantum haerent et natant in eo, in globulis et guttis, et potius franguntur ac comminuuntur ab aere quam in ipsum recipiuntur et incorporantur: hoc in aere communi et aliis spiritalibus, ob subtilitatem corporum, percipi ad sensum non potest; attamen imago quaedam hujus rei, quatenus fiat, concipi possit in liquoribus argenti vivi, olei, aquae; atque etiam in aere, et fractione ejus, quando dissipatur et ascendit in parvis portiunculis per aquam; atque etiam in fumis crassioribus; denique in pulvere excitato et haerente in aere; in quibus omnibus non fit incorporatio. Atque repraesentatio praedicta in hoc subjecto non mala est, si illud primo diligenter inquisitum fuerit, utrum possit esse talis heterogenia inter spiritalia qualis invenitur inter liquida; nam tum demum haec simulacra per Analogiam non incommode substituentur. Atque de instantiis istis supplementi, quod diximus informationem ab iis hauriendam esse, quando desint instantiae propriae, loco perfugii; nihilominus intelligi volumus, quod illae etiam magni sint usus etiam cum propriae instantiae adsint; ad roborandam scilicet informationem una cum propriis. Verum de his exactius dicemus quando ad Adminicula Inductionis tractanda sermo ordine dilabetur.

XLIII.

Inter praerogativas instantiarum ponemus loco vicesimo Instantias Persecantes; quas etiam Instantias Vellicantes appellare consuevimus, sed diversa ratione. Vellicantes enim eas appellamus, quia vellicant intellectum, persecantes, quia persecant naturam: unde etiam illas quandoque Instantias Democriti nominamus. Eae sunt, quae de admirabili et exquisita subtilitate naturae intellectum submonent, ut excitetur et expergiscatur ad attentionem et observationem et inquisitionem debitam. Exempli gratia: quod parum guttulae atramenti ad tot literas vel lineas extendatur; quod argentum, exterius tantum inauratum, ad

tantam longitudinem fili inauratı contınuetur; quod pusillus vermiculus, qualis ın cute invenitur, habeat in se spiritum simul et figuram dissimilarem partium; quod parum croci etiam dolium aquae colore inficiat; quod parum zibethi aut aromatis longe majus contentum aeris odore; quod exiguo suffitu tanta excitetur nubes fumi; quod sonorum tam accuratae differentiae, quales sint voces articulatae, per aerem undequaque vehantur, atque per foramina et poros etiam ligni et aquae (licet admodum extenuatae) penetrent, quin etiam repercutiantur, idque tam distincte et velociter; quod lux et color, etiam tanto ambitu et tam perniciter, per corpora solida vitri, aquae, et cum tanta et tam exquisita varietate imaginum permeent, etiam refringantur et reflectantur; quod magnes per corpora omnigena, etiam maxime compacta, operetur: sed (quod magis mirum est) quod in his omnibus, in medio adiaphoro (quale est aer) unius actio aliam non magnopere impediat; nempe quod eodem tempore per spatia aeris devehantur et visibilium tot imagines, et vocis articulatae tot percussiones, et tot odores specificati, ut violae, rosae; etiam calor et frigus et virtutes magneticae; omnia (inquam) simul, uno alterum non impediente, ac si singula haberent vias et meatus suos proprios separatos, neque unum in alterum impingeret aut incurreret.
Solemus tamen utiliter hujusmodi instantiis persecantibus subjungere instantias, quas Metas Persecationis appellare consuevimus; veluti quod in iis, quae diximus, una actio in diverso genere aliam non perturbet aut impediat, cum tamen in eodem genere una aliam domet et extinguat: veluti, lux solis, lucem cicindelae; sonitus bombardae, vocem; fortior odor, delicatiorem; intensior calor, remissiorem; lamina ferri interposita inter magnetem et aliud ferrum, operationem magnetis. Verum de his quoque inter Adminicula Inductionis erit proprius dicendi locus.

XLIV.

Atque de instantiis quae juvant sensum, jam dictum est; quae praecipui usus sunt ad Partem Informativam. Informatio enim incipit a sensu. At universum negotium desinit in Opera; atque quemadmodum illud principium, ita hoc finis rei est. Sequentur itaque instantiae praecipui usus ad partem operativam. Eae

genere duae sunt, numero septem; quas universas, generali nomine, Instantias Practicas appellare consuevimus. Operativae autem partis, vitia duo; totidemque dignitates instantiarum in genere. Aut enim fallit operatio, aut onerat nimis. Fallit operatio maxime (praesertim post diligentem naturarum inquisitionem) propter male determinatas et mensuratas corporum vires et actiones. Vires autem et actiones corporum circumscribuntur et mensurantur, aut per spatia loci, aut per momenta temporis, aut per unionem quanti, aut per praedominantiam virtutis; quae quatuor nisi fuerint probe et diligenter pensitata, erunt fortasse scientiae speculatione quidem pulchrae, sed opere inactivae. Instantias vero quatuor itidem, quae huc referuntur, uno nomine Instantias Mathematicas vocamus, et Instantias Mensurae.

Onerosa autem fit praxis, vel propter misturam rerum inutilium, vel propter multiplicationem instrumentorum, vel propter molem materiae et corporum quae ad aliquod opus requiri contigerint. Itaque eae instantiae in pretio esse debent, quae aut dirigunt operativam ad ea quae maxime hominum intersunt; aut quae parcunt instrumentis; aut quae parcunt materiae sive supellectili. Eas autem tres instantias quae huc pertinent, uno nomine Instantias Propitias sive Benevolas vocamus. Itaque de his septem instantiis jam sigillatim dicemus; atque cum iis partem illam de Praerogativis sive Dignitatibus Instantiarum claudemus.

XLV.

Inter praerogativas instantiarum ponemus loco vicesimo primo Instantias Virgae, sive Radii; quas etiam Instantias Perlationis, vel de Non Ultra appellare consuevimus. Virtutes enim rerum et motus operantur et expediuntur per spatia non indefinita aut fortuita, sed finita et certa; quae ut in singulis naturis inquisitis teneantur et notentur plurimum interest practicae, non solum ad hoc, ut non fallat, sed etiam ut magis sit aucta et potens. Etenim interdum datur virtutes producere, et distantias tanquam retrahere in propius; ut in perspecillis.

Atque plurimae virtutes operantur et afficiunt tantum per tactum manifestum; ut fit in percussione corporum, ubi alterum non summovet alterum, nisi impellens impulsum tangat. Etiam medicinae quae exterius applicantur, ut unguenta

impulsum tangat. Etiam medicinae quae externus applicantur, ut unguenta, emplastra, non exercent vires suas nisi per tactum corporis. Denique objecta sensuum tactus et gustus non feriunt nisi contigua organis.
Sunt et aliae virtutes quae operantur ad distantiam, verum valde exiguam, quarum paucae adhuc notatae sunt, cum tamen plures sint quam homines suspicentur: ut (capiendo exempla ex vulgatis) cum succinum aut gagates trahunt paleas; bullae approximatae solvunt bullas; medicinae nonnullae purgativae eliciunt humores ex alto, et hujusmodi. At virtus illa magnetica per quam ferrum et magnes, vel magnetes invicem, coeunt, operatur intra orbem virtutis certum, sed parvum; ubi contra, si sit aliqua virtus magnetica emanans ab ipsa terra (paulo nimirum interiore) super acum ferream, quatenus ad verticitatem, operatio fiat ad distantiam magnam.
Rursus, si sit aliqua vis magnetica quae operetur per consensum inter globum terrae et ponderosa, aut inter globum lunae et aquas maris (quae maxime credibilis videtur in fluxibus et refluxibus semi-menstruis), aut inter coelum stellatum et planetas, per quam evocentur et attollantur ad sua apogaea; haec omnia operantur ad distantias admodum longinquas. Inveniuntur et quaedam inflammationes sive conceptiones flammae, quae fiunt ad distantias bene magnas, in aliquibus materiis; ut referunt de naphtha Babylonica. Calores etiam insinuant se per distantias amplas, quod etiam faciunt frigora; adeo ut habitantibus circa Canadam moles sive massae glaciales, quae abrumpuntur et natant per oceanum septentrionalem et deferuntur per Atlanticum versus illas oras, percipiantur et incutiant frigora e longinquo. Odores quoque (licet in his videatur semper esse quaedam emissio corporea) operantur ad distantias notabiles; ut evenire solet navigantibus juxta litora Floridae, aut etiam nonnulla Hispaniae, ubi sunt sylvae totae ex arboribus limonum, arantiorum, et hujusmodi plantarum odoratarum, aut frutices rorismarini, majoranae, et similium. Postremo radiationes lucis et impressiones sonorum operantur scilicet ad distantias spatiosas.
Verum haec omnia, utcunque operentur ad distantias parvas sive magnas, operantur certe ad finitas et naturae notas, ut sit quiddam Non Ultra: idque pro rationibus, aut molis seu quanti corporum; aut vigoris et debilitatis virtutum; aut

rationibus, aut minus sed quanti corporum, aut vigoris et debilitatis virtutum, aut favoribus et impedimentis mediorum; quae omnia in computationem venire et notari debent. Quinetiam mensurae motuum violentorum (quos vocant), ut missilium, tormentorum, rotarum, et similium, cum hae quoque manifesto suos habeant limites certos, notandae sunt.

Inveniuntur etiam quidam motus et virtutes contrariae illis, quae operantur per tactum et non ad distans; quae operantur scilicet ad distans et non ad tactum; et rursus, quae operantur remissius ad distantiam minorem et fortius ad distantiam majorem. Etenim visio non bene transigitur ad tactum, sed indiget medio et distantia. Licet meminerim me audisse ex relatione cujusdam fide digni, quod ipse in curandis oculorum suorum cataractis (erat autem cura talis, ut immitteretur festuca quaedam parva argentea intra primam oculi tunicam, quae pelliculam illam cataractae removeret et truderet in angulum oculi) clarissime vidisset festucam illam supra ipsam pupillam moventem. Quod utcunque verum esse possit, manifestum est majora corpora non bene aut distincte cerni nisi in cuspide coni, coeuntibus radiis objecti ad nonnullam distantiam. Quin etiam in senibus oculus melius cernit remoto objecto paulo longius, quam propius. In missilibus autem certum est percussionem non fieri tam fortem ad distantiam nimis parvam, quam paulo post. Haec itaque et similia in mensuris motuum quoad distantias notanda sunt.

Est et aliud genus mensurae localis motuum, quod non praetermittendum est. Illud vero pertinet ad motus non progressivos, sed sphaericos; hoc est, ad expansionem corporum in majorem sphaeram, aut contractionem in minorem. Inquirendum enim est inter mensuras istas motuum, quantam compressionem aut extensionem corpora (pro natura ipsorum) facile et libenter patiantur, et ad quem terminum reluctari incipiant, adeo ut ad extremum Non Ultra ferant; ut cum vesica inflata comprimitur, sustinet illa compressionem nonnullam aeris, sed si major fuerit, non patitur aer, sed rumpitur vesica.

At nos hoc ipsum subtiliore experimento magis exacte probavimus. Accepimus enim campanulam ex metallo, leviorem scilicet et tenuiorem, quali ad excipiendum salem utimur; eamque in pelvim aquae immisimus, ita ut deportaret secum aerem qui continebatur in concavo usque ad fundum pelvis. Locaveramus

solum aerem qui continebatur in concavo usque ad fundum pelvis. Locavimus autem prius globulum in fundo pelvis, super quem campanula imponenda esset. Quare illud eveniebat, ut si globulus ille esset minusculus (pro ratione concavi), reciperet se aer in locum minorem, et contruderetur solum, non extruderetur. Quod si grandioris esset magnitudinis quam ut aer libenter cederet, tum aer majoris pressurae impatiens campanulam ex aliqua parte elevabat, et in bullis ascendebat.

Etiam ad probandum qualem extensionem (non minus quam compressionem) pateretur aer, tale quippiam practicavimus. Ovum vitreum accepimus, cum parvo foramine in uno extremo ovi. Aerem per foramen exuctione forti attraximus, et statim digito foramen illud obturavimus, et ovum in aquam immersimus, et dein digitum removimus. Aer vero tensura illa per exuctionem facta tortus et magis quam pro natura sua dilatatus, ideoque se recipere et contrahere nitens (ita ut si ovum illud in aquam non fuisset immersum, aerem ipsum traxisset cum sibilo), aquam traxit ad tale quantum quale sufficere posset ad hoc, ut aer antiquam recuperaret sphaeram sive dimensionem.

Atque certum est corpora tenuiora (quale est aer) pati contractionem nonnullam notabilem, ut dictum est; at corpora tangibilia (quale est aqua) multo aegrius et ad minus spatium patiuntur compressionem. Qualem autem patiatur, tali experimento inquisivimus.

Fieri fecimus globum ex plumbo cavum, qui duas circiter pintas vinarias contineret; eumque satis per latera crassum, ut majorem vim sustineret. In illum aquam immisimus, per foramen alicubi factum; atque foramen illud, postquam globus aqua impletus fuisset, plumbo liquefacto obturavimus, ut globus deveniret plane consolidatus. Dein globum forti malleo ad duo latera adversa complanavimus; ex quo necesse fuit aquam in minus contrahi, cum sphaera figurarum sit capacissima. Deinde, cum malleatio non amplius sufficeret, aegrius se recipiente aqua, molendino seu torculari usi sumus; ut tandem aqua, impatiens pressurae ulterioris, per solida plumbi (instar roris delicati) exstillaret. Postea, quantum spatii per eam compressionem imminutum foret computavimus; atque tantam compressionem passam esse aquam (sed violentia magna subactam) intelleximus.

At solidiora, sicca, aut magis compacta, qualia sunt lapides et ligna, necnon metalla, multo adhuc minorem compressionem aut extensionem, et fere imperceptibilem ferunt; sed vel fractione, vel progressione, vel aliis pertentationibus se liberant: ut in curvationibus ligni aut metalli, horologiis moventibus per complicationem laminae, missilibus, malleationibus, et innumeris aliis motibus apparet. Atque haec omnia cum mensuris suis in indagatione naturae notanda et exploranda sunt, aut in certitudine sua, aut per aestimativas, aut per comparativas, prout dabitur copia.

XLVI.

Inter praerogativas instantiarum ponemus loco vicesimo secundo Instantias Curriculi, quas etiam Instantias ad Aquam appellare consuevimus; sumpto vocabulo a clepsydris apud antiquos, in quas infundebatur aqua, loco arenae. Eae mensurant naturam per momenta temporis, quemadmodum Instantiae Virgae per gradus spatii. Omnis enim motus sive actio naturalis transigitur in tempore; alius velocius, alius tardius, sed utcunque momentis certis et naturae notis. Etiam illae actiones quae subito videntur operari, et in ictu oculi (ut loquimur), deprehenduntur recipere majus et minus quoad tempus.

Primo itaque videmus restitutiones corporum coelestium fieri per tempora numerata; etiam fluxus et refluxus maris. Latio autem gravium versus terram et levium versus ambitum coeli fit per certa momenta, pro ratione corporis quod fertur, et medii. At velificationes navium, motus animalium, perlationes missilium, omnes fiunt itidem per tempora (quantum ad summas) numerabilia. Calorem vero quod attinet, videmus pueros per hyemem manus in flamma lavare, nec tamen uri; et joculatores vasa plena vino vel aqua, per motus agiles et aequales, vertere deorsum et sursum recuperare, non effuso liquore; et multa hujusmodi. Nec minus ipsae compressiones et dilatationes et eruptiones corporum fiunt, aliae velocius, aliae tardius, pro natura corporis et motus, sed per momenta certa. Quinetiam in explosione plurium bombardarum simul, quae exaudiuntur quandoque ad distantiam triginta milliarium, percipitur sonus prius

ab iis qui prope absunt a loco ubi fit sonitus, quam ab iis qui longe. At in visu (cujus actio est pernicissima) liquet etiam requiri ad eum actuandum momenta certa temporis: idque probatur ex iis quae propter motus velocitatem non cernuntur; ut ex latione pilae ex sclopeto. Velocior enim est praetervolatio pilae quam impressio speciei ejus quae deferri poterat ad visum.

Atque hoc, cum similibus, nobis quandoque dubitationem peperit plane monstrosam: videlicet, utrum coeli sereni et stellati facies ad idem tempus cernatur quando vere existit, an potius aliquanto post; et utrum non sit (quatenus ad visum coelestium) non minus tempus verum et tempus visum, quam locus verus et locus visus, qui notatur ab astronomis in parallaxibus. Adeo incredibile nobis videbatur, species sive radios corporum coelestium per tam immensa spatia milliarium subito deferri posse ad visum; sed potius debere eas in tempore aliquo notabili delabi. Verum illa dubitatio (quoad majus aliquod intervallum temporis inter tempus verum et visum) postea plane evanuit: reputantibus nobis jacturam illam infinitam et diminutionem quanti, quatenus ad apparentiam, inter corpus stellae verum et speciem visam, quae causatur a distantia; atque simul notantibus ad quantam distantiam (sexaginta scilicet ad minimum milliariorum) corpora, eaque tantum albicantia, subito hic apud nos cernantur; cum dubium non sit lucem coelestium, non tantum albedinis vividum colorem, verum etiam omnis flammae (quae apud nos nota est) lucem, quoad vigorem radiationis, multis partibus excedere. Etiam immensa illa velocitas in ipso corpore, quae cernitur in motu diurno (quae etiam viros graves ita obstupefecit ut mallent credere motum terrae), facit motum illum ejaculationis radiorum ab ipsis (licet celeritate, ut diximus, mirabilem) magis credibilem. Maxime vero omnium nos movit, quod si interponeretur intervallum temporis aliquod notabile inter veritatem et visum, foret ut species per nubes interim orientes et similes medii perturbationes interciperentur saepenumero, et confunderentur. Atque de mensuris temporum simplicibus haec dicta sint.

Verum non solum quaerenda est mensura motuum et actionum simpliciter, sed multo magis comparative: id enim eximii est usus, et ad plurima spectat. Atque videmus flammam alicujus tormenti ignei citius cerni, quam sonitus audiatur; licet necesse sit pilam prius aerem percutere, quam flammae quae pone erat cujus

licet necesse sit pilam prius aerem percutere, quam flamma quae pone erat exire potuerit; fieri hoc autem propter velociorem transactionem motus lucis, quam soni. Videmus etiam species visibiles a visu citius excipi quam dimitti; unde fit quod nervi fidium, digito impulsi, duplicentur aut triplicentur quoad speciem, quia species nova recipitur, antequam prior demittatur; ex quo etiam fit, ut annuli rotati videantur globosi, et fax ardens, noctu velociter portata, conspiciatur caudata. Etiam ex hoc fundamento inaequalitatis motuum quoad velocitatem, excogitavit Galilaeus causam fluxus et refluxus maris; rotante terra velocius, aquis tardius; ideoque accumulantibus se aquis in sursum, et deinde per vices se remittentibus in deorsum, ut demonstratur in vase aquae incitatius movente. Sed hoc commentus est concesso non concessibili (quod terra nempe moveatur), ac etiam non bene informatus de oceani motu sexhorario.

At exemplum hujus rei de qua agitur, videlicet, de comparativis mensuris motuum, neque solum rei ipsius, sed et usus insignis ejus (de quo paulo ante loquuti sumus), eminet in cuniculis subterraneis, in quibus collocatur pulvis pyrius; ubi immensae moles terrae, aedificiorum, et similium, subvertuntur, et in altum jaciuntur, a pusilla quantitate pulveris pyrii. Cujus causa pro certo illa est, quod motus dilatationis pulveris, qui impellit, multis partibus sit pernicior, quam motus gravitatis per quem fieri possit aliqua resistentia; adeo ut primus motus perfunctus sit, antequam motus adversus inceperit; ut in principiis nullitas quaedam sit resistentiae. Hinc etiam fit, quod in omni missili, ictus, non tam robustus quam acutus et celer, ad perlationem potissimum valeat. Neque etiam fieri potuisset, ut parva quantitas spiritus animalis in animalibus, praesertim in tam vastis corporibus qualia sunt balaenae aut elephanti, tantam molem corpoream flecteret et regeret, nisi propter velocitatem motus spiritus, et hebetudinem corporeae molis, quatenus ad expediendam suam resistentiam.

Denique, hoc unum ex praecipuis fundamentis est experimentorum magicorum, de quibus mox dicemus; ubi scilicet parva moles materiae longe majorem superat et in ordinem redigit: hoc, inquam, si fieri possit anteversio motuum per velocitatem unius, antequam alter se expediat.

Postremo, hoc ipsum Prius et Posterius in omni actione naturali notari debet; veluti quod in infusione rhabarbari eligatur purgativa vis prius, astrictiva post;

veluti quod in infusione rhabarbari efficiatur purgativa vis prius, astrictiva post; simile quiddam etiam in infusione violarum in acetum experti sumus; ubi primo excipitur suavis et delicatus floris odor; post, pars floris magis terrea, quae odorem confundit. Itaque si infundantur violae per diem integrum, odor multo languidius excipitur: quod si infundantur per partem quartam horae tantum, et extrahantur; et (quia paucus est spiritus odoratus qui subsistit in viola) infundantur post singulas quartas horae violae novae et recentes ad sexies; tum demum nobilitatur infusio, ita ut licet non manserint violae, utcunque renovatae, plus quam ad sesquihoram, tamen permanserit odor gratissimus, et viola ipsa non inferior, ad annum integrum. Notandum tamen est, quod non se colligat odor ad vires suas plenas, nisi post mensem ab infusione. In distillationibus vero aromatum maceratorum in spiritu vini patet quod surgat primo phlegma aqueum et inutile, deinde aqua plus habens ex spiritu vini, deinde post aqua plus habens ex aromate. Atque hujus generis quamplurima inveniuntur in distillationibus notatu digna. Verum haec sufficiant ad exempla.

XLVII.

Inter praerogativas instantiarum ponemus loco vicesimo tertio Instantias Quanti, quas etiam Doses Naturae (sumpto vocabulo a Medicinis) vocare consuevimus. Eae sunt quae mensurant virtutes per Quanta corporum, et indicant quid Quantum Corporis faciat ad Modum Virtutis. Ac primo sunt quaedam virtutes quae non subsistunt nisi in quanto cosmico, hoc est, tali quanto quod habeat consensum cum configuratione et fabrica universi. Terra enim stat; partes ejus cadunt. Aquae in maribus fluunt et refluunt; in fluviis minime, nisi per ingressum maris. Deinde etiam omnes fere virtutes particulares secundum multum aut parvum corporis operantur. Aquae largae non facile corrumpuntur; exiguae cito. Mustum et cervisia maturescunt longe citius, et fiunt potabilia, in utribus parvis, quam in doliis magnis. Si herba ponatur in majore portione liquoris, fit infusio, magis quam imbibitio; si in minore, fit imbibitio, magis quam infusio. Aliud igitur erga corpus humanum est balneum, aliud levis irroratio. Etiam parvi rores in aere nunquam cadunt, sed dissipantur et cum aere

incorporantur. Et videre est in anhelitu super gemmas, parum illud humoris, quasi nubeculam vento dissipatam, continuo solvi. Etiam frustum ejusdem magnetis non trahit tantum ferri, quantum magnes integer. Sunt etiam virtutes in quibus parvitas quanti magis potest; ut in penetrationibus, stylus acutus citius penetrat, quam obtusus; adamas punctuatus sculpit in vitro; et similia.
Verum non hic morandum est in indefinitis, sed etiam de rationibus quanti corporis erga modum virtutis inquirendum. Proclive enim foret credere, quod rationes quanti rationes virtutis adaequarent; ut si pila plumbea unius unciae caderet in tali tempore, pila unciarum duarum deberet cadere duplo celerius, quod falsissimum est. Nec eaedem rationes in omni genere virtutum valent, sed longe diversae. Itaque hae mensurae ex rebus ipsis petendae sunt, et non ex verisimilitudine aut conjecturis.
Denique in omni inquisitione naturae Quantum corporis requiratur ad aliquod effectum, tanquam dosis, notandum; et cautiones de Nimis et Parum aspergendae.

XLVIII.

Inter praerogativas instantiarum ponemus loco vicesimo quarto Instantias Luctae; quas etiam Instantias Praedominantiae appellare consuevimus. Eae indicant praedominantiam et cessionem virtutum ad invicem; et quae ex illis sit fortior et vincat, quae infirmior et succumbat. Sunt enim motus et nixus corporum compositi, decompositi, et complicati, non minus quam corpora ipsa. Proponemus igitur primum species praecipuas motuum sive virtutum activarum; ut magis perspicua sit ipsarum comparatio in robore, et exinde demonstratio atque designatio instantiarum luctae et praedominantiae.

1. Motus Primus sit Motus Antitypiae materiae, quae inest in singulis portionibus ejus; per quem plane annihilari non vult: ita ut nullum incendium, nullum pondus aut depressio, nulla violentia, nulla denique aetas aut diuturnitas temporis possit redigere aliquam vel minimam portionem materiae in nihilum; quin illa et sit aliquid, et loci aliquid occupet, et se (in qualicunque necessitate

ponatur), vel formam mutando vel locum, liberet, vel (si non detur copia) ut est subsistat; neque unquam res eo deveniat, ut aut nihil sit, aut nullibi. Quem motum Schola (quae semper fere et denominat et definit res potius per effectus et incommoda quam per causas interiores) vel denotat per illud axioma, quod Duo corpora non possint esse in uno loco; vel vocat motum Ne fiat penetratio dimensionum. Neque hujus motus exempla proponi consentaneum est: inest enim omni corpori.

2. Sit Motus Secundus, Motus (quem appellamus) Nexus; per quem corpora non patiuntur se ulla ex parte sui dirimi a contactu alterius corporis, ut quae mutuo nexu et contactu gaudeant. Quem motum Schola vocat Motum Ne detur vacuum: veluti cum aqua attrahitur sursum exuctione, aut per fistulas; caro per ventosas; aut cum aqua sistitur nec effluit in hydriis perforatis, nisi os hydriae ad immittendum aerem aperiatur; et innumera id genus.

3. Sit Motus Tertius, Motus (quem appellamus) Libertatis; per quem corpora se liberare nituntur a pressura aut tensura praeter-naturali, et restituere se in dimensum corpori suo conveniens. Cujus motus etiam innumera sunt exempla: veluti (quatenus ad liberationem a pressura) aquae in natando, aeris in volando; aquae in remigando, aeris in undulationibus ventorum; laminae in horologiis. Nec ineleganter se ostendit motus aeris compressi in sclopettis ludicris puerorum, cum alnum aut simile quiddam excavant, et infarciunt frusto alicujus radicis succulentae, vel similium, ad utrosque fines; deinde per embolum trudunt radicem vel hujusmodi farcimentum in foramen alterum; unde emittitur et ejicitur radix cum sonitu ad foramen alterum, idque antequam tangatur a radice aut farcimento citimo, aut embolo. Quatenus vero ad liberationem a tensura, ostendit se hic motus in aere post exuctionem in ovis vitreis remanente, in chordis, in corio, et panno, resilientibus post tensuras suas, nisi tensurae illae per moram invaluerint, *etc.* Atque hunc motum Schola sub nomine Motus ex Forma Elementi innuit: satis quidem inscite, cum hic motus non tantum ad aerem, aquam, aut flammam pertineat, sed ad omnem diversitatem consistentiae; ut ligni, ferri, plumbi, panni, membranae, etc., in quibus singula corpora suae habent dimensionis modulum, et ab eo aegre ad spatium aliquod notabile

abripiuntur. Verum quia motus iste libertatis omnium est maxime obvius, et ad infinita spectans, consultum fuerit eum bene et perspicue distinguere. Quidam enim valde negligenter confundunt hunc motum cum gemino illo motu antitypiae et nexus; liberationem scilicet a pressura, cum motu antitypiae; a tensura, cum motu nexus; ac si ideo cederent aut se dilatarent corpora compressa, ne sequeretur penetratio dimensionum; ideo resilirent et contraherent se corpora tensa, ne sequeretur vacuum. Atqui si aer compressus se vellet recipere in densitatem aquae, aut lignum in densitatem lapidis, nil opus foret penetratione dimensionum; et nihilominus longe major posset esse compressio illorum, quam illa ullo modo patiuntur. Eodem modo si aqua se dilatare vellet in raritatem aeris, aut lapis in raritatem ligni, non opus foret vacuo; et tamen longe major posset fieri extensio eorum, quam illa ullo modo patiuntur. Itaque non reducitur res ad penetrationem dimensionum et vacuum, nisi in ultimitatibus condensationis et rarefactionis; cum tamen isti motus longe citra eas sistant et versentur, neque aliud sint quam desideria corporum conservandi se in consistentiis suis (sive, si malint, in formis suis), nec ab iis recedendi subito, nisi per modos suaves ac per consensum alterentur. At longe magis necessarium est (quia multa secum trahit), ut intimetur hominibus, motum violentum (quem nos mechanicum, Democritus, qui in motibus suis primis expediendis etiam infra mediocres philosophos ponendus est, motum plagae vocavit) nil aliud esse quam Motum Libertatis, scilicet a compressione ad relaxationem. Etenim in omni sive simplici protrusione sive volatu per aerem, non fit summotio aut latio localis, antequam partes corporis praeter-naturaliter patiantur et comprimantur ab impellente. Tum vero partibus aliis alias per successionem trudentibus, fertur totum; nec solum progrediendo, sed etiam rotando simul; ut etiam hoc modo partes se liberare, aut magis ex aequo tolerare possint. Atque de hoc motu hactenus.

4. Sit Motus Quartus, motus cui nomen dedimus Motus Hyles: qui motus antistrophus est quodammodo Motui, de quo diximus, Libertatis. Etenim in Motu Libertatis, corpora novum dimensum sive novam sphaeram sive novam dilatationem aut contractionem (haec enim verborum varietas idem innuit)

exhorrent, respuunt, fugiunt, et resilire ac veterem consistentiam recuperare totis viribus contendunt. At contra in hoc Motu Hyles, corpora novam sphaeram sive dimensum appetunt; atque ad illud libenter et propere, et quandoque valentissimo nixu (ut in pulvere pyrio) aspirant. Instrumenta autem hujus motus, non sola certe, sed potentissima, aut saltem frequentissima, sunt calor et frigus. Exempli gratia: aer, si per tensuram (velut per exuctionem in ovis vitreis) dilatetur, magno laboret desiderio seipsum restituendi. At admoto calore, e contra appetit dilatari, et concupiscet novam sphaeram, et transit et migrat in illam libenter, tanquam in novam formam (ut loquuntur); nec post dilatationem nonnullam de reditu curat, nisi per admotionem frigidi ad eam invitetur; quae non reditus est, sed transmutatio repetita. Eodem modo et aqua, si per compressionem arctetur, recalcitrat; et vult fieri qualis fuit, scilicet latior. At si interveniat frigus intensum et continuatum, mutat se sponte sua et libenter in condensationem glaciei; atque si plane continuetur frigus, nec a teporibus interrumpatur (ut fit in speluncis et cavernis paulo profundioribus), vertitur in crystallum aut materiam similem, nec unquam restituitur.

5. Sit Motus Quintus, Motus Continuationis. Intelligimus autem non continuationis simplicis et primariae, cum corpore aliquo altero (nam ille est Motus Nexus); sed continuationis sui, in corpore certo. Certissimum enim est, quod corpora omnia solutionem continuitatis exhorreant; alia magis, alia minus, sed omnia aliquatenus. Nam ut in corporibus duris (veluti chalybis, vitri) reluctatio contra discontinuationem est maxime robusta et valida, ita etiam in liquoribus, ubi cessare aut languere saltem videtur motus ejusmodi, tamen non prorsus reperitur privatio ejus; sed plane inest ipsis in gradu tanquam infimo, et prodit se in experimentis plurimis; sicut in bullis, in rotunditate guttarum, in filis tenuioribus stillicidiorum, et in sequacitate corporum glutinosorum, et ejusmodi. Sed maxime omnium se ostendit appetitus iste, si discontinuatio tentetur usque ad fractiones minores. Nam in mortariis, post contusionem ad certum gradum, non amplius operatur pistillum; aqua non subintrat rimas minores; quin et ipse aer, non obstante subtilitate corporis ipsius, poros vasorum paulo solidiorum non pertransit subito, nec nisi per diuturnam insinuationem.

6. Sit Motus Sextus, motus quem nominamus Motum ad Lucrum, sive Motum Indigentiae. Is est, per quem corpora, quando versantur inter plane heterogenea et quasi inimica, si forte nanciscantur copiam aut commoditatem evitandi illa heterogenea et se applicandi ad magis cognata, (licet illa ipsa cognata talia fuerint quae non habeant arctum consensum cum ipsis) tamen statim ea amplectuntur, et tanquam potiora malunt: et lucri loco (unde vocabulum sumpsimus) hoc ponere videntur, tanquam talium corporum indiga. Exempli gratia: aurum, aut aliud metallum foliatum non delectatur aere circumfuso. Itaque si corpus aliquod tangibile et crassum nanciscatur (ut digitum, papyrum, quidvis aliud), adhaeret statim, nec facile divellitur. Etiam papyrus, aut pannus, et hujusmodi, non bene se habent cum aere qui inseritur et commistus est in ipsorum poris. Itaque aquam aut liquorem libenter imbibunt, et aerem exterminant. Etiam saccharum, aut spongia infusa in aquam aut vinum, licet pars ipsorum emineat et longe attollatur supra vinum aut aquam, tamen aquam aut vinum paulatim et per gradus attrahunt in sursum.
Unde optimus canon sumitur aperturae et solutionum corporum. Missis enim corrosivis et aquis fortibus, quae viam sibi aperiunt, si possit inveniri corpus proportionatum et magis consentiens et amicum corpori alicui solido quam illud cum quo tanquam per necessitatem commiscetur, statim se aperit et relaxat corpus, et illud alterum intro recipit, priore excluso aut summoto. Neque operatur aut potest iste motus ad lucrum solummodo ad tactum. Nam electrica operatio (de qua Gilbertus et alii post eum tantas excitarunt fabulas) non alia est quam corporis per fricationem levem excitati appetitus; qui aerem non bene tolerat, sed aliud tangibile mavult, si reperiatur in propinquo.

7. Sit motus Septimus, Motus (quem appellamus) Congregationis Majoris; per quem corpora feruntur ad massas connaturalium suorum: gravia, ad globum terrae; levia, ad ambitum coeli. Hunc Schola nomine Motus Naturalis insignivit: levi contemplatione, quia scilicet nil spectabile erat ab extra quod eum motum cieret (itaque rebus ipsis innatum atque insitum putavit); aut forte quia non cessat. Nec mirum: semper enim praesto sunt coelum et terra; cum e contra

causae et origines plurimorum ex reliquis motibus interdum absint, interdum adsint. Itaque hunc, quia non intermittit sed caeteris intermittentibus statim occurrit, perpetuum et proprium; reliquos ascititios posuit. Est autem iste motus revera satis infirmus et hebes, tanquam is qui (nisi sit moles corporis major) caeteris motibus, quamdiu operantur, cedat et succumbat. Atque cum hic motus hominum cogitationes ita impleverit ut fere reliquos motus occultaverit, tamen parum est quod homines de eo sciunt, sed in multis circa illum erroribus versantur.

8. Sit Motus Octavus, Motus Congregationis Minoris; per quem partes homogeneae in corpore aliquo separant se ab heterogeneis, et coeunt inter sese; per quem etiam corpora integra ex similitudine substantiae se amplectuntur et fovent, et quandoque ad distantiam aliquam congregantur, attrahuntur, et conveniunt: veluti cum in lacte flos lactis post moram aliquam supernatat; in vino faeces et tartarum subsidunt. Neque enim haec fiunt per motum gravitatis et levitatis tantum, ut aliae partes summitatem petant, aliae ad imum vergant; sed multo magis per desiderium homogeneorum inter se coeundi et se uniendi.
Differt autem iste motus a motu indigentiae, in duobus. Uno, quod in motu indigentiae sit stimulus major naturae malignae et contrariae; at in hoc motu (si modo impedimenta et vincula absint) uniuntur partes per amicitiam, licet absit natura aliena quae litem moveat: altero, quod arctior sit unio, et tanquam majore cum delectu. In illo enim, modo evitetur corpus inimicum, corpora etiam non admodum cognata concurrunt; at in hoc coeunt substantiae, germana plane similitudine devinctae, et conflantur tanquam in unum. Atque hic motus omnibus corporibus compositis inest; et se facile conspiciendum in singulis daret, nisi ligaretur et fraenaretur per alios corporum appetitus et necessitates, quae istam coitionem disturbant.
Ligatur autem motus iste plerumque tribus modis: torpore corporum; fraeno corporis dominantis; et motu externo. Ad torporem corporum quod attinet; certum est inesse corporibus tangibilibus pigritiam quandam secundum magis et minus, et exhorrentiam motus localis; ut, nisi excitentur, malint statu suo (prout

sunt) esse contenta quam in melius se expedire. Discutitur autem iste torpor triplici auxilio: aut per calorem, aut per virtutem alicujus cognati corporis eminentem, aut per motum vividum et potentem. Atque primo quoad auxilium caloris; hinc fit, quod calor pronuntietur esse illud quod separet heterogenea, congreget homogenea. Quam definitionem Peripateticorum merito derisit Gilbertus; dicens eam esse perinde ac si quis diceret ac definiret hominem illud esse quod serat triticum et plantet vineas: esse enim definitionem tantum per effectus, eosque particulares. Sed adhuc magis culpanda est illa definitio; quia etiam effectus illi (quales quales sunt) non sunt ex proprietate caloris, sed tantum per accidens (idem enim facit frigus, ut postea dicemus), nempe ex desiderio partium homogenearum coeundi, adjuvante tantum calore ad discutiendum torporem, qui torpor desiderium illud antea ligaverat. Quoad vero auxilium virtutis inditae a corpore cognato; illud mirabiliter elucescit in magnete armato, qui excitat in ferro virtutem detinendi ferrum per similitudinem substantiae, discusso torpore ferri per virtutem magnetis. Quoad vero auxilium motus; conspicitur illud in sagittis ligneis, cuspide etiam lignea, quae altius penetrant in alia ligna quam si fuissent armatae ferro, per similitudinem substantiae, discusso torpore ligni per motum celerem: de quibus duobus experimentis etiam in aphorismo de instantiis clandestinis diximus.

Ligatio vero motus congregationis minoris, quae fit per fraenum corporis dominantis, conspicitur in solutione sanguinis et urinarum per frigus. Quamdiu enim repleta fuerint corpora illa spiritu agili, qui singulas eorum partes cujuscunque generis ipse ut dominus totius ordinat et cohibet, tamdiu non coeunt heterogenea propter fraenum; sed postquam ille spiritus evaporaverit, aut suffocatus fuerit per frigus, tum solutae partes a fraeno coeunt secundum desiderium suum naturale. Atque ideo fit, ut omnia corpora quae continent spiritum acrem (ut sales, et hujusmodi) durent et non solvantur, ob fraenum permanens et durabile spiritus dominantis et imperiosi.

Ligatio vero motus congregationis minoris, quae fit per motum externum, maxime conspicitur in agitationibus corporum per quas arcetur putrefactio. Omnis enim putrefactio fundatur in congregatione homogeneorum; unde

paulatim fit corruptio prioris (quam vocant) formae, et generatio novae. Nam putrefactionem, quae sternit viam ad generationem novae formae, praecedit solutio veteris; quae est ipsa coitio ad homogeniam. Ea vero, si non impedita fuerit, fit solutio simplex: sin occurrant varia quae obstant, sequuntur putrefactiones quae sunt rudimenta generationis novae. Quod si (id quod nunc agitur) fiat agitatio frequens per motum externum, tum vero motus iste coitionis (qui est delicatus et mollis et indiget quiete ab externis) disturbatur et cessat; ut fieri videmus in innumeris: veluti cum quotidiana agitatio aut profluentia aquae arceat putrefactionem; venti arceant pestilentiam aeris; grana in granariis versa et agitata maneant pura; omnia denique agitata exterius non facile putrefiant interius.

Superest ut non omittatur coitio illa partium corporum, unde fit praecipue induratio et desiccatio. Postquam enim spiritus, aut humidum in spiritum versum, evolaverit in aliquo corpore porosiore (ut in ligno, osse, membrana, et hujusmodi), tum partes crassiores majore nixu contrahuntur et coeunt, unde sequitur induratio aut desiccatio: quod existimamus fieri, non tam ob motum nexus, ne detur vacuum, quam per motum istum amicitiae et unionis.

Ad coitionem vero ad distans quod attinet, ea infrequens est et rara; et tamen in pluribus inest quam quibus observatur. Hujus simulacra sunt, cum bulla solvat bullam; medicamenta ex similitudine substantiae trahant humores; chorda in diversis fidibus ad unisonum moveat chordam; et hujusmodi. Etiam in spiritibus animalium hunc motum vigere existimamus, sed plane incognitum. At eminet certe in magnete, et ferro excito. Cum autem de motibus magnetis loquimur, distinguendi plane sunt. Quatuor enim virtutes sive operationes sunt in magnete, quae non confundi, sed separari debent; licet admiratio hominum et stupor eas commiscuerit. Una, coitionis magnetis ad magnetem, vel ferri ad magnetem, vel ferri exciti ad ferrum. Secunda, verticitatis ejus ad septentriones et austrum, atque simul declinationis ejus. Tertia, penetrationis ejus per aurum, vitrum, lapidem, omnia. Quarta, communicationis virtutis ejus de lapide in ferrum, et de ferro in ferrum, absque communicatione substantiae. Verum hoc loco de prima virtute ejus tantum loquimur, videlicet coitionis. Insignis etiam est motus coitionis argenti vivi et auri; adeo ut aurum alliciat argentum vivum, licet

coitionis argenti vivi et auri: adeo ut aurum afficiat argentum vivum, licet confectum in unguenta; atque operarii inter vapores argenti vivi soleant tenere in ore frustum auri, ad colligendas emissiones argenti vivi, alias crania et ossa eorum invasuras; unde etiam frustum illud paulo post albescit. Atque de motu congregationis minoris haec dicta sint.

9. Sit Motus Nonus, Motus Magneticus; qui licet sit ex genere motus congregationis minoris, tamen si operetur ad distantias magnas et super massas rerum magnas, inquisitionem meretur separatam; praesertim si nec incipiat a tactu, quemadmodum plurimi, nec perducat actionem ad tactum, quemadmodum omnes motus congregativi; sed corpora tantum elevet, aut ea intumescere faciat, nec quicquam ultra. Nam si luna attollat aquas, aut turgescere aut intumescere faciat humida; aut coelum stellatum attrahat planetas versus sua apogaea; aut sol alliget astra Veneris et Mercurii, ne longius absint a corpore ejus quam ad distantiam certam; videntur hi motus nec sub congregatione majore nec sub congregatione minore bene collocari, sed esse tanquam congregativa media et imperfecta, ideoque speciem debere constituere propriam.

10. Sit Motus Decimus, Motus Fugae; motus scilicet motui congregationis minoris contrarius; per quem corpora ex antipathia fugiunt et fugant inimica, seque ab illis separant, aut cum illis miscere se recusant. Quamvis enim videri possit in aliquibus hic motus esse motus tantum per accidens aut per consequens, respectu motus congregationis minoris, quia nequeunt coire homogenea, nisi heterogeneis exclusis et remotis; tamen ponendus est motus iste per se, et in speciem constituendus, quia in multis appetitus fugae cernitur magis principalis quam appetitus coitionis.
Eminet autem hic motus insigniter in excretionibus animalium; nec minus etiam in sensuum nonnullorum odiosis objectis, praecipue in olfactu et gustu. Odor enim foetidus ita rejicitur ab olfactu, ut etiam inducat in os stomachi motum expulsionis per consensum; sapor amarus et horridus ita rejicitur a palato aut gutture, ut inducat per consensum capitis conquassationem et horrorem. Veruntamen etiam in aliis locum habet iste motus. Conspicitur enim in

antiperistasibus nonnullis; ut in aeris media regione, cujus frigora videntur esse rejectiones naturae frigidae ex confiniis coelestium; quemadmodum etiam videntur magni illi fervores et inflammationes, quae inveniuntur in locis subterraneis, esse rejectiones naturae calidae ab interioribus terrae. Calor enim et frigus, si fuerint in quanto minore, se invicem perimunt; sin fuerint in massis majoribus et tanquam justis exercitibus, tum vero per conflictum se locis invicem summovent et ejiciunt. Etiam tradunt cinamomum et odorifera, sita juxta latrinas et loca foetida, diutius odorem retinere; quia recusant exire et commisceri cum foetidis. Certe argentum vivum, quod alias se reuniret in corpus integrum, prohibetur per salivam hominis, aut axungiam porci, aut terebinthinam, et hujusmodi, ne partes ejus coeant; propter malum consensum quem habent cum hujusmodi corporibus; a quibus undique circumfusis se retrahunt; adeo ut fortior sit earum fuga ab istis interjacentibus quam desiderium uniendi se cum partibus sui similibus; id quod vocant mortificationem argenti vivi. Etiam quod oleum cum aqua non misceatur, non tantum in causa est differentia levitatis, sed malus ipsorum consensus: ut videre est in spiritu vini, qui cum levior sit oleo, tamen se bene miscet cum aqua. At maxime omnium insignis est motus fugae in nitro, et hujusmodi corporibus crudis, quae flammam exhorrent; ut in pulvere pyrio, argento vivo, necnon in auro. Fuga vero ferri ab altero polo magnetis a Gilberto bene notatur non esse fuga propria, sed conformitas, et coitio ad situm magis accommodatum.

11. Sit Motus Undecimus, Motus Assimilationis, sive Multiplicationis sui, sive etiam Generationis Simplicis. Generationem autem simplicem dicimus non corporum integralium, ut in plantis, aut animalibus; sed corporum similarium. Nempe per hunc motum corpora similaria vertunt corpora alia affinia, aut saltem bene disposita et praeparata, in substantiam et naturam suam: ut flamma, quae super halitus et oleosa multiplicat se, et generat novam flammam; aer, qui super aquam et aquea multiplicat se, et generat novum aerum; spiritus vegetabilis et animalis, qui super tenuiores partes tam aquei quam oleosi in alimentis suis multiplicat se, et generat novum spiritum; partes solidae plantarum et animalium,

veluti folium, flos, caro, os, et sic de caeteris, quae singulae ex succis alimentorum assimilant et generant substantiam successivam et epiusiam. Neque enim quenquam cum Paracelso delirare juvet, qui (distillationibus suis scilicet occaecatus) nutritionem per separationem tantum fieri voluit; quodque in pane vel cibo lateat oculus, nasus cerebrum, jecur; in succo terrae radix, folium, flos. Etenim sicut faber ex rudi massa lapidis vel ligni, per separationem et rejectionem superflui, educit folium, florem, oculum, nasum, manum, pedem, et similia; ita Archaeum illum Fabrum internum ex alimento per separationem et rejectionem educere singula membra et partes asserit ille. Verum missis nugis, certissimum est partes singulas, tam similares quam organicas, in vegetabilibus et animalibus, succos alimentorum suorum fere communes, aut non multum diversos, primo attrahere cum nonnullo delectu, deinde assimilare, et vertere in naturam suam. Neque assimilatio ista, aut generatio simplex, fit solum in corporibus animatis, verum et inanimata ex hac re participant; veluti de flamma et aere dictum est. Quinetiam spiritus emortuus, qui in omni tangibili animato continetur, id perpetuo agit, ut partes crassiores digerat et vertat in spiritum, qui deinde exeat; unde fit diminutio ponderis et exsiccatio, ut alibi diximus. Neque etiam respuenda est in assimilatione accretio illa, quam vulgo ab alimentatione distinguunt; veluti cum lutum inter lapillos concrescit, et vertitur in materiam lapideam; squammae circa dentes vertuntur in substantiam non minus duram quam sunt dentes ipsi, *etc.* Sumus enim in ea opinione, inesse corporibus omnibus desiderium assimilandi, non minus quam coeundi ad homogenea; verum ligatur ista virtus, sicut et illa, licet non iisdem modis. Sed modos illos, necnon solutionem ab iisdem, omni diligentia inquirere oportet, quia pertinent ad senectutis refocillationem. Postremo videtur notatu dignum, quod in novem illis motibus, de quibus diximus, corpora tantum naturae suae conservationem appetere videntur; in hoc decimo autem propagationem.

12. Sit Motus Duodecimus, Motus Excitationis; qui motus videtur esse ex genere assimilationis, atque eo nomine quandoque a nobis promiscue vocatur. Est enim motus diffusivus, et communicativus, et transitivus, et multiplicativus, sicut et ille; atque effectu (ut plurimum) consentiunt, licet efficiendi modo et

subjecto differant. Motus enim assimilationis procedit tanquam cum imperio et potestate; jubet enim et cogit assimilatum in assimilantem verti et mutari. At motus excitationis procedit tanquam arte et insinuatione et furtim; et invitat tantum, et disponit excitatum ad naturam excitantis. Etiam motus assimilationis multiplicat et transformat corpora et substantias; veluti, plus fit flammae, plus aeris, plus spiritus, plus carnis. At in motu excitationis, multiplicantur et transeunt virtutes tantum; et plus fit calidi, plus magnetici, plus putridi. Eminet autem iste motus praecipue in calido et frigido. Neque enim calor diffundit se in calefaciendo per communicationem primi caloris; sed tantum per excitationem partium corporis ad motum illum qui est Forma Calidi; de quo in vindemiatione prima de natura calidi diximus. Itaque longe tardius et difficilius excitatur calor in lapide aut metallo quam in aere, ob inhabilitatem et impromptitudinem corporum illorum ad motum illum; ita ut verisimile sit posse esse interius versus viscera terrae materias quae calefieri prorsus respuant; quia ob condensationem majorem spiritu illo destituuntur a quo motus iste excitationis plerunque incipit. Similiter magnes induit ferrum nova partium dispositione et motu conformi; ipse autem nihil ex virtute perdit. Similiter fermentum panis, et flos cervisiae, et coagulum lactis, et nonnulla ex venenis, excitant et invitant motum in massa farinaria, aut cervisia, aut caseo, aut corpore humano, successivum et continuatum; non tam ex vi excitantis quam ex praedispositione et facili cessione excitati.

13. Sit Motus Decimus Tertius, Motus Impressionis; qui motus est etiam ex genere motus assimilationis, estque ex diffusivis motibus subtilissimus. Nobis autem visum est eum in speciem propriam constituere, propter differentiam insignem quam habet erga priores duos. Motus enim assimilationis simplex corpora ipsa transformat; ita ut si tollas primum movens nihil intersit ad ea quae sequuntur. Neque enim prima accensio in flammam, aut prima versio in aerem, aliquid facit ad flammam aut aerem in generatione succedentem. Similiter, motus excitationis omnino manet, remoto primo movente, ad tempora bene diuturna; ut in corpore calefacto, remoto primo calore; in ferro excito, remoto magnete; in massa farinaria, remoto fermento. At Motus Impressionis, licet sit

diffusivus, et transitivus, tamen perpetuo pendere videtur ex primo movente; adeo ut, sublato aut cessante illo, statim deficiat et pereat; itaque etiam momento, aut saltem exiguo tempore, transigitur. Quare motus illos assimilationis et excitationis, motus generationis Jovis, quia generatio manet; hunc autem motum Motum Generationis Saturni, quia natus statim devoratur et absorbetur, appellare consuevimus. Manifestat se vero hic motus in tribus; in lucis radiis; sonorum percussionibus; et magneticis, quatenus ad communicationem. Etenim amota luce, statim pereunt colores et reliquae imagines ejus; amota percussione prima et quassatione corporis inde facta, paulo post perit sonus. Licet enim soni etiam in medio per ventos tanquam per undas agitentur; tamen diligentius notandum est, quod sonus non tam diu durat quam fit resonatio. Etenim impulsa campana, sonus ad bene magnum tempus continuari videtur; unde quis facile in errorem labatur, si existimet toto illo tempore sonum tanquam natare et haerere in aere; quod falsissimum est. Etenim illa resonatio non est idem sonus numero, sed renovatur. Hoc autem manifestatur ex sedatione sive cohibitione corporis percussi. Si enim sistatur et detineatur campana fortiter et fiat immobilis, statim perit sonus nec resonat amplius; ut in chordis, si post primam percussionem tangatur chorda, vel digito ut in lyra, vel calamo ut in espinetis, statim desinit resonatio. Magnete autem remoto, statim ferrum decidit. Luna autem a mari non potest removeri; nec terra a ponderoso dum cadit. Itaque de illis nullum fieri potest experimentum; sed ratio eadem est.

14. Sit Motus Decimus Quartus, Motus Configurationis, aut Situs; per quem corpora appetere videntur, non coitionem aut separationem aliquam, sed situm, et collocationem, et configurationem cum aliis. Est autem iste motus valde abstrusus, nec bene inquisitus. Atque in quibusdam videtur quasi incausabilis; licet revera (ut existimamus) non ita sit. Etenim si quaeratur cur potius coelum volvatur ab oriente in occidentem quam ab occidente in orientem; aut cur vertatur circa polos positos juxta Ursas potius quam circa Orionem, aut ex alia aliqua parte coeli: videtur ista quaestio tanquam quaedam extasis, cum ista potius ab experientia, et ut positiva recipi debeant. At in natura profecto sunt quaedam ultima et incausabilia; verum hoc ex illis non esse videtur. Etenim hoc fieri existimamus ex quadam harmonia et consensu mundi, qui adhuc non venit in observationem. Quod si recipiatur motus terrae ab occidente in orientem, eaedem manent quaestiones. Nam et ipsa super aliquos polos movetur. Atque cur tandem debeant isti poli collocari magis ubi sunt quam alibi? Item verticitas, et directio, et declinatio magnetis ad hunc motum referuntur. Etiam inveniuntur in corporibus tam naturalibus quam artificialibus, praesertim consistentibus et non fluidis, collatio quaedam et positura partium, et tanquam villi et fibrae, quae diligenter investigandae sunt; utpote sine quarum inventione corpora illa commode tractari aut regi non possunt. At circulationes illas in liquidis, per quas illa dum pressa sint, antequam se liberare possunt, se invicem relevant, ut compressionem illam ex aequo tolerent, motui libertatis verius assignamus.

15. Sit Motus Decimus Quintus, Motus Pertransitionis, sive Motus secundum Meatus; per quem virtutes corporum magis aut minus impediuntur aut provehuntur a mediis ipsorum, pro natura corporum et virtutum operantium, atque etiam medii. Aliud enim medium luci convenit, aliud sono, aliud calori et frigori, aliud virtutibus magneticis, necnon aliis nonnullis respective.

16. Sit Motus Decimus Sextus, Motus Regius (ita enim eum appellamus) sive Politicus; per quem partes in corpore aliquo praedominantes et imperantes reliquas partes fraenant, domant, subigunt, ordinant, et cogunt eas adunari, separari, consistere, moveri, collocari, non ex desideriis suis, sed prout in ordine sit et conducat ad bene esse partis illius imperantis; adeo ut sit quasi Regimen et

Politia quaedam, quam exercet pars regens in partes subditas. Eminet autem hic motus praecipue in spiritibus animalium, qui motus omnes partium reliquarum, quamdiu ipse in vigore est, contemperat. Invenitur autem in aliis corporibus in gradu quodam inferiore; quemadmodum dictum est de sanguine et urinis, quae non solvuntur donec spiritus, qui partes earum commiscebat et cohibebat, emissus fuerit aut suffocatus. Neque iste motus omnino spiritibus proprius est, licet in plerisque corporibus spiritus dominentur ob motum celerem et penetrationem. Veruntamen in corporibus magis condensatis, nec spiritu vivido et vigente (qualis inest argento vivo et vitriolo) repletis, dominantur potius partes crassiores; adeo ut nisi fraenum et jugum hoc arte aliqua excutiatur, de nova aliqua hujusmodi corporum transformatione minime sperandum sit. Neque vero quispiam nos oblitos esse existimet ejus quod nunc agitur; quia cum ista series et distributio motuum ad nil aliud spectet, quam ut illorum praedominantia per instantias luctae melius inquiratur, jam inter motus ipsos praedominantiae mentionem faciamus. Non enim in descriptione motus istius regii, de praedominantia motuum aut virtutum tractamus, sed praedominantia partium in corporibus. Haec enim ea est praedominantia, quae speciem istam motus peculiarem constituit.

17. Sit Motus Decimus Septimus, Motus Rotationis Spontaneus; per quem corpora motu gaudentia, et bene collocata, natura sua fruuntur, atque seipsa sequuntur, non aliud, et tanquam proprios petunt amplexus. Etenim videntur corpora aut movere sine termino; aut plane quiescere; aut ferri ad terminum, ubi pro natura sua aut rotent aut quiescant. Atque quae bene collocata sunt, si motu gaudeant, movent per circulum: motu scilicet aeterno et infinito. Quae bene collocata sunt, et motum exhorrent, prorsus quiescunt. Quae non bene collocata sunt, movent in linea recta (tanquam tramite brevissimo) ad consortia suorum connaturalium. Recipit autem motus iste rotationis differentias novem. Primam, centri sui, circa quod corpora movent: secundam, polorum suorum, supra quos movent: tertiam, circumferentiae sive ambitus sui, prout distant a centro: quartam, incitationis suae, prout celerius aut tardius rotant: quintam, consequutionis motus sui, veluti ab oriente in occidentem, aut ab occidente in

orientem: sextam, declinationis a circulo perfecto per spiras longius aut propius distantes a centro suo: septimam, declinationis a circulo perfecto per spiras longius aut propius distantes a polis suis: octavam, distantiae proprioris aut longioris spirarum suarum ad invicem: nonam et ultimam, variationis ipsorum polorum, si sint mobiles: quae ipsa ad rotationem non pertinet, nisi fiat circulariter. Atque iste motus communi et inveterata opinione habetur pro proprio coelestium. Attamen gravis de illo motu lis est inter nonnullos tam ex antiquis quam modernis, qui rotationem terrae attribuerunt. At multo fortasse justior movetur controversia (si modo res non sit omnino extra controversiam), an motus videlicet iste (concesso quod terra stet) coeli finibus contineatur, an potius descendat, et communicetur aeri et aquis. Motum autem rotationis in missilibus, ut in spiculis, sagittis, pilis sclopetorum, et similibus, omnino ad motum libertatis rejicimus.

18. Sit Motus Decimus Octavus, Motus Trepidationis, cui (ut ab astronomis intelligitur) non multum fidei adhibemus. Nobis autem corporum naturalium appetitus ubique serio perscrutantibus occurrit iste motus; et constitui debere videtur in speciem. Est autem hic motus veluti aeternae cujusdam captivitatis. Videlicet ubi corpora non omnino pro natura sua bene locata, et tamen non prorsus male se habentia, perpetuo trepidant, et irrequiete se agant, nec statu suo contenta, nec ulterius ausa progredi. Talis invenitur motus in corde et pulsibus animalium; et necesse est ut sit in omnibus corporibus, quae statu ancipiti ita degunt inter commoda et incommoda, ut distracta liberare se tentent, et denuo repulsam patiantur, et tamen perpetuo experiantur.

19. Sit Motus Decimus Nonus et postremus, motus ille cui vix nomen motus competit, et tamen est plane motus. Quem motum, Motum Decubitus, sive Motum Exhorrentiae Motus, vocare licet. Per hunc motum terra stat mole sua, moventibus se extremis suis in medium; non ad centrum imaginativum, sed ad unionem. Per hunc etiam appetitum omnia majorem in modum condensata motum exhorrent, atque illis pro omni appetitu est non moveri; et licet infinitis modis vellicentur et provocentur ad motum, tamen naturam suam (quoad possunt) tuentur. Quod si ad motum compellantur, tamen hoc agere semper

videntur ut quietem et statum suum recuperent, neque amplius moveant. Atque circa hoc certe se agilia praebent, et satis perniciter et rapide (ut pertaesa et impatientia omnis morae) contendunt. Hujus autem appetitus imago ex parte tantum cerni potest; quia hic apud nos, ex subactione et concoctione coelestium, omne tangibile non tantum non condensatum est ad ultimitatem, sed etiam cum spiritu nonnullo miscetur.

Proposuimus itaque jam species sive elementa simplicia motuum, appetituum, et virtutum activarum, quae sunt in natura maxime catholica. Neque parum scientiae naturalis sub illis adumbratum est. Non negamus tamen et alias species fortasse addi posse, atque istas ipsas divisiones secundum veriores rerum venas transferri, denique in minorem numerum posse redigi. Neque tamen hoc de divisionibus aliquibus abstractis intelligimus: veluti si quis dicat corpora appetere vel conservationem, vel exaltationem, vel propagationem, vel fruitionem naturae suae; aut si quis dicat motus rerum tendere ad conservationem et bonum, vel universi, ut antitypiam et nexum; vel universitatum magnarum, ut motus congregationis majoris, rotationis, et exhorrentiae motus; vel formarum specialium, ut reliquos. Licet enim haec vera sint, tamen nisi terminentur in materia et fabrica secundum veras lineas, speculativa sunt, et minus utilia. Interim sufficient et boni erunt usus ad pensitandas praedominantias virtutum et exquirendas instantias luctae; id quod nunc agitur.

Etenim ex his quos proposuimus motibus alii prorsus sunt invincibiles; alii aliis sunt fortiores, et illos ligant, fraenant, disponunt; alii aliis longius jaculantur; alii alios tempore et celeritate praevertunt; alii alios fovent, roborant, ampliant, accelerant.

Motus antitypiae omnino est adamantinus et invincibilis. Utrum vero Motus nexus sit invincibilis adhuc haeremus. Neque enim pro certo affirmaverimus utrum detur Vacuum, sive coacervatum sive permistum. At de illo nobis constat, rationem illam, propter quam introductum est Vacuum a Leucippo et Democrito (videlicet quod absque eo non possent eadem corpora complecti et implere

majora et minora spatia), talsam esse. Est enim plane plica materiae complicantis et replicantis se per spatia, inter certos fines, absque interpositione vacui; neque est in aere ex vacuo bis millies (tantum enim esse oportet) plus quam in auro. Id quod ex potentissimis corporum pneumaticorum virtutibus (quae aliter tanquam pulveris minuti natarent in vacuo), et multis aliis demonstrationibus, nobis satis liquet. Reliqui vero Motus regunt et reguntur invicem, pro rationibus vigoris, quanti, incitationis, ejaculationis, necnon tum auxiliorum tum impedimentorum quae occurrunt.

Exempli gratia: magnes armatus nonnullus detinet et suspendit ferrum, ad sexagecuplum pondus ipsius; eo usque dominatur motus congregationis minoris super motum congregationis majoris; quod si majus fuerit pondus, succumbit. Vectis tanti roboris sublevabit tantum pondus; eo usque dominatur motus libertatis super motum congregationis majoris; sin majus fuerit pondus, succumbit. Corium tensum ad tensuram talem non rumpitur; eo usque dominatur motus continuationis super motum tensurae; quod si ulterior fuerit tensura, rumpitur corium, et succumbit motus continuationis. Aqua per rimam perforationis talis effluit; eo usque dominatur motus congregationis majoris super motum continuationis; quod si minor fuerit rima, succumbit, et vincit motus continuationis. In pulvere sulphuris solius immissi in sclopetum cum pila, et admoto igne, non emittitur pila; in eo motus congregationis majoris vincit motum hyles. At in pulvere pyrio immisso vincit motus hyles in sulphure, adjutus motibus hyles et fugae in nitro. Et sic de caeteris. Etenim instantiae luctae (quae indicant praedominantiam virtutum, et secundum quas rationes et calculos praedominentur et succumbant) acri et sedula diligentia undique sunt conquirendae.

Etiam modi et rationes ipsius succumbentiae motuum diligenter sunt introspiciendae. Nempe, an omnino cessent, vel potius usque nitantur, sed ligentur. Etenim in corporibus hic apud nos, nulla vera est quies, nec in integris nec in partibus; sed tantum secundum apparentiam. Quies autem ista apparens causatur aut per aequilibrium, aut per absolutam praedominantiam motuum. Per aequilibrium, ut in bilancibus, quae stant si aequa sint pondera. Per

praedominantiam, ut in hydriis perforatis, ubi quiescit aqua et detinetur a decasu, per praedominantiam motus nexus. Notandum tamen est (ut diximus) quatenus nitantur motus illi succumbentes. Etenim si quis per luctam detineatur extensus in terra, brachiis et tibiis vinctis, aut aliter detentis; atque ille tamen totis viribus resurgere nitatur; non est minor nixus, licet non proficiat. Hujus autem rei conditio (scilicet utrum per praedominantiam motus succumbens quasi annihiletur, an potius continuetur nixus, licet non conspiciatur), quae latet in conflictibus, apparebit fortasse in concurrentiis. Exempli gratia; fiat experimentum in sclopetis, utrum sclopetus, pro tanto spatio quo emittat pilam in linea directa, sive (ut vulgo loquuntur) in puncto blanco, debiliorem edat percussionem ejaculando in supra, ubi Motus Ictus est simplex, quam desuper, ubi Motus Gravitatis concurrit cum Ictu.
Etiam canones praedominantiarum qui occurrunt colligendi sunt. Veluti, quod quo communius est bonum quod appetitur, eo motus est fortior ut motus nexus, qui respicit communionem universi, fortior est motu gravitatis, qui respicit communionem densorum. Etiam quod appetitus qui sunt boni privati, non praevalent plerunque contra appetitus boni magis publici, nisi in parvis quantis. Quae utinam obtinerent in civilibus.

XLIX.

Inter praerogativas instantiarum ponemus loco vicesimo quinto Instantias Innuentes; eas scilicet, quae commoda hominum innuunt aut designant. Etenim ipsum Posse et ipsum Scire naturam humanam amplificant, non beant. Itaque decerpenda sunt ex universitate rerum ea quae ad usus vitae maxime faciunt. Verum de iis erit magis proprius dicendi locus, cum Deductiones ad Praxim tractabimus. Quinetiam in ipso opere Interpretationis circa singula subjecta, locum semper Chartae Humanae, sive Chartae Optativae, assignamus. Etenim et quaerere et optare non inepte, pars scientiae est.

L.

Inter praerogativas instantiarum ponemus loco vicesimo sexto Instantias

inter praerogativas instantiarum ponemus loco vicesimo sexto Instantias Polychrestas. Eae sunt, quae pertinent ad varia et saepius occurrunt; ideoque operae et novis probationibus haud parum parcunt. Atque de instrumentis ipsis atque ingeniationibus proprius erit dicendi locus, cum Deductiones ad Praxim et Experimentandi Modos tractabimus. Quinetiam quae adhuc cognita sunt et in usum venerunt, in Historiis Particularibus singularum artium describentur. In praesenti autem subjungemus quaedam catholica circa ea pro exemplis tantum polychresti.

Operatur igitur homo super corpora naturalia (praeter ipsam admotionem et amotionem corporum simplicem) septem praecipue modis: nempe, vel per exclusionem eorum quae impediunt et disturbant; vel per compressiones, extensiones, agitationes, et hujusmodi; vel per calorem et frigus; vel per moram in loco convenienti; vel per fraenum et regimen motus; vel per consensus speciales; vel per alternationem tempestivam et debitam, atque seriem et successionem horum omnium; aut saltem nonnullorum ex illis.

1. Ad primum igitur quod attinet; aer communis qui undique praesto est et se ingerit, atque radii coelestium, multum turbant. Quae itaque ad illorum exclusionem faciunt, merito haberi possint pro polychrestis. Huc igitur pertinent materies et crassities vasorum, in quibus corpora ad operationem praeparata reponuntur. Similiter, modi accurati obturationis vasorum, per consolidationem et lutum sapientiae, ut loquuntur chymici. Etiam clausura per liquores in extimis, utilissima res est; ut cum infundunt oleum super vinum aut succos herbarum, quod expandendo se in summitate instar operculi, optime ea conservat illaesa ab aere. Neque pulveres res malae sunt; qui, licet contineant aerem permistum, tamen vim aeris coacervati et circumfusi arcent: ut fit in conservatione uvarum et fructuum intra arenam, et farinam. Etiam cera, mel, pix, et hujusmodi tenacia, recte obducuntur ad clausuram perfectiorem, et ad summovendum aerem et coelestia. Etiam nos experimentum quandoque fecimus, ponendo vas, necnon aliqua alia corpora, intra argentum vivum, quod omnium longe densissimum est ex iis quae circumfundi possunt. Quinetiam specus et cavernae subterraneae magni usus sunt ad prohibendum insolationem et aerem istum apertum

praedatorium; qualibus utuntur Germani Septentrionales pro granariis. Necnon repositio corporum in fundo aquarum ad hoc spectat: ut memini me quippiam audisse de utribus vini demissis in profundum puteum, ad infrigidationem scilicet, sed casu et per neglectum ac oblivionem ibidem remanentibus per multos annos, et deinde extractis; unde vinum factum est non solum non vapidum aut emortuum, sed multo magis nobile ad gustum, per commixtionem partium suarum (ut videtur) magis exquisitam. Quod si postulet res ut corpora demittantur ad fundum aquarum, veluti intra fluvios aut mare, neque tamen aquas tangant, nec in vasibus obturatis concludantur, sed aere tantum circumdentur; bonus est usus vasis illius quod adhibitum est nonnunquam ad operandum subter aquis super navigia demersa, ut urinatores diutius manere possint sub aquis, et per vices ad tempus respirare. Illud hujusmodi erat. Conficiebatur dolium ex metallo concavum, quod demittebatur aequabiliter ad superficiem aquae, atque sic deportabat totum aerem qui continebatur in dolio secum in fundum maris. Stabat autem super pedes tres (instar tripodis), qui longitudinis erant aliquanto minoris statura hominis; ita ut urinator posset cum anhelitus deficeret, immittere caput in cavum dolii, et respirare, et deinde opus continuare. Atque audivimus inventam esse jam machinam aliquam naviculae aut scaphae, quae homines subter aquis vehere possit ad spatia nonnnulla. Verum sub tali vase, quale modo diximus, corpora quaevis facile suspendi possint; cujus causa hoc experimentum adduximus.

Est et alius usus diligentis et perfectae clausurae corporum: nempe, non solum ut prohibeatur aditus aeris per exterius (de quo jam dictum est), verum etiam ut cohibeatur exitus spiritus corporis, super quod fit operatio per interius. Necesse est enim ut operanti circa corpora naturalia constet de summis suis: *viz.* quod nihil expirarit aut effluxerit. Fiunt enim profundae alterationes in corporibus, quando, natura prohibente annihilationem, ars prohibeat etiam deperditionem aut evolationem alicujus partis. Atque hac de re invaluit opinio falsa (quae si vera esset, de ista conservatione summae certae absque diminutione esset fere desperandum): *viz.* spiritus corporum, et aerem majori gradu caloris attenuatum, nullis vasorum claustris posse contineri, quin per poros vasorum subtiliores

evolent. Atque in hanc opinionem adducti sunt homines per vulgata illa experimenta, poculi inversi super aquam cum candela aut charta inflammata, ex quo fit ut aqua sursum attrahatur; atque similiter ventosarum, quae super flammam calefactae trahunt carnes. Existimant enim in utroque experimento aerem attenuatum emitti, et inde quantum ipsius minui, ideoque aquam aut carnes per nexum succedere. Quod falsissimum est. Aer enim non quanto diminuitur, sed spatio contrahitur; neque incipit motus iste successionis aquae, antequam fiat extinctio flammae aut refrigeratio aeris: adeo ut medici, quo fortius attrahant ventosae, ponant spongias frigidas aqua madefactas super ventosas. Itaque non est cur homines multum sibi metuant de facili exitu aeris aut spirituum. Licet enim verum sit etiam solidissima corpora habere suos poros, tamen aegre patitur aer aut spiritus comminutionem sui ad tantam subtilitatem; quemadmodum et aqua exire recusat per rimam minusculam.

2. De secundo vero modo ex septem praedictis illud imprimis notandum est, valere certe compressiones et hujusmodi violentias ad motum localem, atque alia id genus, potentissime; ut in machinis et missilibus: etiam ad destructionem corporis organici, atque earum virtutum quae consistunt plane in motu. Omnis enim vita, immo etiam omnis flamma et ignitio destruitur per compressiones; ut et omnis machina corrumpitur et confunditur per easdem. Etiam ad destructionem virtutum quae consistunt in posituris, et dissimilaritate partium paulo crassiore; ut in coloribus (neque enim idem color floris integri et contusi, neque succini integri et pulverizati); etiam in saporibus (neque enim idem sapor pyri immaturi, et ejusdem compressi ac subacti; nam manifesto dulcedinem majorem concipit). Verum ad transformationes et alterationes nobiliores corporum similarium non multum valent istae violentiae; quia corpora per eas non acquirunt consistentiam aliquam novam constantem et quiescentem, sed transitoriam, et nitentem semper ad restitutionem et liberationem sui. Attamen non abs re foret hujus rei facere experimenta aliqua diligentiora; ad hoc scilicet, utrum condensatio corporis bene similaris (qualia sunt aer, aqua, oleum, et hujusmodi), aut rarefactio similiter per violentiam indita, possint fieri constantes

et fixae et quasi mutatae in naturam. Id quod primo experiendum per moram simplicem; deinde per auxilia et consensus. Atque illud nobis in promptu fuisset (si modo in mentem venisset), cum aquam (de qua alibi) per malleationes et pressoria condensavimus, antequam erumperet. Debueramus enim sphaeram complanatam per aliquot dies sibi permisisse, et tum demum aquam extraxisse; ut fieret experimentum, utrum statim impletura fuisset talem dimensionem, qualem habebat ante condensationem. Quod si non fecisset aut statim, aut certe paulo post, constans videlicet facta videri potuisset ista condensatio; sin minus, apparuisset factam fuisse restitutionem, et compressionem fuisse transitoriam. Etiam simile quiddam faciendum erat circa extensionem aeris in ovis vitreis. Etenim debuerat fieri, post exuctionem fortem, subita et firma obturatio; deinde debuerant ova illa manere ita obturata per nonnullos dies; et tum demum experiendum fuisset, utrum aperto foramine attractus fuisset aer cum sibilo, aut etiam attracta fuisset tanta quantitas aquae post immersionem, quanta fuisset ab initio, si nulla adhibita fuisset mora. Probabile enim, aut saltem dignum probatione est, haec fieri potuisse et posse; propterea quod in corporibus paulo magis dissimilaribus similia efficiat mora temporis. Etenim baculum per compressionem curvatum post aliquod tempus non resilit; neque id imputandum est alicui deperditioni ex quanto ligni per moram; nam idem fiet in lamina ferri (si augeatur mora), quae non est expirabilis. Quod si non succedat experimentum per moram simplicem, tamen non deserendum est negotium, sed auxilia alia adhibenda. Non enim parum lucri fit, si per violentias indi possint corporibus naturae fixae et constantes. Hac enim ratione aer possit verti in aquam per condensationes, et complura alia id genus. Dominus enim est homo motuum violentorum, magis quam caeterorum.

3. At tertius ex septem modis refertur ad magnum illud organum, tam naturae quam artis, quoad operandum; videlicet calidum et frigidum. Atque in hac parte claudicat plane potentia humana, tanquam ex uno pede. Habemus enim calorem ignis, qui caloribus solis (prout ad nos deferuntur) et caloribus animalium quasi infinitis partibus potentior est et intensior. At deest frigus, nisi quale per

tempestates hyemales, aut per cavernas, aut per circundationes nivis et glaciei, haberi potest: quod in comparatione aequari potest cum calore fortasse solis meridiano in regione aliqua ex torridis, aucto insuper per reverberationes montium et parietum; nam hujusmodi utique tam calores quam frigora ab animalibus ad tempus exiguum tolerari possunt. Nihili autem sunt fere prae calore fornacis ardentis, aut alicujus frigoris quod huic gradui respondeat. Itaque omnia hic apud nos vergunt ad rarefactionem, et desiccationem, et consumptionem: nihil fere ad condensationem et intenerationem, nisi per misturas et modos quasi spurios. Quare Instantiae Frigoris omni diligentia sunt conquirendae: quales videntur inveniri in expositione corporum super turres quando gelat acriter; in cavernis subterraneis; circundationibus nivis et glaciei in locis profundioribus, et ad hoc excavatis; demissione corporum in puteos; sepulturis corporum in argento vivo et metallis; immersione corporum in aquis, quae vertunt ligna in lapides; defossione corporum in terra (qualis fertur apud Chinenses esse confectio porcellanae, ubi massae ad hoc factae dicuntur manere intra terram per quadraginta aut quinquaginta annos, et transmitti ad haeredes, tanquam minerae quaedam artificiales); et hujusmodi. Quinetiam quae interveniunt in natura condensationes, factae per frigora, similiter sunt investigandae; ut, causis eorum cognitis, transferri possint in artes. Quales cernuntur in exudatione marmoris et lapidum; in rorationibus super vitra per interius fenestrarum, sub auroram, post gelu noctis; in originibus et collectionibus vaporum in aquas sub terra, unde saepe scaturiunt fontes; et quaecunque sunt hujus generis.

Inveniuntur autem, praeter illa quae sunt frigida ad tactum, quaedam alia potestate frigida, quae etiam condensant; veruntamen operari videntur super corpora animalium tantum, et vix ultra. Hujus generis se ostendunt multa in medicinis et emplastris. Alia autem condensant carnes et partes tangibiles; qualia sunt medicamenta astringentia, atque etiam inspissantiae: alia condensant spiritus; id quod maxime cernitur in soporiferis. Duplex autem est modus condensationis spirituum, per medicamenta soporifera, sive provocantia somnum: alter per sedationem motus; alter per fugam spirituum. Etenim viola,

rosa sicca, lactuca, et hujusmodi benedicta sive benigna, per vapores suos amicos et moderate refrigerantes, invitant spiritus ut se uniant, et ipsorum acrem et inquietum motum compescunt. Etiam aqua rosacea, apposita ad nares in deliquiis animae, spiritus resolutos et nimium relaxatos se recipere facit, et tanquam alit. At opiata et eorum affinia spiritus plane fugant, ex qualitate sua maligna et inimica. Itaque si applicentur parti exteriori, statim aufugiunt spiritus ab illa parte, nec amplius libenter influunt: sin sumantur interius, vapores eorum, ascendentes ad caput, spiritus in ventriculis cerebri contentos undequaque fugant; cumque se retrahant spiritus neque in aliam partem effugere possint, per consequens coeunt et condensantur; et quandoque plane extinguuntur et suffocantur; licet rursus eadem opiata moderate sumpta, per accidens secundarium (videlicet condensationem illam quae a coitione succedit), confortent spiritus, eosque reddant magis robustos, et retundant eorum inutiles et incensivos motus, ex quo ad curas morborum, et vitae prolongationem haud parum conferant.

Etiam praeparationes corporum ad excipiendum frigus non sunt omittendae; veluti quod aqua parum tepida facilius conglacietur quam omnino frigida, et hujusmodi.

Praeterea, quia natura frigus tam parce suppeditat, faciendum est quemadmodum pharmacopolae solent; qui, quando simplex aliquod haberi non possit, capiunt succedaneum ejus, et quid pro quo, ut vocant: veluti lignum aloes pro xylobalsamo, cassiam pro cinamomo. Simili modo diligenter circumspiciendum est, si quae sint succedanea frigoris; videlicet quibus modis fieri possint condensationes in corporibus, aliter quam per frigus, quod illas efficit ut opus suum proprium. Illae autem condensationes videntur intra quaternum numerum (quantum adhuc liquet) contineri. Quarum prima videtur fieri per contrusionem simplicem; quae parum potest ad densitatem constantem (resiliunt enim corpora) sed nihilominus forte res auxiliaris esse queat. Secunda fit per contractionem partium crassiorum in corpore aliquo, post evolationem aut exitum partium tenuiorum, ut fit in indurationibus per ignem, et repetitis extinctionibus metallorum, et similibus. Tertia fit per coitionem partium homogenearum, quae

sunt maxime solidae in corpore aliquo, atque antea fuerant distractae, et cum minus solidis commistae: veluti in restitutione mercurii sublimati, qui in pulvere longe majus occupat spatium quam mercurius simplex, et similiter in omni repurgatione metallorum a scoriis suis. Quarta fit per consensus, admovendo quae ex vi corporum occulta condensant; qui consensus adhuc raro se ostendunt; quod mirum minime est, quoniam antequam inventio succedat formarum et schematismorum, de inquisitione consensuum non multum sperandum est. Certe quoad corpora animalium, dubium non est quin sint complures medicinae, tam interius quam exterius sumptae, quae condensant tanquam per consensum, ut paulo ante diximus. Sed inanimatis rara est hujusmodi operatio. Percrebuit sane, tam scriptis quam fama, narratio de arbore in una ex insulis sive Terceris sive Canariis (neque enim bene memini), quae perpetuo stillat; adeo ut inhabitantibus nonnullam commoditatem aquae praebeat. Paracelsus autem ait, herbam vocatam Rorem Solis meridie et fervente sole rore impleri, cum aliae herbae undique sint siccae. At nos utramque narrationem fabulosam esse existimamus. Omnino autem illae instantiae nobilissimi forent usus, et introspectione dignissimae, si essent verae. Etiam rores illos mellitos, et instar mannae, qui super foliis quercus inveniuntur mense Maio, non existimamus fieri et densari a consensu aliquo, sive a proprietate folii quercus; sed cum super aliis foliis pariter cadant, contineri scilicet et durare in foliis quercus, quia sunt bene unita, nec spongiosa, ut plurima ex aliis.

Calorem vero quod attinet, copia et potestas nimirum homini abunde adest; observatio autem et inquisitio deficit in nonnullis, iisque maxime necessariis, utcunque spagyrici se venditent. Etenim caloris intensioris opificia exquiruntur et conspiciuntur; remissioris vero, quae maxime in vias naturae incidunt, non tentantur, ideoque latent. Itaque videmus per vulcanos istos qui in pretio sunt, spiritus corporum magnopere exaltari, ut in aquis fortibus, et nonnullis aliis oleis chymicis; partes tangibiles indurari, et, emisso volatili, aliquando figi; partes homogeneas separari; etiam corpora heterogenea grosso modo incorporari et commisceri; maxime autem compages corporum compositorum et subtiliores schematismos destrui et confundi. Debuerant autem opificia caloris lenioris

tentari et exquiri; unde subtiliores misturae et schematismi ordinati gigni possint et educi, ad exemplum naturae et imitationem operum solis; quemadmodum in aphorismo de instantiis foederis quaedam adumbravimus. Opificia enim naturae transiguntur per longe minores portiones, et posituras magis exquisitas et varias, quam opificia ignis, prout nunc adhibetur. Tum vero videatur homo revera auctus potestate, si per calores et potentias artificiales opera naturae possint specie repraesentari, virtute perfici, copia variari; quibus addere oportet accelerationem temporis. Nam rubigo ferri longo tempore procedit, at versio in crocum Martis subito; et similiter de aerugine et cerussa. Christallum longo tempore conficitur, vitrum subito conflatur. Lapides longo tempore concrescunt, lateres subito coquuntur, *etc.* Interim (quod nunc agitur) omnes diversitates caloris cum effectibus suis respective diligenter et industrie undique sunt colligendae et exquirendae: coelestium, per radios suos directos, reflexos, refractos, et unitos in speculis comburentibus; fulguris, flammae, ignis carbonum; ignis ex diversis materiis; ignis aperti, conclusi, angustiati, et inundantis, denique per diversas fabricas fornacium qualificati; ignis flatu exciti, quieti et non exciti; ignis ad majorem aut minorem distantiam remoti; ignis per varia media permeantis; calorum humidorum, ut balnei Mariae, fimi, caloris animalium per exterius, caloris animalium per interius, foeni conclusi; calorum aridorum, cineris, calcis, arenae tepidae; denique calorum cujusvis generis cum gradibus eorum.

Praecipue vero tentanda est inquisitio et inventio effectuum et opificiorum caloris accedentis et recedentis graduatim, et ordinatim, et periodice, et per debita spatia et moras. Ista enim inaequalitas ordinata revera filia coeli est, et generationis mater; neque a calore aut vehementi, aut praecipiti, aut subsultorio, aliquid magni expectandum est. Etenim et in vegetabilibus hoc manifestissimum est; atque etiam in uteris animalium magna est caloris inaequalitas, ex motu, somno, alimentationibus et passionibus foemellarum quae uterum gestant; denique in ipsis matricibus terrae, iis nimirum in quibus metalla et fossilia efformantur, locum habet et viget ista inaequalitas. Quo magis notanda est inscitia aliquorum alchymistarum ex reformatis, qui per calores aequabiles

lampadum et hujusmodi, perpetuo uno tenore ardentium, se voti compotes fore existimarunt. Atque de opificiis et effectibus caloris haec dicta sint. Neque vero tempestivum est illa penitus scrutari, antequam rerum formae et corporum schematismi ulterius investigati fuerint, et in lucem prodierint. Tum enim quaerenda et adoperanda et aptanda sunt instrumenta, quando de exemplaribus constiterit.

4. Quartus modus operandi est per moram, quae certe et promus et condus naturae est, et quaedam dispensatrix. Moram appellamus, cum corpus aliquod sibi permittitur ad tempus notabile, munitum interim et defensum ab aliqua vi externa. Tum enim motus intestini se produnt et perficiunt, cum motus extranei et adventitii cessant. Opera autem aetatis sunt longe subtiliora quam ignis. Neque enim possit fieri talis clarificatio vini per ignem, qualis fit per moram; neque etiam incinerationes per ignem tam sunt exquisitae, quam resolutiones et consumptiones per saecula. Incorporationes etiam, et mistiones subitae et praecipitatae per ignem, longe inferiores sunt illis, quae fiunt per moram. At dissimilares et varii schematismi, quos corpora per moras tentant (quales sunt putredines), per ignem aut calorem vehementiorem destruuntur. Illud interim non abs re fuerit notare; motus corporum penitus conclusorum habere nonnihil ex violento. Incarceratio enim illa impedit motus spontaneos corporis. Itaque mora in vase aperto plus facit ad separationes; in vase penitus clauso ad commistiones; in vase nonnihil clauso, sed subintrante aere, ad putrefactiones. Utcunque de opificiis et effectibus morae undique sunt diligenter conquirendae instantiae.

5. At regimen motus (quod est quintus ex modis operandi) non parum valet. Regimen autem motus vocamus, cum corpus aliud occurrens corporis alterius motum spontaneum impedit, repellit, admittit, dirigit. Hoc vero plerunque in figuris et situ vasorum consistit. Etenim conus erectus juvat ad condensationem vaporum in alembicis; at conus inversus juvat defaecationem sacchari in vasis resupinatis. Aliquando autem sinuatio requiritur, et angustiatio, et dilatatio per vices, et hujusmodi. Etiam omnis percolatio huc spectat; scilicet cum corpus

occurrens uni parti corporis alterius viam aperit, alteri obstruit. Neque semper percolatio aut aliud regimen motus fit per extra; sed etiam per corpus in corpore: ut cum lapilli immittuntur in aquas ad colligendam limositatem ipsarum; syrupi clarificantur cum albuminibus ovorum, ut crassiores partes adhaerescant, et postea separari possint. Etiam huic regimini motus satis leviter et inscite attribuit Telesius figuras animalium, ob rivulos scilicet et loculos matricis. Debuerat autem notare similem efformationem in testis ovorum, ubi non sunt rugae aut inaequalitas. At verum est regimen motus efformationes perficere in modulis et proplasticis.

6. Operationes vero per consensus aut fugas (qui sextus modus est) latent saepenumero in profundo. Istae enim (quas vocant) proprietates occultae, et specificae, et sympathiae, et antipathiae, sunt magna ex parte corruptelae philosophiae. Neque de consensibus rerum inveniendis multum sperandum est, ante inventionem formarum et schematismorum simplicium. Consensus enim nil aliud est quam symmetria formarum et schematismorum ad invicem.
Atqui majores et magis catholici rerum consensus non prorsus obscuri sunt. Itaque ab iis ordiendum. Eorum prima et summa diversitas ea est; ut quaedam corpora copia et raritate materiae admodum discrepent, schematismis consentiant: alia contra copia et raritate materiae consentiant, schematismis discrepent. Nam non male notatum est a chymicis, in principiorum suorum triade, sulphur et mercurium quasi per universitatem rerum permeare. (Nam de sale inepta ratio est, sed introducta ut possit comprehendere corpora terrea, sicca, et fixa.) At certe in illis duobus videtur consensus quidam naturae ex maxime catholicis conspici. Etenim consentiunt sulphur; oleum, et exhalatio pinguis; flamma; et fortasse corpus stellae. Ex altera parte consentiunt mercurius; aqua et vapores aquei; aer; et fortasse aether purus et interstellaris. Attamen istae quaterniones geminae, sive magnae rerum tribus (utraque intra ordines suos), copia materiae atque densitate immensum differunt, sed schematismo valde conveniunt; ut in plurimis se produnt. At contra metalla diversa copia et densitate multum conveniunt (praesertim respectu vegetabilium, etc.), sed

schematismo multifariam differunt; et similiter vegetabilia et animalia diversa schematismis quasi infinitis variantur, sed intra copiam materiae sive densitatem paucorum graduum continentur.

Sequitur consensus maxime post priorem catholicus, videlicet corporum principalium et fomitum suorum; videlicet menstruorum, et alimentorum. Itaque exquirendum, sub quibus climatibus, et in qua tellure, et ad quam profunditatem metalla singula generentur; et similiter de gemmis, sive ex rupibus, sive inter mineras natis; in qua gleba terrae, arbores singulae, et frutices, et herbae potissimum proveniant, et tanquam gaudeant; et insimul quae impinguationes, sive per stercorationes cujuscunque generis, sive per cretam, arenam maris, cineres, etc., maxime juvent; et quae sint ex his pro varietate glebarum magis aptae et auxiliares. Etiam insitio et inoculatio arborum et plantarum, earumque ratio, quae scilicet plantae super quas foelicius inserantur, etc., multum pendet de consensu. In qua parte non injucundum foret experimentum, quod noviter audivimus esse tentatum, de insitione arborum sylvestrium (quae hucusque in arboribus hortensibus fieri consuevit), unde folia et glandes majorem in modum amplificantur, et arbores fiunt magis umbrosae. Similiter, alimenta animalium respective notanda sunt in genere, et cum negativis. Neque enim carnivora sustinent herbis nutriri; unde etiam Ordo Folitanorum (licet voluntas humana plus possit quam animantium caeterorum super corpus suum), post experientiam factam (ut aiunt), tanquam ab humana natura non tolerabilis, fere evanuit. Etiam materiae diversae putrefactionum, unde animalcula generantur, notandae sunt. Atque consensus corporum principalium erga subordinata sua (tales enim ii possint censeri quos notavimus) satis in aperto sunt. Quibus addi possunt sensuum consensus erga objecta sua. Qui consensus, cum manifestissimi sint, bene notati, et acriter excussi, etiam aliis consensibus qui latent magnam praebere possint lucem.

At interiores corporum consensus et fugae, sive amicitiae et lites (taedet enim nos fere vocabulorum sympathiae et antipathiae, propter superstitiones et inania), aut falso ascriptae, aut fabulis conspersae, aut per neglectum rarae admodum sunt. Etenim si quis asserat inter vineam et brassicam esse dissidium,

quia juxta sata minus laete proveniunt, praesto ratio est: quod utraque planta succulenta sit et depraedatrix, unde altera alteram defraudat. Si quis asserat esse consensum et amicitiam inter segetes et cyaneum, aut papaver sylvestre, quia herbae illae fere non proveniunt nisi in arvis cultis: debuit is potius asserere dissidium esse inter ea, quia papaver et cyaneus emittuntur et creantur ex tali succo terrae qualem segetes reliquerint et repudiaverint; adeo ut satio segetum terram praeparet ad eorum proventum. Atque hujusmodi falsarum ascriptionum magnus est numerus. Quoad fabulas vero, illae omnino sunt exterminandae. Restat tenuis certe copia eorum consensuum, qui certo probati sunt experimento; quales sunt magnetis et ferri, atque auri et argenti vivi, et similium. At in experimentis chymicis circa metalla inveniuntur et alii nonnulli observatione digni. Maxima vero frequentia eorum (ut in tanta paucitate) invenitur in medicinis nonnullis, quae, ex proprietatibus suis occultis (quas vocant) et specificis, respiciunt aut membra, aut humores, aut morbos, aut quandoque naturas individuas. Neque omittendi sunt consensus inter motus et affectus lunae et passiones corporum inferiorum, prout ex experimentis agriculturae, nauticae, et medicinae, aut alias cum delectu severo et sincero colligi et recipi possint. Verum instantiae universae consensuum secretiorum, quo magis sunt infrequentes, eo majori cum diligentia sunt inquirendae, per traditiones, et narrationes fidas et probas; modo hoc fiat absque ulla levitate, aut credulitate, sed fide anxia et quasi dubitabunda. Restat consensus corporum modo operandi tanquam inartificialis, sed usu polychrestus, qui nullo modo omittendus est, sed sedula observatione investigandus. Is est coitio sive unio corporum, proclivis aut difficilis, per compositionem, sive appositionem simplicem. Etenim corpora nonnulla facile et libenter commiscentur et incorporantur, alia autem aegre et perverse: veluti pulveres melius incorporantur cum aquis; calces et cineres, cum oleis; et sic de similibus. Neque tantum sunt colligendae instantiae propensionis aut aversionis corporum erga misturam, sed etiam collocationis partium, et distributionis, et digestionis, postquam commista sint; denique et praedominantiae post misturam transactam.

7. Superest ultimo loco ex modis septem operandi septimus et postremus: operatio scilicet per alternationem et vicissitudines priorum sex; de quo antequam in singulos illos paulo altius fuerit inquisitum, tempestivum non foret exempla proponere. Series autem sive catena hujusmodi alternationis, prout ad singula effecta accommodari possit, res est et cognitu maxime difficilis, et ad opera maxime valida. Summa autem detinet et occupat homines impatientia hujusmodi tam inquisitionis, quam praxeos; cum tamen sit instar fili labyrinthi, quoad opera majora. Atque haec sufficiant ad exemplum Polychresti.

LI.

Inter praerogativas instantiarum, ponemus loco vicesimo septimo atque ultimo Instantias Magicas. Hoc nomine illas appellamus, in quibus materia aut efficiens tenuis aut parva est, pro magnitudine operis et effectus qui sequitur; adeo ut etiamsi fuerint vulgares, tamen sint instar miraculi; aliae primo intuitu, aliae etiam attentius contemplanti. Has vero natura ex sese subministrat parce; quid vero factura sit sinu excusso, et post inventionem formarum, et processuum, et schematismorum, futuris temporibus apparebit. At ista effecta magica (quantum adhuc conjicimus) fiunt tribus modis: aut per multiplicationem sui, ut in igne, et venenis, quae vocant specifica; necnon in motibus, qui transeunt et fortificantur de rota in rotam: aut per excitationem sive invitationem in altero, ut in magnete, qui excit acus innumeras, virtute nullatenus deperdita aut diminuta; aut in fermento, et hujusmodi: aut per anteversionem motus, ut dictum est de pulvere pyrio, et bombardis, et cuniculis: quorum priores duo modi indagationem consensuum requirunt; tertius, mensurae motuum. Utrum vero sit aliquis modus mutandi corpora per minima (ut vocant), et transponendi subtiliores materiae schematismos (id quod ad omnimodas corporum transformationes pertinet, ut ars brevi tempore illud facere possit, quod natura per multas ambages molitur), de eo nulla hactenus nobis constant indicia. Quemadmodum autem in solidis et veris aspiramus ad ultima et summa; ita vana et tumida perpetuo odimus, et quantum in nobis est profligamus.

LII.

Atque de Dignitatibus sive Praerogativis Instantiarum haec dicta sint. Illud vero monendum, nos in hoc nostro Organo tractare logicam, non philosophiam. Sed cum logica nostra doceat intellectum et erudiat ad hoc, ut non tenuibus mentis quasi claviculis rerum abstracta captet et prenset (ut logica vulgaris), sed naturam revera persecet, et corporum virtutes et actus eorumque leges in materia determinatas inveniat; ita ut non solum ex natura mentis, sed ex natura rerum quoque haec scientia emanet: mirum non est, si ubique naturalibus contemplationibus et experimentis, ad exempla artis nostrae, conspersa fuerit et illustrata. Sunt autem (ut ex iis quae dicta sunt patet) Praerogativae Instantiarum numero 27; nominibus: Instantiae Solitariae: Instantiae Migrantes: Instantiae Ostensivae: Instantiae Clandestinae: Instantiae Constitutivae: Instantiae Conformes: Instantiae Monodicae: Instantiae Deviantes: Instantiae Limitaneae: Instantiae Potestatis: Instantiae Comitatus et Hostiles: Instantiae Subjunctivae: Instantiae Foederis: Instantiae Crucis: Instantiae Divortii: Instantiae Januae: Instantiae Citantes: Instantiae Viae: Instantiae Supplementi: Instantiae Persecantes: Instantiae Virgae: Instantiae Curriculi: Doses Naturae: Instantiae Luctae: Instantiae Innuentes: Instantiae Polychrestae: Instantiae Magicae. Usus autem harum instantiarum, in quo instantias vulgares excellunt, versatur in genere aut circa partem informativam; aut circa operativam; aut circa utramque. Atque quoad informativam, juvant illae aut sensum, aut intellectum. Sensum, ut quinque Instantiae Lampadis: intellectum, aut accelerando exclusivam formae, ut Solitariae; aut angustiando et propius indicando affirmativam formae, ut Migrantes, Ostensivae, Comitatus, cum Subjunctivis; aut erigendo intellectum, et ducendo ad genera et naturas communes; idque aut immediate, ut Clandestinae, Monodicae, Foederis; aut gradu proximo, ut Constitutivae; aut gradu infimo, ut Conformes; aut rectificando intellectum a consuetis, ut Deviantes; aut ducendo ad Formam Magnam, sive Fabricam Universi, ut Limitaneae; aut cavendo de formis et causis falsis, ut Crucis et Divortii. Quod vero ad Operativam attinet; illae practicam aut designant, aut mensurant, aut sublevant. Designant aut

ostendendo a quibus incipiendum, ne actum agamus, ut Instantiae Potestatis; aut ad quid aspirandum, si detur facultas, ut Innuentes: mensurant quatuor illae Mathematicae: sublevant Polychrestae et Magicae.
Rursus ex istis instantiis 27, nonnullarum (ut superius diximus de aliquibus) facienda est collectio jam ab initio, nec expectanda particularis inquisitio naturarum. Cujus generis sunt instantiae conformes, monodicae, deviantes, limitaneae, potestatis, januae, innuentes, polychrestae, magicae. Hae enim aut auxiliantur et medentur intellectui et sensui, aut instruunt praxin in genere. Reliquae tum demum conquirendae sunt, cum conficiemus tabulas comparentiae ad opus interpretis circa aliquam naturam particularem. Sunt enim instantiae praerogativis istis insignitae et donatae animae instar, inter vulgares instantias comparentiae; et ut ab initio diximus, paucae illarum sunt vice multarum; quocirca cum tabulas conficimus, illae omni studio sunt investigandae, et in tabulas referendae. Erit etiam earum mentio necessaria in iis quae sequuntur. Praeponendus itaque erat earum tractatus. Nunc vero ad adminicula et rectificationes Inductionis, et deinceps ad concreta, et latentes processus, et latentes schematismos, et reliqua quae Aphorismo 21. ordine proposuimus, pergendum; ut tandem (tanquam curatores probi et fideles) tradamus hominibus fortunas suas, emancipato intellectu, et facto tanquam majore: unde necesse est sequi emendationem status hominis, et ampliationem potestatis ejus super naturam. Homo enim per lapsum et de statu innocentiae decidit, et de regno in creaturas. Utraque autem res etiam in hac vita nonnulla ex parte reparari potest; prior per religionem et fidem, posterior per artes et scientias. Neque enim per maledictionem facta est creatura prorsus et ad extremum rebellis. Sed in virtute illius diplomatis, In sudore vultus comedes panem tuum, per labores varios (non per disputationes certe, aut per otiosas ceremonias magicas), tandem et aliqua ex parte ad panem homini praebendum, id est, ad usus vitae humanae subigitur.

Finis Libri Secundi Novi Organi.

History of the Reign of King Henry VII

AFTER that Richard the Third of that Name, King in Fact only, but Tyrant both in Title and Regiment, and so commonly termed and reputed in all times since, was by the Divine Revenge, favouring the Design of an Exil'd man, overthrown and slain at Bosworth-field: There succeeded in the Kingdom the Earl of Richmond, thence-forth stiled Henry the Seventh. The King immediately after the Victory, as one that had been bred under a devout Mother, and was in his nature, a great observer of Religious Forms, caused Te Deum Laudamus to be solemnly sung in the presence of the whole Army upon the place, and was himself with general Applause, and great Cries of Joy, in a kind of Militar Election, or Recognition, saluted King. Meanwhile the Body of Richard, after many Indignities and Reproaches (the Dirigies and Obsequies of the common People towards Tyrants) was obscurely Buried. For though the King of his Nobleness gave charge unto the Fryers of Leicester to see an Honourable Interrment to be given to it, yet the Religious people themselves (being not free from the Humours of the Vulgar) neglected it; wherein nevertheless they did not then incurr any mans blame or Censure. No man thinking any Ignominy or Contumely unworthy of him, that had been the Executioner of King Henry the Sixth (that innocent Prince) with his own hands; the Contriver of the death of the Duke of Clarence, his Brother; the Murderer of his two Nephews (one of them his Lawfull King in the Present, and the other in the Future failing of him) and vehemently suspected to have been the Impoisoner of his Wife, thereby to make vacant his Bed, for a Marriage within the Degrees forbidden. And although he were a Prince in Militar Virtue approved, jealous of the Honour of the English Nation, and likewise a good Law-maker, for the ease and solace of the common People: yet his Cruelties and Parricides, in the Opinion of all men, weighed down his Virtues and Merits; and in the opinion of Wise men, even those Virtues themselves were conceived to be rather feigned, and affected things to serve his

Ambition, than Qualities ingenrate in his Judgement or Nature. And therefore it was noted by men of great Understanding, (who seeing his after Acts, looked back upon his former Proceedings) that even in the time of King Edward his Brother, he was not without secret Trains and Mines to turn Envy and Hatred upon his Brother's Government; as having an Expectation and a kind of Divination, that the King, by reason of his many Disorders, could not be of long Life, but was like to leave his Sonnes of tender years; and then he knew well, how easie a step it was, from the place of a Protector, and first Prince of the Blood, to the Crown. And that out of this deep root of Ambition it sprang, that as well at the Treaty of Peace that passed between Edward the Fourth, and Lewis the Eleventh of France, concluded by Enterview of both Kings at Piqueny, as upon all other Occasions, Richard then Duke of Glocester, stood ever upon the side of Honour, raising his own Reputation to the disadvantage of the King his Brother, and drawing the eyes of all (specially of the Nobles and Soldiers) upon himself; as if the King by his voluptuous Life and mean Marriage, were become Effeminate, and less sensible of Honour, and Reason of State, than was fit for a King. And as for the Politique and wholesom Laws which were Enacted in his Time, they were interpreted to be but the Brocage of an Usurper, thereby to wooe, and winne the Hearts of the People; as being conscious to himself that the true Obligations of Soveraignty in him failed, and were wanting. But King Henry in the very entrance of his Reign, and the instant of time, when the Kingdom was cast into his Arms, met with a Point of great difficulty, and knotty to solve, able to trouble and confound the Wisest King in the newness of his Estate; and so much the more, because it could not endure a Deliberation, but must be at once deliberated and determined. There were fallen to his Lot, and concurrent to his Person, three several Titles to the Imperial Crown: The first, the Title of the Lady Elizabeth, with whom, by precedent Pact with the Party that brought him in, he was to Marry. The second, the Antient and long disputed Title (both by Plea and Arms) of the House of Lancaster, to which he was Inheritour in his own Person. The third, the Title of the Sword or Conquest, for that he came in by Victory of Battel, and that the King in possession was slain in

the field. The first of these was fairest, and most like to give contentment to the People, who by Two and twenty Years Reign of King Edward the Fourth, had been fully made capable of the clearness of the Title of the White-Rose or House of York; and by the milde and plausible Reign of the same King toward his latter time, were become affectionate to that Line. But then it lay plain before his Eyes, that if he relyed upon that Title, he could be but a King at Curtesie, and have rather a Matrimonial than a Regal Power: the Right remaining in his Queen, upon whose decease, either with Issue, or without Issue, he was to give place, and be removed. And though he should obtain by Parliament to be continued, yet he knew there was a very great difference between a King that holdeth his Crown by a civil Act of Estates, and one that holdeth it Originally by the Law of Nature, and Descent of Blood. Neither wanted there even at that time secret Rumors and whisperings (which afterwards gathered strength, and turned to great Troubles) that the two young Sons of King Edward the Fourth, or one of them (which were said to be destroyed in the Tower) were not indeed Murthered, but conveyed secretly away, and were yet living: which if it had been true, had prevented the Title of the Lady Elizabeth. On the other side, if he stood upon his own Title of the House of Lancaster, inherent in his Person; he knew it was a Title condemned by Parliament, and generally prejudged in the common Opinion of the Realm, and that it tended directly to the Dis-inherison of the Line of York, held then the indubiate Heirs of the Crown. So that if he should have no Issue by the Lady Elibabeth, which should be Descendents of the Double-Line, then the Ancient flames of Discord and Intestine Wars, upon the Competition of both Houses, would again return and revive.

As for Conquest notwithstanding, Sir William Stanly, after some Acclamations of the Soldiers in the Field, had put a Crown of Ornament (which Richard wore in the Battel, and was found amongst the Spoils) upon King Henry's Head, as if there were his chief Title; yet he remembred well upon what Conditions and Agreements he was brought in, and that to claim as Conqueror, was to put as well his own Party, as the rest, into Terrour and Fear; as that which gave him Power of Disannulling of Laws, and disposing of Mens Fortunes and

Estates, and the like points of Absolute Power, being in themselves so harsh and odious, as that William himself, commonly called the Conqueror, however he used and exercised the Power of a Conqueror, to reward his Normans, yet he forbare to use that Claim in the beginning, but mixed it with a Titulary pretence grounded upon the Will and Designation of Edward the Confessor. But the King out of the greatness of his own mind, presently cast the Die, and the Inconveniences appearing unto him on all parts; and knowing there could not be any Interreign or suspension of Title; and preferring his Affection to his own Line and Blood, and liking that Title best which made him independent; and being in his Nature and constitution of Mind not very apprehensive or forecasting of future Events a-far off, but an Entertainer of Fortune by the Day; resolved to rest upon the Title of Lancaster as the Main, and to use the other two, that of Marriage, and that of Battel, but as Supporters, the one to appease secret Discontents, and the other to beat down open murmur and dispute: Not forgetting that the same Title of Lancaster had formerly maintained a possession of three Descents in the Crown, and might have proved a Perpetuity, had it not ended in the weakness and inability of the last Prince. Whereupon the King presently that very day, being the Two and Twentieth of August, assumed the Stile of King in his own name, without mentioning of the Lady Elizabeth at all, or any relation thereunto. In which course he ever after persisted, which did spin him a Thread of many Seditions and Troubles. The King full of these thoughts, before his departure from Leicester, dispatched Sir Robert Willoughby to the Castle of Sheriff-Hutton in Torkshire, where were kept in safe Custody by King Richard's commandment, both the Lady Elizabeth Daughter of King Edward, and Edward Plantagenet, Son and Heir to George Duke of Clarence. This Edward was by the King's Warrant delivered from the Constable of the Castle to the hand of Sir Robert Willoughby; and by him with all safety and diligence conveyed to the Tower of London, where he was shut up Closeprisoner. Which Act of the King's (being an Act meerly of Policy and Power) proceeded not so much from any apprehension he had of Doctor Shaw's Tale at Paul's Cross, for the Bastarding of Edward the Fourth's Issues, in which case this young

Gentleman was to succeed, (for that Fable was ever exploded) but upon a setled disposition to depress all Eminent Persons of the Line of Tork. Wherein still the King out of strength of Will, or weakness of Judgement, did use to shew a little more of the Party, than of the King.

For the Lady Elizabeth she received also a direction to repait with all convenient speed to London, and there to remain with the Queen Dowager her Mother; which accordingly she soon after did, accompanied with many. Noblemen and Ladies of Honour. In the mean season the King set forwards by easie Journeys to the City of London, receiving the Acclamations and Applauses of the People as he went, which indeed were true and unfeigned, as might well appear in the very Demonstrations and fulness of the Cry. For they thought generally that he was a Prince as ordained and sent down from Heaven, to unite and put to an end to the long Dissentions of the two Houses, which although they had had in the times of Henry the Fourth, Henry the Fifth, and a part of Henry the Sixth on the one side, and the times of Edward the Fourth on the other, Lucid-Intervalls and happy Pauses; yet they did ever hang over the Kingdom, ready to break forth into new Perturbations and Calamities. And as his Victory gave him the Knee, so his purpose of Marriage with the Lady Elizabeth gave him the Heart; so that both Knee and Heart did truly bow before him.

He on the other side, with great Wisdom, (not ignorant of the Affections and Fears of the People) to disperse the conceit and terrour of a Conquest, had given Order that there should be nothing in his Journey like unto a Warlike March, or manner: but rather like unto the Progress of a King in full Peace and Assurance.

He entred the City upon a Saturday, as he had also obtained the Victory upon a Saturday, which Day of the Week first upon an Observation, and after upon Memory and Fancy, he accounted and chose as a Day prosperous unto him.

The Mayor and Companies of the City received him at Shoreditch: whence, with great and Honorable attendance and troops of Noblemen, and Persons of Quality he entred the City; himself not being on Horseback, or in any open Chair, or Throne, but in a close Chariot, as one that having been sometimes an

Enemy to the whole State, and a Proscribed person, chose rather to keep State, and strike a Reverence into the People, than to fawn upon them.

He went first into Saint Paul's Church, where not meaning that the People should forget too soon that he came in by Battel, he made an Offertory of his Standards, and had Orizon and Te Deum again sung, and went to his Lodging prepared in the Bishop of London's Palace, where he stayed for a time.

During his abode there, he Assembled his Council, and other principal Persons, in presence of whom, he did renew again his promise to marry with the Lady Elizabeth. This he did the rather, because having at his coming out of Britain given artificially, for serving of his own turn, some hopes, in case he obtained the Kingdome, to Marry Anne Inheritress to the Dutchy of Britain, whom Charles the Eighth of France soon after Married. It bred some doubt and suspition amongst divers, that he was not sincere, or at least not fixed in going on with the Match of England so much desired: which Conceit also, though it were but Talk and Discourse, did much afflict the poor Lady Elizabeth her self. But howsoever he both truly intended it, and desired also it should be so believed, (the better to extinguish Envy and Contradiction to his other purposes) yet was he resolved in himself not to proceed to the Consummation thereof, till his Coronation and a Parliament were past. The one, lest a joynt-Coronation of himself and his Queen might give any countenance of Participation of Title: The other, lest in the Intayling of the Crown to himself, which he hoped to obtain by Parliament, the Votes of the Parliament might any ways reflect upon her.

About this time in Autumn, towards the end of September, there began and reigned in the City and other parts of the Kingdom a Disease then new; which of the Accidents, and manner thereof, they called the Sweating-Sickness. This Disease had a swift course both in the Sick-Body and in the Time and Period of the lasting thereof: for they that were taken with it, upon Four and twenty Hours escaping were thought almost assured. And as to the Time of the malice and reign of the Disease e're it ceased; It began about the One and twentieth of September, and cleared up before the end of October, insomuch that it was no hinderance to the King's Coronation, which was the last of October: nor (which

was more) to the holding of the Parliament, which began but seven days after. It was a Pestilent-Feaver, but, as it seemeth, not seated in the Veins or Humors, for that there followed no Carbuncle, no purple or livid Spots, or the like, the Mass of the Body being not tainted: only a malign Vapour flew to the Heart, and seised the Vital Spirits; which stirred Nature to strive to send it forth by an extreme Sweat. And it appeared by Experience that this Disease was rather a Surprize of Nature, than obstinate to Remedies, if it were in time looked unto. For if the Patient were kept in an equal temper, both for Clothes, Fire, and Drink, moderately warm, with temperate Cordials, whereby Natures work were neither irritated by Heat, nor turned back by Cold, he commonly Recovered. But infinite Persons dyed suddenly of it, before the manner of the Cure and attendance was known. It was conceived not to be an Epidemick Disease, but to proceed from a Malignity in the Constitution of the Air, gathered by the predispositions of Seasons: and the speedy Cessation declared as much.

On Simon and Jude's Even the King dined with Thomas Bourcchier, Arch-Bishop of Canterbury and Cardinal: and from Lambeth went by Land over the Bridge to the Tower, where the morrow after he made Twelve Knights-Bannerets. But for Creations he dispensed them with a sparing Hand. For notwithstanding a Field so lately fought, and a Coronation so near at hand, he only created Three: James Earl of Pembrook (the King's Uncle) was created Duke of Bedford; Thomas the Lord Stanley (the King's Father-in-Law) Earl of Derby; and Edward Courtney Earl of Devon; though the King had then nevertheless a purpose in himself to make more in time of Parliament; bearing a wise and decent respect to Distribute his Creations, some to honour his Coronation, and some his Parliament.

The Coronation followed two days after upon the Thirtyeth day of October in the year of our Lord 1485. At which time Innocent the Eighth was Pope of Rome, Frederick the Third, Emperour of Almaine; and Maximilian his Son newly chosen King of the Romans; Charles the Eighth, King of France; Ferdinando and Isabella, Kings of Spain; and James the Third, King of Scotland: with all which Kings and States, the King was at that time in good Peace and

Amity. At which Day also (as if the Crown upon his Head, had put Perils into his Thoughts) he did institute sor the better Security of his Person a Band of Fifty Archers under a Captain to attend him, by the name of Yeomen of his Guard: and yet that it might be thought to be rather a matter of Dignity, after the imitation of that he had known abroad, than any matter of Diffidence appropriate to his own Case, he made it to be understood for an Ordinance not Temporary, but to hold in Succession for ever after.

The Seventh of November the King held his Parliament at Westmister, which he had Summoned immediately after his coming to London. His Ends in calling a Parliament (and that so speedily) were chiefly three; First, to procure the Crown to be entayled upon himself. Next, to have the Attaindors of all of his Party (which were in no small Number) reversed, and all Acts of Hostility by them done in his Quarrel, remitted and discharged: and on the other side, to attaint by Parliament, the Heads and Principals of his Enemies. The Third, to calm and quiet the fears of the rest of that Party by a General Pardon: not being ignorant in how great danger a King stands from his Subjects, when most of his Subjects are conscious in themselves, that they stand in his danger. Unto these three special Motives of a Parliament was added, that he as a prudent and moderate Prince, made this Judgement; That it was fit for him to hasten to let his People see, that he meant to govern by Law, howsoever he came in by the Sword: and fit also to reclaim them to know him for their King, whom they had so lately talked of as an Enemy or Banished man. For that which concerned the Entayling of the Crown; (more than that he was true in his own Will, that he would not endure any mention of the Lady Elizabeth: no not in the nature of Special-Intail,) he carried it otherwise with great Wisdom and measure. For he did not press to have the Act penned by way of Declaration or Recognition of Right: as on the other side, he avoided to have it by new Law or Ordinance; but chose rather a kind of middle-way, by way of Establishment, and that under covert and indifferent words; That the inheritance of the Crown should rest, remain, and abide in the King, &c. which words might equally be applied; That the Crown should continue to him: but whether as having former Right to it,

(which was doubtful,) or having it then in Fact and Possession, (which no man denyed,) was left fair to Interpretation either way. And again for the limitation of the Entail, he did not press it to go further than to himself and to the Heirs of his Body, not speaking of his right Heirs; but leaving that to the Law to decide: so as the Entail might seem rather a personal Favour to him and his Children, than a total Dis-inherison to the House of York. And in this form was the Law drawn and passed. Which Statute he procured to be confirmed by the Pope's Bull the year following, with mention nevertheless (by way of Recital) of his other Titles; both of Descent and Conquest. So as now the wreath of Three was made a wreath of Five, for to the three first Titles of the two Houses, or Lines, and Conquest, were added two more; the Authorities Parliamentary and Papal.

The King likewise in the Reversal of the Attaindors of his Partakers, and discharging them of all Offences incident to his service and succour, had his Will: and Acts did pass accordingly. In the passage whereof, exception was taken to divers Persons in the House of Commons, for that they were Attainted, and thereby not legal, nor habilitate to serve in Parliament, being disabled in the highest degree; And that it should be a great incongruity to have them to make Laws, who themselves were not Inlawed. The truth was, that divers of those which had in the time of King Richard been strongest and most declared for the King's Party, were returned Knights and Burgesses for the Parliament, whether by care or recommendation from the State, or the voluntary inclination of the People: many of which had been by Richard the Third attainted by Outlawries, or otherwise. The King was somewhat troubled with this. For though it had a grave and specious Shew, yet it reflected upon his Party. But wisely not shewing himself at all moved therewith, he would not understand it but as a Case of Law; and wished the Judges to be advised thereupon: who for that purpose were forthwith Assembled in the Exchequer-Chamber, (which is the Council-Chamber of the Judges,) and upon deliberation they gave a grave and safe Opinion and Advice, mixed with Law and Convenience; which was, That the Knights and Burgesses attainted by the course of Law, should forbear to come into the House, 'till a Law were passed for the Reversal of their Attaindors.

It was at that time incidently moved amongst the Judges in their Consultation, what should be done for the King himself, who likewise was attainted; But it was with unanimous consent Resolved; That the Crown takes away all defects and stops in Blood: and that from the time the King did assume the Crown, the Fountain was cleared, and all Attaindors and Corruption of Blood discharged. But nevertheless for Honours sake it was Ordained by Parliament, that all Records wherein there was any memory, or mention of the King's Attaindor, should be defaced, cancelled, and taken off the File.

But on the part of the King's Enemies there were by Parliament attainted; the late Duke of Glocester, calling himself Richard the Third, the Duke of Norfolk, the Earl of Surrey, Viscount Lovel, the Lord Ferrers, the Lord Zouch, Richard Ratcliff, William Catesby, and many others of degree and quality. In which Bills of Attaindors, nevertheless there were contained many just and temperate Clauses, Savings and Proviso's, well shewing and foretokening the Wisdom, Stay, and Moderation of the King's Spirit of Government. And for the Pardon of the rest, that had stood against the King; the King, upon a second advice, thought it not fit it should pass by Parliament, the better (being matter of Grace) to impropriate the Thanks to himself: using only the Opportunity of a Parliament time, the better to disperse it into the Veins of the Kingdom. Therefore during the Parliament, he Published his Royal Proclamation, offering Pardon and Grace of Restitution, to all such as had taken Arms, or been participant of any Attempts against him; so as they submitted themselves to his Mercy by a Day, and took the Oath of Allegiance and Fidelity to him. Whereupon many came out of Sanctuary, and many more came out of Fear, no less guilty than those that had taken Sanctuary.

As for Money or Treasure; the King thought it not seasonable, or fit to demand any of his Subjects at this Parliament: both because he had received satisfaction from them in matters of so great Importance, and because he could not remunerate them with any General Pardon, being prevented therein by the CoronationPardon, passed immediately before: but chiefly, for that it was in every mans Eye, what great Forfeitures and Confiscations he had at that present

to help himself: Whereby those Casualties of the Crown might in reason spare the Purses of his Subjects; especially in a time when he was in Peace with all his Neighbours. Some few Laws passed at that Parliament, almost for form sake: amongst which there was One, to reduce Aliens, being made Denizens, to pay Strangers Customs; and another, to draw to himself the Seisures and Compositions of Italian Goods, for not employment, being Points of Profit to his Coffers, whereof from the very Beginning he was not forgetful; and had been more happy at the Latter End, if his early Providence (which kept him from all necessity of Exacting upon his People) could likewise have attemp'red his nature therein. He added during Parliament, to his former Creations, the Innoblement or Advancement in Nobility of a few others: The Lord Chandos of Britain, was made Earl of Bath; and Sir Giles Dawbeny was made Lord Dawbeny; and Sir Robert Willoughby Lord Brook.

The King did also with great Nobleness and Bounty (which Virtues at that time had their turns in his Nature) restore Edward Stafford (eldest Son to Henry, Duke of Buckingham, attainted in the time of King Richard,) not only to his Dignities, but to his Fortunes and Possessions, which were great; to which he was moved also by a kind of Gratitude, for that the Duke was the man that moved the first Stone against the Tyranny of King Richard, and indeed made the King a Bridge to the Crown upon his own Ruins. Thus the Parliament brake up.

The Parliament being dissolved, the King sent forthwith Money to redeem the Marquess Dorset, and Sir John Bourchier, whom he had left as his Pledges at Paris, for Money which he had borrowed, when he made his Expedition for England. And thereupon he took a fit occasion to send the Lord Treasurer and Master Bray (whom he used as Counsellor) to the Lord Mayor of London, requiring of the City a Prest of six thousand Marks: But after many Parlees, he could obtain but two thousand Pounds. Which nevertheless the King took in good part; as men use to do, that practise to borrow Money when they have no need. About this time, the King called unto his PrivyCouncil, John Morton, and Richard Fox, the one Bishop of Ely, the other Bishop of Exceter, vigilant men,

and secret, and such as kept watch with him almost upon all men else. They had been both versed in his Affairs before he came to the Crown, and were partakers of his adverse Fortune. This Morton soon after upon the death of Bourchier', he made Archbishop of Canterbury. And for Fox, he made him Lord Keeper of his Privy-Seal, and afterwards advanced him by Degrees, from Exceter to Bath and Wells, thence to Durham, and last to Winchester. For although the King loved to employ and advance Bishops, because having rich Bishopricks they carried their Reward upon themselves: yet he did use to raise them by steps; that he might not lose the profit of the First-fruits, which by that course of Gradation was multiplied.

At last, upon the Eighteenth of January was Solemnized the so long expected and so much desired Marriage, between the King and the Lady Elizabeth: which Day of Marriage was celebrated with greater Triumph, and Demonstrations (especially on the Peoples part) of Joy and Gladness, than the days either of his Entry, or Coronation; which the King rather noted, than liked. And it is true, that all his life time, while the Lady Elizabeth lived with him, (for she dyed before him) he shewed himself no very indulgent Husband towards her, though she was beautiful, gentle, and fruitful. But his aversion towards the House of York was so predominant in him, as it found place, not only in his Wars and Councils, but in his Chamber and Bed.

Towards the middle of the Spring, the King, full of confidence and assurance, as a Prince that had been Victorious in Battel, and had prevailed with his Parliament in all that he desired, and had the Ring of Acclamations fresh in his Ears, thought the rest of his Reign should be but Play, and the enjoying of a Kingdom. Yet as a wise and watchful King, he would not neglect any thing for his Safety; thinking nevertheless to perform all things now, rather as an Exercise, than as a Labour. So he being truly informed, that the Northern parts were not only Affectionate to the House of York, but particularly had been Devoted to King Richard the Third, thought it would be a Summer well spent to visit those Parts, and by his presence and application of himself, to reclaim and rectifie those Humours. But the King, in his accompt of Peace, and Calms, did much

overcast his Fortunes, which proved for many Years together full of Broken Seas, Tides, and Tempests. For he was no sooner come to Lincoln, where he kept his Easter, but he received news, that the Lord Lovel, Humphrey Stafford, and Thomas Stafford (who had formerly taken Sanctuary at Colchester) were departed out of Sanctuary, but to what place, no man could tell. Which advertisement, the King despised, and continued his Journey to York. At York there came fresh. and more certain advertisement, that the Lord Lovel was at hand with a great power of men, and that the Staffords were in Arms in Worcestershire, and had made their approaches to the City of Worcester, to assail it. The King, as a Prince of great and profound Judgement, was not much moved with it; for that he thought it was but a Ragg or Remnant of Bosworth-Field, and had nothing in it of the main Party of the House of York. But he was more doubtful of the raising of Forces to resist the Rebels, than of the Resistance it self; for that he was in a Core of People, whose affections he suspected. But the Action enduring no delay, he did speedily levy and sent against the Lord Lovel to the number of three thousand men, ill armed, but well assured, (being taken some few out of his own Train, and the rest out of the Tenants and Followers of such as were safe to be trusted,) under the Conduct of the Duke of Bedford. And as his manner was to send his Pardons rather before the Sword than after, he gave Commission to the Duke, to proclaim Pardon to all that would come in: Which the Duke, upon his approach to the Lord Lovel's Camp, did perform. And it fell out as the King expected; the Heralds were the GreatOrdnance. For the Lord Lovel, upon Proclamation of Pardon, mistrusting his men, fled into Lancashire, and lurking for a time with Sir Thomas Broughton, after sailed over into Flanders, to the Lady Margaret. And his men, forsaken of their Captain, did presently submit themselves to the Duke. The Staffords likewise, and their Forces, hearing what had happened to the Lord Lovel (in whose Success their chief Trust was) despaired, and dispersed. The two Brothers, taking Sanctuary at Colnham, a Village near Abington; which Place, upon view of their Priviledge in the King's Bench, being judged no sufficient Sanctuary for Traytors, Humphrey was Executed at Tyburn; and

Thomas, as being led by his elder Brother, was Pardoned. So this Rebellion proved but a Blast; and the King having by this Journey purged a little the Dregs and Leaven of the Northern People, that were before in no good affection towards him, returned to London.

In September following, the Queen was delivered of her first Son, whom the King (in Honour of the British-Race, of which himself was) named Arthur, according to the Name of that ancient worthy King of the Britains; in whose Acts there is truth enough to make him Famous, besides that which is Fabulous. The Child was strong and able, though he was Born in the eighth Month, which Physicians do prejudge.

THere followed this Year, being the Second of the King's Reign, a strange Accident of State, whereof the Relations which we have, are so naked, as they leave it scarce credible; not for the nature of it, (for it hath fallen out oft,) but for the manner and circumstance of it, especially in the beginnings. Therefore we shall make our Judgement upon the things themselves, as they give light one to another, and (as we can) dig Truth out of the Mine. The King was green in his Estate; and contrary to his own Opinion, and Desert both, was not without much Hatred throughout the Realm. The root of all, was the discountenancing of the House of York, which the general Body of the Realm still affected. This did alienate the Hearts of the Subjects from him dayly more and more, especially when they saw, that after his Marriage, and after a Son born, the King did nevertheless not so much as proceed to the Coronation of the Queen, not vouchsafing her the Honour of a Matrimonial Crown; for the Coronation of Her was not 'till almost two Years after, when Danger had taught him what to do. But much more, when it was spread abroad (whether by Errour, or the cunning of Malecontents) that the King had a purpose to put to death Edward Plantagenet closely in the Tower: Whose case was so neerly parallel'd with that of Edward the Fourth's Children, in respect of the blood, like age, and the very place of the Tower, as it did refresh and reflect upon the King a most odious resemblance, as if he would be another King Richard. And all this time it was still whispered every where, that at least one of the Children of Edward the Fourth was living.

Which Bruit was cunningly fomented by such as desired Innovation. Neither was the King's nature and customs greatly fit to disperse these Mists; but contrary-wise he had a fashion rather to create Doubts, than Assurance. Thus was Fuel prepared for the Spark: the Spark that afterwards kindled such a Fire, and Combustion, was at the first contemptible.

There was a subtil Priest called Richard Simon, that lived in Oxford, and had to his Pupil a Baker's Son named Lambert Simnel, of the age of some Fifteen years; a comely Youth, and wellfavoured, not without some extraordinary dignity and grace of Aspect. It came into this Priest's fancy (hearing what men talked, and in hope to raise himself to some great Bishoprick,) to cause this Lad to counterfeit and Personate the second Son of Edward the Fourth, supposed to be murthered; and afterward (for he changed his intention in the manage) the Lord Edward Plantagenet then Prisoner in the Tower, and accordingly to frame him and instruct him in the Part he was to play. This is that which (as was touched before) seemeth scarcely credible: Not that a false Person should be assumed to gain a Kingdom, for it hath been seen in antient and late times; nor that it should come into the mind of such an abject Fellow, to enterprise so great a matter for high Conceits do sometime come streaming into the Imaginations of base persons, especially when they are drunk with News and Talk of the People. But here is that which hath no apparance; That this Priest being utterly unacquainted with the true Person, according to whose pattern he should shape his Counterfeit, should think it possible for him to instruct his Player, either in gesture and fashions, or in recounting past matters of his Life and Education; or to fit Answers to Questions, or the like, any ways to come near the Resemblance of him whom he was to represent. For this Lad was not to personate one, that had been long before taken out of his Cradle, or conveyed away in his Infancy, known to few; but a Youth that 'till the age almost of Ten years had been brought up in a Court where infinite Eyes had been upon him. For King Edward touched with remorse of his Brother the Duke of Clarence's Death, would not indeed restore his Son, (of whom we speak) to be Duke of Clarence, but yet created him Earl of Warwick, reviving his Honour on the Mothers side, and used

him honorably during his time, though Richard the Third afterwards confined him. So that it cannot be, but that some great Person, that knew particularly, and familiarly Edward Plantagenet, had a hand in the business, from whom the Priest might take his aim. That which is most probable, out of the precedent and subsequent Acts, is, that it was the Queen Dowager, from whom this Action had the principal source and motion. For certain it is, she was a busie negotiating Woman, and in her withdrawing-Chamber had the fortunate Conspiracy for the King against King Richard the Third, been hatched; which the King knew, and remembred perhaps but too well; and was at this time extremely discontent with the King, thinking her Daughter (as the King handled the matter) not advanced, but depressed: and none could hold the Book so well to prompt and instruct this Stage-play, as she could. Nevertheless it was not her meaning; nor no more was it the meaning of any of the better and sager sort that favoured the Enterprize and knew the Secret, that this disguised Idol should possess the Crown; but at his peril to make way to the Overthrow of the King: and that done, they had their several Hopes and Ways. That which doth chiefly fortifie this Conjecture, is, that as soon as the matter brake forth in any strength, it was one of the King's first Acts to cloister the Queen Dowager in the Nunnery of Bermonsey, and to take away all her Lands and Estate; and this by close Council without any Legal proceeding, upon far-fetcht Pretences; That she had delivered her two Daughters out of Sanctuary to King Richard, contrary to promise. Which Proceeding being even at that time taxed for rigorous and undue, both in-matter and manner, makes it very probable there was some greater matter against her, which the King upon reason of Policy, and to avoid Envy would not publish. It is likewise no small Argument that there was some Secret in it, and some suppressing of Examinations; for that the Priest Simon himself, after he was taken, was never brought to Execution, no not so much as to publick Tryal, (as many Clergy-men were upon less Treasons,) but was only shut up close in a Dungeon. Add to this, that after the Earl of Lincoln (a principal Person of the House of York) was slain in Stoke-field, the King opened himself to some of his Council, that he was sorry

for the Earl's Death, because by him (he said) he might have known the bottom of his Danger.

But to return to the Narration it self; Simon did first instruct his Scholar for the part of Richard Duke of York, second Son to King Edward the Fourth, and this was at such time as it was voyced that the King purposed to put to Death Edward Plantagenet Prisoner in the Tower, whereat there was great murmur. But hearing soon after a general bruit that Plantagenet had escaped out of the Tower, and thereby finding him so much beloved amongst the People, and such rejoycing at his Escape, the cunning Priest changed his Copy, and chose now Plantagenet to be the Subject his Pupil should personate, because he was more in the present speech, and Votes of the People; and it pieced better, and followed more close and handsomly upon the bruit of Plantagenet's Escape. But yet doubting that there would be too near looking and too much Perspective into his Disguise; if he should shew it here in England; he thought good (after the manner of Scenes in Stage-Plays and Masques) to shew it a-far-off; and therefore sailed with his Scholar into Ireland, where the Affection to the House of York was most in height. The King had been a little Improvident in matters of Ireland, and had not removed Officers and Chancellors, and put in their places, or at least intermingled persons, of whom he stood assured, as he should have done, since he knew the strong Bent of that Countrey towards the House of York; and that it was a ticklish and unsetled State, more easie to receive distempers and mutations, than England was. But trusting to the reputation of his Victories and Successes in England, he thought he should have time enough to extend his Cares afterwards to that second Kingdom.

Wherefore through this neglect, upon the coming of Simon with his pretended Plantagenet into Ireland, all things were prepared for Revolt and Sedition, almost as if they had been set and plotted beforehand. Simon's first Address was to the Lord Thomas Fitz-Gerard, Earl of Kildare, and Deputy of Ireland: before whose Eyes he did cast such a Mist, (by his own insinuation, and by the carriage of his Youth, that expressed a natural Princely Behaviour;) as joyned perhaps with some inward Vapours of Ambition and Affection in the Earl's own mind, left

him fully possessed, that it was the true Plantagenet. The Earl presently communicated the matter with some of the Nobles and others there, at the first secretly. But finding them of like Affection to himself, he suffered it of purpose to vent and pass abroad; because they thought it not safe to resolve, till they had a tast of the Peoples Inclination. But if the Great ones were in forwardness, the People were in fury, entertaining this Airy Body or Phantasm with incredible affection; partly out of their great devotion to the House of York; partly out of a proud humour in the Nation, to give a King to the Realm of England. Neither did the Party in this heat of affection much trouble themselves with the Attaindor of George Duke of Clarence; having newly learned by the King's example, that Attaindors do not interrupt the conveying of Title to the Crown. And as for the Daughters of King Edward the Fourth, they thought King Richard had said enough for them: and took them to be but as of the King's Party, because they were in his power, and at his disposing. So that with marvellous consent and applause, this Counterfeit Plantagenet was brought with great Solemnity to the Castle of Dublin, and there saluted, served and honoured as King; the Boy becoming it well, and doing nothing that did bewray the baseness of his condition. And within few days after he was proclaimed King in Dublin, by the Name of King Edward the Sixth; there being not a Sword drawn in King Henry his Quarrel.

The King was much moved with this unexpected Accident, when it came to his Ears, both because it strook upon that String which ever he most , as also because it was stirred in such a Place, where he could not with safety transfer his own Person, to suppress it. For partly through natural Valour, and partly through an universal Suspition (not knowing whom to trust) he was ever ready to wait upon all his Atchievements in person. The King therefore first called his Council together at the Charterhouse at Shine. Which Council was held with great secresie, but the open Decrees thereof, which presently came abroad, were three.

The first was, That the Queen Dowager, for that she contrary to her Pact and Agreement with those that had concluded with her concerning the Marriage of her Daughter Elizabeth with King Henry, had nevertheless delivered her

Daughters out of Sanctuary into King Richard's hands; should be Cloystered in the Nunnery of Bermonsey, and forfeit all her Lands and Goods.

The next was, That Edward Plantagenet then Closeprisoner in the Tower, should be in the most publick and notorious manner, that could be devised, shewed unto the People: In part to discharge the King of the Envy of that opinion and bruit, how he had been put to death privily in the Tower; But chiefly to make the People see the levity and imposture of the Proceedings of Ireland, and that their Plantagenet was indeed but a Puppet, or a Counterfeit.

The third was, That there should be again Proclaimed a General-Pardon to all that would reveal their Offences, and submit themselves by a Day. And that this Pardon should be conceived in so ample and liberal a manner, as no High-Treason (no not against the King's own Person) should be excepted. Which though it might seem strange, yet was it not so to a wise King, that knew his greatest dangers were not from the least Treasons, but from the greatest. These Resolutions of the King and his Council were immediately put in execution. And first, the Queen Dowager was put into the Monastery of Bermonsey, and all her Estate seized into the King's hands, whereat there was much wondering; That a weak Woman, for the yielding to the menaces and promises of a Tyrant, after such a distance of time, (wherein the King had shewed no displeasure, nor alteration,) but much more after so happy a Marriage, between the King and her Daughter, blessed with Issue-male, should upon a sudden mutability or disclosure of the King's mind be so severely handled.

This Lady was amongst the Examples of great variety of Fortune. She had first from a distressed Suitor, and desolate Widow, been taken to the Marriage-Bed of a Batchelor-King, the goodliest Personage of his time; and even in his Reign she had endured a strange Eclipse by the King's flight, and temporary depriving from the Crown. She was also very happy, in that she had by him fair Issue, and continued his Nuptial Love (helping her self by some obsequious bearing and dissembling of his Pleasures) to the very end. She was much affectionate to her own Kindred, even unto Faction; which did stir great Envy in the Lords of the King's side, who counted her Blood a disparagement to be

mingled with the King's. With which Lords of the King's Blood, joyned also the King's Favorite the Lord Hastings; who, notwithstanding the King's great affection to him, was thought at times through her malice and spleen, not to be out of danger of falling. After her Husband's death, she was matter of Tragedy, having lived to see her Brother beheaded, and her two Sons deposed from the Crown, bastarded in their Blood, and cruelly murthered. All this while nevertheless she enjoyed her Liberty, State, and Fortunes. But afterwards again, upon the Rise of the wheel, when she had a King to her Son-in-Law, and was made Grand-mother to a Grand-child of the best Sex; yet was she (upon dark and unknown Reasons, and no less strange Pretences) precipitated, and banished the World, into a Nunnery; where it was almost thought dangerous to visit her, or see her; and where not long after she ended her Life: but was by the King's commandment Buried with the King her Husband at Windsor. She was Foundress of Queens-College in Cambridge. For this Act the King sustained great Obloquy, which nevertheless (besides the reason of State) was somewhat sweetned to him by a great Confiscation.

About this time also Edward Plantagenet was upon a Sunday brought throughout all the principal Streets of London, to be seen of the people. And having passed the view of the Streets, was conducted to St. Paul's Church, in solemn Procession, where great store of people were assembled. And it was provided also in good fashion, that divers of the Nobility, and others of Quality (especially of those that the King most suspected, and knew the person of Plantagenet best) had communication with the young Gentleman by the way, and entertained him with speech and discourse; which did in effect marr the Pageant in Ireland with the Subjects here, at least with so many, as out of Errour, and not out of Malice, might be mis-led. Nevertheless, in Ireland (where it was too late to go back) it wrought little or no effect. But contrariwise, they turned the Imposture upon the King, and gave out, That the King, to defeat the true Inheritor, and to mock the World, and blind the Eyes of simple men, had tricked up a in the likeness of Edward Plantagenet, and shewed him to the People, not

sparing to prophane the Ceremony of a Procession, the more to countenance the Fable.

The General-Pardon likewise near the same time came forth; and the King therewithal omitted no diligence, in giving straight Order, for the keeping the Ports; that Fugitives, Malecontents, or suspected Persons might not pass over into Ireland, and Flanders,

Mean while the Rebels in Ireland had sent privy Messengers both into England, and into Flanders, who in both places had wrought effects of no small Importance. For in England they won to their Party John, Earl of Lincoln, Son of John de la Pole, Duke of Suffolk, and of Elizabeth, King Edward the Fourth's eldest Sister. This Earl was a man of great Wit and Courage, and had his thoughts highly raised by Hopes and Expectations for a time. For Richard the Third had a Resolution, out of his hatred to both his Brethren, King Edward, and the Duke of Clarence, and their Lines, (having had his hand in both their Bloods,) to disable their Issues upon false and incompetent pretexts; the one, of Attaindor; the other, of Illegitimation: and to design this Gentleman (in case himself should dye without Children) for Inheritor of the Crown. Neither was this unknown to the King, who had secretly an Eye upon him. But the King having tasted of the Envy of the People, for his Imprisonment of Edward Plantagenet, was doubtful to heap up any more distasts of that kind, by the Imprisonment of De la Pole also; the rather thinking it Policy to conserve him as a Corrival unto the other. The Earl of Lincoln was induced to participate with the Action of Ireland, not lightly upon the strength of the Proceedings there, which was but a Bubble, but upon Letters from the Lady Margaret of Burgundy, in whose succours and declaration for the Enterprize, there seemed to be a more solid Foundation, both for Reputation and Forces. Neither did the Earl refrain the Business, for that he knew the pretended Plantagenet to be but an Idol. But contrariwise, he was more glad it should be the false Plantagenet than the true: because the false being sure to fall away of himself, and the true to be made sure of by the King; it might open and pave a fair and prepared way to his own Title. With this Resolution he sayled secretly into Flanders; where was a little before

arrived the Lord Lovel, leaving a correspondence here in England with Sir Thomas Broughton, a man of great Power and Dependencies in Lancashire. For before this time, when the pretended Plantagenet was first received in Ireland, secret Messengers had been also sent to the Lady Margaret, advertising her what was passed in Ireland, imploring Succours in an Enterprize (as they said) so pious and just, and that God had so miraculously prospered the beginning thereof; and making offer, that all things should be guided by her will and direction, as the Sovereign Patroness and Protectress of the Enterprize. Margaret was second Sister to King Edward the Fourth, and had been second Wife to Charles, sirnamed the Hardy, Duke of Burgundy; by whom, having no Children of her own, she did with singular care and tenderness intend the Education of Philip and Margaret, Grand-children to her former Husband; which won her great Love and Authority among the Dutch. This Princess (having the Spirit of a Man, and Malice of a Woman) abounding in Treasure, by the greatness of her Dower, and her provident Government, and being childless, and without any nearer Care, made it her Design and Enterprize, to see the Majesty Royal of England once again re-placed in her House, and had set up King Henry as a Mark, at whose Overthrow all her Actions should aim and shoot; in-so-much as all the Counsels of his succeeding Troubles came chiefly out of that Quiver. And she bare such a mortal Hatred to the House of Lancaster, and personally to the King, as she was no ways mollified by the Conjunction of the Houses in her Neeces Marriage, but rather hated her Neece, as the means of the King's ascent to the Crown, and assurance therein. Wherefore with great violence of affection she embraced this Overture: And upon Counsel taken with the Earl of Lincoln, and the Lord Lovel, and some other of the Party, it was resolved with all speed, the two Lords assisted with a Regiment of two thousand Almains, being choice and veterane Bands under the Command of Martin Swart (a valiant and experimented Captain) should pass over into Ireland to the new King. Hoping, that when the Action should have the face of a received and setled Regality, (with such a second Person, as the Earl of Lincoln, and the Conjunction and Reputation of Forein Succors,) the Fame of it would embolden and prepare all

the Party of the Confederates and Malecontents within the Realm of England, to give them Assistance, when they should come over there. And for the Person of the Counterfeit, it was agreed, that if all things succeeded well, he should be put down, and the true Plantagenet received: Wherein nevertheless the Earl of Lincoln had his particular hopes. After they were come into Ireland, and that the Party took courage, by seeing themselves together in a Body, they grew very confident of success, conceiving and discoursing amongst themselves, that they went in upon far better Cards to overthrow King Henry, than King Henry had to overthrow King Richard. And that if there were not a Sword drawn against them in Ireland, it was a sign the Swords in England would be soon sheathed, or beaten down. And first, for a Bravery upon this accession of Power, they Crowned their new King in the in the Cathedral Church of Dublin; who formerly had been but Proclaimed only; and then sate in Council what should further be done. At which Council, though it were propounded by some, that it were the best way to Establish themselves first in Ireland, and to make that the Seat of the War, and to draw King Henry thither in Person, by whose absence, they thought there would be great Alterations and Commotions in England, yet because the Kingdom there was poor, and they should not be able to keep their Army together, nor pay their German Soldiers, and for that also the sway of the Irish-men, and generally of the Men-ofWar, which (as in such cases of popular Tumults is usual) did in effect govern their Leaders, was eager, and in affection to make their Fortunes upon England: It was concluded with all possible speed to transport their Forces into England. The King in the mean time, who at the first when he heard what was done in Ireland, though it troubled him, yet thought he should be well enough able to scatter the Irish as a Flight of Birds, and rattle away this Swarm of Bees, with their King; when he heard afterwards that the Earl of Lincoln was embarqued in the Action, and that the Lady Margaret was declared for it, he apprehended the danger in a true Degree as it was, and saw plainly that his Kingdom must again be put to the Stake, and that he must fight for it. And first, he did conceive, before he understood of the Earl of Lincoln’s sayling into Ireland out of Flanders, that he should be assailed both upon the

East-parts of the Kingdom of England by some impression from Flanders, and upon the Northwest out of Ireland. And therefore having ordered Musters to be made in both Parts, and having provisionally designed two Generals, Jasper Earl of Bedford, and John Earl of Oxford, (meaning himself also to go in person, where the Affairs should most require it,) and nevertheless not expecting any actual Invasion at that time (the Winter being far on) he took his journey himself towards Suffolk and Norfolk, for the confirming of those parts. And being come to St. Edmonds-bury, he understood, that Thomas, Marquess Dorset (who had been one of the Pledges in France) was hastning towards him, to purge himself of some Accusations which had been made against him. But the King, though he kept an Ear for him, yet was the time so doubtful, that he sent the Earl of Oxford to meet him, and forthwith to carry him to the Tower; with a fair Message nevertheless, that he should bear that disgrace with patience, for that the King meant not his hurt, but only to preserve him from doing hurt, either to the King's service, or to himself; and that the King should always be able (when he had cleared himself) to make him reparation.

From St. Edmonds-bury he went to Norwich, where he kept his Christmas. And from thence he went (in a manner of Pilgrimage) to Walsingham, where he visited our Ladies Church, famous for Miracles, and made his Prayers and Vows for help and deliverance. And from thence he returned by Cambridge to London. Not long after, the Rebels with their King (under the Leading of the Earl of Lincoln, the Earl of Kildare, the Lord Lovel, and Colonel Swart) landed at Fouldrey in Lancashire, whither there repaired to them, Sir Thomas Broughton, with some small company of English. The King by that time (knowing now the Storm would not divide, but fall in one place) had levied Forces in good number; and in person (taking with him his two designed Generals, the Duke of Bedford, and the Earl of Oxford) was come on his way towards them as far as Coventry, whence he sent forth a Troop of Light-horsmen for discovery, and to intercept some straglers of the Enemies, by whom he might the better understand the particulars of their Progress and purposes, which was accordingly done; though the King otherwise was not without Intelligence from Espials in the Camp.

The Rebels took their way towards York, without spoiling the Countrey, or any act of Hostility, the better to put themselves into favour of the People, and to personate their King: who (no doubt, out of a Princely feeling) was sparing, and compassionate towards his Subjects. But their Snow-ball did not gather as it went. For the People came not in to them: Neither did any rise or declare themselves in other parts of the Kingdom for them, which was caused partly by the good tast that the King had given his People of his Government, joyned with the reputation of his Felicity, and partly for that it was an odious thing to the People of England, to have a King brought in to them upon the shoulders of Irish and Dutch, of which their Army was in substance compounded. Neither was it a thing done with any great Judgement on the Party of the Rebels, for them to take their way towards York: Considering that howsoever those parts had formerly been a Nursery of their Friends; yet it was there, where the Lord Lovel had so lately disbanded, and where the King's presence had a little before qualified discontents. The Earl of Lincoln, deceived of his hopes of the Countries concourse unto him, (in which case he would have temporized,) and seeing the business past Retract, resolved to make on where the King was, and to give him Battel; and thereupon, marched towards Newark, thinking to have surprised the Town. But the King was somewhat before this time come to Nottingham, where he called a Council of War, at which was consulted, whether it were best to protract time, or speedily to set upon the Rebels. In which Council the King himself (whose continual vigilancy did suck in sometimes causeless Suspitions, which few else knew) inclined to the accelerating a Battel. But this was presently put out of doubt, by the great Aids that came in to him in the instant of this Consultation, partly upon Missives, and partly Voluntaries from many parts of the Kingdom.

The principal persons that came then to the King's aid, were the Earl of Shrewsbury, and the Lord Strange, of the Nobility; and of Knights and Gentlemen to the number of at least Threescore and ten persons, with their Companies, making in the whole, at the least Six Thousand fighting men, besides the Forces that were with the King before. Whereupon the King, finding

his Army so bravely re-enforced, and a great alacrity in all his men to fight, was confirmed in his former Resolution, and marched speedily, so as he put himself between the Enemies Camp and Newark; being loth their Army should get the commodity of that Town. The Earl nothing dismayed, came forwards that day unto a little Village called Stoke, and there camped that night, upon the brow or hanging of a Hill. The King the next day presented him Battel upon the Plain, the fields there being open and champion. The Earl couragiously came down and joyned Battel with him. Concerning which Battel, the Relations that are left unto us are so naked and negligent, (though it be an Action of so recent memory) as they rather declared the Success of the day, than the Manner of the Fight. They say, that the King divided his Army into three Battels, whereof the Vaunt-guard only well strengthned with Wings, came to fight. That the Fight was fierce and obstinate, and lasted three hours, before the Victory inclined either way; save that Judgement might be made, by that the King's Vaunt-guard of it self maintained fight against the whole Power of the Enemies, (the other two Battels remaining out of action,) what the success was like to be in the end: That Martin Swart with his Germans performed bravely; and so did those few English that were on that side, neither did the Irish fail in courage or fierceness, but being almost naked men, only armed with Darts and Skeins, it was rather an Execution, than a Fight upon them; insomuch as the furious slaughter of them was a great discouragement and appalement to the rest: That there dyed upon the place all the Chieftains; that is, the Earl of Lincoln, the Earl of Kildare, Francis Lord Lovel, Martin Swart, and Sir Thomas Broughton; all making good the fight, without any ground given. Only of the Lord Lovel there went a report, that he fled and swam over Trent on horseback, but could not recover the further side, by reason of the steepness of the Bank, and so was drowned in the River. But another report leaves him not there, but that he lived long after in a Cave or Vault. The number that was slain in the field, was of the Enemies part, Four thousand at the least; and of the King's part, one half of his Vaunt-guard, besides many hurt, but none of name. There were taken Prisoners, amongst others, the Counterfeit Plantagenet (now Lambert Simnel again) and the crafty Priest his

Tutor. For Lambert, the King would not take his Life, both out of Magnanimity, taking him but as an Image of Wax, that others had tempered and molded; and likewise out of Wisdom, thinking that if he suffered death, he would be forgotten too soon; but being kept alive, he would be a continual Spectacle, and a kind of remedy against the like Inchantments of People, in time to come. For which cause he was taken into service in his Court, to a base office in his Kitchin; so that (in a kind of Mattacina of humane fortune) he turned a Broach, that had worn a Crown: Whereas Fortune commonly doth not bring in a Comedy or Farce after a Tragedy. And afterwards he was preferred to be one of the King's Falconers. As to the Priest, he was committed Closeprisoner, and heard of no more, the King loving to seal up his own dangers.

After the Battel, the King went to Lincoln, where he caused Supplications and Thanksgivings to be made for his Deliverance and Victory. And that his Devotions might go round in Circle, he sent his Banner to be Offered to our Lady of Walsingham, where before he made his Vows. And thus delivered of this so strange an Engin and new Invention of Fortune, he returned to his former confidence of mind, thinking now, that all his misfortunes had come at once. But it fell out unto him according to the Speech of the common People in the beginning of his Reign, that said; It was a token he should reign in Labour, because his Reign began with a sickness of Sweat. But howsoever the King thought himself now in a Haven, yet such was his Wisdom, as his Confidence did seldom darken his Foresight, especially in things near hand. And therefore awakened by so fresh, and unexpected dangers, he entred into due consideration, as well how to weed out the Partakers of the former Rebellion, as to kill the Seeds of the like in time to come: and withal to take away all shelters and harbours for discontented Persons, where they might hatch and foster Rebellions, which afterwards might gather strength and motion. And first, he did yet again make a Progress from Lincoln to the Northern parts, though it were indeed rather an Itinerary Circuit of Justice, than a Progress. For all along as he went, with much severity and strict inquisition, partly by Martial Law, and partly by Commission, were punished, the Adherents and Ayders of the late Rebels: not

all by Death, (for the Field had drawn much blood,) but by Fines and Ransoms, which spared Life, and raised Treasure. Amongst other Crimes of this nature, there was diligent inquiry made of such as had raised and dispersed a bruit and rumour, a little before the Field fought, That the Rebels had the day; and that the King's Army was overthrown, and the King fled. Whereby it was supposed that many Succours, which otherwise would have come unto the King, were cunningly put off, and kept back. Which Charge and Accusation, though it had some ground, yet it was industriously embraced and put on by divers, who having been in themselves not the best affected to the King's part, nor forward to come to his ayd, were glad to apprehend this colour, to cover their neglect and coldness, under the pretence of such discouragements. Which cunning nevertheless, the King would not understand, though he lodged it, and noted it in some particulars, as his manner was.

But for the extirpating of the roots and causes of the like Commotions in time to come, the King began to find where his shooe did wring him, and that it was his depressing of the House of York, that did rancle and fester the Affections of his People. And therefore being now too wise to disdain perils any longer, and willing to give some contentment in that kind (at least in Ceremony) he resolved at last to proceed to the Coronation of his Queen. And therefore at his coming to London, where he entred in State, and in a kind of Triumph, and celebrated his Victory, with two days of Devotion, (for the first day he repaired to St. Pauls, and had the Hymn of Te Deum sung, and the morrow after he went in Procession, and heard the Sermon at the Cross,) the Queen was with great solemnity Crowned at Westminster, the five and twentyeth of November, in the third year of his Reign, which was about two years after the Marriage; Like an old Christning, that had staid long for Godfathers. Which strange and unusual distance of time, made it subject to every man's note, that it was an Act against his stomach, and put upon him by necessity and reason of State. Soon after, to shew that it was now fair weather again, and that the Imprisonment of Thomas Marquess Dorset, was rather upon suspition of the Time, than of the Man, he the said Marquess was set at liberty without Examination, or other circumstance. At

that time also the King sent an Ambassador unto Pope Innocent, signifying unto him this his Marriage, and that now (like another Aeneas) he had passed through the floods of his former Troubles and Travels, and was arrived unto a safe Haven: and thanking His Holiness, that he had honoured the Celebration of his Marriage with the presence of his Ambassador, and offering both his Person and the Forces of his Kingdom upon all occasions to do him service.

The Ambassador, making his Oration to the Pope, in the presence of the Cardinals, did so magnifie the King and Queen, as was enough to glut the Hearers. But then he did again so extol and deifie the Pope, as made all that he had said in praise of his Master and Mistress seem temperate and passable. But he was very honorably entertained, and extremely much made on by the Pope; who knowing himself to be lazy and unprofitable to the Christian World, was wonderfully glad to hear that there were such Eccho's of him sounding in remote parts. He obtained also of the Pope a very just and honorable Bull, qualifying the Priviledges of Sanctuary, (wherewith the King had been extremely galled) in three Points.

The first, that if any Sanctuary-man did by night, or otherwise, get out of Sanctuary privily, and commit mischief and trespass, and then come in again, he should lose the benefit of Sanctuary for ever after. The second, that howsoever the Person of the Sanctuary-man was protected from his Creditors, yet his Goods out of Sanctuary should not. The third, that if any took Sanctuary for case of Treason, the King might appoint him Keepers to look to him in Sanctuary.

The King also for the better securing of his Estate, against mutinous and male-contented Subjects (whereof he saw the Realm was full) who might have their refuge into Scotland, which was not under Key, as the Ports were: For that cause, rather than for any doubt of Hostility from those parts, before his coming to London (when he was at Newcastle) had sent a solemn Ambassage unto James the Third, King of Scotland, to treat and conclude a Peace with him. The Ambassadors were Richard Fox Bishop of Exceter, and Sir Richard Edgcomb Comptroller of the King's House, who were honourably received and entertained there. But the King of Scotland labouring of the same disease that King Henry

did, (though more mortal, as afterwards appeared) that is, Discontented Subjects, apt to rise, and raise Tumult, although in his own affection he did much desire to make a Peace with the King: Yet finding his Nobles averse, and not daring to displease them, concluded only a Truce for seven years; giving nevertheless promise in private, that it should be renewed from time to time, during the two Kings lives.

HItherto the King had been exercised in setling his Affairs at home. But about this time brake forth an occasion that drew him to look abroad, and to hearken to forein business. Charles the Eighth the French King, by the virtue and good fortune of his two immediate Predecessors, Charles the Seventh his Grand-father, and Lewis the Eleventh his Father, received the Kingdom of France in more flourishing and spread Estate, than it had been of many years before; being redintegrate in those principal Members, which antiently had been portions of the Crown of France, and were after dissevered, so as they remained only in Homage, and not in Sovereignty, (being governed by absolute Princes of their own) Anjou, Normandy, and Burgundy; there remained only Britain to be re-united, and so the Monarchy of France to be reduced to the antient Terms and Bounds.

King Charles was not a little inflamed with an ambition to re-purchase, and re-annex that Dutchy. Which his ambition was a wise and well-weighed Ambition; not like unto the ambitions of his succeeding Enterprizes of Italy. For at that time being newly come to the Crown, he was somewhat guided by his Father's Counsels, (Counsels, not Counsellors) for his Father was his own Counsel, and had few able men about him. And that King (he knew well) had ever distasted the Designs of Italy, and in particular had an Eye upon Britain. There were many circumstances that did feed the Ambition of Charles, with pregnant and apparent hopes of Success. The Duke of Britain old, and entred into a Lethargy, and served with Mercenary Counsellors, Father of two only Daughters, the one sick and not likely to continue. King Charles himself in the flower of his age, and the Subjects of France at that time well trained for War, both for Leaders and Soldiers; men of service being not yet worn out, since the

Wars of Lewis against Burgundy. He found himself also in Peace with all his Neighbour-Princes. As for those that might oppose to his Enterprize; Maximilian King of the Romans, his Rival in the same desires, (as well for the Dutchy, as the Daughter) feeble in means; and King Henry of England as well somewhat obnoxious to him for his favours and benefits, as busied in his particular troubles at home. There was also a fair and specious occasion offered him to hide his Ambition, and to justifie his Warring upon Britain, for that the Duke had received and succoured Lewis Duke of Orleance, and other of the French Nobility; which had taken Arms against their King. Wherefore King Charles being resolved upon that War, knew well he could not receive any opposition so potent, as if King Henry should either upon Policy of State, in preventing the growing Greatness of France; or upon gratitude unto the Duke of Britain, for his former favours, in the time of his distress, espouse that Quarrel, and declare himself in ayd of the Duke. Therefore he no sooner heard that King Henry was setled by his Victory, but forth with he sent Ambassadors unto him, to pray his assistance, or at the least that he would stand neutral. Which Ambassadors found the King at Leicester, and delivered their Embassy to this effect: They first imparted unto the King the success that their Master had had a little before against Maximilian, in recovery of certain Towns from him: which was done in a kind of privacy, and inwardness towards the King; and if the French King did not esteem him for an outward or formal Confederate, but as one that had part in his Affections and Fortunes, and with whom he took pleasure to communicate his Business. After this Compliment, and some gratulation for the King's Victory, they fell to their Errand; declaring to the King, that their Master was enforced to enter into a just and necessary War with the Duke of Britain, for that he had received and succoured those that were Traytors, and declared Enemies unto his Person and State. That they were no mean, distressed, and calamitous persons that fled to him for refuge, but of so great quality, as it was apparent that they came not thither to protect their own fortune, but to infest and invade his; the Head of them being the Duke of Orleance, the first Prince of the Blood, and the second Person of France. That therefore, rightly to understand it, it was

rather on their Master's part a Defensive War, than an Offensive; as that, that could not be omitted or forborn, if he tendred the conservation of his own Estate; and that it was not the first Blow that made the War Invasive, (for that no wise Prince would stay for) but the first Provocation, or at least the first Preparation. Nay that this War was rather a suppression of Rebels, than a War with a just Enemy, where the Case is; That his Subjects, Traytors, are received by the Duke of Britain his Homager. That King Henry knew well what went upon it in example, if Neighbour Princes should patronize and comfort Rebels, against the Law of Nations and of Leagues. Nevertheless that their Master was not ignorant, that the King had been beholding to the Duke of Britain in his adversity; as on the other side, they knew he would not forget also the readiness of their King, in ayding him when the Duke of Britain, or his mercenary Counsellors failed him, and would have betrayed him; And that there was a great difference between the courtesies received from their Master, and the Duke of Britain; for that the Dukes might have ends of Utility and Bargain, whereas their Masters could not have proceeded but out of entire Affection. For that, if it had been measured by a politick line, it had been better for his affairs, that a Tyrant should have reigned in England, troubled and hated, than such a Prince, whose virtues could not fail to make him great and potent, whensoever he was come to be Master of his affairs. But howsoever it stood for the point of Obligation, which the King might owe to the Duke of Britain, yet their Master was well assured, it would not divert King Henry of England from doing that, that was just, nor ever embarque him in so ill-grounded a Quarrel. Therefore, since this War which their Master was now to make, was but to deliver himself from imminent dangers, their King hoped the King would shew the like affection to the conservation of their Master's Estate, as their Master had (when time was) shewed to the King's acquisition of his Kingdom. At the least, that according to the inclination which the King had ever professed of Peace, he would look on, and stand Neutral; for that their Master could not with reason press him to undertake part in the War, being so newly setled and recovered from intestine Seditions. But touching the Mystery of re-annexing of the Dutchy of Britain to the Crown of France, either by War, or by

Marriage with the Daughter of Britain; the Ambassadors bare aloof from it, as from a Rock, knowing that it made most against them. And therefore by all means declined any mention thereof, but contrariwise interlaced in their conference with the King, the assured purpose of their Master, to match with the Daughter of Maximilian; And entertained the King also with some wandring Discourses of their King's purpose, to recover by Arms his right to the Kingdom of Naples, by an expedition in Person; All to remove the King from all-jealousie of any Design, in these hither Parts upon Britain, otherwise than for quenching of the Fire, which he feared might be kindled in his own Estate.

The King after advice taken with his Council, made answer to the Ambassadors. And first returned their Compliment, shewing he was right glad of the French King's reception of those Towns from Maximilian. Then he familiarly related some particular passages of his own Adventures and Victory passed. As to the business of Britain, the King answered in few words; That the French King and the Duke of Britain, were the two persons to whom he was most obliged of all men; and that he should think himself very happy, if things should go so between them, as he should not be able to acquit himself in gratitude towards them both; and that there was no means for him as a Christian King and a common Friend to them, to satisfie all Obligations both to God and man, but to offer himself for a Mediator of an Accord and Peace between them; by which course he doubted not but their King's Estate, and Honour both, would be preserved with more Safety and less Envy than by a War, and that he would spare no cost or pains, no if it were To go on Pilgrimage, for so good an effect; And concluded, that in this great Affair, which he took so much to heart, he would express himself more fully by an Ambassage, which he would speedily dispatch unto the French King for that purpose. And in this sort the French Ambassadors were dismissed; the King avoiding to understand any thing touching the re-annexing of Britain, as the Ambassadors had avoided to mention it; save that he gave a little touch of it in the word, Envy. And so it was, that the King was neither so shallow, nor so ill advertised, as not to perceive the intention of the French, for the investing himself of Britain. But first he was

utterly unwilling (howsoever he gave out) to enter into War with France. A Fame of a War he liked well, but not an Atchievement; for the one he thought would make him Richer, and the other Poorer: and he was possessed with many secret fears, touching his own People, which he was therefore loth to arm, and put Weapons into their hands. Yet notwithstanding (as a prudent and couragious Prince) he was not so averse from a War, but that he was resolved to choose it, rather than to have Britain carried by France, being so great and opulent a Dutchy, and situate opportunely to annoy England, either for Coast, or Trade. But the King's hopes were, that partly by negligence, commonly imputed to the French, (especially in the Court of a young King) and partly by the native, power of Britain it self, which was not small; but chiefly in respect of the great Party, that the Duke of Orleance had in the Kingdom of France, and thereby means to stir up Civil troubles, to divert the French King from the Enterprize of Britain: And lastly, in regard of the Power of Maximilian, who was Cotrival to the French King in that pursuit, the Enterprize would either bow to a Peace, or break in it self. In all which, the King measured and valued things amiss, as afterwards appeared. He sent therefore forth with to the French King, Christopher Urswick, his Chaplain, a person by him much trusted and employed; choosing him the rather, because he was a Church-man, as best sorting with an Embassy of Pacification: and giving him also a Commission, That if the French King consented to Treat, he should thence repair to the Duke of Britain, and ripen the Treaty on both parts. Urswick made declaration to the French King, much to the purpose of the King's answer to the French Ambassadors here; instilling also tenderly some overture of receiving to grace the Duke of Orleance, and some tasted of Conditions of Accord. But the French King on the other side proceeded not sincerely, but with a great deal of art and dissimulation, in this Treaty; having for his end to gain time, and so put off the English Succours, under hope of Peace, till he had got good footing in Britain, by force of Arms. Wherefore he answered the Ambassador, That he would put himself into the King's hands, and make him Arbiter of the Peace: and willingly consent, that the Ambassador should straightways pass into Britain, to signifie this his , and to know the

Duke's mind likewise; well foreseeing, that the Duke of , by whom the Duke of Britain was wholly led, taking himself to be upon terms irreconcilable with him, would admit of no Treaty of Peace. Whereby he should in one, both generally abroad veil over his Ambition, and win the reputation of just and moderate proceedings; and should withal endear himself in the of the King of England, as one, that had committed all to his Will: Nay, and (which was yet more fine) make faith in him, That although he went on with the War, yet it should be but with his Sword in his hand, to bend the stiffness of the other party to accept of Peace: and so the King should take no umbrage of his arming and prosecution; but the Treaty to be kept on foot, to the very last instant, till he were Master of the Field.

Which grounds being by the French King wisely laid, all things fell out as he expected. For when the English Ambassador came to the Court of Britain, the Duke was then scarcely perfect his memory, and all things were directed by the Duke of Orleance; who gave audience to the Chaplain Urswick, and upon his Ambassage delivered, made answer in somewhat high terms, That the Duke of Britain having been an Host, and a kind of Parent or Foster-father to the King, in his tenderness of age, and weakness of fortune, did look for at this time from King Henry (the renowned King of England) rather brave Troops for for his Succours, than a vain Treaty of Peace. And if the King could forget the good Offices of the Duke done unto him ; yet he knew well, he would in his Wisdom consider of the future, how much it imported his own Safety and Reputation, both in Foreign parts, and with his own People, not to suffer Britain (the old Confederates of England) to be swallowed up by France, and so many good Ports, and strong Towns upon the Coast, be in the command of so potent a Neighbour-King, and so ancient an Enemy. And therefore humbly desired the King to think of this business as his own; and therewith brake off, and denyed any further Conference for Treaty.

Urswick returned first to the French King, and related to him what had passed. Who finding things to sort to his desire, took hold of them, and said; That the Ambassador might perceive now, that which he for his part, partly,

imagined before; That considering in what hands the Duke of Britain was, there would be no Peace, but by a mixt Treaty of force and perswasion. And therefore he would go on with the one, and desired the King not to desist from the other. But for his own part, he did faithfully promise, to be still in the King's power, to rule him in the matter of Peace. This was accordingly represented unto the King by Urswick at his return, and in such a fashion, as if the Treaty were in no sort desperate, but rather stayd for a better hour, till the Hammer had wrought, and beat the Party of Britain more pliant. Whereupon there passed continually Pacquets and Dispatches between the two Kings, from the one out of desire, and from the other out of dissimulation, about the negotiation of Peace. The French King meanwhile invaded Britain with great Forces, and distressed the City of Nantes with a strait Siege, and (as one, who though he had no great Judgement, yet had that, that he could Dissemble home) the more he did urge the prosecution of the War, the more he did at the same time, urge the solicitation of the Peace. Insomuch as during the Siege of Nantes, after many Letters and particular Messages, the better to maintain his dissimulation, and to refresh the Treaty, he sent Bernard Daubigney (a person of good quality) to the King, earnestly to desire him, to make an end of the business howsoever.

The King was no less ready to revive and quicken the Treaty; and thereupon sent three Commissioners, the Abbot of Abbington, Sir Richard Tunstal, and Chaplain Urswick formerly employed, to do their utmost endeavours, to manage the Treaty roundly and strongly.

About this time the Lord Woodvile, (Uncle to the Queen) a valiant Gentleman, and desirous of Honour, sued to the King, that he might raise some Power of Voluntaries under-hand, and without licence or pasport (wherein the King might any ways appear) go to the ayd of the Duke of Britain. The King denyed his request, (or at least seemed so to do) and strait Commandment upon him, that he should not stir, for that the King thought his Honour would suffer therein, during a Treaty, to better a Party. Nevertheless this Lord (either being unruly, or out of conceit that the King would not inwardly dislike that, which he would not openly avow) sailed secretly over into the Isle of , whereof he was

Governour, and levied a fair Troop of four hundred men, and with them passed over into Britain, and joyned himself with the Duke's forces. The news whereof when it came to the French Court, put divers Young bloods into such a fury, as the English Ambassadors were not without peril to be outraged. But the French King, both to preserve the Priviledge of Ambassadors, and being conscious to himself, that in the business of Peace, he himself was the greater dissembler of the two, forbad all injuries of fact or word, against their Persons; or Followers. And presently came an Agent from the King, to purge himself touching the Lord Woodvile's going over, using for a principal argument, to demonstrate that it was without his privity, for that the Troops were so small, as neither had the face of a Succour by Authority, nor could much advance the Britains Affairs. To which Message, although the French King gave no full credit, yet he made fair weather with the King, and seemed satisfied. Soon after the English Ambassadors returned, having two of them been likewise with the Duke of Britain, and found things in no other terms, than they were before. Upon their return, they informed the King of the state of the Affairs, and how far the French King was from any true meaning of Peace; and therefore he was now to advise of some other course. Neither was the King himself all this while with credulity meerly, as was generally supposed; but his Errour was not so much facility of belief, as an ill-measuring of the Forces of the other Party.

For (as was partly touched before) the King had cast the business thus with himself. He took it for granted in his own judgement, that the War of Britain, in respect of the strength of the Towns, and of the Party, could not speedily come to a period. For he conceived that the Counsels of a War, that was undertaken by the French King, then Childless, against an Heir-apparent of France, would be very faint and slow. And besides, that it was not possible, but that the state of France should be embroyled with some troubles and in favour of the Duke of Orleance. He conceived likewise, that Maximilian, King of the Romans, was a Prince warlike and potent, who (he made account) would give succours to the Britains roundly. So then judging it would be a work of Time, he laid his Plot, how he might best make use of that Time, for his own affairs. Wherein first he

thought to make his vantage upon his Parliament; knowing that they being affectionate unto the Quarrel of Britain, would give Treasure largely. Which Treasure, as a noise of War might draw forth, so a Peace succeeding might coffer up. And because he knew his People were upon the business, he chose rather to seem to be deceived, and asleep by the French, than to be backward in himself; considering his Subjects were not so fully capable of the reasons of State, which made him hold back. Wherefore to all these purposes he saw no other expedient, than to set and keep on foot a continual Treaty of Peace; laying it down, and taking it up again, as the occurrence required. Besides, he had in consideration the point of Honour in bearing the blessed person of a Pacificator. He thought likewise to make use of the Envy, that the French King met with, by occasion of this War of Britain, in strengthning himself with new Alliances; as namely that of Ferdinando of Spain, with whom he had ever a consent even in Nature and Customs, and likewise with Maximilian, who was particularly interessed. So that in substance he promised himself Money, Honour, Friends, and Peace in the end. But those things were too fine to be fortunate, and succeed in all parts; for that great affairs are commonly too rough and stubborn to be wrought upon by the finer edges, or points of Wit. The King was likewise deceived in his two main grounds. For although he had reason to conceive, that the Council of France would be wary to put the King into a War against the Heir-apparent of France; yet he did not consider, that Charles was not guided by any of the principal of the Blood or Nobility, but by mean men, who would make it their Master-piece, of Credit and Favour, to give venturous Counsols, which no great or wise man durst or would. And for Maximilian, he was thought then a Greater-matter than he was; his unstable and necessitous Courses being not then known.

After Consultation with the Ambassadors, who brought him no other news, than he expected before, (though he would not seem to know it till then) he presently summoned his Parliament, and in open Parliament propounded the Cause of Britain to both Houses, by his Chancellor Morton Archbishop of Canterbury, who spake to this effect:

MY Lords and Masters; The King's Grace our Sovereign Lord, hath commanded me to declare unto you the Causes that have moved him at this time to summon this his Parliament; which I shall do in few words, craving Pardon of his Grace, and you all, if I perform it not as I would.

His Grace doth first of all let you know, that he retaineth in thankful memory the Love and Loyalty shewed to him by you, at your last Meeting, in Establishment of his Royalty; freeing and discharging of his Partakers, and confiscation of his Traytors and Rebels: more than which could not come from Subjects to their Sovereign, in one action. This he taketh so well at your hands, as he hath made it a Resolution to himself to communicate with so loving and well-approved Subjects, in all Affairs that are of publick nature, at home or abroad.

Two therefore are the causes of your present Assembling: the one, a Forein business; the other, matter of Government at home.

The French King (as no doubt ye have heard) maketh at this present hot War upon the Duke of Britain. His Army is now before Nantes, and holdeth it straitly Besieged, being the principal City (if not in Creremony and Preheminence, yet in Strength and Wealth) of that Duchy. Ye may guess at his Hopes, by his attempting of the hardest part of the War first. The cause of this War he knoweth best. He alledgeth the entertaining and succouring of the Duke of Orleance, and some other French Lords, whom the King taketh for his Enemies. Others divine of other Matters. Both parts have by their Ambassadors divers times prayed the King's Ayds: The French King, Ayds or Neutrality; the Britons, Ayds simply; for so their case requireth. The King, as a Christian Prince, and blessed Son of the Holy Church, hath offered himself as a Mediator, to treat a Peace between them. The French King yieldeth to Treat, but will not stay the prosecution of the War. The Britons, that desire Peace most, hearken to it least; not upon considence or stiffness, but upon distrust of true meaning, seeing the War goes on. So as the King, after as much pains and care to effect a Peace, as ever he took in any business, not being able to remove the Prosecution on the one side,

nor the Distrust on the other, caused by that Prosecution, hath let fall the Treaty; not repenting of it, but despairing of it now, as not likely to succeed. Therefore by this Narrative you now understand the state of the Question, whereupon the King prayeth your Advice; which is no other, but whether he shall enter into an auxiliary and defensive War for the Britons, against France.

And the better to open your understandings in this Affair, the King bath commanded me to say somewhat to you from him, of the Persons that do intervene in this Business; and somewhat of the Consequence thereof, as it hath relation to this Kingdom; and somewhat of the Example of it in general: making nevertherless no Conclusion or Judgement of any Point, until his Grace hath received your faithful and politique Advices.

First, for the King our Sovereign himself, who is the principal Person you are to eye in this business; his Grace doth profess, that he truly and constantly desireth to reign in Peace. But his Grace saith, he will neither buy Peace with Dishonour, nor take it up at interest of Danger to ensue; but shall think it a good Change, if it pleased God to change the inward Troubles and Seditions, wherewith he hath been hitherto exercised, into an honourable Forein War. And for the other two Persons in this Action, the French King, and the Duke of Britain, his Grace doth declare unto you, that they be the men, unto whom he is of all other Friends and Allies most bounden: the one having held over him his hand of Protection from the Tyrant; the other having reacht forth unto him his hand of help, for the Recovery of his Kingdom. So that his affection toward them in his natural Person, is upon equal terms. And whereas you may have heard, that his Grace was enforced to fly out of Britain into France, for doubts of being betrayed; his Grace would not in any sort have that reflect upon the Duke of Britain, in defacement of his former benefits: for that he is throughly informed, that it was but the practice of some corrupt persons about him, during the time of his Sickness, altogether without his consent or privity.

But howsoever these things do interess his Grace in his particular, yet he knoweth well that the higher Bond that tyeth him to procure by all means the safety and welfare of his loving Subjects, doth dis-interess him of these

Obligations of Gratitude, otherwise than thus; that if his Grace be forced to make a War, he do it without Passion, or Ambition.

For the consequence of this Action towards this Kingdom, it is much as the French King's intention is. For if it be no more, but to range his Subjects to reason, who bear themselves stout upon the strength of the Duke of Britain, it is nothing to us. But if it be in the French King's purpose, or if it should not be in his purpose, yet if it shall follow all one, as if it were sought, that the French King shall make a Province of Britain, and joyn it to the Crown of France: then it is worthy the consideration, how this may import England, as well in the increasement of the greatness of France, by the addition of such a Countrey, that stretcheth his Boughs unto our Seas, as in depriving this Nation, and leaving it so naked of so firm and assured Confederates, as the Britons have always been. For then it will come to pass, that whereas not long since, this Realm was mighty upon the Continent, first in Territory, and after in Alliance, in respect of Burgundy and Britain, which were Confederates indeed, but dependant Confederates; now the one being already cast, partly into the greatness of France, and partly into that of Austria, the other is like wholly to be cast into the greatness of France, and this Island shall remain confined in effect within the Salt-Waters, and girt about with the Coast-Countries of two mighty Monarchs.

For the Example, it resteth likewise upon the same Question, upon the French King's intent. For if Britain be carried and swallowed up by France, as the World abroad (apt to impute and construe the Actions of Princes to Ambition) conceive it will; then it is an Example very dangerous and universal, that the lesser Neighbour-Estate should be devoured of the greater. For this may be the case of Scotland, towards England; of Portugal, towards Spain; of the smaller Estates of Italy, towards the greater; and so of Germany; or as if some of you of the Commons might not live and dwell safely, besides some of these great Lords. And the bringing in of this Example, will be chiefly laid to the King's charge, as to him that was most interessed and most able to forbid it. But then on the other side, there is so fair a Pretext on the French King's part, (and yet pretext is never wanting to power) in regard the danger imminent to his own

Estate is such; as may make this Enterprize seem rather a work of Necessity, than of Ambition, as doth in reason correct the Danger of the Example. For that the Example of that which is done in a man's own defence, cannot be dangerous; because it is in another's power to avoid it. But in all this business, the King remits himself to your grave and mature Advice, whereupon he purposeth to rely.

This was the effect of the Lord Chancellor's Speech touching the Cause of Britain: For the King had commanded him to carry it so, as to affect the Parliament towards the Business; but without engaging the King in any express Declaration.

The Chancellor went on:

FOR that which may concern the Government at home, the King hath commanded me to say unto you; That he thinketh there was never any King (for the small time that he hath reigned) had greater and juster cause of the two contrary Passions of Joy and Sorrow, than his Grace hath. Joy, in respect of the rare and visible Favours of Almighty GOD in girting the Imperial Sword upon his side; and assisting the same his Sword against all his Enemies: and likewise in blessing him with so many good and loving Servants and Subjects, which have never failed to give him faithful Counsel, ready Obedience, and couragious Defence. Sorrow for that it both not pleased God to suffer him to sheath his Sword, (as he greatly desired, otherwise than for Administration of Justice) but that he hath been forced to draw it so oft, to cut off Trayterous and disloyal Subjects, whom (it seems) God hath left (a few amongst many good) as the Canaanites among the People of Israel to be thorns in their sides, to tempt and try them though the end hath been always (God's Name be blessed therefore) that the Destruction hath faln upon their own Heads.

Wherefore his Grace saith; That he seeth that it is not the Blood spelt in the Field, that will save the Blood in the City not the Marshal's Sword, that will set this Kingdom in perfect Peace: But that the true way is, to stop the Seeds of Sedition and Rebellion in their beginnings; and for that purpose to devise, confirm, and quicken good and wholsom Laws, against Riots and unlawful

Assemblies of People and all Combinations and Confederacies of them; by Liveries, Tokens, and other Badges of Factious dependance; that the Peace of the Land may by these Ordinances, as by Bars of Iron, be soundly bound in and strengthned, and all Force, both in Court, Countrey, and private Houses, be supprest. The care hereof, which so much concern eth your selves, and which the nature of the Times doth instantly calls for his Grace commends to your Wisdoms.

And because it is the King's desire, that this Peace, wherein he hopeth to govern and maintain you, do not bear only'unto you. Leaves for you to sit under the shade of them in Safety; but also should bear you fruit of Riches, Wealth and Plenty: Therefore his Grace prays you to take into consideration matter of Trade, as also the Manufactures of the Kingdom, and to repress the bastard and barren Employment of Moneys, to Usury and unlawful Exchanges, that they may be (as their natural use is) turned upon Commerce, and lawful and Royal Trading. And likewise, that Our People be set on work in Arts and Handycrafts; that the Realm may subsist more of it self; that Idleness be avoided, and the draining out of our Treasure, for Foreign Manufactures, stopped. But you are not to rest here only, but to provide further, that whatsoever Merchandize shall be brought in from beyond the Seas, may be employed upon the Commodities of this Land; whereby the Kingdoms stock of Treasure may be sure to be kept from being diminished, by any over-trading of the Foreiner.

And lastly, because the King is well assured, that you would not have him poor, that wishes you rich; he doubteth not, but that you will have care, as well to maintain his Revenues, of Customs, and all other Natures, as also to supply him with your loving Ayds, if the case shall so require. The rather, for that you know the King is a good Husband, and but a Steward in effect for the Publick; and that what comes from you is but as Moisture drawn from the Earth, which gathers into a Cloud, and falls back upon the Earth again. And you know well, how the Kingdoms about you grow more and more in Greatness, and the Times are stirring; and therefore not fit to find the King with an empty Purse. More I have not to say to you; and wish, that what hath been said, had been better

exprest: But that your Wisdoms and good Affections will supply. GOD bless your Doings.

IT was no hard matter to dispose and affect the Parliament in this Business, as well in respect of the Emulation between the Nations, and the Envy at the late growth of the French Monarchy; as in regard of the Danger, to suffer the French to make their approaches upon England, by obtaining so goodly a Maritim Province, full of Sea-Towns, and Havens, that might do mischief to the English, either by Invasion, or by interruption of Traffick. The Parliament was also moved with the point of Oppression; for although the French seemed to speak Reason, yet Arguments are ever with multitudes too weak for Suspitions. Wherefore they did advise the King roundly to embrace the Britons Quarrel, and to send them speedy Ayds, and with much alacrity and forwardness granted to the King a great rate of Subsidy, in contemplation of these Ayds. But the King both to keep a decency towards the French King, to whom he himself to be obliged, and indeed desirous rather to shew War, than to make it; sent new solemn Ambassadors to intimate unto him, the Decree of his Estates, and to iterate his motion, that the French would desist from Hostilitiy; or if War must follow, to desire him to take it in good part, if at the motion of his People, who were sensible of the cause of the Britons as the ancient Friends, and Confederates, he did send them Succours; with protestation nevertheless, that to save all Treaties and Laws of Friendship, he had limited his Force, to proceed in ayd of the Britons, but in no wise to war upon the French, otherwise than as they maintained the possession of Britain. But before this formal Ambassage arrived, the Party of the Duke had received a great blow, and grew to manifest declination. For near the Town of Saint Alban in Britain, a Battel had been given, where the Britons were overthrown, and the Duke of Orleance, and the Prince of Orange taken Prisoners; there being slain on the Britons part six thousand men, and amongst them the Lord Woodvile, and almost all his Souldiers, valiantly fighting. And of the French part one thousand two hundred, with their Leader, James Galeot, a great Commander.

When the news of this Battel came over into England, it was time for the King (who now had no subterfuge to continue further Treaty, and saw before his Eyes, that Britain went so speedily for lost, contrary to his hopes, knowing also that with his People and Foreiners both, he sustained no small Envy and disreputation for his former delays) to dispatch with all possible speed his Succour into Britain; which he did under the Conduct of Robert Lord Brook, to the number of eight thousand choise men, and well armed; who having a fair wind, in few hours landed in Britain, and joyned themselves forthwith to those Briton Forces, that remained after the Defeat, and marched straight on to find the Enemy, and encamped fast by them. The French wisely husbanding the possession of a Victory, and well acquainted with the Courage of the English, especially when they are fresh, kept themselves within their Trenches, being strongly lodged, and resolved not to give Battel. But meanwhile, to harrass and weary the English, they did upon all advantages set upon them with their Light-horse; wherein nevertheless they received commonly loss, especially by means of the English Archers.

But upon these Atchievements Francis Duke of Britain deceased; an accident that the King might easily have foreseen, and ought to have reckoned upon, and provided for, but that the Point of Reputation, when news first came of the Battel lost, (that somewhat must be done) did over-bear the Reason of War.

After the Duke's decease, the principal persons of Britain, partly bought, partly through faction, put all things into confusion; so as the English not finding Head or Body with whom to joyn their Forces, and being in jealousie of Friends, as well as in danger of Enemies, and the Winter begun, returned home five Months after their landing. So the Battel of Saint Alban, the death of the Duke, and the retire of the English Succours were (after some time) the causes of the loss of that Duchy; which action some accounted as a blemish of the King's Judgement; but most, but as the misfortune of his times.

But howsoever the temporary Fruit of the Parliament in their Ayd and Advice given for Britain, took not, nor prospered not; yet the lasting Fruit of Parliament, which is good and wholesom Laws, did prosper, and doth yet continue to this

day. For according to the Lord Chancellor's admonition, there were that Parliament divers excellent Laws ordained, concerning the Points which the King recommended.

First, the Authority of the StarChamber, which before subsisted by the ancient Common-Laws of the Realm, was confirmed in certain Cases by Act of Parliament. This Court is one of the sagest and noblest Institutions of this Kingdom. For in the distribution of Courts of Ordinary Justice (besides the High Court of Parliament) in which distribution the King's-Bench holdeth the Pleas of the Crown, the Common-Place, Pleas-Civil, the Exchequer-Pleas concerning the King's Revenue, and the Chancery the Pretorian power for mitigating the rigour of Law, in case of extremity, by the conscience of a good man; there was nevertheless always reserved a high and preheminent power to the King's Council, in Causes that might in example, or consequence, concern the state of the Commonwealth, which if they were Criminal, the Council used to sit in the Chamber, called the StarChamber; if Civil, in the White-Chamber, or White-Hall. And as the Chancery had the Pretorian power for Equity, so the StarChamber had the Censorian power for Offences, under the degree of Capital. This Court of StarChamber is compounded of good Elements: for it consisteth of four kinds of Persons, Counsellors, Peers, Prelates, and chief Judges. It discerneth also principally of four kinds of Causes; Forces, Frauds, Crimes various of Stellionate, and the Inchoations or middle, acts towards Crimes capital; or heinous, not actually committed or perpetrated. But that which was principally aimed at by this act was Force, and the two chief Supports of Force, Combination of Multitudes, and Maintenance or Headship of Great persons.

From the general peace of the Countrey, the King's care went on to the peace of the King's House, and the security of his great Officers and Counsellors. But this Law was somewhat of a strange composition and temper; That if any of the King's Servants under the degree of a Lord, do conspire the death of any of the King's Council; or Lord of the Realm, it is made Capital. This Law was thought to be procured by the Lord Chancellor, who being a stern and haughty man, and finding he had some mortal Enemies in Court, provided for his own safety;

drowning the envy of it in a general Law, by communicating the priviledge with all other Counsellors and Peers, and yet not daring to extend it further, than to the King's Servants in Check-roll, lest it should have been too harsh to the Gentlemen, and other Commons of the Kingdom; who might have thought their ancient Liberty, and the clemency of the Laws of England invaded, If the will in any case of Felony should be made the deed. And yet the reason which the Act yieldeth (that is to say, That he that conspireth the death of Counsellors may be thought indirectly, and by a mean conspire the death of the King himself,) is indifferent to all Subjects, as well as to Servants in Court. But it seemeth this sufficed to serve the Lord Chancellor's turn at this time. But yet he lived to need a General Law, for that he grew afterwards as odious to the Countrey, as he was then to the Court.

From the peace of the King's House, the King's care extended to the peace of Private Houses and Families. For there was an excellent Moral Law molded thus; The taking and carrying away of Women forcibly, and against their will (except FemaleWards and Bond-Women) was made Capital. The Parliament wisely and justly conceiving, that the obtaining of Women by force into Possession (howsoever afterwards Assent might follow by Allurements) was but a Rape drawn forth in length, because the first Force drew on all the rest.

There was made also another Law for Peace in general, and repressing of Murthers and Man-slaughters, and was in amendment of the Common Laws of the Realm, being this: That whereas by the Common Law, the King's Suit in case of Homicide, did expect the Year and the Day, allowed to the Parties Suit by way of Appeal; and that it was found by experience, that the Party was many times compounded with, and many times wearied with the Suit, so that in the end such Suit was let fall, and by that time the matter was in a manner forgotten, and thereby Prosecution at the King's Suit by Indictment (which is ever best, Flagrante crimine) neglected; it was Ordained, That the Suit by Indictment might be taken as well at any time within the Year and the Day, as after, not prejudicing nevertheless the Parties Suit.

The King began also then, as well in Wisdom as in Justice to pare a little the Priviledge of Clergy, ordaining, That Clerks convict should be burned in the hand; both because they might taste of some corporal Punishment, and that they might carry a Brand of Infamy. But for this good Acts sake, the King himself was after branded by Perkin's Proclamation, for an execrable breaker of the Rites of Holy Church.

Another Law was made for the better Peace of the Countrey; by which Law the King's Officers and Farmors were to forfeit their Places and Holds, in case of unlawful Retainer, or partaking in Routs and unlawful Assemblies.

These were the Laws that were made for repressing of Force, which those times did chiefly require; and were so prudently framed, as they are found fit for all succeeding times, and so continue to this day.

There were also made good and politick Laws that Parliament against Usury, which is the Bastard-use of Money; And against unlawful Chievances and Exchanges, which is Bastard-Usury; And also for the Security of the King's Customs; And for the Employment of the Procedures of Forein Commodities, brought in by Merchant-strangers, upon the Native-Commodities of the Realm; together with some other Laws of less importance.

But howsoever the Laws made in that Parliament did bear good and wholesom Fruit; yet the Subsidy granted at the same time, bare a Fruit, that proved harsh and bitter. All was inned at last into the King's Barn; but it was after a Storm. For when the Commissioners entred into the Taxation of the Subsidy in Yorkshire, and the Bishoprick of Duresm; the People upon a sudden grew into great mutiny, and said openly, that they had endured of late years a thousand miseries, and neither could nor would pay the Subsidy. This (no doubt) proceeded not simply of any present necessity, but much by reason of the old humour of those Countries, where the memory of King Richard was so strong, that it lyes like Lees in the bottom of mens hearts; and if the Vessel was but stirred, it would come up. And (no doubt) it was partly also by the instigation of some factious Malecontents, that bare principal stroke amongst them. Hereupon the Commissioners being somewhat astonished, deferred the matter unto the Earl

of Northumberland, who was the principal man of Authority in those Parts. The Earl forthwith wrote unto the Court, signifying to the King plainly enough in what flame he found the people of those Countries, and praying the King's direction. The King wrote back peremptorily, That he would not have one penny abated, of that which had been granted to him by Parliament, both because it might encourage other Countries to pray the like Release or Mitigation, and chiefly, because he would never endure, that the base Multitude should frustrate the Authority of the Parliament, wherein their Votes and Consents were concluded. Upon this dispatch from Court, the Earl assembled the principal Justices and Free-holders of the Countrey; and speaking to them in that imperious Language wherein the King had written to him, which needed not, (save that an harsh business was unfortunately fallen into the hands of a harsh man,) did not only irritate the People, but make them conceive, by the stoutness and haughtiness of delivery of the King's Errand; that himself was the Author or principal Perswader of that Counsel. Whereupon the meaner sort routed together, and suddenly assailing the Earl in his house, slew him, and divers of his servants. And rested not there, but creating for their Leader Sir John Egremond, a factious person, and one that had of a long time born an ill Talent towards the King; and being animated also by a base Fellow, called John A Chamber, a very Boutefeu, who bare much sway amongst the vulgar and popular, entred into open Rebellion, and gave out in flat terms that they would go against King Henry, and fight with him for the maintenance of their Liberties.

When the King was advertised of this new Insurrection (being almost a Fever that took him every year) after his manner little troubled therewith, he sent Thomas Earl of Surrey (whom he had a little before not only released out of the Tower, and pardoned, but also received to special favour) with a competent Power against the Rebels; who fought with the principal Band of them, and defeated them, and took alive John A Chamber, their firebrand. As for Sir John Egremond, he fled into Flanders, to the Lady Margaret of Burgundy; whose Palace was the Sanctuary and Receptacle of all Traytors against the King. John A Chamber was Executed at York, in great state; for he was hanged upon a

Gibbet raised a Stage higher in the midst of a square Gallows, as a Traytor paramount; and a number of his men that were his chief Complices, were hanged upon the lower Story round about him; and the rest were generally pardoned. Neither did the King himself omit his custom, to be first or second in all his Warlike Exploits; making good his Word, which was usual with him when he heard of Rebels; that He desired but to see them. For immediately after he had sent down the Earl of Surrey, he marched towards them himself in person. And although in his journey he heard news of the Victory, yet he went on as far as York, to pacifie and settle those Countries. And that done returned to London, leaving the Earl of Surrey for his Lieutenant in the Northern parts, and Sir Richard Tunstal for his principal Commissioner, to levy the Subsidy, whereof he did not remit a Denier.

About the same time that the King lost so good a Servant, as the Earl of Northumberland, he lost likewise a faithful Friend and Allie of James the Third, King of Scotland, by a miserable disaster. For this unfortunate Prince, after a long smother of discontent, and hatred of many of his Nobility and People, breaking forth at times into seditions and alterations of Court, was at last distressed by them, having taken Arms, and surprised the person of Prince James his Son, partly by force, partly by threats that they would otherwise deliver up the Kingdom to the King of England, to shadow their Rebellion, and to be the titular and painted Head of those Arms. Whereupon the King (finding himself too weak) sought unto King Henry, as also unto the Pope, and the King of France, to compose those troubles, between him and his Subjects. The King accordingly interposed their Mediation in a round and Princely manner: Not only by way of request and perswasion, but also by way of protestation of menace; declaring, that they thought it to be the common Cause of all Kings, If Subjects should be suffered to give Laws unto their Sovereign; and that they would accordingly resent it, and revenge it. But the Rebels that had shaken off the greater Yoak of Obedience, had likewise cast away the lesser Tye of Respect. And Fury prevailing above Fear, made answer, That there was no talking of Peace, except the King would resign his Crown. Whereupon (Treaty of Accord

taking no place) it came to a Battel, at Bannocks-bourn by Strivelin. In which Battel, the King transported with wrath and just indignation, inconsiderately fighting and precipitating the charge, before his whole numbers came up to him, was (notwithstanding the contrary express and straight commandment of the Prince his Son) slain in the Pursuit, being fled to a Mill, situate in the field, where the Battel was fought.

As for the Pope's Embassy, which was sent by Adrian de Castello an Italian Legate, (and perhaps, as those times were, might have prevailed more) it came too late for the Embassy, but not for the Ambassador. For passing through England, and being honourably entertained, and received of King Henry; (who ever applied himself with much respect to the See of Rome) he fell into great grace with the King, and great familiarity and friendship with Morton the Chancellor. In so much as the King taking a liking to him, and finding him to his mind, preferred him to the Bishoprick of Hereford, and afterwards to that of Bath and Wells, and employed him in many of his affairs of State, that had relation to Rome. He was a man of great learning, wisdom, and dexterity in business of State; and having not long after ascended to the degree of Cardinal, payd the King large tribute of his gratitude, in diligent and judicious advertisement of the occurrents of Italy. Nevertheless in the end of his time, he was partaker of the conspiracy, which Cardinal Alphonso Petrucci, and some other Cardinals had plotted against the life of Pope Leo. And this offence in it self so heinous, was yet in him aggravated by the motive thereof, which was not malice or discontent, but an aspiring mind to the Papacy. And in this height of impiety there wanted not an intermixture of levity and folly; for that (as was generally believed) he was animated to expect the Papacy, by a fatal mockery, the Prediction of a Soothsayer; which was, That one should succeed Pope Leo, whose name should be Adrian, an aged man of mean birth, and of great learning and wisdom. By which character, and figure, he took himself to be described, though it were fulfilled of Adrian the Fleming, Son of a Dutch Brewer, Cardinal of Tortosa, and Preceptor unto Charles the Fifth, the same that not changing his Christen-name, was afterward called Adrian the Sixth.

But these things happened in the year following, which was the fifth of this King. But in the end of the fourth year the King had called again his Parliament, not as it seemeth for any particular occasion of State. But the former Parliament being ended somewhat suddenly, in regard of the preparation for Britain, the King thought he had not remunerated his People sufficiently with good Laws, which evermore was his Retribution for Treasure. And finding by the Insurrection in the North, there was discontentment abroad, in respect of the Subsidy, he thought it good to give his Subjects yet further contentment, and comfort in that kind. Certainly his times for good Commonwealths Laws did . So as he may justly be celebrated for the best Lawgiver to this Nation, after King Edward the First. For his Laws (who so marks them well) are deep, and not vulgar: not made upon the spur of a particular Occasion for the present, but out of Providence of the future, to make the Estate of his People still more and more happy; after the manner of the Legislators in ancient and Heroical times.

First therefore he made a Law, suitable to his own Acts and Times. For as himself had in his Person and Marriage made a final Concord, in the great Suit and Title for the Crown; so by this Law he setled the like Peace and Quiet in the private Possessions of the Subjects. Ordaining, That Fines thence-forth should be final, to conclude all Strangers Rights; and that upon Fines levied, and solemnly proclaimed, the Subject should have his time of Watch for five years after his Title accrued; which if he forepassed, his Right should be bound for ever after; with some exception nevertheless, of Minors, Married-women, and such incompetent Persons.

This Statute did in effect but restore an ancient Statute of the Realm, which was it self also made but in affirmance of the Common-Law. The alteration had been by a Statute, commonly called the Statute of Nonclaim, made in the time of Edward the Third. And surely this Law was a kind of Prognostick of the good Peace, which since his time hath (for the most part) continued in this Kingdom, until this day. For Statutes of Nonclaim are fit for times of War, when mens heads are troubled, that they cannot intend their Estate; but Statutes, that quiet

Possessions, are fittest for times of Peace, to extinguish Suits and Contentions, which is one of the Banes, of Peace.

Another Statute was made of singular Policy, for the Population apparently, and (if it be throughly considered) for the Soldiery, and Militar Forces of the Realm.

Inclosures at that time began to be more frequent, whereby Arable Land (which could not be manured without People and Families) was turned into Pasture, which was easily rid by a few Herds-men; and Tenancies for Years, Lives, and At Will (whereupon much of the Yeomandry lived) were turned into Demesnes. This bred a decay of People, and (by consequence) a decay of Towns, Churches, Tythes, and the like. The King likewise knew full well, and in no wise forgot, that there ensued withal upon this a decay and diminution of Subsidy and Taxes; for the more Gentlemen, ever the lower Books of Subsidies. In remedying of this inconvenience, the King's Wisdom was admirable, and the Parliaments at that time. Inclosures they would not forbid, for that had been to forbid the improvement of the Patrimony of the Kingdom; nor Tillage they would not compel, for that was to strive with Nature and Utility. But they took a course to take away depopulating Inclosures, and depopulating Pasturage, and yet not by that name, or by any Imperious express Prohibition, but by consequence. The Ordinance was, That all Houses of Husbandry, that were used with twenty Acres of Ground, and upwards, should be maintained and kept up for ever; together with a competent proportion of Land to be used and occupied with them; and in no wise to be severed from them, as by another Statute, made afterwards in his Successors time, was more fully declared. This upon Forfeiture to be taken; not by way of Popular Action, but by seisure of the Land it self, by the King and Lords of the Fee, as to half the Profits, till the Houses and Lands were restored. By this means the Houses being kept up, did of necessity enforce a Dweller; and the proportion of Land for Occupation being kept up, did of necessity enforce that Dweller, not to be a Beggar or Cottager, but a man of some substance, that might keep Hinds and Servants, and set the Plough on goingThis did wonderfully concern the Might and Manner-hood of the

Kingdom, to have Ferms, as it were of a Standard sufficient to maintain an able Body out of Penury, and did in effect amortize a great part of the Lands of the Kingdom unto the Hold and Occupation of the Teomanry or Middle people, of a condition between Gentlemen and Cottagers or Pesants. Now, how much this did advance the Militar power of the Kingdom, is apparent by the true Principles of War, and the examples of other Kingdoms. For it hath been held by the general Opinion of men of best Judgement in the Wars (howsoever some few have varied, and that it may receive some distinction of Case) that the principal strength of an Army consisteth in the Infantry or Foot. And to make good Infantry, it requireth men bred, not in a servile or indigent fashion, but in some free and plentiful manner. Therefore if a State run most to Noblemen and Gentlemen, and that the Husband-men and Plough-men be but as their Work-folks and Labourers, or else meer Cottagers, (which are but Housed-Beggars) you may have a good Cavalry, but never good stable Bands of Foot; like to Coppice-Woods, that if you leave in them Staddles too thick, they will run to Bushes and Bryars, and have little clean Underwood. And this is to be seen in France, and Italy, and some other parts abroad, where in effect all is Nobless, or Pesantry, I speak of people out of Towns, and no middle people; and therefore no good Forces of Foot: In so much, as they are enforced to employ Mercenary Bands, of Switzers and the like, for their Battuilions of Foot; Whereby also it comes to pass, that those Nations have much People, and few Soldiers. Whereas the King saw, that contrariwise it would follow, that England, though much less in Territory, yet should have infinitely more Soldiers of their native Forces, than those other Nations have. Thus did the King secretly sow Hidra's teeth, whereupon (according to the Poets fiction) should rise up Armed men for the service of the Kingdom.

The King also (having care to make his Realm potent, as well by Sea as by Land) for the better maintenance of the Navy, Ordained, That Wines and Woads from the parts of Gascoign and Languedock; should not be brought but in English Bottoms; Bowing the ancient Policy of this Estate, from consideration of Plenty, to consideration of Power. For that almost all the ancient Statutes incite

by all means Merchant-strangers, to bring in all sorts of Commodities; having for end cheapness, and not looking to the point of State concerning the Naval-power.

The King also made a Statute in that Parliament Monitory and Minatory, towards Justices of Peace, that they should duly execute their Office, inviting complaints against them, first to their Fellow Justices, then to the Justices of Assize, then to the King or Chancellor; and that a Proclamation, which he had published of that Tenor, should be read in open Sessions four times a year, to keep them awake. Meaning also to have his Laws executed, and thereby to reap either Obedience or Forfeitures; (wherein towards his latter times he did decline too much to the left hand) he did ordain remedy against the practice that was grown in use, to stop and damp Informations upon Penal Laws, by procuring Informations by collusion to be put in by the Confederates of the Delinquents, to be faintly prosecuted, and let fall at pleasure, and pleading them in Bar of the Informations, which were prosecuted with effect.

He made also Laws for the correction of the Mint, and counterfeiting of Forein Coyn currant. And that no payment in Gold should be made to any Merchant-stranger, the better to keep Treasure within the Realm, for that Gold was the metal that lay in least room.

He made also Statutes for the maintenance of Drapery, and the keeping of Wools within the Realm; and not only so, but for stinting, and limiting the prices of Cloth, one for the finer, and another for the courser sort. Which I note, both because it was a rare thing to set prices by Statute, especially upon our HomeCommodities; and because of the wise Model of the Act, not prescribing Prices, but stinting them not to exceed a rate, that the Clothier might drape accordingly as he might afford.

Divers other good Statutes were made that Parliament, but these were the principal. And here I do desire those, into whose hands this Work shall fall, that they do take in good part my long insisting upon the Laws that were made in this King’s Reign; whereof I have these reasons: Both because it was the preheminent virtue and merit of this King, to whose memory I do honour, and

because it hath some correspondence to my Person; but chiefly, because (in my judgement) it is some defect even in the best Writers of History that they do not often enough summarily deliver and set down the most memorable Laws, that passed in the times whereof they write, being indeed the principal Acts of Peace. For although they may be had in Original Books of Law themselves; yet that informeth not the judgement of Kings and Counsellors, and Persons of Estate, so well as to see them described, and entred in the Table and Pourtrait of the Times.

About the same time, the King had a Loan from the City of Four thousand pounds; which was double to that they lent before, and was duely and orderly payd back at the day, as the former likewise had been; the King ever choosing rather to borrow too soon, than to pay too late, and so keeping up his Credit.

Neither had the King yet cast off his cares and hopes touching Britain, but thought to master the occasion by Policy, though his Arms had been unfortunate, and to bereave the French King of the fruit of his Victory. The summ of his design was, to encourage Maximilian to go on with his suit, for the Marriage of Ann, the Heir of Britain, and to ayd him to the consummation thereof. But the affairs of Maximilian were at that time in great trouble and combustion, by a Rebellion of his Subjects in Flanders; especially those of Bruges and Gaunt, whereof the Town of Bruges (at such time as Maximilian was there in person) had suddenly armed in tumult, and slain some of his principal Officers, and taken himself prisoner, and held him in durance, till they had enforced him, and some of his Counsellors, to take a solemn Oath to pardon all their offences, and never to question and revenge the same in time to come. Nevertheless Frederick the Emperor would not suffer this reproach and indignity offered to his Son to pass, but made sharp Wars upon Flanders, to reclaim and chastise the Rebels. But the Lord Ravenstein, a principal person about Maximilian, and one that had taken the Oath of Abolition with his Master, pretending the Religion thereof, but indeed upon private ambition, and (as it was thought) instigated and corrupted from France, forsook the Emperor and Maximilian his Lord, and made himself an Head of the popular Party, and seized upon the Towns of Ipre and Sluce, with both the Castles; and forthwith sent to the Lord Cordes, Governour of Picardy

under the French King, to desire ayd, and to move him, that he on the behalf of the French King would be Protector of the united Towns, and by force of Arms reduce the rest. The Lord Cordes was ready to embrace the occasion, which was partly of his own setting, and sent forthwith greater Forces, than it had been possible for him to raise on the sudden, if he had not looked for such a summons before, in ayd of the Lord Ravenstein, and the Flemmings, with instructions to invest the Towns between France and Bruges. The French Forces besieged a little Town called Dixmue, where part of the Flemish Forces joyned with them. While they lay at this siege, the King of England, upon pretence of the safety of the English Pale about Calice, but in truth being loth that Maximilian should become contemptible, and thereby be shaken off by the States of Britain about this Marriage, sent over the Lord Morley with a thousand men unto the Lord Daubigny, then Deputy of Calice, with secret instructions to ayd Maximilian, and to raise the siege of Dixmue. The Lord Daubigny (giving it out that all was for the strengthning of the English Marches) drew out of the Garrisons, of Calice, Hammes, and Guines, to the number of a thousand men more. So that with the fresh Succours that came under the Conduct of the Lord Morley, they made up to the number of two thousand, or better. Which Forces joyning with some Companies of Almains, put themselves into Dixmue, not perceived by the Enemies; and passing through the Town with some re-enforcement, (from the Forces that were in the Town) assailed the Enemies Camp, negligently guarded, as being out of fear; where there was a bloody Fight, in which the English and their Partakers obtained the Victory, and slew to the number of eight thousand men, with the loss on the English part of a hundred or thereabouts; amongst whom was the Lord Morley. They took also their great Ordnance, with much rich spoils, which they carried to Newport, whence the Lord Daubigny returned to Calice, leaving the hurt men, and some other Voluntaries in Newport. But the Lord Cordes being at Ipre with a great power of men, thinking to recover the loss and disgrace of the Fight at Dixmue, came presently on, and sate down before Newport and besieged it; and after some days siege, he resolved to try the fortune of an Assault: Which he did one day, and succeeded therein so far, that

he had taken the principal Tower and Fort in that City, and planted upon it the French Banner. Whence nevertheless they were presently beaten forth by the English, by the help of some fresh Succours of Archers arriving by good fortune (at the instant) in the Haven of Newport; Whereupon the Lord Cordes discouraged, and measuring the new Succours (which were small) by the Success, (which was great,) levied his Siege. By this means, matters grew more exasperate between the two Kings of England and France, for that in the War of Flanders, the auxiliary Forces of French and English were much blooded one against another. Which Blood rankled the more, by the vain words of the Lord Cordes, that declared himself an open Enemy of the English, beyond that that appertained to the present Service; making it a common by-word of his, That he could be content to lye in Hell seven years, so he might win Calice from the English.

The King having thus upheld the Reputation of Maximilian, advised him now to press on his Marriage with Britain to a conclusion. Which Maximilian accordingly did, and so far forth prevailed both with the young Lady, and with the principal persons about her, as the Marriage was consummate by Proxy, with a Ceremony at that time in these parts new. For she was not only publickly contracted, but stated as a Bride, and solemnly Bedded; and after she was laid, there came in Maximilian's Ambassador with Letters of Procuration, and in the presence of sundry Noble Personages, Men and Women, put his Leg (stript naked to the Knee) between the Espousal-Sheets; to the end, that that Ceremony might be thought to amount to a Consummation, and actual Knowledge. This done, Maximilian (whose property was to leave things then, when they were almost come to perfection, and to end them by imagination; like ill Archers, that draw not their Arrows up to the Head: and who might as easily have Bedded the Lady himself, as to have made a Play and Disguise of it) thinking now all assured, neglected for a time his further proceeding, and intended his Wars. Meanwhile, the French King (consulting with his Divines, and finding that this pretended Consummation was rather an Invention of Court, than any ways valid by the Laws of the Church) went more really to work, and by secret Instruments

and cunning Agents, as well Matrans about the young Lady, as Counsellors, first sought to remove the point of Religion and Honour out of the mind of the Lady her self, wherein there was a double labour. For Maximilian was not only contracted unto the Lady, but Maximilian's Daughter was likewise contracted to King Charles. So as the Marriage halted upon both feet, and was not clear on either side: But for the Contract with King Charles, the Exception lay plain and fair, for that Maximilian's Daughter was under years of Consent, and so not bound by Law, but a power of Disagreement left to either part. But for the Contract made by Maximilian with the Lady her self, they were harder driven; having nothing to alledge, but that it was done without the consent of her Sovereign Lord, King Charles, whose Ward and Client she was, and he to her in place of a Father; and therefore it was void, and of no force, for want of such Consent. Which defect (they said) though it would not evacuate a Marriage, after Cohabitation, and Actual Consummation, yet it was enough to make void a Contract. For as for a pretended Consummation, they made sport with it, and said; That it was an argument, that Maximilian was a Widdower, and a cold Wooer, that could content himself to be a Bridegroom by Deputy, and would not make a little Journey, to put all out of question. So that the young Lady; wrought upon by these Reasons, finely instilled by such as the French King, (who spared for no Rewards or Promises) had made on his side; and allured likewise by the present Glory and Greatness of King Charles, (being also a young King, and a Batchelor) and loth to make her Countrey the Seat of a long and miserable War; secretly yielded to accept of King Charles: But during this secret Treaty with the Lady, the better to save it from Blasts of Opposition and Interruption, King Charles resorting to his wonted Arts, and thinking to carry the Marriage, as he had carried the Wars, by entertaining the King of England in vain belief, sent a solemn Ambassage by Francis Lord of Luxemberg, Charles Marignian and Robert Gaguein, General of the Order of the Bonnes Hommes of the Trinity, to treat Peace and League with the King; accoupling it with an Article in nature of a Request, that the French King might with the King's good will (according unto his right of Seigniory and Tutelage) dispose of the Marriage of the young

Duchess of Britain, as he should think good; offering by a Judicial proceeding to make void the Marriage of Maximilian by Proxy. Also all this while the better to amuse the World, he did continue in his Court and custody the Daughter of Maximilian, who formerly had been sent unto him, to be bred and educated in France; not dismissing or renvoying her, but contrariwise professing and giving out strongly, that he meant to proceed with that Match. And that for the Duchess of Britain, he desired only to preserve his right of Seigniory, and to give her in Marriage to some such Allie, as might depend upon him.

When the three Commissioners came to the Court of England, they delivered their Ambassage unto the King, who remitted them to his Council; where some days after they had Audience, and made their Proposition by the Prior of the Trinity, (who though he were third in place, yet was held the best Speaker of them) to this effect:

MY Lords, the King our Master, the greatest and mightiest King that reigned in France since Charles the Great, (whose Name he beareth) hath nevertheless thought it no disparagement to his Greatness, at this time to propound a Peace, yea, and to pray a Peace with the King of England. For which purpose he hath sent us his Commissioners instructed and enabled with full and ample power, to treat and conclude; giving us further in charge, to open in some other business the secrets of his own intentions. These be indeed the pretious Love-tokens between great Kings, to communicate one with another the true state of their Affairs, and to pass by nice Points of Honour, which ought not to give Law unto Affection, This I do assure your Lordships; It is not possible for you to imagine the true and cordial Love, that the King our Master beareth to your Sovereign, except you were near him, as we are. He useth his Name with so great respect; he remembreth their first acquaintance at Paris with so great contentment; nay, he never speaks of him, but that presently he falls into discourse of the miseries of great Kings, in that they cannot converse with their Equals, but with Servants. This affection to your King's Person and Virtues, GOD hath put into the Heart of our Master, no doubt for the good of Christendom, and for purposes yet unknown to us all. For other Root it cannot have, since it was the same to the

earl of Richmond, that it is now to the King of England. This is therefore the first motive that makes our King to desire Peace, and League with your Sovereign: Good affection, and somewhat that he finds in his own Heart. This affection is also armed with reason of Estate. For our King doth in all candour and frankness of dealing open himself unto you; that having an honourable, yea, and a Holy purpose, to make a Voyage and War in remote parts, he considereth that it will be of no small effect, in point of Reputation to his Enterprize, if it be known abroad, that he ulin in good peace with all his Neighbour Princes, and specially with the King of England, whom for good causes he esteemeth most.

But now (my Lords) give me leave to use a few words to remove all scruples and miss-understandings, between your Sovereign and ours, concerning some late Actions; which if they be not cleared, may perhaps hinder this Peace. To the end, that for matters past, neither King may conceive unkindness of other, nor think the other conceiveth unkindness of him. The late Actions are two; that of Britain, and that of Flanders. In both which, it is true, that the Subjects swords of both Kings, have encountred and stricken, and the ways and inclinations also of the two Kings, in respect of their Confederates and Allies, have severed.

For that of Britain, The King your Sovereign knoweth best what hath passed. It was a War of necessity on our Masters part. And though the Motives of it were sharp and piquant as could be, yet did be make that War rather with an Olive-branch, than a Laurel-branch in his hand, more desiring Peace than Victory. Besides, from time to time he sent (as it were) Blank-papers to your King, to write the conditions of Peace. For though both his Honour and Safety went upon it, yet he thought neither of them too precious, to put into the King of England's hands. Neither doth our King on the other side make any unfriendly interpretation, of your King's sending of Succours to the Duke of Britain; for the King knoweth well, that many things must be done of Kings for satisfaction of their People, and it is not hard to discern what is a King's own. But this matter of Britain is now (by the Act of GOD) ended and passed; and (as the King hopesh) like the way of a Ship in the Sea, without leaving any impression in either of the Kings minds; as he is sure, for his part, it hath not done in his.

For the Action of Flanders; As the former of Britain was a War of Necessity, so this was a War of Justice; which with a good King is of equal necessity, with danger of Estate, for else he should leave to be a King. The Subjects of Burgundy are Subjects in Chief to the Crown of France, and their Duke the Homager and Vassal of France. They had wont to be good Subjects, howsoever Maximilian hath of late distempered them. They fled to the King for Justice, and deliverance from Oppression. Justice he could not deny; Purchase he did not seek. This was good for Maximilian, if he could have seen it in people mutined, to arrest Fury, and prevent Despair. My Lords, it may be this I have said is needless, save that the King our Master is tender in any thing, that may but glance upon the Friendship of England. The amity between the two Kings (no doubt) stands entire and inviolate. And that their Subjects swords have clashed, it is nothing unto the publick Peace of the Crowns; it being a thing very usual in Auxiliary Forces of the best and straitest Confederates, to meet and draw blood in the Field. Nay, many times there be Ayds of the same Nation on both sides, and yet it is not (for all that) A Kingdom divided in it self.

It resteth (my Lords) that I impart unto you a matter, that I know your Lordships all will much rejoyce to hear; as that which importeth the Christian Commonweal more, than any Action that hath hapned of long time. The King our Master hath a purpose and determination, to make War upon the Kingdom of Naples; being now in the possession of a Bastardship of Arragon, but appertaining unto his Majesty, by clear and undoubted right; which if he should not by just Arms seek to recover, he could neither acquit his Honour, nor answer it to his People. But his Noble and Christian thoughts rest not here. For his Resolution and Hope is, to make the Re-conquest of Naples, but as a Bridge, to transport his Forces into Grecia; and not to spare Blood or Treasure (if it were to the impawning of his Crown, and dis-peopling of France) till either he hath overthrown the Empire of the Ottomans, or taken it in his way to Paradise. The King knoweth well, that this is a design, that could not arise in the mind of any King, that did not stedfastly look up unto GOD, whose quarrel this is, and from whom cometh both the will, and the Deed. But yet it is agreeable to the Person

that he beareth (though unworthy) of the Thrice-Christian King, and the Eldest Son of the Church. Whereunto he is also invited by the Example (in more ancient time) of King Henry the Fourth of England, (the First Renowned King of the House of Lancaster, Ancestor, though not Progenitor to your King) who had a purpose towards the end of his time (as you know better) to make an Expedition into the Holy Land; and by the Example also (present before his eyes) of that Honourable and Religious War which the King of Spain now maketh, and hath almost brought to perfection, for the Recovery of the Realm of Granada from the Moors. And although this Enterprize may seem vast and unmeasured, for the King to attempt that by his own Forces, wherein heretofore a Conjunction of most of the Christian Princes hath found work enough; yet his Majesty wisely considereth, that sometimes smaller Forces being united under one Command, are more effectual in Proof (though not so promising in Opinion and Fame) than much greater Forces, variously propounded by Associations and Leagues; which commonly in a short time after their beginnings, turn to Dissociations and Divisions. But (my Lords) that which is as a Voice from Heaven that called the King to this Enterprize, is a Rent at this time in the House of the Ottomans. I do not say, but there hath been Brother against Brother in that House before, but never any that had refuge to the Arms of the Christians, as now hath Gemes, (Brother unto Bajazeth, that reigneth) the far braver man of the two; the other being between a Monk and a Philosopher, and better read in the Alcoran and Averroes, than able to weild the Scepter of so warlike an Empire. This therefore is the King our Master's memorable and heroical Resolution for an Holy War. And because he carrieth in this the person of a Christian Soldier, as well as of a great Temporal Monarch; he beginneth with Humility, and is content for this cause, to beg Peace at the hands of other Christian Kings. There remaineth only rather a Civil Request, than any essential part of our Negotiation, which the King maketh to the King your Sovereign. The King (as the World knoweth) is Lord in chief of the Duchy of Britain. The Marriage of the Heir belongeth to him as Guardian. This is a private Patrimonial Right, and no business of Estate: yet nevertheless (to run a fair course with your King; whom

he desires to make another Himself, and to be one and the same thing with him) his Request is, That with the King's Favour and Consent, he may dispose of her Marriage, as he thinketh good, and make void the intruded and pretended Marriage of Maximilian, according to Justice. This (my Lords) is all that I have to say, desiring your pardon for my weakness in the delivery.

THus did the French Ambassadors with great shew of their King's affection, and many sugred words seek to adulce all matters between the two Kings, having two things for their ends; The one, to keep the King quiet till the Marriage of Britain was past, and this was but a Summers-fruit, which they thought was almost ripe, and would be soon gathered. The other was more lasting; and that was to put him into such a temper as he might be no disturbance or impediment to the Voyage for Italy. The Lords of the Council were silent; and said only, That they knew the Ambassadors would look for no answer, till they had reported to the King; and so they rose from Council. The King could not well tell what to think of the Marriage of Britain. He saw plainly the ambition of the French King was to impatronize himself of the Duchy; but he wondred he would bring into his House a litigious Marriage, especially considering who was his Successor. But weighing one thing with another, he gave Britain for lost; but resolved to make his profit of this business of Britain, as a quarrel for War; and that of Naples, as a Wrench and mean for Peace; being well advertised, how strongly the King was bent upon that Action. Having therefore conferred divers times with his Council, and keeping himself somewhat close, he gave a direction to the Chancellor, for a formal Answer to the Ambassadors, and that he did in the presence of his Council. And after calling the Chancellor to him apart, bade him speak in such language, as was fit for a Treaty that was to end in a Breach; and gave him also a special Caveat, that he should not use any words, to discourage the Voyage of Italy. Soon after the Ambassadors were sent for to the Council, and the Lord Chancellor spake to them in this sort:

MY Lords Ambassadors, I shall make answer by the King's Commandment, unto the eloquent Declaration of you my Lord Prior, in a brief and plain manner. The King forgetteth not his former love and acquaintance with the King your

Master. But of this there needeth no repetition. For if it be between them as it was, it is well; if there be any alteration, it is not words that will make it up.

For the Business of Britain, the King findeth it a little strange that the French King maketh mention of it, as matter of well-deserving at his hand. For that Deserving was no more, but to make him his Instrument, to surprize one of his best Confederates. And for the Marriage, the King would not meddle in it if your Master would marry by the Book, and not by the Sword.

For that of Flanders, if the Subjects of Burgundy had appealed to your King, as their Chief Lord, at first, by way of Supplication, it might have had a shew of Justice. But it was a new form of Process, for Subjects to imprison their Prince first, and to slay his Officers, and then to be Complainants. The King saith, That sure he is, when the French King, and himself sent to the Subjects of Scotland (that had taken Arms against their King) they both spake in another Stile, and did in Princely manner signifie their detestation of Popular Attentates, upon the Person or Authority of Princes. But my Lords Ambassadors, the King leaveth these two actions thus: That on the one side, he hath not received any manner of satisfaction from you concerning them; and on the other, that he doth not apprehend them so deeply, as in respect of them, to refuse to treat of Peace, if other things may go hand in hand. As for the War of Naples, and the Design against the Turk; the King hath commanded me expresly to say, That he doth wish with all his heart, to his good Brother the French King, that his Fortunes may succeed according to his hopes, and honourable intentions. And whensoever he shall hear, that he is prepared for Grecia, as your Master is pleased now to say, that he beggeth a Peace of the King, so the King will then beg of him a part in that War.

But now my Lords Ambassadors, I am to propound unto you somewhat on the King's part. The King your Master hath taught our King what to say and demand. You say (my Lord Prior) that your King is resolved to recover his right to Naples, wrongfully detained from him. And that if he should not thus do, he could not acquit his Honour, nor answer it to his People. Think (my Lords) that

the King our Master saith the same thing over again to you touching Normandy, Guien, Anjou, yea and the Kingdom of France it self. I cannot express it better than in your own words: If therefore the French King shall consent, that the King our Master's Title to France (at least Tribute for the same) be handled in the Treaty, the King is content to go on with the rest, otherwise he refuseth to Treat.

THE Ambassadors being somewhat abashed with this demand, answered in some heat; That they doubted not, but the King their Sovereign's Sword would be able to maintain his Scepter: And they assured themselves, he neither could nor would yield to any diminution of the Crown of France, either in Territory or Regality. But howsoever, they were too great matters for them to speak of, having no Commission. It was replied, that the King looked for no other answer from them; but would forthwith send his own Ambassadors to the French King. There was a question also asked at the table, Whether the French King would agree to have the disposing of the Marriage of Britain with an exception and exclusion, that he should not marry her himself? To which the Ambassadors answered; That it was so far out of their King's thoughts, as they had received no Instruction touching the same. Thus were the Ambassadors dismissed, all save the Prior; and were followed immediately by Thomas Earl of Ormond, and Thomas Goldenston Prior of Christ-Church in Canterbury, who were presently sent over into France. In the mean space, Lionel Bishop of Concordia, was sent as Nuntio from Pope Alexander the sixth to both Kings, to move a Peace between them. For Pope Alexander finding himself pent and lockt up, by a League and Association of the principal States of Italy, that he could not make his way for the advancement of his own House, (which he immoderately thirsted after) was desirous to trouble the waters in Italy, that he might fish the better; casting the Net, not out of St. Peter's, but out of Borgia's Bark. And doubting lest the fear from England, might stay the French King's voyage into Italy, dispatched this Bishop to compose all matters between the two Kings, if he could. Who first repaired to the French King, and finding him well inclined (as he conceived) took on his Journey towards England, and found the English Ambassadors at Calice, on their way towards the French King. After some

conference with them, he was in honourable manner transported over into England, where he had audience of the King. But notwithstanding he had a good ominous name to have made a Peace, nothing followed. For in the mean time, the purpose of the French King to marry the Duchess could be no longer dissembled. Wherefore the English Ambassadors (finding how things went) took their leave, and returned. And the Prior also was warned from hence, to depart out of England. Who when he turned his back (more like a Pedant, than an Ambassador) dispersed a bitter Libel, in Latin Verse, against the King; unto which the King (though he had nothing of a Pedant) yet was content to cause an answer to be made in like Verse; and that as speaking in his own person, but in a stile of scorn and sport. About this time also was born the King's second Son Henry, who afterward relgned. And soon after followed the solemnization of the Marriage between Charles, and Ann Duchess of Britain, with whom he received the Duchy of Britain as her Dowry; the Daughter of Maximilian being a little before sent home. Which when it came to the ears of Maximilian, (who would never believe it till it was done, being ever the Principal in deceiving himself, though in this the French King did very handsomly second it) and tumbling it over and over in his thoughts, that he should at one blow (with such a double scorn) be defeated, both of the Marriage of his Daughter, and his own (upon both which he had fixed high imaginations;) he lost all patience, and casting off the Respects fit to be continued between great Kings, (even when their blood is hottest, and most risen) fell to bitter Invectives against the person and actions of the French King. And (by how much he was the less able to do, talking so much the more) spake all the Injuries he could devise of Charles, saying; That he was the most Perfidious man upon the earth, and that he had made a Marriage compounded between an Advoutry and a Rape: which was done (he said) by the just judgment of God; to the end, that (the Nullity thereof being so apparent to all the World) the Race of so unworthy a person might not reign in France. And forthwith he sent Ambassadors as well to the King of England as to the King of Spain, to incite them to War, and to treat a League offensive against France, promising to concur with great Forces of his own. Hereupon the King of

England (going nevertheless his own way) called a Parliament, it being the seventh year of his Reign, and the first day of opening thereof, (sitting under his Cloth of Estate) spake himself unto his Lords and Commons, in this manner:

MY Lords, and you the Commons; When I purposed to make a War in Britain by my Lieutenant, I made declaration thereof to you by my Chancellor. But now that I mean to make a War upon France in Person, I will declare it to you my Self. That War, was to defend another man's right, but this is to recever our own; and that ended by Accident, but we hope this shall end in Victory.

The French King troubles the Christian World. That which he hath, is not his own, and yet he seeketh more. He hath invested himself of Britain, he maintaineth the Rebels in Flanders, and he threatneth Italy. For Our Selves, he hath proceeded from Dissimulation to Neglect, and from Neglect to Contumely. He hath assailed our Confederates; he denieth our Tribute; in a word, he seeks War. So did not his Father, but sought Peace at our hands; and so perhaps will be, when good Counsel or Time shall make him see as much as his Father did.

Meanwhile; let us make his Ambition, our Advantage; and let us not stand upon a few Crowns of Tribute, or Acknowledgement, but (by the favour of Almighty GOD) try Our Right for the Crown of France it self; remembring that there hath been a French King Prisoner in England, and a King of England Crowned in France. Our Confederates are not diminished. Burgundy is in a mightier Hand than ever, and never more provoked; Britain cannot help us, but it may hurt them. New Acquests are more Burthen, than Strength. The Malecontents of his own Kingdom have not been Base, Popular, nor Titulary Impostors, but of an higher nature. The King of Spain (doubt ye not) will with us, not knowing where the French King's Ambition will stay. Our Holy Father the Pope, likes no Tramontanes in Italy. But howsoever it be, this matter of Confederates, is rather to be thought on, than reckoned on. (For God forbid; but England should be able to get Reason of France, without a Second.

At the Battels of Cressy, Poictiers, Agent-Court, we were of Our selves. France hath much People, and few Soldiers. They have no stable Bands of Foot: some good Horse they have; but these are Forces, which are least fit for a

Defensive War, where the Actions are in the Assailant's choice. It was our Discords only, that lost France; and (by the Power of GOD) it is the good Peace which we now enjoy, that will recover it. GOD hath hitherto blessed my Sword. I have in this time that I have Reigned, weeded out my bad Subjects, and tryed my good. My People and I know one another; which breeds Confidence. And if there should be any bad Blood left in the Kingdom, an Honourable Forein War will vent it, or purifie it. In this great Business, let me have your Advice, and Ayd. If any of you were to make his Son Knight; you might have ayd of your Tenants by Law. This concerns the Knighthood and Spurs of the Kingdom, whereof I am Father; and bound not only to seek to maintain it, but to advance it. But for matter of Treasure, let it not be taken from the Poorest sort; but from those, to whom the Benefit of the War may redound. France is no Wilderness: and I, that profess good husbandry, hope to make the War (after the Beginnings) to pay it self. Go together in GOD's Name, and lose no time; for I have called this Parliament wholly for this Cause.

THus spake the King. But for all this, though he shewed great forwardness for a War, not only to his Parliament and Court, but to his Privy Council likewise, (except the two Bishops, and a few more) yet nevertheless in his secret intentions, he had no purpose to go through with any War, upon France. But the truth was, that he did but traffick with that War, to make his Return in money. He knew well, that France was now entire, and at unity with it self, and never so mighty many years before. He saw by the tast that he had of his Forces sent into Britain, that the French knew well enough how to make War with the English; by not putting things to the hazard of a Battel, but wearing them by long Sieges of Towns, and strong fortified Encampings. James the Third of Scotland, (his true Friend, and Confederate) gone; and James the Fourth (that had succeeded) wholly at the devotion of France, and ill affected towards him. As for the Conjunctions of Ferdinando of Spain, and Maximilian; he could make no foundation upon them: for the one had Power, and not Will; and the other had Will, and not Power. Besides that, Ferdinando had but newly taken breath, from the War with the Moors; and merchanded at this time with France, for the

restoring of the Counties of Russignon and Perpignian, oppignorated to the French. Neither was he out of fear of the Discontents, and ill blood within the Realm; which having used always to repress and appease in person, he was loth they should find him at a distance beyond Sea, and engaged in War. Finding therefore the Inconveniences and Difficulties in the prosecution of a War, he cast with himself how to compass two things: The one, how by the declaration, and inchoation of a War, to make his Profit; the other, how to come off from the War, with saving of his Honour. For Profit, it was to be made two ways; upon his Subjects for the War, and upon his Enemies for the Peace; like a good Merchant, that maketh his gain, both upon the Commodities Exported, and Imported back again. For the point of Honour, wherein he might suffer, for giving over the War; he considered well, that as he could not trust upon the ayds of Ferdinando and Maximilian for supports of War: so the impuissance of the one, and the double proceeding of the other, lay fair for him for occasions to accept of Peace. These things he did wisely foresee, and did as artificially conduct, whereby all things fell into his lap, as he desired.

For as for the Parliament, it presently took fire, being affectionate (of old) to the War of France; and desirous afresh to repair the dishonour, they thought the King sustained by the loss of Britain. Therefore they advised the King (with great alacrity) to undertake the War of France. And although the Parliament consisted of the first and second Nobility, (together with principal Citizens and Townsmen) yet worthily and justly respecting more the People (whose Deputies they were) than their own private Persons, and finding by the Lord Chancellor's Speech the King's inclination that way; they consented that Commissioners should go forth, for the gathering and levying of a Benevolence, from the more able sort. This Tax (called Benevolence) was devised by Edward the Fourth, for which he sustained much Envy. It was abolished by Richard the Third, by Act of Parliament, to ingratiate himself with the people; and it was now revived by the King, but with consent of Parliament, for so it was not in the time of King Edward the Fourth. But by this way he raised exceeding great summs. Insomuch as the City of London (in those days) contributed nine thousand pounds and

better, and that chiefly levied upon the wealthier sort. There is a Tradition of a Dilemma, that Bishop Morton the Chancellor used, to raise up the Benevolence to higher Rates; and some called it his Fork, and some his Crotch. For he had couched an Article in the Instructions to the Commissioners, who were to levy the Benevolence; That if they met with any that were sparing, they should tell them, That they must needs have, because they laid up; and if they were spenders, they must needs have, because it was seen in their port, and manner of living. So neither kind came amiss.

This Parliament was meerly a Parliament of War; for it was in substance, but a Declaration of War against France and Scotland, with some Statutes conducing thereunto; As the severe punishing of Mortpayes, and keeping back of Soldiers Wages in Captains. The like severity for the departure of Soldiers without licence; Strengthning of the Common Law in favour of Protections, for those that were in the King's service; And the setting the gate open and wide, for men to Sell or Mortgage their Lands without Fines for Alienation, to furnish themselves with Money for the War; And lastly, the avoiding of all Scottish-men out of England. There was also a Statute, for the dispersing of the Standard of the Exchequer, throughout England; thereby to size Weights and Measures; and two or three more of less importance.

After the Parliament was broken up (which lasted not long) the King went on with his Preparations for the War of France; yet neglected not in the mean time the affairs of Maximilian, for the quieting of Flanders, and restoring him to his Authority amongst his Subjects. For at that time, the Lord of Ravenstein being not only a Subject rebelled, but a Servant revolted, (and so much the more malicious and violent, by the ayd of Bruges and Ghent) had taken the Town, and both the Castles of Sluyce; as we said before.

And having (by the commodity of the Haven) gotten together certain Ships and Barques, fell to a kind of Pyratical trade; robbing and spoyling, and taking Prisoners the Ships and Vessels of all Nations, that passed alongst that Coast, towards the Mart of Antwerp, or into any part of Brabant, Zealand, or Friesland; being ever will victualled from Picardy, besides the commodity of Victuals from

Sluyce, and the Countrey adjacent, and the avails of his own Prizes. The French assisted him still under-hand; and he likewise (as all men do, that have been of both sides) thought himself not safe, except he depended upon a third Person.

There was a small Town some two miles from Bruges, towards the Sea, called Dam; which was a Fort and Approch to Bruges, and had a relation also to Sluyce. This Town the King of the Romans had attempted often, (not for any worth of the Town in it self, but because it might choak Bruges, and cut it off from the Sea) and ever failed. But therewith the Duke of Saxony came down into Flanders, taking upon him the person of an Umpire, to compose things between Maximilian and his Subjects; but being (indeed) fast and assured to Maximilian. Upon this Pretext of Neutrality and Treaty, he repaired to Bruges; desiring the States of Bruges, to enter peaceably into their Town, with a Retinue of some number of men of Arms, fit for his Estate, being somewhat the more (as he said) the better to guard him in a Countrey, that was up in Arms: and bearing them in hand, that he was to communicate with them of divers matters of great importance, for their good. Which having obtained of them, he sent his Carriages and Harbingers before him, to provide his Lodging. So that his Men of War entred the City in good Array, but in peaceable manner, and he followed. They that went before, enquired still for Inns and Lodgings, as if they would have rested there all night, and so went on, till they came to the Gate, that leadeth directly towards Dam; and they of Bruges only gazed upon them, and gave them passage. The Captains and inhabitants of Dam also suspected no harm, from any that passed through Bruges; and discovering Forces a-far-off, supposed they had been some Succours, that were come from their Friends, knowing some Dangers towards them. And so perceiving nothing but well, till it was too late, suffered them to enter their Town. By which kind of Sleight, rather than Stratagem, the Town of Dam was taken, and the Town of Bruges shrewdly blockt up, whereby they took great discouragement.

The Duke of Saxony having won the Town of Dam, sent immediately to the King, to let him know that it was Sluyce chiefly, and the Lord Ravenstein, that

kept the Rebellion of Flanders in life; And that if it pleased the King to besiege it by Sea, he also would besiege it by Land, and so cut out the Core of those Wars.

The King willing to uphold the Authority of Maximilian, (the better to hold France in awe) and being likewise sued unto by his Merchants, for that the Seas were much infested by the Barques of the Lord Ravenstein; sent straightways Sir Edward Poynings, a valiant man, and of good service, with twelve Ships, well furnished with Soldiers and Artillery, to clear the Seas, and to besiege Sluyce on that part. The Englishmen did not only coop up the Lord Ravenstein, that he stirred not, and likewise hold in strait Siege the Maritim part of the Town; but also assailed one of the Castles, and renewed the assault so for twenty days space (issuing still out of their Ships at the Ebb) as they made great slaughter of them of the Castle; who continually fought with them to repulse them, though of the English part also were slain a Brother of the Earl of Oxford's, and some fifty more.

But the Siege still continuing more and more strait, and both the Castles (which were the principal strength of the Town) being distressed, the one by the Duke of Saxony, and the other by the English; and a Bridge of boats, which the Lord Ravenstein had made between both Castles, whereby Succours and Relief might pass from the one to the other, being on a night set on fire by the English, he despairing to hold the Town, yielded (at the last) the Castle to the English, and the Town to the Duke of Saxony, by composition. Which done, the Duke of Saxony and Sir Edward Poynings treated with them of Bruges, to submit themselves to Maximilian their Lord; which after some time they did, paying (in some good part) the Charge of the War, whereby the Almains and foreln Succours were dismissed. The example of Bruges, other of the Revolted Towns followed, so that Maximilian grew to be out of danger, but (as his manner was to handle matters) never out of necessity. And Sir Edward Poynings (after he had continued at Sluyce some good while, till all things were setled) returned unto the King, being then before Bulloign.

Somewhat about this time came Letters from Ferdinando, and Isabella, King and Queen of Spain; signifying the final Conquest of Granada from the Moors;

which action in it self so worthy, King Ferdinando, (whose manner was never to lose any virtue for the shewing) had expressed and displayed in his Letters at large, with all the particularities, and Religious Puncto's and Ceremonies, that were observed in the reception of that City and Kingdom: Shewing amongst other things, That the King would not by any means in person enter the City, until he had first aloof seen the Cross set up upon the greater Tower of Granada, whereby it became Christian ground: That likewise before he would enter, he did Homage to God above, pronouncing by an Herald from the height of that Tower, that he did acknowledge to have recovered that Kingdom, by the help of God Almighty and the glorious Virgin, and the virtuous Apostle St. James, and the holy Father Innocent the Eighth, together with the ayds and services of his Prelates, Nobles and Commons: That yet he stirred not from his Camp, till he had seen a little Army of Martyrs, to the number of seven hundred and more Christians (that had lived in bonds and servitude, as Slaves to the Moors) pass before his Eyes, singing a Psalm for their redemption, and that he had given Tribute unto God by alms, and relief, extended to them all, for his admission into the City. These things were in the Letters, with many more Ceremonies of a kind of Holy Ostentation.

The King ever willing to put himself into the consort or Choir of all Religious actions, and naturally affecting much the King of Spain, (as far as one King can affect another) partly for his virtues, and partly for a counterpoise to France; upon the receipt of these Letters, sent all his Nobles and Prelates, that were about the Court, together with the Mayor and Aldermen of London, in great solemnity to the Church of St. Pauls; there to hear a Declaration from the Lord Chancellor, now Cardinal. When they were assembled, the Cardinal (standing upon the uppermost step, or half-pace before the Chair; and all the Nobles, Prelates, and Governours of the City at the foot of the stairs) made a Speech to them; letting them know, that they were assembled in that Consecrate place, to sing unto God a New-song; For that (said he) these many years the Christians have not gained new ground or Territory upon the Infidels, nor enlarged and set further the Bounds of the Christianworld: But this is now done, by the prowess and

devotion of Ferdinando and Isabella, Kings of Spain; who have (to their immortal Honour) recovered the great and rich Kingdom of Granade, and the populous and mighty City of the same name, from the Moors, having been in possession thereof by the space of seven hundred years and more. For which, this Assembly and all Christians are to render laud and thanks unto God, and to celebrate this noble Act of the King of Spain; who in this is not only Victorious, but Apostolical, in the gaining of new Provinces to the Christian Faith. And the rather, for that this victory and Conquest is obtained, without much effusion of blood. Whereby it is to be hoped, that there shall be gained, not only new Territory, but infinite Souls, to the Church of Christ; whom the Almighty (as it seems) would have live to be converted. Herewithal he did relate some of the most memorable particulars of the War and Victory. And after his Speech ended, the whole assembly went solemnly in Procession, and Te Deum was sung.

Immediately after the Solemnity, the King kept his May-day at his Palace of Shein, now Richmond. Where to warm the blood of his Nobility, and Gallants, against the War, he kept great Triumphs of Justing and Tourney, during all that Month. In which space it so fell out, that Sir James Parker, and Hugh Vaughan, (one of the King's Gentlemen-Ushers) having had a controversie touching certain Arms, that the King at Arms had given Vaughan, were appointed to run some Courses one against another. And by accident of a faulty Helmet, that Parker had on, he was stricken into the mouth at the first Course, so that his tongue was born unto the hinder part of his head, in such sort that he died presently upon the place. Which because of the Controversie precedent, and the Death that followed, was accounted among the Vulgar, as a Combat or Tryal of Right. The King, towards the end of this Summer, having put his Forces, wherewith he meant to invade France, in readiness, (but so as they were not yet met or mustered together) sent Urswick (now made his Almoner) and Sir John Risley, to Maximilian; to let him know, that he was in Arms, ready to pass the Seas into France, and did but expect to hear from him, when and where he did appoint to joyn with him, according to his promise made unto him by Countebal, his Ambassador.

The English Ambassadors, having repaired to Maximilian, did find his power and promise at a very great distance; he being utterly unprovided of Men, Money, and Arms, for any such enterprize. For Maximilian, having neither Wing to flie on (for that his Patrimony of Austria was not in his hands, his Father being then living: And on the other side, his Matrimonial Territories of Flanders being partly in Dowre to his Mother-in-law, and partly not serviceable, in respect of the late Rebellions) was thereby destitute of means to enter into War. The Ambassadors saw this well, but wisely thought fit to advertise the King thereof, rather than to return themselves, till the King's further pleasure were known: The rather, for that Maximilian himself spake as great, as ever he did before, and entertained them with dilatory Answers; so as the formal part of their Ambassage might well warrant and require their further stay. The King hereupon (who doubted as much before, and saw through his business from the beginning) wrote back to the Ambassadors, commending their discretion in not returning, and willing them to keep the state wherein they found Maximilian, as a Secret, till they heard further from him; And mean while went on with his Voyage Royal for France, suppressing for a time this Advertisement touching Maximilian's poverty and disability.

By this time, was drawn together a great and puissant Army into the City of London; in which were Thomas Marquess Dorset, Thomas Earl of Arundel, Thomas Earl of Derby, George Earl of Shrewsbury, Edmond Earl of Suffolk, Edward Earl of Devonshire, George Earl of Kent, the Earl of Essex, Thomas Earl of Ormond, with a great number of Barons, Knights, and principal Gentlemen; and amongst them, Richard Thomas, much noted for the brave Troops that he brought out of Wales; the Army rising in the whole to the number of five and twenty thousand Foot, and sixteen hundred Horse. Over which, the King (constant in his accustomed trust and employment) made Jasper Duke of Bedford, and John Earl of Oxford Generals under his own person. The ninth of September, in the eighth year of his Reign, he departed from Greenwich; towards the Sea, all men wondering, that he took that season (being so near Winter) to begin the War; and some thereupon gathering it was a sign that the

War would not be long. Nevertheless, the King gave out the contrary, thus: That he intending not to make a Summer-business of it, but a resolute War (without term prefixed) until he recovered France; it skilled not much when he began it: especially having Calice at his back; where he might winter, if the reason of the War so required. The sixth of October, he embarqued at Sandwich; and the same day took land at Calice: which was the Rendezvonz, where all his Forces were assigned to meet. But in this his Journey towards the Sea-side (wherein, for the cause that we shall now speak of, he hovered so much the longer) he had received Letters from the Lord Cordes: who the hotter he was against the English in time of War, had the more credit in a Negotiation of Peace; and besides was held a man open, and of good faith. In which Letters there was made an overture of Peace from the French King, with such Conditions, as were somewhat to the King's tast: but this was carried at the first with wonderful secrecy. The King was no sooner come to Calice, but the calm winds of Peace began to blow. For first, the English Ambassadors returned out of Flanders from Maximilian; and certified the King, that he was not to hope for any ayd from Maximilian, for that he was altogether improvided. His will was good; but he lacked money. And this was made known; and spread through the Army. And although the English were therewithal nothing dismayed; and that it be the manner of Soldiers, upon bad news to speak the more bravely: yet nevertheless it was a kind of preparative to a Peace. Instantly in the neck of this (as the King had laid it) came news that Ferdinando and Isabella, Kings of Spain, had concluded a peace with King Charles; and that Charles had restored unto them the Counties of Russignon and Perpignian, which formerly were Mortgaged by John King of Arragon (Ferdinando's Father) unto France, for three hundred thousand Crowns; which debt was also, upon this Peace, by Charles clearly released. This came also handsomly to put on the Peace: both because so potent a Confederate was faln off, and because it was a fair example of a Peace bought; so as the King should not be the sole Merchant in this Peace. Upon these Airs of Peace, the King was content, that the Bishop of Exceter, and the Lord Daubigny (Governour of Calice) should give a meeting unto the Lord Cordes, for the

Treaty of a Peace. But himself nevertheless, and his Army, the fifteenth of October, removed from Calice, and in four days march sate him down before Bulloign.

During this Siege of Bulloign (which continued near a Month) there passed no memorable Action, nor Accident of War: only Sir John Savage, a valiant Captain, was slain, riding about the Walls of the Town, to take a View. The Town was both well fortified, and well manned; yet it was distressed, and ready for an Assault: which if it had been given (as was thought) would have cost much blood; but yet the Town would have been carried in the end. Mean while, a Peace was concluded by the Commissioners, to continue for both the Kings Lives. Where there was no Article of importance; being in effect, rather a Bargain, than a Treaty. For, all things remained as they were: save that there should be paid to the King seven hundred forty five thousand Ducats in present, for his Charges in that Journey; and five and twenty thousand Crowns yearly, for his Charges sustained in the Ayds of the Britons. For which Annual, though he had Maximilian bound before for those Charges; yet he counted the alteration of the Hand, as much as the principal Debt. And besides, it was left somewhat indefinitely; when it should determine or expire; which made the English esteem it as a Tribute, carried under fair Terms. And the truth is, it was paid both to the King, and to his Son King Henry the Eighth, longer than it could continue upon any computation of Charges. There were also assigned by the French King, unto all the King's principal Counsellors, great Pensions, besides rich Gifts for the present. Which whether the King did permit, to save his own Purse from Rewards, or to communicate the Envy of a Business, that was displeasing to his People, was diversly interpreted; for certainly, the King had no great fancy to own this Peace. And therefore, a little before it was concluded, he had under-hand procured some of his best Captains, and Men of War, to advise him to a Peace under their hands, in an earnest manner, in the nature of a Supplication. But, the truth is, this Peace was welcom to both Kings. To Charles, for that it assured unto him the possession of Britain, and freed the enterprise of Naples. To Henry, for that it filled his Coffers; and that he foresaw at that time a storm of

inward troubles coming upon him; which presently after brake forth. But it gave no less discontent to the Nobility, and principal persons of the Army; who had many of them sold or engaged their Estates, upon the hopes of the War. They stuck not to say, That the King cared not to plume his Nobility and People, to feather himself. And some made themselves merry with that the King had said in Parliament: That after the War was once begun, he doubted not but to make it pay it self; saying he had kept promise.

Having risen from Bulloign, he went to Calice, where he stayed some time. From whence also he wrote Letters, (which was a Courtesie that he sometimes used) to the Mayor of London, and Aldermen his Brethren; half bragging, what great summs he had obtained for the Peace; knowing well, that full Coffers of the King, is ever good news to London. And better news it would have been, if their Benevolence had been but a Loan. And upon the seventeenth of December following, he returned to Westminster, where he kept his Christmas.

Soon after the King's return, he sent the Order of the Garter, to Alphonso Duke of Calabria, eldest Son to Ferdinando King of Naples; an honour sought by that Prince, to hold him up in the eyes of the Italians: who, expecting the Arms of Charles, made great account of the Amity of England, for a Bridle to France. It was received by Alphonso, with all Ceremony and Pomp that could be devised; as things use to be carried that are intended for Opinion. It was sent by Urswick: upon whom the King bestowed this Ambassage, to help him, after many dry Employments.

AT this time the King began again to be haunted with Spirits, by the Magick and curious Arts of the Lady Margaret: who raised up the Ghost of Richard Duke of York, second Son to King Edward the Fourth, to walk and vex the King. This was a finer Counterfeit Stone, than Lambert Simnel, better done, and worn upon greater hands; being graced after, with the wearing of a King of France, and a King of Scotland, not of a Duchess of Burgundy only. And for Simnel, there was not much in him, more than that he was a handsom Boy, and did not shame his Robes. But this Youth (of whom we are now to speak) was such a Mercurial, as the like hath seldom been known, and could make his own Part, if

at any time he chanced to be out. Wherefore, this being one of the strangest Examples of a Personation, that ever was in Elder or Latter times; it deserveth to be discovered, and related at the full: Although the King's manner of shewing things, by Pieces and by Dark Lights, hath so musfled it, that it hath left it almost as a Mystery to this day.

The Lady Margaret (whom the King's Friends called Juno, because she was to him as Junb was to Aeneas, stirring both Heaven and Hell, to do him mischief) for a foundation of her particular Practices against him, did continually, by all means possible, nourish, maintain, and divulge the flying Opinion, That Richard Duke of York (second Son to Edward the Fourth) was not murthered in the Tower, (as was given out) but saved alive; For that those, who were employed in that barbarous Fact, having destroyed the elder Brother, were stricken with remorse and compassion towards the younger, and set him privily at liberty, to seek his Fortune. This Lure she cast abroad, thinking that this Fame and Belief (together with the fresh Example of Lambert Simnel) would draw at one time, or other, some Birds to strike upon it. She used likewise a further diligence, not committing all to Chance. For, she had some secret Espials (like to the Turks Commissioners for Children of Tribute) to look abroad for handsom and graceful Youths to make Plantagenets, and Dukes of York. At the last she did light on one, in whom all things met, as one would wish to serve her turn, for a Counterfeit of Richard Duke of York.

This was Perkin Warbeck, whose Adventures we shall now describe. For, first, the years agreed well. Secondly, he was a Youth of fine favour and shape. But more than that, he had such a crafty and bewitching fashion, both to move Pity, and to induce Belief, as was like a kind of Fascination, and Inchantment to those that saw him, or heard him. Thirdly, he had been from his Childhood such a Wanderer, or (as the King called him) such a Land-loper, as it was extreme hard to hunt out his Nest and Parents. Neither again could any man, by company or conversing with him, be able to say or detect well what he was; he did so flit from place to place. Lastly, there was a Circumstance (which is mentioned by one that wrote in the same time) that is very likely to have made somewhat to the

matter; which is, That King Edward the Fourth was his Godfather. Which, as it is somewhat suspicious, for a wanton Prince to become Gossip in so mean a House; and might make a man think, that he might indeed have in him some base Blood of the House of York: so at the least (though that were not) it might give the occasion to the Boy, in being called King Edward's God-son, or perhaps in sport, King Edward's Son, to entertain such Thoughts into his Head. For, Tutor he had none, (for ought that appears) as Lambert Simnel had, until he came unto the Lady Margaret, who instructed him.

Thus therefore it came to pass: There was a Towns-man of Tourney, that had born Office in that Town, whose name was John Osbeck, a Convert-Jew, married to Catherine de Faro; whose business drew him, to live for a time with his Wife at London, in King Edward the Fourth's days. During which time he had a Son by her: and being known in Court, the King either out of a religious Nobleness, because he was a Convert, or upon some private acquaintance, did him the Honor, as to be Godfather to his Child, and named him Peter. But, afterwards, proving a dainty and effeminate Youth, he was commonly called by the diminutive of his name; Peterkin, or Perkin. For, as for the name of Warbeck, it was given him when they did but guess at it, before examinations had been taken. But yet he had been so much talked on by that name, as it stuck by him after his true name of Osbeck was known. While he was a young Child his Parents returned with him to Tourney. Then was he placed in a house of a kinsman of his, called John Stenbeck, at Antwerp: and so roved up and down between Antwerp and Tourney, and other Towns of Flanders, for a good time; living much in English Company, and having the English Tongue perfect. In which time, being grown a comely Youth, he was brought by some of the Espials of the Lady Margaret unto her Presence. Who viewing him well, and seeing that he had a Face and Personage that would bear a Noble fortune, and finding him otherwise of a fine Spirit, and winning Behaviour; thought she had now found a curious Piece of Marble, to carve out an Image of a Duke of York. She kept him by her a great while, but with extreme secrecy. The while, she instructed him, by many Cabinet-Conferences. First, in Princely behaviour and

gesture; teaching him how he should keep State, and yet with a modest sense of his misfortunes. Then she informed him of all the circumstances and particulars, that concerned the Person of Richard Duke of York, which he was to act: Describing unto him the Personages, Lineaments, and Features of the King and Queen, his pretended Parents; and of his Brother and Sisters, and divers others, that were nearest him in his Childhood; together with all passages, some secret, some common, that were fit for a Child's memory, until the death of King Edward. Then she added the particulars of the time, from the King's death, until he and his Brother were committed to the Tower, as well during the time he was abroad, as while he was in Sanctuary. As for the times while he was in the Tower, and the manner of his Brother's death; and his own escape; she knew they were things that a very few could controle. And therefore she taught him, only to tell a smooth and likely Tale of those matters; warning him not to vary from it. It was agreed likewise between them, what account he should give of his Peregrination abroad; intermixing many things which were true, and such as they knew others could testifie, for the credit of the rest: but, still making them to hang together, with the Part he was to play. She taught him likewise how to avoid sundry captious and tempting questions which were like to be asked of him. But, in this she found him of himself so nimble and shifting, as she trusted much to his own wit and readiness; and therefore laboured the less in it. Lastly, she raised his thoughts with some present rewards, and further promises; setting before him chiefly the glory, and fortune of a Crown, if things went well; and a sure refuge to her Court, if the worst should fall. After such time as she thought he was perfect in his Lesson, she began to cast with her self from what coast this Blazing star should first appear, and at what time it must be upon the Horizon of Ireland; for there had the like Meteor strong influence before: the time of the Apparition to be, when the King should be engaged into a War with France. But well she knew, that whatsoever should come from her, would be held suspected. And therefore; if he should go out of Flanders immediately into Ireland, she might be thought to have some hand in it. And besides, the time was not yet ripe; for that the two Kings were upon terms of Peace. Therefore she wheel'd about;

and to put all suspition a far off, and loth to keep him any longer by her, (for that she knew Secrets are not long-lived) she sent him unknown into Portugal, with the Lady , an English Lady, for Portugal at that time; with some Privado of her own, to have an eye upon him: and there he was to remain and to expect her further directions. In the mean time, she omitted not to prepare things for his better welcome, and accepting, not only in the Kingdom of Ireland, but in the Court of France. He continued in Portugal about a year; and, by that time, the King of England called his Parliament (as hath been said) and declared open War against France. Now did the Sign , and the was come, under Perkin should appear. And therefore he was straight sent unto by the Duchess, to go for Ireland, according to the first designment. In Ireland he did arrive at the Town of Cork. When he was thither come, his own Tale was, (when he made his Confession afterwards) That the Irish-men, finding him in some good clothes, came flocking about him, and bare him down, that he was the Duke of Clarence, that had been there before; and after, that he was Richard the Third's base Son; and lastly, that he was Richard Duke of York, second Son to Edward the Fourth: But that he (for his part) renounced all these things, and offered to swear upon the Holy Evangelists, that he was no such man; till, at last, they forced it upon him, and bad him fear nothing, and so forth. But the truth is, that immediately upon his coming into Ireland, he took upon him the said Person of the Duke of York., and drew unto him Complices, and Partakers, by all the means he could devise: Insomuch, as he wrote his Letters unto the Earl of Densmond and Kildare, to come in to his Ayd, and be of his Party: the Originals of which Letters are yet extant.

Somewhat before this time, the Duchess had also gained unto her a near Servant of King Henry's own, one Stephen Frion, his Secretary for the French Tongue; an active man, but turbulent, and discontented. This Frion had fled over to Charles the French King, and put himself into his service, at such time as he began to be in open enmity with the King. Now King Charles, when he understood of the Person and Attempts of Perkin (ready of himself to embrace all advantages against the King of England; instigated by Frion, and formerly

prepared by the Lady Margaret,) forthwith dispatched one Lucas, and this Frion, in the nature of of Ambassadors to Perkin, to advertise him of the King's good inclination to him, and that he was resolved to ayd him, to recover his right against King Henry, an Usurper of England, and an Enemy of France; and wished him, to come over unto him at Paris. Perkin thought himself in heaven now, that he was invited by so great a King, in so honourable a manner; And imparting unto his Friends in Ireland for their encouragement; how Fortune called him, and what great hopes he had, sailed presently into France. When he was come to the Court of France, the King received him with great honour; saluted, and stiled him by the name of the Duke of York; lodged him, and accommodated him in great State: And the better to give him the representation and the countenance of a Prince, assigned him a Guard for his Person, whereof the Lord Congreshall was Captain. The Courtiers likewise (though it be ill mocking with the French) applied themselves to their King's bent, seeing there was reason of State for it. At the same time there repaired unto Perkin divers Englishmen of Quality; Sir George Nevile, Sir John Taylor, and about one hundred more: and amongst the rest, this Stephen Frion, of whom we spake; who followed his fortune both then and for a long time after, and was indeed his principal Counsellor and Instrument in all his Proceedings. But all this, on the French King's part, was but a Trick, the better to bow King Henry to Peace. And therefore upon the first Grain of Incense, that was sacrificed upon the Altar of Peace, at Bulloign, Perkin was smoaked away. Yet would not the French King deliver him up to King Henry (as he was laboured to do) for his Honors sake, but warned him away, and dismissed him. And Perkin on his part, was as ready to be gone, doubting he might be caught up under-hand. He therefore took his way into Flanders, unto the Duchess of Burgundy; pretending, that having been variously tossed by Fortune, he directed his course thither, as to a safe Harbour: No ways taking knowledge, that he had ever been there before, but as if that had been his first address. The Duchess; on the other part, made it as new and strange to see him: pretending (at the first) that she was taught and made wise by the example of Lambert Simnel, how she did admit of any Counterfeit stuff;

though even in that (she said) she was not fully satisfied. She pretended at the first (and that was ever in the presence of others) to pose him and sift him, thereby to try whether he were indeed the very Duke of York, or no. But, seeming to receive full satisfaction by his answers, she then feined her self to be transported with a kind of astonishment, mixt of Joy and Wonder, at his miraculous deliverance; receiving him, as he were risen from death to life; and inferring, that God, who had in such wonderful manner preserved him from Death, did likewise reserve him for some great and prosperous Fortune. As for his dismission out of France, they interpreted it not, as if he were detected or neglected for a Counterfeit Deceiver; but contrariwise, that it did shew manifestly unto the World, that he was some Great matter; for that it was his abandoning, that (in effect) made the Peare: being no more but the sacrificing of a poor distressed Prince unto the utility and Ambition of two Mighty Monarchs. Neither was Perkin for his part wanting to himself, either in gracious and Princely behaviour, or in ready and apposite answers, or in contenting and caressing those that did apply themselves unto him or in pretty scorn and disdain to those that seemed to doubt of him; but in all things did notably acquit himself: Insomuch as it was generally believed (as well amongst great Persons, as amongst the Vulgar) that he was indeed Duke Richard. Nay, himself, with long and continual counterfeiting, and with oft telling a Lye, was turned by habit almost into the thing he seemed to be, and from a Lyar, to a Believer. The Duchess therefore (as in a case out of doubt) did him all Princely honour, calling him always by the name of her Nephew, and giving him the Delicare Title of the White-Rose of England; and appointed him a Guard of thirty persons, Halberdiers, clad in a party-coloured Livery of Murrey and Blew, to attend his Person. Her Court likewise, and generally the Dutch and Strangers in their usage towards him, expressed no less respect.

The News hereof came blazing and thundering over into England; that the Duke of York was sure alive. As for the name of Perkin Warbeck, it was not at that time come to light, but all the news ran upon the Duke of York; that he had been entertained in Ireland, bought and sold in France, and was now plainly

avowed, and in great honour in Flanders. These Fames took hold of divers; in some upon discontent, in some upon ambition, in some upon levity and desire of change, and in some few upon conscience and belief, but in most upon simplicity; and in divers out of dependance upon some of the better sort, who did in secret favour and nourish these bruits. And it was not long, ere these rumors of Novelty, had begotten others of Scandal and Murmur against the King, and his government; taxing him for a great Taxer of his People, and discountenancer of his Nobility. The loss of Britain, and the Peace with France were not forgotten. But chiefly they fell upon the wrong that he did his Queen, in that he did not reign in her Right. Wherefore they said, that God had now brought to light a Masculine-Branch of the House of York, that would not be at his Courtesie, howsoever he did depress his poor Lady. And yet (as it fareth in things which are currant with the Multitude, and which they affect) these Fames grew so general, as the Authors were lost in the generality of Speakers. They being like running Weeds, that have no certain root; or like Footings up and down, impossible to be traced. But after a while, these ill Hamors drew to an head, and setled secretly in some eminent Persons; which were Sir William Stanley Lord Chamberlain of the King's Houshold, the Lord Fitz-water, Sir Simon Mountfort, Sir Thomas Thwaites. These entred into a secret Conspiracy to favour Duke Richard's Title. Nevertheless none engaged their fortunes in this business openly, but two; Sir Robert Clifford, and Master William Barley, who sailed over into Flanders, sent indeed from the Party of the Conspirators here, to understand the truth of those things that passed there, and not without some help of monies from hence; Provisionally to be delivered, if they found and were satisfied, that there was truth in these pretences. The person of Sir Robert Clifford (being a Gentleman of Fame and Family) was extremely welcome to the Lady Margaret. Who after she had confeernce with him, brought him to the sight of Perkin, with whom he had often speech and discourse. So that in the end won either by the Duchess, to affect, or by Perkin to believe, he wrote back into England, that he knew the Person of Richard Duke of York, as well as he knew his own; and that this Young-man was undoubtedly he. By this means all things

grew prepared to Revolt and Section here, and the Conspiracy came to have a Correspondence between Planders and England.

The King on his part was not asleep; but to Arm or levy Forces yet, he thought would but shew fear, and do this Idol too much worship. Nevertheless the Ports he did shut up, or at least kept a Watch on them, that none should pass to or fro that was suspected. But for the rest, he chose to work by Counter-mine. His purposes were two; the one, to lay open the Abuse: the other, to break the knot of the Conspirators. To detect the Abuse, there were but two ways; the first, to make it manifest to the world, that the Duke of York was indeed murthered: the other, to prove, that were he dead or alive, yet Perkin was a Counterfeit. For the first, thus it stood. There were but four persons that could speak upon knowledge, to the murther of the Duke of York; Sir James Tirrel, (the employed-man from King Richard) John Dighton, and Miles Forrest, his Servants, (the two Butchers or Tormentors) and the Priest of the Tower, that buried them. Of which four, Miles Forrest, and the Priest were dead, and there remained alive only Sir James Tirrel, and John Dighton. These two the King caused to be committed to the Tower, and examined touching the manner of the Death of the two Innocent Princes. They agreed both in a Tale, (as the King gave out) to this effect: That King Richard having directed his Warrant for the putting of them to death, to Brackenbury the Lieutenant of the Tower, was by him refused. Whereupon the King directed his Warrant to Sir James Tirrel, to receive the Keys of the Tower from the Lieutenant (for the space of a night) for the King's special service. That Sir James Tirrel accordingly repaired to the Tower by night, attended by his two Servants afore-named, whom he had chosen for that purpose. That himself stood at the stair-foot, and sent these two Villains to execute the murther. That they smothered them in their bed; and that done, called up their Master to see their naked dead bodies, which they had laid forth. That they were buried under the Stairs, and some stones cast upon them. That when the report was made to King Richard, that his will was done, he gave Sir James Tirrel great thanks, but took exception to the place of their burial, being too base for them that were King's

children. Where upon another night by the King's Warrant renewed, their bodies were removed by the Priest of the Tower, and buried by him in some place, which (by means of the Priest's death soon after) could not be known. Thus much was then delivered abroad, to be the effect of those Examinations. But the King nevertheless made no use of them in any of his Declarations; whereby (as it seems) those Examinations left the business somewhat perplexed. And as for Sir James Tirrel, he was soon after beheaded in the Tower-yard, for other matters of Treason. But John-Dighton (who it seemeth spake best for the King) was forthwith set at liberty, and was the principal means of divulging this Tradition. Therefore this kind of proof being left so naked, the King used the more diligence in the latter, for the tracing of Perkin. To this purpose, he sent abroad into several parts, and especially into Flanders, divers secret and nimble Scouts and Spies; some feigning themselves to flie over unto Perkin, and to adhere unto him; and some under other pretences, to learn, search, and discover all the circumstances and particulars of Perkin's Parents, Birth, Person, Travels up and down; and in brief, to have a Journal (as it were) of his life and doings. He furnished these his employed-men liberally with Money, to draw on and reward intelligences: giving them also in charge, to advertise continually what they found, and nevertheless still to go on. And ever as one Advertisement and Discovery called up another, he employed other new Men, where the Business did require it. Others he employed in a more special nature and trust, to be his Pioners in the main Counter-mine. These were directed to insinuate themselves into the familiarity and confidence of the principal persons of the Party in Flanders, and so to learn what Associates they had, and Correspondents, either here in England, or abroad; and how far every one engaged, and what new ones they meant afterwards to try, or board. And as this for the Persons; so for the Actions themselves, to discover to the Bottom (as they could) the utmost of Perkin's and the Conspirators their Intentions, Hopes, and Practices. These latter Best-be-trust-Spies had some of them further instructions, to practise and draw off the best Friends and Servants of Perkin, by making remonstrance to them, how weakly his Enterprize and Hopes were built, and with how prudent and

potent a King they had to deal; and to reconcile them to the King, with promise of Pardon, and good Conditions of Reward, And (above the rest) to assail, sap, and work into the constancy of Sir Robert Clifford; and to win him, (if they could) being the man that knew most of their secrets, and who being won away, would most appall and discourage the rest, and in a manner break the Knot.

There is a strange Tradition; That the King being lost in a Wood of Suspitions, and not knowing whom to trust, had both intelligence with the Confessors and Chaplains of divers great men, and for the better Credit of his Espials abroad with the contrary side, did use to have them cursed at St. Pauls (by Name) amongst the Bead-Roll of the King's Enemies, according to the Custom of those Times. These Espials plyed their Charge so roundly; as the King had an Anatomy of Perkin alive; and was likewise well informed of the particular correspondent Conspirators in England, and and many other Mysteries were revealed; and Sir Robert Clifford in especial won to be assured to the King, and industrious and officious for his service. The King therefore (receiving a rich Return of his diligence, and great satisfaction touching a number of Particulars) first divulged and spred abroad the Imposture and jugling of Perkin's Person and Travels, with the Circumstances thereof, throughout the Realm. Not by Proclamation (because things were yet in Examination, and so might receive the more or the less) but by Court-fames, which commonly print better than printed Proclamations. Then thought he it also time to send an Ambassage unto Archduke Philip, into Flanders, for the abandoning and dismissing of Perkin. Herein he employed Sir Edward Poynings, and Sir William Warham, Doctor of the Canon Law. The Archduke was then young, and governed by his Council: before whom the Embassadors had audience, and Doctor Warham spake in this manner:

MY Lords, the King our Master is very sorry, that England and your Countrey here of Flanders having been counted as Man and Wife for so long time, now this Countrey of all others should be the Stage, where a base Counterfeit should play the part of a King of England; not only to his Graces disquiet and dishonour, but to the scorn and reproach of all Sovereign Princes.

To counterfeit the dead Image of a King in his Coyn, is an high Offence by all Laws: But to counterfeit the living Image of a King in his Person, exceedeth all Falsifications, except it should be that of a Mahomet, or an Antichrist, that counterfeit Divine Honour. The King hath too great an Opinion of this sage Council, to think that any of you is caught with this Fable, (though way may be given by you to the passion of some): the thing in it self is so improbable. To set Testimonies aside of the Death of Duke Richard, which the King hath upon Record, plain and infallible because they may be thought to be in the King's own Power) let the thing testifie for it self. Sense and Reason no Power can command. Is it possible (trow you) that King Richard should damn his Soul, and foul his Name with so a Murther, and yet not mend his Case? Or do you think, that Men of Blood (that were his Instruments) did turn to Pity in the middest of their Execution? Whereas in cruel and savage Beasts, and Men also, the first Draught of Blood doth yet make them more fierce, and enraged. Do you not know, that the Bloody Executioners of Tyrants do go to such Errants, with an Halter about their neck: So that if they perform not, they are sure to die for it? And do you think, that these men would hazard their own lives, for sparing anothers? Admit they should have saved him: What should they have done with him? Turn him into London-Streets, that the Watch-men or any Passenger that should light upon him, might carry him before a Justice, and so all come to light? Or should they have kept him by them secretly? That surely would have required a great deal of Care, Charge, and continual Fears. But (my Lords) I labour too much in a clear Business. The King is so wise, and hath so good Friends abroad, as now he knoweth Duke Perkin from his Cradle. And because he is a great Prince, if you have any good Poet here, he can help him with Notes to write his Life; and to parallel him with Lambert Simnel, now the King's Falconer. And therefore (to speak plainly to your Lordships) it is the strangest thing in the World, that the Lady Margaret (excuse us, if we name her, whose Malice to the King is both causlless and endless) should now when she is old, at the time when other Women give over Child-bearing, bring forth two such Monsters; being not the Births of nine or ten Months, but of many Years. And

whereas other natural Mothers bring forth Children weak, and not able to help themselves; she bringeth forth tall Striplings, able soon after their coming into the World, to bid Battel to mighty Kings. My Lords, we stay unwillingly upon this Part. We would to God, that Lady would once tast the Joys, which God Almighty doth serve up unto her, in beholding her Niece to Reign in such Honour, and with so much Royal Issue, which she might be pleased to accompt as her own. The Kings Request unto the Archduke, and your Lordships, might be; That, according to the example of King Charles, who hath already discarded him, you would banish this unworthy Fellow out of your Dominions. But because the King may justly expect more from an ancient Confederate, than from a new reconciled Enemy; he maketh his Request unto you, to deliver him up into his hands. Pirates and Impostures of this sort, being fit to be accounted the Common Enemies of Mankind, and no ways to be protected by the Law of Nations.

After some time of deliberation, the Ambassadors received this short Answer:

THat the Archduke, for the love of King Henry, would in no sort ayd or assist the pretended Duke, but in all things conserve the Amity he had with the King. But for the Duchess Dowager, she was absolute in the Lands of her Dowry, and that he could not let her to dispose of her own.

THE King, upon the return of the Ambassadors, was nothing satisfied with this Answer. For well he knew, that a Patrimonial Dowry carried no part of Sovereignty, or Command of Forces. Besides, the Ambassadors told him plainly, that they saw the Duchess had a great Party in the Archduke's Council; and that howsoever it was carried in a course of connivence, yet the Archduke under-hand gave ayd and furtherance to Perkin. Wherefore (partly out of Courage, and partly out of Policy) the King forthwith banished all Flemings (as well their Persons, as their Wares) out of his Kingdom; commanding his Subjects likewise (and by name his Merchants-Adventurers) which had a Resiance in Antwerp, to return; translating the Mart (which commonly followed the English Cloth) unto Calice, and embarred also all further Trade for the future. This the King did, being sensible in point of honour, not to suffer a Pretender to the Crown of

England, to affront him so near at hand, and he to keep terms of Friendship with the Countrey where did set up. But he had also a further reach: for that he knew well, that the Subjects of Flanders drew so great commodity from the Trade of England, as by this Embargo they would soon wax weary of Perkin, and that the Tumults of Flanders had been so late and fresh, as it was no time for the Prince to displease the People. Nevertheless for forms sake, by way of requital, the Archduke did likewise banish the English out of Flanders; which in effect was done to his hand.

The King being well advertised, that Perkin did more trust upon Friends and Partakers within the Realm, than upon forein Arms, thought it behoved him to apply the Remedy, where the Disease lay; and to proceed with severity against some of the principal Conspirators here within the Realm; Thereby to purge the ill humours in England, and to cool the hopes in Flanders. Wherefore he caused to be apprehended (almost at an instant) John Ratcliff Lord Fitz-water, Sir Simon Mountford, Sir Thomas Thwaites, William Daubigney, Robert Ratcliff, Thomas Chressenor, and Thomas Astwood. All these were arraigned, convicted and condemned for High-Treason, in adhering, and promising ayd to Perkin. Of these, the Lord Fitz-water was conveyed to Calice, and there kept in hold, and in hope of life, until soon after (either impatient, or betrayed) he dealt with his Keeper to have escaped, and thereupon was beheaded. But Sir Simon Mountford, Robert Ratcliff, and William Daubigney were beheaded immediately after their Condemnation. The rest were pardoned, together with many others, Clerks and Laicks; amongst which were two Dominican Friers, and William Worseley, Dean of St. Pauls: which latter sort passed Examination, but came not to publick Tryal.

The Lord Chamberlain at that time was not touched; whether it were, that the King would not stir too many humours at once, but (after the manner of good Physicians) purge the Head last; or that Clifford (from whom most of these Discoveries came) reserved that Piece for his own coming over: signifying only to the King in the mean time, that he doubted there were some greater ones in

the business, whereof he would give the King further account, when he came to his presence.

Upon All-hallows-day-even, being now the tenth year of the King's Reign, the King's second Son Henry was created Duke of York; and as well the Duke, as divers others, Noblemen, KnightsBatchelors, and Gentlemen of quality were made Knights of the Bath, according to the Ceremony. Upon the morrow after Twelfthday, the King removed from Westminster (where he had kept his Christmas) to the Tower of London. This he did as soon as he had advertisement, that Sir Robert Clifford (in whose Bosom or Budget most of Perkin's secrets were laid up) was come into England. And the place of the Tower was chosen to that end, that if Clifford should accuse any of the Great-ones, they might without suspition, or noise, or sending abroad of Warrants, be presently attached; the Court and Prison being within the cincture of one Wall. After a day or two, the King drew unto him a selected Council, and admitted Clifford to his presence; who first fell down at his feet, and in all humble manner craved the King's Pardon, which the King then granted, though he were indeed secretly assured of his life before. Then commanded to tell his knowledge, he did amongst many others (of himself, not interrogated) appeach Sir William Stanley, the Lord Chamberlain of the King's Houshold.

The King seemed to be much amazed at the naming of this Lord, as if he had heard the news of some strange and fearful Prodigy. To hear a man that had done him service of so high a nature, as to save his Life, and set the Crown upon his head; a man, that enjoyed by his favour and advancement, so great a fortune, both in Honour and Riches; a man, that was tyed unto him in so near a band of Alliance, his Brother having married the King's Mother; and lastly, a man to whom he had committed the trust of his Person, in making him his Chamberlain. That this Man, no ways disgraced, no ways discontent, no ways put in fear, should be false unto him. Clifford was required to say over again, and again, the Particulars of his Accusation; being warned, that in a matter so unlikely, and that concerned so great a Servant of the King's, he should not in any wise go too far. But the King finding that he did sadly, and constantly (without hesitation or

varying, and with those civil Protestations that were fit) stand to that that he had said, offering to justifie it upon his soul and life; he caused him to be removed. And after he had not a little bemoaned himself unto his Council there present, gave order that Sir William Stanley should be restrained in his own Chamber, where he lay before, in the Square Tower. And the next day he was examined by the Lords. Upon his Examination, he denyed little of that wherewith he was charged, nor endeavoured much to excuse or extenuate his fault. So that (not very wisely) thinking to make his Offence less by Confession, he made it enough for Condemnation. It was conceived, that he trusted much to his former Merits, and the interest that his Brother had in the King. But those helps were over-weighed by divers things that made against him, and were predominant in the King's nature and mind. First, an Over-merit; for convenient Merit, unto which reward may easily reach, doth best with Kings. Next the sense of his Power; for the King thought, that he that could set him up, was the more dangerous to pull him down. Thirdly, the glimmering of a Confiscation; for he was the richest Subject for value in the Kingdom: there being found in his Castle of Holt forty thousand Marks in ready Money, and Plate, besides Jewels, Houshold-stuff, Stocks upon his grounds, and other Personal Estate, exceeding great. And for his Revenue in Land and Fee, it was three thousand Pounds a year of old-Rent, a great matter in those times. Lastly, the Nature of the Time; for if the King had been out of fear of his own Estate, it was not unlike he would have spared his life. But the Cloud of so great a Rebellion hanging over his head, made him work sure. Wherefore after some six Weeks distance of time, which the King did honorably interpose, both to give space to his Brother's Intercession, and to shew to the world, that he had a conflict with himself what he should do; he was arraigned of High-Treason, and condemned, and presently after beheaded.

Yet it is to this day left but in dark memory, both what the Case of this Noble Person was, for which he suffered; and what likewise was the ground and cause of his defection, and the alienation of his heart from the King. His Case was said to be this: That in discourse between Sir Robert Clifford and him, he had said, That if he were sure, that that young man were King Edward's Son, he would

never bear Arms against him. This Case seems somewhat an hard Case, both in respect of the Conditional, and in respect of the other words. But for the Conditional, it seems the Judges of that time (who were Learned men, and the three chief of them of the Privy Council) thought it was a dangerous thing to admit Ifs and Ands, to qualifie words of Treason; whereby every man might express his malice, and blanch his danger. And it was like to the Case (in the following times) of Elizabeth-Barton, the holy Maid of Kent; who had said, That if King Henry the Eighth did not take Catherine his Wife again, he should be deprived of his Crown, and dye the death of a Dog. And infinite Cases may be put of like nature. Which (it seemeth) the grave Judges taking into Consideration, would not admit of Treasons upon Condition. And as for the Positive words, That he would not bear Arms against King Edward's Son, though the words seem calm, yet it was a plain and direct Overruling of the King's Title, either by Line of Lancaster, or by Act of Parliament. Which (no doubt) pierced the King more, than if Stanley had charged his Lance upon him in the field. For if Stanley would hold that opinion, that a Son of King Edward had still the better right, he being so principal a person of Authority, and favour about the King; it was to teach all England to say as much. And therefore (as those times were) that speech touched the quick. But some Writers do put this out of doubt; for they say, that Stanley did expresly promise to ayd Perkin, and sent him some help of Treasure.

Now for the Motive of his falling off from the King; It is true, that at Bosworth-Field the King was be-set, and in a manner inclosed round about by the Troops of King Richard, and in manifest danger of his life; when this Stanley was sent by his Brother, with three thousand men to his Rescue, which he performed so, that King Richard was slain upon the Place. So as the condition of Mortal men is not capable of a greater benefit, than the King received by the hands of Stanley; being like the benefit of Christ, at once to Saye, and Crown. For which service the King gave him great gifts, made him his Counsellor and Chamberlain; and (some what contrary to his nature) had winked at the great Spoils of Bosworth-Field, which came almost wholly to this man's hands, to his

infinite enriching. Yet nevertheless blown up with the conceit of his Merit, he did not think he had received good Measure from the King, at least not Pressing-down, and Runningover, as he expected. And his ambition was so exorbitant, and unbounded, as he became Sultor to the King for the Earldom of Chester. Which ever being a kind of Appennage to the Principality of Wales and using to go to the King's Son; his Suit did not only end in a Denial, but in a Distaste. The King perceiving thereby, that his Desires were intemperate, and his Cogitations vast, and irregular, and that his former Benefits were but cheap, and lightly regarded by him. Wherefore the King began not to brook him well. And as a little Leaven of new Distaste doth commonly sowre the whole Lump of former Merits, the King's Wit began now to suggest unto his Passion, that Stanley, at Bosworth-Field, though he came time enough to save his life, yet he stayed long enough to endanger it. But yet having no matter against him, he continued him in his Places, until this his Fall.

After him was made Lord Chamberlain, Giles Lord Dawbeny, a man of great sufficiency and valour; the more, because he was gentle and moderate.

There was a common Opinion, That Sir Robert Clifford (who now was become the State-Informer) was from the beginning an Emissary, and Spy of the King's; and that he fled over into Flanders, with his consent and privity. But this is not probable; both because he never recovered that degree of Grace, which he had with the King before his going over: and chiefly, for that the Discovery which he had made touching the Lord Chamberlain (which was his great Service) grew not from any thing he learn'd abroad, for that he knew it well before he went.

These Executions (and especially that of the Lord Chamberlain's, which was the chief strength of the Party, and by means of Sir Robert Clifford, who was the most inward man of Trust amongst them) did extremely quail the Design of Perkin, and his complices, as well through Discouragement, as Distrust. So that they were now (like Sand without Lime) ill bound together; especially as many as were English: who were at a gaze, looking strange, one upon another, not knowing who was faithful to their Side; but thinking, that the King (what with

his Baits, and what with his Nets) would draw them all unto him that were any thing worth. And indeed it came to pass, that divers came away by the Thred, sometimes one, and sometimes another, Barley (that was Joynt-Commissioner with Clifford) did hold out one of the longest, till Perkin was far worn; yet made his Peace at the length. But the Fall of this Great man, being in so high Authority and Favour (as was thought) with the King; and the manner of Carriage of the Business, as if there had been secret Inquisition upon him, for a great time before, and the Cause for which he suffered, which was little more, than for saying in effect, That the Title of York was better than the Title of Lancaster; which was the Case almost of every man (at the least in Opinion;) was matter of great Terrour amongst all the King's Servants and Subjects: Insomuch, as no man almost thought himself secure; and men durst scarce commune or talk one with another: but there was a general Diffidence every where. Which nevertheless made the King rather more Absolute, than more Safe. For, Bleeding Inwards and shut Vapours strangle soonest, and oppress most.

Hereupon presently came forth Swarms and Volies of Libels (which are the Gusts of Liberty of Speech restrained, and the Females of Sedition) containing bitter Invectives, and Slanders against the King, and some of the Council. For the contriving and dispersing whereof (after great Diligence of Inquiry) five mean persons were caught, and executed.

Mean while; the King did not neglect Ireland, being the Soil where the Musbromes and Upstart-Weeds (that spring up in a Night) did chiefly prosper. He sent therefore from hence (for the better setling of his affairs there) Commissioners of both Robes: The Prior of Lanthony, to be his Chancellour in that Kingdom; and Sir Edward Poynings, with a Power of Men, and a Marshal Commission, together with a Civil Power of his Lieutenant, with a Clause, That the Earl of Kildare, then Deputy, should obey him. But, the Wild-Irish (who were the principal Offendors) fled into the Woods and Bogs, after their manner: and those, that knew themselves guilty, in the Pale, fled to them. So that Sir Edward Poynings was enforced to make a Wild-Chase upon the Wild-Irish: Where (in respect of the Mountains and Fastnesses) he did little good. Which

(either out of a suspicious Melancholy upon his bad Success, or the better to save his service from Disgrace) he would needs impute unto the Comfort, that the Rebels should receive under-hand from the Earl of Kildare; every light suspition growing upon the Earl, in respect of the Kildare that was in the Action of Lambert Simnel, and slain at Stoke-field. Wherefore he caused the Earl to be apprehended, and sent into England; where, upon Examination, he cleared himself so well, as he was re-placed in his Government. But, Poynings (the better to make compensation of the Meagerness of his Service in the Wars, by acts of Peace) called a Parliament; where was made that memorable Act, which this day is called Poynings Law, whereby all the Statutes of England were made to be of force in Ireland. For, before they were not: neither are any now in force in Ireland, which were made in England since that time; which was the tenth year of the King.

About this time, began to be discovered in the King that disposition, which, afterward nourished and whet-on by bad Counsellors and Ministers, proved the Blot of his times; which was, the course he took, to crush Treasure out of his Subjects Purses, by Forfeitures upon Penal Laws. At this, men did startle the more at this time, because it appeared plainly to be in the King's Nature, and not out of his Necessity, he being now in Float for Treasure; For that he had newly received the Peace-money from France, the Benevolence-money from his Subjects, and great Casualties upon the Confiscations of the Lord Chamberlain, and divers others. The first noted Case of this kind, was that of Sir William Capel, Alderman of London: Who, upon sundry Penal Laws, was condemned in the summ of seven and twenty hundred Pounds, and compounded with the King for sixteen hundred: And yet after, Empson would have cut another Chop out of him, if the King had not died in the instant.

The Summer following, the King, to comfort his Mother (whom he did always tenderly love and revere) and to make Demonstration to the World, that the proceedings against Sir William Stanley (which was imposed upon him by necessity of State) had not in any degree diminished the affection he bare to

Thomas, his Brother; went in Progress to Latham, to make merry with his Mother, and the Earl; and lay there divers days.

During this Progress, Perkin Warbeck finding, that time and temporizing, which (whilest his practices were covert and wrought well in England) made for him; did now, when they were discovered and defeated, rather make against him, (for that when matters once go down the Hill, they stay not without a new force) resolved to try his adventure in some exploit upon England; hoping still upon the affections of the Common People towards the House of York. Which body of Common People he thought was not to be practised upon, as persons of Quality are; But, that they only practice upon their affections, was, to set up a Standard in the field. The Place where he should make his Attempt, he chose to be the Coast of Kent.

The King by this time was grown to such an height of Reputation for cunning and Policy, that every Accident and Event, that went well, was laid and imputed to his foresight, as if he had set it before: As, in this particular of Perkin's Design upon Kent. For, the world would not believe afterwards, but the King, having secret Intelligence of Perkin's intention for Kent (the better to draw it on) went of purpose into the North, a-faroff, laying an open side unto Perkin, to make him come to the close, and so to trip up his heels, having made sure in Kent beforehand.

But so it was, that Perkin had gathered together a Power of all Nations, neither in number, not in the hardiness and courage of the Persons, contemptible; but, in their nature and fortunes, to be feared as well of Friends as Enemies; being Bankrupts, and many of them Felons, and such as lived by Rapine. These he put to Sea, and arrived upon the Coast of Sandwich and Deal in Kent, about July.

There he cast Anchor; and to prove the affections of the People, sent some of his men to land, making great boast of the Power that was to follow. The Kentish-men (perceiving that Perkin was not followed by any English of name or account, and that his forces consisted but of strangers born, and most of them base People, and Free-booters, fitter to spoil a Coast, than to recover a Kingdom) resorting unto the principal Gentlemen of the Countrey, professed their loyalty to the King, and desired to be directed and commanded for the best of the King's service. The Gentlemen, entring into Consultation, directed some forces in good number, to shew themselves upon the Coast; and some of them to make signs, to entice Perkin's Soldiers to land, as if they would joyn with them: and some others to appear from some other places, and to make semblance as if they fled from them; the better to encourage them to land. But, Perkin (who, by playing the Prince, or else taught by Secretary Frion, had learned thus much, That People under Command, do use to consult, and after to march in order; and Rebels contrariwise run upon an Head together in confusion) considering the delay of time, and observing their orderly, and not tumultuary Arming, doubted the worst. And therefore the wily Youth would not set one foot out of his Ship, till he might see things were sure. Wherefore the King's Forces, perceiving that they could draw on no more than those that were formerly landed, set upon them, and cut them in pieces, ere they could flie back to their Ships. In which Skirmish (besides those that fled, and were slain) there were taken about an hundred and fifty persons. Which, for that the King thought, that to punish a few for example was Gentleman's play, but for Rascal-People, they were to be cut off every man, especially in the beginning of an Enterprize; and likewise for that he saw, that Perkin's Forces would now consist chiefly of such Rabble and scum of desperate people; he therefore hanged them all, for the greater terrour. They were brought to London, all rail'd in Ropes, like a Team of Horses in a Cart; and were executed some of them at London, and Wapping, and the rest at divers places upon the Sea-Coast of Kent, Sussex, and Norfolk, for Sea-marks, or Light-houses, to teach Perkin's People to avoid the Coast. The King, being advertised of the landing of the Rebels, thought to leave his Progress: But, being certified

the next day, that they were partly defeated, and partly fled, he continued his Progress, and sent Sir Richard Guilford into Kent in message. Who, calling the Countrey together, did much commend (from the King) their fidelity, manhood, and well handling of that service; and gave them all thanks, and (in private) promised Reward to some particulars.

Upon the sixteenth of November (this being the Eleventh year of the King) was holden the Serjeants-Feast, at Ely-Place; there being nine Serjeants of that Call. The King, to honour the Feast, was present with his Queen at the Dinner; being a Prince, that was ever ready to grace and countenance the Professors of the Law; having a little of that, That as he governed his Subjects by his Laws, so he governed his Laws by his Lawyers.

This year also the King entred into League with the Italian Potentates, for the defence of Italy, against France. For, King Charles had conquered the Realm of Naples, and lost it again, in a kind of Felicity of a Dream. He passed the whole length of Italy without resistance: so that it was true which Pope Alexander was wont to say; That the French-men came into Italy, with in their hands, to mark up their lodgings, rather than with Swords to fight. He likewise entred and won, in effect, the whole Kingdom of Naples it self, without striking stroke. But, presently thereupon, he did commit and multiply so many Errours, as was too great a task for the best fortune to overcome. He gave no contentment to the Barons of Naples, of the Faction of the Angeovines; but, scattered his rewards according to the mercenary appetites of some about him. He put all Italy upon their Guard, by the seizing and holding of Ostia, and the protecting of the Liberty of Pisa: which made all men suspect that his purposes looked further, than his Title of Naples. He fell too soon at difference with Ludovico Sfortia; who was the man that carried the Keys which brought him in, and shut him out. He neglected to extinguish some reliques of the War. And lastly, in regard of his easie passage through Italy without resistance, he entred into an over-much despising of the Arms of the Italians: whereby he left the Realm of Naples, at his departure, so much the less provided. So that not long after his return; the whole Kingdom revolted to Ferdinando the younger, and the French were quite driven

out. Nevertheless, Charles did make both great threats, and great preparations, to re-enter Italy once again. Wherefore, at the instance of divers of the States of Italy (and especially of Pope Alexander, there was a League concluded, between the said Pope, Maximilian King of Romans, Henry King of England, Ferdinando and Isabella, King and Queen of Spain (for so they are constantly placed in the Original Treaty throughout,) Augustissimo Barbadico, Duke of Venice and Ludovico Sfortia, Duke of Millan, for the common defence of their Estates. Wherein though Ferdinando of Naples was not named as principal; yet, no doubt, the Kingdom of Naples was tacitly included, as a Fee of the Church.

There dyed also this year Cecile, Duchess of York, Mother to King Edward the Fourth, at her Castle of Barkbamstead, being of extreme years; and who had lived to see three Princes of her body crowned, and four murthered. She was buried at Foderingham, by her Husband.

This year also the King called his Parliament: where many Laws were made, of a more private and vulgar nature, than ought to detain the Reader of an History. And it may be justly suspected, by the proceedings following, that as the King did excell in good Common-wealth Laws; so nevertheless he had, in secret, a design to make use of them, as well for collecting of Treasure, as for correcting of Manners; and so, meaning thereby to harrow his People, did accumulate them the rather.

The principal Law, that was made this Parliament, was a Law of a strange nature: rather just, than legal; and more magnanimous than provident. This Law did ordain, That no person, that did assist in Arms, or otherwise, the King for the time being, should after be impeached therefore, or attainted, either by the course of the Law, or by Act of Parliament: But, if any such Act of Attainder did happen to be made, it should be void, and of none effect; For that it was agreeable to reason of Estate, that the Subject should not enquire of the justness of the King's Title, or Quarrel; and it was agreeable to good Conscience, (that whatsoever the fortune of the War were) the Subject should not suffer for his Obedience. The spirit of this Law was wonderful Pious and Noble: being like in matter of War, unto the spirit of David in matter of Plague, who said, If I have

sinned, strike me; but what have these sheep done? Neither wanted this Law parts of prudent and deep fore-sight. For, it did the better take away occasion, for the People to busie themselves, to pry into the King's Title for that howsoever it fell, their safety was already provided for. Besides, it could not but greatly draw unto him, the love and hearts of the People, because he seemed more careful for them, than for himself. But yet nevertheless, it did take off from his Party, that great Tye and Spur of necessity, to fight and go Victors out of the field; considering their lives and fortunes were put in safety, and protected, whether they stood to it, or ran away. But the force and obligation of this Law was in it self Illusory, as to the latter part of it; by a precedent Act of Parliament, to bind or frustrate a future. For a supreme and absolute Power cannot conclude it self, neither can that which is in nature revocable be made fixed: no more than if a man should appoint or declare by his Will, that if he made any Latter Will, it should be void. And for the Case of the Act of Parliament, there is a notable President of it in King Henry the Eighth's time: Who, doubting he might dye in the minority of his Son, procured an Act to pass, That no Statute made during the minority of the King, should bind him or his Successors, except it were confirmed by the King under his great Seal, at his full age. But the first Act that passed in King Edward the Sixth his time, was an Act of Repeal of that former Act; at which time nevertheless the King was Minor. But things that do not bind; may satisfie for the time.

There was also made a shoaring or under-propping Act for the Benevolence; to make the summs which any person had agreed to pay, and nevertheless were not brought in, to be leviable by course of Law. Which Act did not only bring in the Arears, but did indeed countenance the whole business, and was pretended to be made at the desire of those, that had been forward to pay.

This Parliament also was made that good Law, which gave the Attaint upon a false Verdict between Party and Party, which before was a kind of Evangile, irremediable. It extends not to causes Capital, as well because they are for the most part at the King's Suit; as because in them (if they be followed in Course of Indictment) there passeth a double Jury, the Indictors and the Tryers; and so not

Twelve Men, but Four and twenty. But it seemeth that was not the only reason; for this reason holdeth not in the Appeal. But the great reason was, lest it should tend to the discouragement of Jurors in Cases of Life and Death; if they should be subject to Suit and Penalty, where the favour of Life maketh against them. It extendeth not also to any Suit, where the Demand is under the value of forty Pounds; for that in such Cases of petty value, it would not quit the Charge, to go about again.

There was another Law made against a branch of Ingratitude in Women, who having been advanced by their Husbands., or their Husbands Ancestors, should alien, and thereby seek to defeat the Heirs, or those in Remainder, of the Lands, whereunto they had been so advanced. The remedy was, by giving power to the next, to enter for a forfeiture.

There was also enacted that Charitable Law, for the admission of poor Suitors In Forma Pauperis, without Fee to Counsellor, Attorney, or Clerk, whereby poor men became rather able to vex; than unable to sue. There were divers other good Laws made that Parliament, as we said before: but we still observe our manner, in selecting out those, that are not of a Vulgar nature.

The King this while, though he sate in Parliament, as in full Place, and seemed to account of the designs of Perkin (who was now returned into Flanders) but as a May-game; yet having the composition of a wise-King (Stout without, and Apprehensive within) had given order for the watching of Beacons upon the Coasts, and erecting more where they stood too thin; and had a careful eye where this wandering Cloud would break. But Perkin advised to keep his fire (which hitherto burned as it were upon green wood) alive, with continual blowing; Sailed again into Ireland, whence he had formerly departed, rather upon the hopes France, than upon any unreadiness or discouragement he found in that People. But in the space of time between the King’s Diligence and Poynings Commission, had so setled things there, as there was nothing left for Perkin, but the blustring affection of wild and naked people. Wherefore he was advised by his Council, to seek ayd of the King of Scotland; a Prince young, and valorous, and in good terms with his Nobles and People, and ill affected to King

Henry. At this time also both Maximilian and Charles of France began to bear no good will to the King. The one being displeased with the King's Prohibition of Commerce with Flanders; the other holding the King for suspect, in regard of his late entry into League with the Italians. Wherefore besides the open Ayds of the Duchess of Burgandy, which did with Sails and Oars put on and advance Perkin's designs, there wanted not some secret Tides from Maximilian and Charles, which did further his fortunes. In so much as they, both by their secret Letters, and Messages, recommended him to the King of Scotland.

Perkin therefore coming into Scotland upon those hopes, with a well appointed company, was by the King of Scots (being formerly well prepared) honourably welcomed, and soon after his arrival admitted to his Presence, in a solemn manner. For the King received him in State in his Chamber of Presence, accompanied with divers of his Nobles. And Perkin well attended, as well with those that the King had sent before him, as with his own Train, entred the room where the King was, and coming near to the King, and bowing a little to embrace him, he retired some paces back, and with a loud voice (that all that were present might hear him) made his Declaration in this manner:

HIgh and Mighty King, your Grace, and these your Nobles here present, may be pleased benignly to bow your Ears, to hear the Tragedy of a young Man, that by right ought to hold in his hand the Ball of a Kingdom; but by Fortune is made Himself a Ball; tossed from Misery to Misery, and from Place to Place. You see here before you the Spectacle of a Plantagenet, who hath been carried from the Nursery to the Sanctuary; from the Sanctuary, to the direful Prison; from the Prison, to the hand of the cruel Tormentor; and from that hand, to the wide-Wilderness (as I may truly call it) for so the World hath been to me. So that he that is born to a great Kingdom, hath not ground to set his foot upon, more than this where he now standeth, by your Princely Favour. Edward the Fourth, late King of England, (as your Grace cannot but have heard) left two Sons; Edward, and Richard Duke of York, both very young. Edward, the eldest succeeded their Father in the Crown, by the name of King Edward the Fifth. But Richard, Duke of Gloceffer, their unnatural Uncle, first thirsting after the Kingdom, through

Ambition, and afterwards thirsting for their Blood, out of desire to secure himself; employed an Instrument of his (confident to him, as he thought) to murther them both. But this Man that was employed to execate that execrable Tragedy, having cruelly slain King Edward the eldest of the two, was moved partly by Remorse, and partly by some other mean, to save Richard his Brother; making a Report nevertheless to the Tyrant, that he had performed his Commandment for both Brethren. This Report was accordingly believed, and published generally. So that the World hath been possessed of an Opinion, that they both were barbarously made away, though ever Truth hath some sparks that flie abroad, until it appear in due time, as this hath had. But Almighty God, that stopped the mouth of the Lion, and saved little Joas from the Tyranny of Athaliah, when she massacred the King's Children; and did save Isaac, when the hand was stretched forth to sacrifice him, preserved the second Brother. For I my self, that stand here in your presence, am that very Richard, Duke of York, Brother of that infortunate Prince, King Edward the Fifth, now the most rightful surviving Heir-male to that Victorious and most Noble Edward, of that name the Fourth, late King of England. For the manner of my Escape, it is fit it should pass in silence, or (at least) in a more secret Relation: for that it may concern some alive, and the memory of some that are dead. Let it suffice to think, that I had then a Mother living, a Queen, and one that expected daily such a Commandment from the Tyrant, for the murthering of her Children. Thus in my tender age escaping by God's mercy out of London, I was secretly conveyed over Sea. Where, after a time, the Party that had me in Charge, (upon what new Fears, change of Mind; or Practice, God knoweth) suddenly forsook me. Whereby I was forced to wander abroad, to seek mean Conditions for the sustaining of my Life. Wherefore distracted between several Passions, the one of fear to be known, lest the Tyrant should have a new Attempt upon me; the other of Grief and Disdain to be unknown, and to live in that base and servile manner that I did; I resolved with my self to expect the Tyrant's death, and then to put my self into my Sisters hands, who was next Heir to the Crown. But in this season, it happened one Henry Tidder, Son to Edmond Tidder Earl of Richmond,

to come from France, and enter into the Realm, and by subtil and foul means to obtain the Crown of the same, which to me rightfully appertained. So that it was but a change, from Tyrant to Tyrant. This Henry, my extreme and mortal Enemy, so soon as he had knowledge of my being alive, imagined and wrought all the subtil ways and means he could, to procure my final Destruction. For my mortal Enemy hath not only falsly surmised me to be a feigned Person, giving me Nick-names, so abusing the World; but also, to deferr and put me from entry into England, hath offered large summs of Money, to corrupt the Princes and their Ministers, with whom I have been retained; and made importune Labours to certain Servants about my Person, to murther or Poyson me, and others to forsake and leave my righteous Quarrel, and to depart from my Service, as Sir Robert Clifford, and others. So that every man of Reason may well perceive, that Henry, calling himself King of England, needed not to have bestowed such great summs of Treasure, nor so to have busied himself with importune and incessant Labour and Industry, to compass my Death and Ruine, if I had been such a feigned Person. But the truth of my Cause being so manifest, moved the most Christian King Charles, and the Lady Duchess Dowager of Burgundy, my most dear Aunt, not only to acknowledge the truth thereof, but lovingly to assist me. But it seemeth that God above (for the good of this whole Island, and the knitting of these two Kingdoms of England and Scotland in a strait Concord and Amity, by so great an Obligation) had reserved the placing of me in the Imperial Throne of England, for the Arms and Succours of your Grace. Neither is it the first time that a King of Scotland hath supported them, that were bereft and spoiled of the Kingdom of England; as of late (in fresh memory) it was done in the Person of Henry the Sixth. Wherefore for that your Grace hath given clear signs, that you are in no Noble quality inferiour to your Royal Ancestors; I, so distressed a Prince, was hereby moved to come and put my self into your Royal Hands, desiring your Assistance to recover my Kingdom of England; promising faithfully to bear my self towards your Grace no otherwise, than if I were your own Natural Brother, and will upon the Recovery of mine Inheritance, gratefully do you all the Pleasure that is in my utmost Power.

AFter Perkin had told his Tale, King James answered bravely and wisely;

That whatsoever he were, he should not repent him of putting himself into his hand.

And from that time forth, though there wanted not some about him, that would have perswaded him, that all was but an Illusion; yet notwithstanding, either taken by Perkin's amiable and alluring behaviour, or inclining to the recommendation of the great Princes abroad, or willing to take an occasion of a War against King Henry, he entertained him in all things, as became the person of Richard Duke of York; embraced his Quarrel; (and the more to put it out of doubt, that he took him to be a great Prince, and not a Representation only) he gave consent that this Duke should take to Wife the Lady Catherine Gordon, Daughter to Earl Huntley, being a near Kinswoman to the King himself, and a young Virgin of excellent beauty and virtue.

Not long after, the King of Scots in person, with Perkin in his company, entred with a great Army (though it consisted chiefly of Borderers, being raised somewhat suddenly) into Northumberland. And Perkin, for a Perfume before him as he went, caused to be published a Proclamation of this tenour following, in the name of Richard Duke of York, true Inheritor of the Crown of England.

IT hath pleased God, who putteth down the Mighty from their Seat, and exalteth the Humble, and suffereth not the hopes of the Just to perish in the end, to give Us means at the length, to shew Our Selves armed unto Our Lieges and People of England. But far be it from Us, to intend their hurt and damage, or to make War upon them, otherwise than to deliver Our Self and them from Tyranny and Oppression. For, Our mortal Enemy Henry Tidder, a false of the Crown of England, (which tolls by Natural and Lineal Right appertaineth) knowing in his own Heart Our undoubted Right, (We being the very Richard, Duke of York; younger Son, and now surviving Heir-male of the Noble and Victorious Edward the Fourth, late King of England) hath not only deprived Us of Our Kingdom, but likewise by all foul and wicked means, sought to betray Us, and bereave Us of Our Life. Yet if his Tyranny only extended it self to Our Person (although Our Royal Blood teacheth Us to be sensible of Injuries) it should be less to Our

Grief. But this Tidder, who boasteth himself to have overthrown a Tyrant, hath ever since his first entrance into his Usurped Reign, put little in practice, but Tyranny and the feats thereof.

For King Richard Our unnatural Uncle, although desire of Rule did blind him, yet in his other actions (like a true Plantagenet) was Noble, and loved the Honour of the Realm, and the Contentment and Comfort of his Nobles and People. But this Our Mortal Enemy (agreeable to the meanness of his Birth) hath trod under foot the Honour of this Nation; selling Our hest Confederates for Money, and making Merchandize of the Blood, Estates, and Fortunes of Our Peers and Subjects, by feigned wars, and dishonourable Peace, only to enrich his Coffers. Nor unlike hath been his hateful Misgovernment, and evil Deportments at home. First, he hath (to fortifie his false Quarrel) caused divers Nobles of this Our Realm (whom he held Suspect, and stood in dread of) to be cruelly murthred; as Our Cousin Sir William Stanley Lord Chamberlain, Sir Simon Mountfort, Sir Robert Ratcliff, William Dawbeney, Humphrey Stafford, and many others, besides such as have dearly bought their Lives with intolerable Ransoms. Some of which Nobles are now in the Sanctuary. Also he hath long kept, and yet keepeth in Prison, Our right entirely beloved Cousin Edward, Son and Heir to Our Uncle Duke of Clarence, and others; with-bolding from them their rightful Inheritance, to the intent they should never be of might and power, to aid and assist Us at Our need, after the duty of their Liegeances. He also married by compulsion certain of Our Sisters, and also the Sister of Our said Cousin the Earl of Warwick, and divers other Ladies of the Royal Blood, unto certain of his Kinsmen and Friends of simple and low Degree, and putting apart all well-disposed Nobles, he hath none in favour and trust about his Person, but Bishop Fox, Smith, Bray, Lovel, Oliver King, David Owen, Risley, Turbervile, Tiler, Cholmley, Empson, James Hobart, John Cut, Garth, Henry Wyat, and such other Cattiffs and Villains of Birth, which by subtil Inventions and Pilling of the People, have been the principal Finders, Occasioners, and Counsellors of the Mis-rule and Mischief now reigning in England.

We remembring these Premisses, with the great and execrable Offences daily committed and done by Our foresaid great Enemy, and his Adherents, in breaking the Liberties and Franchises of Our Mother the Holy Church, upon pretences of Wicked and Heathenish Policy, to the high displeasure of Almighty God; besides the manifold Treasons, abominable Murthers Man-slaughters, Robberies, Extortions, the daily Pilling of the People, by Disms, Taxes, Tallages, Benevolences, and other unlawful Impositions, and grievous Exactions, with many other heinous Effects, to the likely destruction and desolation of the whole Realm; shall by God's grace, and the help and assistante of the great Lords of Our Blood, with the counsel of other sad Persons, see that the Commodities of Our Realm be employed to the most advantage of the same; the intercourse of Merchandise betwixt Realm and Realm, to be ministred and handled, as shall more be to the Common-weal and prosperity of Our Subjects; and all such Disms, Taxes, Tallages, Benevolences, unlawful Impositions, and grievous Exactions, as be above rehearsed to be fore-done and laid apart, and never from henceforth to be called upon, but in such cases as Our Noble Progenitors, Kings of England, have of old time been accustomed to have the ayd, succour, and help of their Subjects and true Liege-men.

And further, We do out of Our Grace and Clemency, hereby as well publish and promise to all our Subjects Remission and free Pardon of all By-past Offences whatsoever, against Our Person, or Estate, in adhering to Our said Enemy, by whom (We know well) they have been mis-led, if they shall within time convenient submit themselves unto Us. And for such as shall come with the foremost, to assist Our Righteous Quarrel, We shall make them so far partakers of Our Princely Favour and Bounty; as shall be highly for the Comfort of them and theirs, both during their life, and after their death. As also We shall by all means, which God shall put into Our hands, demean Our selves to give Royal contentment to all Degrees and Estates of Our People, maintaining the Liberties of Holy Church in their Entire, preserving the Honours, Priviledges, and Prebeminences of Our Nobles, from contempt or disparagement, according to the dignity of their Blood. We shall also unyoak. Our People from all heavy

Burthens and Endurances, and confirm Our Cities, Boroughs, and Towns in their Charters and Freedoms, with enlargement, where it shall be deserved, and in all points give Our Subjects cause to think, that the blessed and debonair Government of Our Noble Father King Edward (in his last times) is in Us revived.

And for as much as the putting to death, or taking alive of Our said Mortal Enemy, may be a mean to stay much effusion of Blood, which otherwise may ensue, if by Compulsion or fair Promises, he shall draw after him any number of Our Subjects to resist Us; whith We desire to avoid (though We be certainly informed, that Our said Enemy is purposed and prepared to flie the Land, having already made over great masses of the Treasure of Our Crown, the better to support him in Forein Parts) We do hereby declare, That whosoever shall take or distress Our said Enemy (though the Party be of never so mean a Condition) he shall be by Us rewarded with a Thousand Pound in Money, forthwith to be laid down to him, and an Hundred Marks by the year of Inheritance; besides that he may otherwise merit, both toward God and all good People, for the destruction of such a Tyrant.

Lastly, We do all men to wit; and herein We take also God to witness, That whereas God hath moved the Heart of Our dearest Cousin, the King of Scotland, to aid Us in Person, in this Our righteous Quarrel; it is altogether without any Pact or Promise, or so much as demand of any thing, that may prejudice Our Crown, or Subjects: But contrariwise with promise on Our said Cousin's part, that whensoever he shall find Us in sufficient strength to get the upper hand of Our Enemy, (which we hope will be very suddenly) he will forthwith peaceably return into his own Kingdom; contenting himself only with the glory of so Honourable an Enterprize, and Our true and faithful Love and Amity. Which We shall ever (by the Grace of Almighty God) so order, as shall be to the great comfort of both Kingdoms.

BUT Perkin's Proclamation did little edifie with the people of England; neither was he the better welcom for the company he came in. Wherefore the King of Scotland seeing none came in to Perkin, nor none stirred any where in

his favour, turned his Enterprize into a Rode; and wasted and destroyed the Countrey of Northumberland with fire and sword. But hearing that there were Forces coming against him, and not willing that they should find his men heavy and laden with booty, he returned into Scotland with great Spoils, deferring further prosecution, till another time. It is said, that Perkin acting the part of a Prince handsomly, when he saw the Scottish fell to waste the Countrey, came to the the King in a passionate manner, making great lamentation, and desired, That that might not be the manner of making the War, for that no Crown was so dear to his mind, as that he desired to purchase it with the blood and ruine of his Countrey. Whereunto the King answered half in sport; that he doubted much, he was careful for that that was none of his, and that he should be too good a Steward for his Enemy, to save the Countrey to his use.

By this time, being the Eleventh year of the King, the Interruption of Trade between the English and the Plemmish, began to pinch the Merchants of both Nations very sore. Which moved them, by all means they could devise, to affect and dispose their Savereigns respectively, to open the Intercourse again. Wherein, time favoured them. For the ArchDuke and his Council began to see, that Perkin would prove but a Runnagate, and Citizen of the World; and that it was the part of Children to fall out about Babies. And the King on his part, after the Attempts upon Kent and Northumberland, began to have the business of Perkin in less estimation; so as he did not put it to accompt, in any Consultation of State. But that that moved him most, was, that being a King that loved Wealth and Treasure, he could not endure to have Trade sick, nor any Obstruction to continue in the Gate-vein, which disperseth that blood. And yet he kept State so far, as first to be sought unto. Wherein the Merchant-Adventurers likewise, (being a strong Company at that time, and well under-set with rich men, and good order) did hold out bravely; taking off the Commodities of the Kingdom, though they lay dead upon their hands for want of Vent. At the last, Commissioners met at London, to Treat. On the King’s part; Bishop Fox Lord Privy Seal, Viscount Wells; Kendal Prior of St. John’s, Warham Master of the Polls, who began to gain much upon the King’s opinion; Urswick, who was

almost ever one; and Risley. On the ArchDuke's part, the Lord Bevers his Admiral, the Lord Verunsel President of Flanders, and others. These concluded a perfect Treaty, both of Amity and Intercourse, between the King and the ArchDuke; containing Articles both of State, Commerce, and Free-Fishing. This is that Treaty, which the Flemings call at this day; Intercursus Magnus; both because it is more compleat, than the precedent Treaties of the Third and Fourth years of the King: and chiefly to give it a difference from the Treaty (that followed in the One and twentieth year of the King, which they call Intercursus Malus. In this Treaty, there was an express Article against the Reception of the Rebels of either Prince by other; purporting, that if any such Rebel should be required by the Prince whose Rebel he was, of the Prince Confederate, that forthwith the Prince Confederate should by Proclamation command him to avoid the Countrey. Which if he did not within fifteen days, the Rebel was to stand proscribed, and put out of Protection. But nevertheless in this Article, Perkin was not named, neither perhaps contained, because he was no Rebel. But by this means his wings were clipt off his Followers, that were English. And it was expresly comprised in the Treaty, that it should extend to the Territories of the Duchess Dowager. After the Intercourse thus restored, the English Merchants came again to their Mansion at Antwerp, where they were received with Procession and great Joy.

The Winter sollowing, being the Twelfth year of his reign, the King called again his Parliament: Where he did much exaggerate both the Malice, and the cruel Predatory War lately made by the King of Scotland; That that King, being in Amity with him, and no ways provoked, should so burn in hatred towards him, as to drink of the Lees and Dregs of Perkin's Intoxication, who was every where else detected and discarded. And that when he perceived it was out of his reach, to do the King any hurt, he had turned his Arms upon unarmed and unprovided people, to spoil only and depopulate, contrary to the Laws both of War and Peace: Concluding, that he could neither with Honour, nor with the safety of his People, to whom he did owe Protection, let pass these wrongs unrevenged. The Parliament understood him well, and gave him a Subsidy,

limited to the summ of one hundred and twenty thousand Pounds, besides two Fifteens. For his Wars were always to him as a Mine of Treasure, of a strange kind of Ore; Iron at the top, and Gold and Silver at the bottom. At this Parliament (for that there had been so much time spent in making Laws the year before; and for that it was called purposely in respect of the Scottish War, there were no Laws made to be remembred. Only there passed a Law, at the Suit of the Merchant-Adventurers of England, against the Merchant-Adventurers of London, for Monopolizing and exacting upon the Trade: which it seemeth they did, a little to save themselves, after the hard time they had sustained by want of Trade. But those Innovations were taken away by Parliament.

But it was fatal to the King, to fight for his Money. And though he avoided to fight with Enemies abroad, yet he was still enforced to fight for it with Rebels at home. For no sooner began the Subsidie to be levied in Cornwal, but the people there began to grudge and murmur. The Cornish being a race of men, stout of stomach, mighty of body and limb, and that lived hardly in a barren Countrey, and many of them could (for a need) live under ground, that were Tinners; they muttered extremely, that it was a thing not to be suffered, that for a little stir of the Scots, soon blown over, they should be thus grinded to Powder with Payments: And said, it was for them to pay, that had too much, and lived idly. But they would eat the bread they got with the sweat of their brows, and no man should take it from them. And as in the Tides of People once up, there want not commonly stirting Winds to make them more rough: So this People did light upon two Ring-leaders, or Captains of the Rout. The one was one Michael Joseph, a Black-smith or Farrier of Bodmin; a notable talking Fellow, and no less desirous to be talked of. The other was Thomas Flammocke, a Lawyer; who, by telling his neighbours commonly upon any occasion, that the Law was on their side, had gotten great sway amongst them. This man talked learnedly, and as if he could tell how to make a Rebellion, and never break the Peace. He told the people, that Subsidies were not to be granted nor levied in this case; that is, for Wars of Scotland, (for that the Law had provided another course, by service of Escuage, for those Journies,) much less when all was quiet, and War was

made but a Pretence to poll and pill the People: And therefore that it was good, they should not stand now like sheep before the Shearers, but put on Harness, and take Weapons in their hands: Yet to do no creature hurt; but go and deliver the King a Strong Petition, for the laying down of those grievous Payments, and for the punishment of those that had given him that Counsel; to make others beware how they did the like in time to come: And said, for his part he did not see how they could do the duty of true English-men, and good Liege-men, except they did deliver the King from such wicked Ones that would destroy both Him and the Countrey. Their aim was at Archbishop Morton, and Sir Reginald Bray, who were the King's Skreens in this Envy.

After that these two, Flammocke and the Black-smith, had, by joynt and several Pratings, found tokens of consent in the Multitude, they offered themselves to lead them, until they should hear of better men, to be their Leaders; which they said would be ere long: Telling them further, that they would be but their servants, and first in every danger; but doubted not but to make both the West-end and East-end of England to meet in so good a Quarrel; and that all (rightly understood) was but for the King's service. The People, upon these seditious Instigations, did arm (most of them with Bows, and Arrows, and Bills, and such other Weapons of rude and Countrey People) and forthwith under the Command of their Leaders (which in such cases is ever at pleasure) marched out of Cornwal, through Devonshire, unto Taunton in Somersetshire, without any slaughter, violence, or spoil of the Countrey. At Taunton they killed, in fury, an officious and eager Commissioner for the Subsidie, whom they called the Provoct of Perin. Thence they marched to Wells: where the Lord Audley (with whom their Leaders had; before, some secret Intelligence) a Noble-man of an ancient Family, but unquiet and popular, and aspiring to Ruine, came-in to them, and was by them (with great gladness and cries of Joy) accepted as their General; they being now proud, that they were led by a Noble-man. The Lord Audley led them on from Wells to Salisbury, and from Salisbury to Winchester. Thence the foolish people, who (in effect) led their Leaders, had a mind to be led into Kent; fancying, that the people there would joyn with them, contrary to all

reason or judgment; considering, the Kentish-men had shewed great Loyalty and Affection to the King so lately before. But the rude People had heard Flammock say, that Kent was never Conquered, and that they were the freest People of England. And, upon these vain Noises, they looked for great matters at their hands, in a cause which they conceited to be for the liberty of the Subject. But when they were come into Kent, the Countrey was so well setled, both by the King's late kind usage towards them, and by the credit and power of the Earl of Kent, the Lord Abergaveny, and the Lord Cobham, as neither Gentleman nor Yeoman came-in to their aid; which did much damp and dismay many of the simpler sort: Insomuch, as divers of them did secretly flie from the Army, and went home. But the sturdier sort, and those that were most engaged, stood by it, and rather waxed Proud, than failed in Hopes and Courage. For as it did somewhat appall them, that the people came not in to them; so it did no less encourage them, that the King's Forces had not set upon them, having marched from the West unto the East of England. Wherefore they kept on their way, and encamped upon Black-heath, between Greenwich and Eltham; threatning either to bid Battel to the King, (for now the Seas went higher than to Morton, and Bray) or to take London within his view, imagining with themselves, there to find no less Fear, than Wealth.

But to return to the King. When first he heard of this Commotion of the Cornish-men occasioned by the Subsidie, he was much troubled therewith: Not for it self, but in regard of the Concurrence of other Dangers, that did hang over him at that time. For he doubted lest a War from Scotland, a Rebellion from Cornwal, and the Practices and Conspiracies of Perkin and his Partakers, would come upon him at once; Knowing well, that it was a dangerous Triplicity to a Monarchy, to have the Arms of a Foreiner, the Discontents of Subjects, and the Title of a Pretender, to meet. Nevertheless, the Occasion took him in some part well provided. For as soon as the Parliament had broken up, the King had presently raised a puissant Army, to war upon Scotland. And King James of Scotland likewise, on his part, had made great preparations either for defence, or

for new assailing of England. But as for the King's Forces, they were not only in preparation, but in readiness presently to set forth, under the Conduct of Dawbeney, the Lord Chamberlain. But as soon as the King understood of the Rebellion of Cornwal, he stayed those Forces, retaining them for his own service and safety. But therewithal he dispatched the Earl of Surrey into the North, for the defence and strength of those parts, in case the Scots should stir. But for the course he held towards the Rebels, it was utterly differing from his former custom, and practice; which was ever full of forwardness and celerity, to make head against them, or to set upon them as soon as ever they were in Action. This he was wont to do. But now, besides that he was attempered by Years, and less in love with Dangers, by the continued Fruition of a Crown; it was a time when the various appearance to his Thoughts of Perils of several Natures, and from divers Parts, did make him judge it his best and surest way, to keep his Strength together, in the Seat and Centre of his Kingdom. According to the ancient Indian Emblem; in such a swelling Season, To hold the hand upon the middle of the Bladder, that no side might rise. Besides, there was no necessity put upon him, to alter this Counsel. For neither did the Rebels spoil the Countrey; in which case it had been dishonour to abandon his People: Neither on the other side, did their Forces gather or increase, which might hasten him to precipitate and assail them, before they grew too strong. And lastly, both Reason of Estate and War seemed to agree with this course; For that Insurrections of base People are commonly more furious in their Beginnings. And by this means also he had them the more at Vantage, being tired and harrassed with a long march; and more at Mercy, being cut off far from their Countrey, and therefore not able by any sudden flight to get to Retrait, and to renew the Troubles.

When therefore the Rebels were encamped on Black-heath, upon the Hill, whence they might behold the City of London, and the fair Valley about it: the King knowing well, that it stood him upon, by how much the more he had hitherto protracted the time in not encountring them, by so much the sooner to dispatch with them, that it might appear to have been no Coldness in foreslowing, but Wisdom in choosing his time; resolved with all speed to assail

them, and yet with that Providence, and Surety, as should leave little to Venture or Fortune. And having very great and puissant Forces about him, the better to master all Events and Accidents, he divided them into three parts. The first was led by the Earl of Oxford in chief, assisted by the Earls of Essex and Suffolk. These Noble-men were appointed, with some Cornets of Horses and Bands of Foot, and good store of Artillery wheeling about to put themselves beyond the Hill, where the Rebels were encamped; and to beset all the skirts and descents thereof, except those that lay towards London; whereby to have these Wild Beasts (as it were) in a Toyl. The second part of his Forces (which were those that were to be most in Action, and upon which he relyed most for the Fortune of the Day) he did assign to be led by the Lord Chamberlain, who was appointed to set upon the Rebels in Front, from that side which is toward London. The third part of his Forces (being likewise great and brave Forces) he retained about himself, to be ready, upon all Events, to restore the Fight, or consummate the Victory; and mean while, to secure the City. And for that purpose he encamped in Person in St. George's Fields, putting himself between the City and the Rebels. But the City of London (specially at the first) upon the near encamping of the Rebels, was in great Tumult: As it useth to be with wealthy and populous Cities, (especially those, which, for greatness and fortune, are Queens of their Regions) who seldom see out of their Windows, or from their Towers, an Army of Enemies. But that which troubled them most, was the conceit, that they dealt with a Rout of People, with whom there was no Composition, or Condition, or orderly Treating, if need were, but likely to be bent altogether upon Rapine and Spoil. And although they had heard that the Rebels had behaved themselves quietly and modestly, by the way as they went; yet they doubted much, that would not last, but rather make them more hungry, and more in appetire, to fall upon spoil in the end. Wherefore there was great running to and fro of People, some to the Gates, some to the Walls, some to the Water ; giving themselves Alarms, and Panick fears continually. Nevertheless, both Tate the Lord Mayor, and Shaw, and Haddon, the Sheriffs, did their parts stoutly and well, in arming and ordering the People. And the King likewise did adjoyn some Captains of

experience in the Wars, to advise and assist the Citizens. But soon aften, when they understood that the King had so ordered the matter, that the Rebels must win three Battels, before they could approach the City, and that he had put his own Person between the Rebels and them, and that the great care was rather how to impound the Rebels, that none of them might escape, than that any doubt was made to vanquish them; they grew to be quiet and out of fear. The rather, for the confidence they reposed (which was not small) in the three Leaders, Oxford, Essex, and Dawbency; all, men famed and loved amongst the People. As for Jasper Duke of Bedford, whom the King used to employ with the first in his Wars, he was then sick, and dyed soon after.

It was the two and twentieth of June, and a Saturday (which was the day of the week the King fancied) when the Battel was fought; though the King had, by all the Art he could devise; given out a false Day, as if he prepared to give the Rebels Battel on the Monday following, the better to find them unprovided, and in disarray. The Lords, that were appointed to circle the Hill, had some days before planted themselves (as at the Receipt) in places convenient. In the afternoon, towards the decline of the day, (which was done, the better to keep the Rebels in opinion that they should not fight that day) the Lord Dawbeney marched on towards them, and first beat some Troops of them from Detford-bridge, where they fought manfully: But being in no great number were soon driven back, and fled up to their main Army upon the Hill. The Army, at that time hearing of the approach of the King's Forces, were putting themselves in Array, not without much Confusion. But neither had they placed upon the first high-ground towards the Bridge, any Forces to second the Troops below, that kept the Bridge; neither had they brought forwards their Main-Battel (which stood in array far into the Heath) near to the ascent of the Hill. So that the Earl with his Forces mounted the Hill, and recovered the Plain, without resistance. The Lord Dawbeney charged them with great fury; Insomuch, as it had like (by accident) to have brandled the Fortune of the Day. For, by inconsiderate Forwardness in fighting in the head of his Troops, he was taken by the Rebels; but, immediately rescued, and delivered. The Rebels maintained the Fight for a

small time, and for their Persons shewed no want of courage: but being ill armed, and ill led, and without Horse or , they were with no great difficulty cut in pieces, and put to flight. And for their three Leaders; the Lord Audley, the Black-smith, and Flammocke, (as, commonly the Captains of Commotions are but half-couraged Men) suffered themselves to be taken alive. The number slain on the Rebels part, were some two thousand men, their Army amounting (as it is said) unto the number of sixteen thousand. The rest were (in effect) all taken; for that the Hill, as was said, was encompassed with the King's Forces round about. On the King's part there dyed about three hundred; most of them shot with Arrows, which were reported to be of the length of a Taylor's-yard: So strong and mighty a Bow the Cornish-men were said to draw.

The Victory thus obtained, the King created divers Bannerets, as well upon Black-heath, where his Lieutenant had won the Field (whither he rode in Person to perform the said Creation) as in St. George's Fields, where his own person had been encamped. And for matter of Liberality, he did (by open Edict) give the goods of all the Prisoners, unto those that had taken them; either to take them in Kind, or compound for them as they could. After matter of Honour and Liberality, followed matter of Severity and Execution. The Lord Audley was led from Newgate to Tower-hill, in a Paper-Coat painted with his own Arms; the Arms reversed, the Coat torn, and he at Tower-hill beheaded. Flammocke, and the Black-smith were hanged, drawn, and quartered at Tyburn; The Black-smith taking pleasure upon the Hurdle (as it seemeth by words that he uttered) to think that he should be famous in after-times. The King was once in mind to have sent down Flammocke, and the Black-smith, to have been executed in Cornwal, for the more terrour. But, being advertised, that the Countrey was yet unquiet and boyling, he thought better not to irritate the People further. All the rest were pardoned by Proclamation, and to take out their Pardons under Seal, as many as would: So that, more than the blood drawn in the Field, the King did satisfie himself with the lives of only three Offenders, for the expiation of this great Rebellion.

It was a strange thing, to observe the variety and inequality of the King's Executions and Pardons. And a man would think it, at the first, a kind of Lottery or Chance. But, looking into it more nearly, one shall find there was reason for it, much more perhaps than (after so long a distance of time) we can now discern. In the Kentish Commotion (which was but an handful of men) there were executed to the number of one hundred and fifty; and, in this so mighty a Rebellion, but three: Whether it were, that the King put to accompt the men that were slain in the field; or that he was not willing to be severe in a popular cause; or that the harmless behaviour of this People (that came from the West of England, to the East, without mischief almost, or spoil of the Countrey) did somewhat mollifie him, and move him to compassion; or lastly, that he made a great difference between People, that did rebel upon Wantonness, and them that did rebel upon Want.

After the Cornish-men were defeated, there came from Calioe to the King, an honourable Ambassage from the French King, which had arrived at Calice a Month before, and there was stayed in respect of the troubles; but honourably entertained and defrayed.

The King, at their first coming, sent unto them, and prayed them to have patience, till a little Smoak, that was raised in his Countrey, were over, which would soon be: Slighting (as his manner was) that openly, which nevertheless he intended seriously.

This Ambassage concerned no great Affair; but only the Prolongation of Days for payment of Moneys, and some other Particulars of the Frontiers. And it was (indeed) but a wooing Ambassage; with good respects to entertain the King in good affection: but nothing was done, or handled, to the derogation of the King's late Treaty with the Italians.

But, during the time that the Cornish-men were in their march towards London, the King of Scotland (well advertised of all that passed, and knowing himself sure of War from England, whensoever those Stirs were appeased) neglected not his opportunity; But, thinking the King had his hands full, entred

the Frontiers of England again with an Army, and besieged the Castle of Norham in Person, with part of his Forces, sending the rest to forrage the Countrey. But Fox, Bishop of Duresm (a wise man, and one that could see through the Present, to the Future) doubting as much before, had caused his Castle of Norham to be strongly fortified, and furnished, with all kind of Munition: And had manned it likewise, with a very great number of tall Soldiers, more than for the proportion of the Castle; reckoning rather upon a sharp Assault, than a long Siege. And for the Countrey likewise, he had caused the people withdraw their Cattel and Goods into Fact Places, that were not of easie approach; and sent in post to the Earl of Surrey (who was not far off, in Yorkshire) to come in diligence to the Succour. So as the Scottish King both failed of doing good upon the Castle, and his men had but a catching Harvest of their Spoils. And when he understood, that the Earl of Surrey was coming on with great Forces, he returned back into Scotland. The Earl finding the Castle freed, and the Enemy retired, pursued with all into Scotland; hoping to have overtaken the Scottish King, and to have given him Battel; But not attaining him in time, sate down before the Castle of Aton (one of the strongest places, then esteemed, between Berwick and Edenburgh) which in a small time he took. And soon after, the Scottish King retiring further into his Countrey, and the weather being extraordinary foul and stormy, the Earl returned into England. So that the Expeditions on both parts were (in effect) but a Castle taken, and a Castle distressed; not answerable to the puissance of the Forces, nor to the heat of the Quarrel, nor to the greatness of the Expectation.

Amongst these Troubles, both Civil and External, came into England from Spain Peter Hialas, some call him Elias, (surely he was the fore runner of the good Hap, that we enjoy at this day. For his Ambassage set the Truce between England and Scotland; the Truce drew on the Peace; the Peace the Marriage; and the Marriage the Union of the Kingdoms) a man of great Wisdom, and (as those times were) not unlearned; sent from Ferdinando and Isabella Kings of Spain unto the King, to treat a Marriage between Catherine their second Daughter, and Prince Arthur. This Treaty was by him set in a very good way, and almost brought to perfection. But it so fell out by the way, that upon some Conference

which he had with the King touching this business, the King (who had a great dexterity in getting suddenly into the bosom of Ambassadors of forein Princes, if he liked the men; Insomuch as he would many times communicate with them of his own affairs; yea and employ them in his service) fell into speech and discourse incidently, concerning the ending the Debates and differences with Scotland. For the King naturally did not love the barren Wars with Scotland, though he made his profit of the Noise of them. And he wanted not in the Council of Scotland those that would advise their King to meet him at the half-way, and to give over the War with England; pretending to be good Patriots, but indeed favouring the affairs of the King. Only his heart was too great to begin with Scotland for the motion of Peace. On the other side, he had met with an Allie of Ferdinando of Arragon, as fit for his turn as could be. For after that King Ferdinando had; upon assured confidence of the Marriage to succeed, taken upon him the person of a Fraternal Allie to the King, he would not let (in a Spanish gravity) to counsel the King in his own affairs. And the King on his part not being wanting to himself, but making use of every man's humours, made his advantage of this in such things as he thought either not decent, or not pleasant to proceed from himself; putting them off, as done by the Counsel of Ferdinando. Wherefore he was content that Hialas (as in a matter moved and advised from Hialas himself) should go into Scotland, to treat of a Concord between the two Kings. Hialas took it upon him: and coming to the Scottish King, after he had with much Art brought King James to hearken to the more safe and quiet Counsels, wrote unto the King, that he hoped that Peace would with no great difficulty cement and close, if he would send some wise and temperate Counsellor of his own, that might treat of the Conditions. Whereupon the King directed Bishop Fox (who at that time was at his Castle of Norham) to confer with Hialas, and they both to treat with some Commissioners, deputed from the Scottish King. The Commissioners on both sides met. But after much dispute upon the Articles and Conditions of Peace, propounded upon either part, they could not conclude a Peace. The chief Impediments thereof was the demand of the King, to have Perkin delivered into his hands, as a reproach to all Kings,

and a person not protected by the Law of Nations. The King of Scotland, on the other side, peremptorily denied so to do; saying, That he (for his part) was no competent Judge of Perkin's Title: But that he had received him as a Suppliant, protected him as a person fled for Refuge, espoused him with his Kinswoman, and aided him with his Arms, upon the belief that he was a Prince; And therefore that he could not now with his Honour so unrip, and (in a sort) put a Lye upon all that he had said and done before, as to deliver him up to his Enemies. The Bishop likewise (who had certain proud instructions from the King, at the least in the Front, though there were a pliant clause at the Foot, that remitted all to the Bishop's discretion, and required him by no means to break off in ill terms) after that he had failed to obtain the delivery of Perkin, did move a second point of his Instructions; which was, that the Scottish King would give the King an Enterview in Person at Newcastle. But this being reported to the Scottish King, his answer was, That he meant to treat a Peace, and not to go a begging for it. The Bishop also (according to another Article of his Instructions) demanded Restitution of the Spoils taken by the Scottish, or Damages for the same. But the Scottish Commissioners answered; That that was but as Water spilt upon the ground, which could not be gotten up again; and that the King's People were better able to bear the loss, than their Master to it. But in the end (as persons capable of Reason) on both sides they made a kind of Recess, than a Breach of Treaty, and concluded upon a Truce for some Months following. But the King of Scotland, though he would not formally retract his judgement of Perkin, wherein he had engaged himself so far; yet in his private opinion, upon often speech with the English-men, and divers other advertisements, began to suspect him for a Counterfeit. Wherefore in a Noble fashion he called him unto him, and recounted the benefits and favours that he had done him, in making him his Allie, and in provoking a Mighty and Opulent King by an Offensive War in his Quarrel, for the space of two years together. Nay more; that he had refused an Honourable Peace, whereof he had a fair Offer, if he would have delivered him; and that to keep his promise with him, he had deeply offended both his Nobles and People, whom he might not hold in any long discontent. And therefore

required him to think of his own Fortunes, and to choose out some fitter place for his Exile: Telling him withal, that he could not say, but the English had forsaken him before the Scottish, for that upon two several Tryals, none had declared themselves on his side. But nevertheless he would make good what he said to him at his first receiving, which was, That he should not repent him, for putting himself into his hands; For that he would not cast him off, but help him with Shipping and means, to transport him where he should desire. Perkin, not descending at all from his Stage-like Greatness, answered the King in few words; That he saw his time was not yet come; But whatsoever his Fortunes were, he should both think and speak Honour of the King. Taking his leave, he would not think on Flanders, doubting it was but hollow ground for him, since the Treaty of the ArchDuke concluded the year before; but took his Lady, and such followers as would not leave him, and sailed over into Ireland.

This Twelfth year of the King, a little before this time, Pope Alexander (who loved best those Princes that were furthest off, and with whom he had least to do) taking very thankfully the King's late entrance into League, for the defence of Italy, did remunerate him with an Hallowed Sword, and Cap-of-Maintenance sent by his Nuncio. Pope Innocent had done the like, but it was not received in that Glory. For the King appointed the Mayor and his Brethren to meet the Pope's Orator at London-Bridge, and all the Streets between the Bridge-foot and the Palace of St. Pauls (where the King then lay) were garnished with the Citizens, standing in their Liveries. And the morrow after (being All-hallows day) the King, attended with many of his Prelates, Nobles, and principal Courtiers, went in Procession to St. Pauls, and the Cap and Sword were born before him. And after the Procession, the King himself remaining seated in the Choir, the Lord Archbishop upon the greece of the Choir, made a long Oration, setting forth the greatness and Eminency of that Honour, which the Pope (in these Ornaments and Ensigns of Benediction) had done the King, and how rarely, and upon what high deserts they used to be bestowed. And then recited

the Kings principal Acts and Merits, which had made him appear worthy in the eyes of his Holiness of this great Honour.

All this while the Rebellion of Cornwal (whereof we have spoken) seemed to have no relation to Perkin; save that perhaps Perkin's Proclamation had stricken upon the right Vein, in promising to lay down Exactions and Payments, and so had made them now and then have a kind thought on Perkin. But now these Bubbles by much stirring began to meet, as they use to do upon the top of Water. The King's lenity (by that time the Cornish Rebels, who were taken and pardoned, and (as it was said) many of them sold by them that had taken them, for twelve pence and two shillings a piece, were come down into their Countrey) had rather imboldened them, than reclaimed them: Insomuch, as they stuck not to say to their Neighbours and Countrey-men, that The King did well to pardon them, for that he knew he shouldl eave few Subjects in England, if he hanged all that were of their mind: And began whetting and inciting one another to renew the Commotion. Some of the subtilest of them, hearing of Perkin's being in Ireland, found means to send to him, to let him know, that if he would come over to them, they would serve him.

When Perkin heard this News, he began to take heart again, and advised upon it with his Council, which were principally three; Herne a Mercer, that had fled for Debt; Skelton a Taylor, and Astley a Scrivener: for Secretary Frion was gone. These told him, that he was mightily overseen, both when he went into Kent, and when he went into Scotland. The one being a place so near London, and under the King's Nose; and the other a Nation so distasted with the People of England, that if they had loved him never so well, yet they could never have taken his part in that Company. But if he had been so happy, as to have been in Cornwal at the first, when the People began to take Arms there, he had been crowned at Westminster before this time. For, these Kings (as he had now experience) would sell poor Princes for shooes: But he must rely wholly upon People; and therefore advised him to sail over with all possible speed into Cornwal. Which, accordingly he did; having in his Company four small Barques, with some six score or seven score fighting men. He arrived in September at

Whitsand-Bay; and forthwith came to Bodmin, the Black-smith's Town: Where there assembled unto him to the number of three thousand men of the rude People. There he set forth a new Proclamation, stroaking the People with fair Promises, and humouring them with Invectives against the King and his Government. And; as it fareth with Smoak, that never loseth it self till it be at the highest; he did now before his end raise his Stile, intituling himself no more Richard, Duke of York; but Richard the Fourth, King of England. His Council advised him, by all means, to make himself Master of some good walled Town; as well to make his Men find the sweetness of rich Spoils, and to allure to him all loose and lost People; by like hopes of Booty; as to be a sure Retrait to his Forces, in case they should have any ill Day, or unlucky Chance in the Field. Wherefore they took heart to them, and went on, and besieged the City of Exceter, the principal Town for Strength and Wealth in those Parts.

When they were come before Exceter, they forbare to use any Force at the first; but made continual Shouts and Out-cries, to terrifie the Inhabitants. They did likewise in divers places call and talk to them from under the Walls, to joyn with them, and be of their Party; telling them, that the King would make them another London, if they would be the first Town that should acknowledge him. But they had not the wit to send to them, in any orderly fashion, Agents, or chosen Men, to tempt them, and to treat with them. The Citizens on their part shewed themselves stout and loyal Subjects. Neither was there so much as any Tumult or Division amongst them: but all prepared themselves for a valiant Defence, and making good the Town. For, well they saw, that the Rebels were of no such Number or Power, that they needed to fear them as yet: and well they hoped, that before their Numbers increased, the King's Succours would come-in. And, howsoever, they thought it the extremest of Evils, to put themselves at the mercy of those hungry and disorderly People. Wherefore, setting all things in good order within the Town, they nevertheless let down with Cords, from several parts of the Walls privily, several Messengers (that, if one came to mischance, another might pass-on) which should advertise the King of the State of the Town, and implore his ayd. Perkin also doubted, that Succours would

come ere long; and therefore resolved to use his utmost Force to assault the Town: And for that purpose, having mounted Scaling-Ladders in divers places upon the Walls, made at the same instant an Attempt to force one of the Gates. But, having no Artillery nor Engins, and finding that he could do no good by ramming with Logs of Timber, nor by the use of Iron Bars and Iron Crows, and such other means at hand, he had no way left him, but to set one of the Gates on fire: which he did. But the Citizens, well perceiving the Danger, before the Gate could be fully consumed, blocked up the Gate, and some space about it on the inside, with Fagots and other Fuel: which they likewise set on fire, and so repulsed fire with fire; And, in the mean time, raised up Rampiers of earth, and cast up deep Trenches, to serve instead of Wall and Gate. And for the Escalada's, they had so bad success, as the Rebels were driven from the Walls, with the loss of two hundred men.

The King, when he heard of Perkin's Siege of Exceter, made sport with it, and said to them that were about him, that The King of Rake-hells was landed in the West, and that he hoped now to have the honour to see him, which he could never yet do. And it appeared plainly to those that were about the King, that he was indeed much joyed with the News of Perkin's being on English ground, where he could have no retreat by Land; thinking now, that he should be cured of those privy Stitches, which he had long had about his Heart, and had sometimes broken his Sleeps in the midst of all his felicity. And, to set all mens hearts on fire, he did by all possible means let it appear, that those, who should now do him service to make an end of these troubles, should be no less accepted of him, than he that came upon the Eleventh Hour, and had the whole Wages of the Day. Therefore now (like the end of a Play) a great number came upon the Stage at once. He sent the Lord Chamberlain, and the Lord Brook, and Sir Rice ap Thomas, with expedite Forces to speed to Exceter, to the Rescue of the Town, and to spread the Fame of his own following in Person with a Royal Army. The Earl of Devonshire, and his Son, with the Caroes, and the Fulfords, and other principal Persons of Devonshire (uncalled from the Court, but hearing that the King's heart was so much bent upon this Service) made haste with Troops, that

they had raised, to be the first that should succour the City of Exceter, and prevent the King's Succours. The Duke of Buckingham likewise, with many brave Gentlemen, put themselves in Arms, not staying either the King's, or the Lord Chamberlain's coming on, but making a Body of Forces of themselves, the more to indear their merit, signifying to the King their readiness, and desiring to know his pleasure. So that according to the Proverb, In the coming down, every Saint did help.

Perkin, hearing this Thunder of Arms, and Preparations against him from so many Parts, raised his Siege, and marched to Taunton; beginning already to squint one eye upon the Crown, and another upon the Sanctuary: Though the Cornish-men were become, like Metal often fired and quenched, churlish, and that would sooner break than bow; swearing and vowing not to leave him, till the uttermost drop of their blood were spilt. He was at his rising from Exceter between six and seven thousand strong, many having come unto him, after he was set before Exceter, upon fame of so great an Enterprize, and to partake of the Spoil; though upon the raising of his Siege, some did slip away. When he was come near Taunton, he dissembled all fear, and seemed all the day to use diligence in preparing all things ready to fight. But about midnight, he fled with threescore Horse to Bewley in the New-Forest, where he and divers of his Company registred themselves Sanctuary-men, leaving his Cornish-men to the Four Winds; But yet thereby easing them of their Vow, and using his wonted Compassion, Not to be by when his Subjects blood should be spilt. The King, as soon as he heard of Perkin's Flight, sent presently five hundred Horse to pursue and apprehend him, before he should get either to the Sea, or to that same little Island, called a Sanctuary. But they came too late for the latter of these. Therefore all they could do, was to beset the Sanctuary, and to maintain a strong Watch about it, till the King's pleasure were further known. As for the rest of the Rebels, they (being destituted of their head) without stroke stricken, submitted themselves unto the King's Mercy. And the King, who commonly drew Blood (as Physicians do) rather to save life, than to spill it, and was never Cruel, when he was Secure; now he saw the danger was past, pardoned them all in the end,

except some few desperate persons which he reserved to be Executed, the better to set off his Mercy towards the rest. There were also sent with all speed some Horse to St. Michael's-Mount in Cornwal, where the Lady Catherine Gordon was left by her Husband, whom in all fortunes she entirely loved; adding the virtues of a Wife, to the virtues of her Sex. The King sent in the greater diligence, not knowing whether she might be with Child; whereby the business would not have ended in Perkin's person. When she was brought to the King, it was commonly said, that the King received her not only with Compassion, but with Affection; Pity giving more Impression to her excellent Beauty. Wherefore comforting her (to serve as well his Eye as his Fame) he sent her to his Queen, to remain with her; giving her very honourable Allowance for the suport of her Estate: which she enjoyed both during the King's life, and many years after. The name of the White-Rose (which had been given to her Husband's False-Title) was continued in common speech to her true Beauty.

The King went forward on his Journey, and made a joyful entrance into Exceter, where he gave the Citizens great commendations and thanks; and taking the Sword he wore, from his side, he gave it to the Mayor, and commanded it should be ever after carried before him. There also he caused to be executed some of the Ring-leaders of the Cornish-men, in sacrifice to the Citizens, whom they had put in fear, and trouble. At Exceter the King consulted with his Council, whether he should offer life to Perkin, if he would quit the Sanctuary, and voluntarily submit himself. The Council were divided in opinion. Some advised the King to take him out of Sanctuary per-force, and to put him to death, as in a case of Necessity, which in it self dispenseth with Consecrated Places and things. Wherein they doubted not also, but the King should find the Pope tractable to ratifie his Deed, either by Declaration, or (at least) by Indulgence. Others were of opinion (since all was now safe, and no further hurt could be done) that it was not worth the exposing of the King to new Scandal and Envy. A third sort fell upon the opinion that it was not possible for the King ever, either to satisfie the World well touching the Imposture, or to learn out the bottom of the Conspiracy, except by promise of Life and Pardon, and other fair

means, he should get Perkin into his hands. But they did all in their Preambles much bemoan the King's Case, with a kind of Indignation at his Fortune; That a Prince of his high Wisdom and Virtue, should have been so long, and so oft exercised and vexed with Idols. But the King said; that it was the Vexation of God Almighty himself, to be vexed with Idols, and therefore that that was not to trouble any of his Friends. And that for himself, he always despised them; but was grieved that they had put his People to such trouble and misery. But (in Concusion) he leaned to the third opinion, and so sent some to deal with Perkin. Who seeing himself Prisoner, and destitute of all hopes, having tryed Princes and People, Great and Small, and found all either false, faint or unfortunate, did gladly accept of the Condition. The King did also (while he was at Exceter) appoint the Lord Darcy, and others, Commissioners, for the fining of all such, as were of any value, or had any hand or partaking in the ayd or comfort of Perkin or the Cornish-men, either in the Field or in the Flight.

These Commissioners proceeded with such strictness and severity, as did much obscure the King's mercy in sparing of Blood, with the bleeding of so much Treasure. Perkin was brought unto the King's Court, but not to the King's presence; though the King (to satisfie his Curiosity) saw him sometimes out of a window, or in passage. He was in shew at liberty, but guarded with all care and watch that was possible, and willed to follow the King to London. But from his first appearance upon the Stage, in his new person of a Sycophant or Jugler, instead of his former person of a Prince, all men may think how he was exposed to the derision, not only of the Courtiers, but also of the Common-People who flocked about him as he went along; that one might know a-far-off, where the Owl was by the Flight of Birds. Some mocking, some wondering, some cursing, some prying and picking matter out of his Countenance and Gesture, to talk of. So that the false Honour and Respects which he had so long enjoyed, was plentifully repayed in Scorn and Contempt. As soon as he was come to London, the King gave also the City the solace of this May-Game. For he was conveyed leisurely on Horse-back (but not in any ignominious fashion) through Cheapside, and Cornwill, to the Tower; and from thence back again unto Westminster, with

the Churm of a thousand taunts and reproaches. But to amend the Show, there followed a little distance of Perkin, an inward Counsellor of his, one that had been SerjeantFarrier to the King. This Fellow when Perkin took Sanctuary, chose rather to take an Holy Habit than an Holy Place, and clad himself like an Hermit, and in that weed wandred about the Countrey, till he was discovered, and taken. But this Man was bound hand and foot upon the Horse, and came not back with Perkin, but was left at the Tower, and within few days after Executed. Soon after, now that Perkin could tell better what himself was, he was diligently examined; and after his Confession taken, an Extract was made of such parts of them as were thought fit to be divulged, which was Printed and dispersed abroad. Wherein the King did himself no Right. For as there was a laboured Tale of particulars, of Perkin's Father, and Mother, and Grandsire, and Grandmother, and Uncles, and Cousins, by Names and Sirnames, and from what places he travelled up and down; so there was little or nothing to purpose of any thing concerning his Designs, or any Practices that had been held with him; nor the Duchess of Burgundy her self (that all the World did take knowledge of, as the Person that had put Life and Being into the whole Business) so much as named or pointed at. So that men missing of that they looked for, looked about for they knew not what, and were in more doubt than before. But the King chose rather not to satisfie, than to kindle Coals. At that time also it did not appear by any new Examinations or Commitments, that any other Person of quality was discovered or appeached, though the King's closeness made that a DoubtDormant.

About this time, a great Fire in the night time suddenly began at the King's Palace of Sheyn, near unto the King's own Lodgings, whereby a great part of the building was consumed, with much costly Houshold-stuff; which gave the King occasion of Building from the ground that fine Pile of Richmond, which is now standing.

Somewhat before this time also, there fell out a memorable Accident. There was one Sebastian Gabato, a Venetian, dwelling in Bristow, a man seen and expert in Cosmography and Navigation. This man seeing the success, and

emulating perhaps the enterprize of Christopherus Columbus in that fortunate discovery towards the South-west, which had been by him made some six years before; conceited with himself, that Lands might likewise be discovered towards the North-west. And surely it may be he had more firm and pregnant Conjectures of it, than Columbus had of this at the first. For the two great Islands of the Old and New World, being (in the shape and making of them) broad towards the North, and pointed towards the South; it is likely, that the discovery first began where the Lands did nearest meet. And there had been before that time a discovery of some Lands, which they took to be Islands, and were indeed the Continent of America, towards the North-west. And it may be, that some Relation of this nature coming afterwards to the knowledge of Columbus, and by him suppressed, (desirous rather to make his Enterprize the Child of his Science and Fortune, than the Follower of a former Discovery) did give him better assurance that all was not Sea, from the West of Europe and Africk unto Asia, than either Seneca's Prophesie, or Plato's Antiquities, or the Nature of the Tides, and Land-winds, and the like, which were the Conjectures that were given out, whereupon he should have relyed. Though I am not ignorant, that it was likewise laid unto the casual and wind-beaten Discovery (a little before) of a Spanish Pilot, who dyed in the house of Columbus. But this Gabato bearing the King in hand, that he would find out an Island endued with rich Commodities, procured him to man and victual a Ship at Bristow, for the discovery of that Island; With whom ventured also three small Ships of London-Merchants, fraught with some gross and sleight Wares, fit for Commerce with barbarous people. He sayled (as he affirmed at his return, and made a Card thereof) very far Westwards, with a Quarter of the North, on the North-side of Tierra de Labrador, until he came to the Latitude of sixty seven Degrees and an half, finding the Seas still open. It is certain also, that the King's Fortune had a tender of that great Empire of the West-Indies. Neither was it a Refusal on the King's part, but a Delay by accident, that put by so great an Acquest. For Christopherus Columbus refused by the King of Portugal (who would not embrace at once both East and West) employed his Brother Bartholomaus Columbus unto King Henry, to negotiate

for his Discovery. And it so fortuned, that he was taken by Pirates at Sea, by which accidental impediment he was long ere he came to the King. So long, that before he had obtained a Capitulation with the King for his Brother; the Enterprize by him was atchieved, and so the West-Indies by Providence were then reserved for the Crown of Castilia. Yet this sharpened the King so, that not only in this Voyage, but again in the Sixteenth year of his Reign, and likewise in the Eighteenth thereof, he granted forth new Commissions, for the Discovery and investing of unknown Lands.

In this Fourteenth year also (by God's wonderful providence, that boweth things unto his will, and hangeth great Weights upon small Wires) there fell out a trifling and untoward Accident that drew on great and happy effects. During the Truce with Scotland, there were certain Scottish young Gentleman, that came into Norham Town, and there made merry with some of the English of the Town. And having little to do, went sometimes forth, and would stand looking upon the Castle. Some of the Garrison of the Castle, observing this their doing twice or thrice, and having not their minds purged of the late ill blood of Hostility, either suspected them, or quarrelled them for Spies. Whereupon they fell at ill Words, and from Words to Blows; so that many were wounded of either side, and the Scottish-men (being strangers in the Town) had the worst. In so much as some of them were slain, and the rest made haste home. The matter being complained on, and often debated before the Wardens of the Marches of both sides, and no good order taken, the King of Scotland took it to himself, and being much kindled, sent a Herald to the King to make Protestation, That if Reparation were not done, according to the Conditions of the Truce, his King did denounce War. The King (who had often tryed Fortune, and was inclined to Peace) made answer; That what had been done, was utterly against his will, and without his Privity. But if the Garrison-Souldiers had been in fault, he would see them punished, and the Truce in all points to be preserved. But this answer seemed to the Scottish King but a delay, to make the complaint breathe out with time; and therefore it did rather exaspetare him, than satisfie him. Bishop Fox, understanding from the King, that the Scottish King was still discontent and

impatient, being troubled that the occasion of breaking of the Truce should grow from his men, sent many humble and deprecatory Letters to the Scottish King to appease him. Whereupon King James, mollified by the Bishop's submiss and eloquent Letters, wrote back unto him; That though he were in part moved by his Letters, yet he should not be fully satisfied, except he spake with him; as well about the compounding of the present differences, as about other matters that might concern the good of both Kingdoms. The Bishop advising first with the King, took his Journey for Scotland. The meeting was at Metross, an Abbey of the Cestercians; where the King then abode. The King first roundly uttered unto the Bishop his offence conceived for the insolent Breach of Truce, by his men of Norham Castle. Whereunto Bishop Fox made such an humble and smooth answer, as it was like Oyl into the wound, whereby it began to heal. And this was done in the presence of the King and his Council. After, the King spake with the Bishop apart, and opened himself unto him, saying; That these temporary Truces and Peaces were soon made, and soon broken: But that he desired a straiter Amity with the King of England, discovering his mind; that if the King would give him in Marriage, the Lady Margaret, his eldest Daughter, That indeed might be a Knot indissoluble. That he knew well what Place and Authority the Bishop deservedly had with his Master. Therefore, if he would take the business to heart, and deal in it effectually, he doubted not but it would succeed well. The Bishop answered soberly, that he thought himself rather happy, than worthy, to be an instrument in such a matter; but would do his best endeavour. Wherefore the Bishop returning to the King, and giving account what had passed, and finding the King more than well disposed in it, gave the King advice; first to proceed to a Conclusion of Peace, and then to go on with the Treaty of Marriage, by degrees. Hereupon a Peace was concluded, which was published a little before Christmas in the Fourteenth year of the King's Reign to continue for both the Kings lives, and the overliver of them, and a year after. In this Peace there was an Article contained, that no English-man should enter into Scotland, and no Scottish-man into England, without Letters Commendatory from the Kings of either Nation. This at the first sight might seem a means to

continue a strangeness between the Nations; but it was done, to lock in the Borderers.

This year there was also born to the King a third Son, who was christned by the name of Edmund, and shortly after dyed. And much about the same time came news of the death of Charles the French King; For whom there were celebrated Solemn and Princely Obsequies.

It was not long, but Perkin (who was made of Quick-silver, which is hard to hold or imprison) began to stir. For deceiving his Keepers, he took him to his heels, and made speed to the Seacoasts. But presently all Corners were laid for him, and such diligent pursuit and search made, as he was fain to turn back, and get him to the house of Bethleem, called the Priory of Shyne, (which had the priviledge of a Sanctuary) and put himself into the hands of the Prior of that Monastery. The Prior was thought an Holy Man, and much reverenced in those days. He came to the King, and besought the King for Perkin's life only, leaving him otherwise to the Kings discretion. Many about the King were again more hot than ever, to have the King take him forth, and hang him. But the King (that had an high stomach, and could not hate any that he despised) bid, Take him forth, and set the Knave in the stocks. And so promising the Prior his life, he caused him to be brought forth. And within two or three days after, upon a fold, set up in the Palace-Court at Westminster, he was and set in the Stocks, for the whole day. And the next after, the like was done by him at the Cross in Cheapside in both places he read his Confession, of which we made before; and was from Cheapside conveyed and laid up the Tower. Notwithstanding all this, the King was (as partly touched before) grown to be such a Partner with , as no body could tell what Actions the one, and what other owned. For it was believed generally that Perkin was betrayed, and that this Escape was not without the King's privity, who had him all the time of his Flight in a Line; and that the King did this, to pick a Quarrel to him to put him to death, and to be rid of him at once. But this is not probable. For that the same Instruments who observed him in his Flight, might have kept him from getting into Sanctuary.

But it was ordained, that this Winding-Ivy of a Plantagenet, should kill the true Tree it self. For Perkin, after he had been a while in the Tower, began to insinuate himself into the favour and kindness of his Keepers, Servants to the Lieutenant of the Tower, Sir John Digby, being four in number; Strangways, Blewet, Astwood, and Long-Roger. These Varlets, with mountains of promises, he sought to corrupt, to obtain his Escape. But knowing well, that his own Fortunes were made so contemptible, as he could feed no man's Hopes (and by Hopes he must work, for Rewards he had none) he had contrived with himself a vast and tragical Plot, which was, to draw into his Company Edward Plantagenet Earl of Warwick, then Prisoner in the Tower; whom the weary life of a long Imprisonment, and the often and renewing Fears of being put to Death, had softned to take any impression of counsel for his Liberty. This young Prince he thought these Servants would look upon, though not upon himself. And therefore after that by some Message by one or two of them, he had tasted of the Earl's consent; it was agreed that these four should murder their Master the Lieutenant, secretly in the night, and make their best of such Money and portable Goods of his, as they should find ready at hand, and get the Keys of the Tower, and presently let forth Perkin and the Earl. But this Conspiracy was revealed in time, before it could be executed. And in this again the Opinion of the King's great Wisdom did surcharge him with a sinister Fame, that Perkin was but his Bait, to entrap the Earl of Warwick. And in the very instant while this Conspiracy was in working (as if that also had been the King's industry) it was fatal, that there should break forth a counterfeit Earl of Warwick, a Cordwainer's Son, whose name was Ralph Wilford; a young man, taught and set on by an Augustin Frier, called Patrick. They both from the parts of Suffolk, came forwards into Kent, where they did not only privily and underhand give out, that this Wilford was the true Earl of Warwick; but also the Frier finding some light Credence in the People, took the boldness in the Pulpit to declare as much, and to incite the People to come in to his ayd. Whereupon they were both presently , and the young fellow executed, and the Frier condemned perpetual Imprisonment. This also hapning so opportunely, to the danger to the King's Estate, from the Earl of

Warwick, and thereby to colour the King's severity that followed, together the madness of the Frier, so vainly and desperately to divulge a Treason, before it had gotten any manner of strength; and the saving of the Frier's life, which nevertheless was (indeed) but the priviledge of his Order; and the Pity in the common People (which if it run in a strong Stream, doth ever cast up Scandal and Envy) made it generally rather talked, than believed, that all was but the King's device. But howsoever it were, hereupon Perkin (that had offended against Grace now the third time) was at the last proceeded with, and by Commissioners of Oyer and Determiner, arraigned at Westminster, upon divers Treasons committed and perpetrated after his coming on land within this Kingdom (for so the Judges advised, for that he was a Poreiner) and condemned, and a few days after executed at Tyburn. Where he did again openly read his Confession, and take it upon his Death to be true. This was the end of this little Cockatrice of a King, that was able to destroy those that did not espy him first. It was one of the longest Plays of that kind, that hath been in memory; and might perhaps have had another end, if he had not met with a King both wise, stout and fortunate.

As for Perkin's three Counsellors, they had registred themselves Sanctuary-men when their Master did. And whether upon Pardon obtained, or continuance within the Priviledge, they came not to be proceeded with.

There was executed with Perkin the Mayor of Cork, and his Son, who had been principal Abettors of his Treasons. And soon after were likewise condemned eight other Persons, about the TowerConspiracy, whereof four were the Lieutenant's men. But of those eight but two were executed. And immediately after was arraigned before the Earl of Oxford (then for the time High-Steward of England) the poor Prince the Earl of Warwick; not for the Attempt to escape simply (for that was not acted; And besides, the Imprisonment not being for Treason, the Escape by Law could not be Treason) but for conspiring with Perkin to raise sedition, and to destroy the King. And the Earl confessing the Indictment had Judgment, and was shortly after beheaded on Tower-hill.

This was also the end not only of this Noble and Commiserable person Edward the Earl of Warwick, eldest Son to the Duke of Clarence, but likewise of the Line-Male of the Plantagenets, which had flourished in great Royalty and Renown, from the time of the famous King of England King Henry the Second. Howbeit it was a Race often dipped in their own Blood. It hath remained since only transplanted into other Names, as well of the Imperial-Line, as of other Noble Houses. But it was neither guilt of Crime, nor reason of Estate, that could quench the Envy that was upon the King for this Execution. So that he thought good to export it out of the Land, and to lay it upon his new Ferdinando King of Spain. For these two Kings understanding one another at half a word, so it was, that there were Letters shewed out of Spain, whereby in the passages concerning the Treaty of the Marriage, Ferdinando had written to the King in plain terms, that he saw no assurance of his Succession, as long as the Earl of Warwick lived; and that he was loth to send his Daughter to Troubles and Dangers. But hereby, as the King did in some part remove the Envy from himself; so he did not observe, that he did withal bring a kind of Malediction and Infausting upon the Marriage, as an ill Prognostick. Which in event so far proved true, as both Prince Arthur enjoyed a very small time after the Marriage, and the Lady Katherine, her self (a sad and a religious woman) long after, when King Henry the Eighth his resolution of a Divorce from her was first made known to her, used some words; That she had not offended: but it was a Judgment of God, for that her former Marriage was made in blood; meaning that of the Earl of Warwick.

This Fifteenth year of the King there was a great Plague, both in London, and in divers parts of the Kingdom. Wherefore the King after often change of Places (whether to avoid the danger of the Sickness, or to give occasion of an Enterview with the ArchDuke, or both) sayled over with his Queen to Calice. Upon his coming thither, the ArchDuke sent an honourable Ambassage unto him, as well to welcom him into those parts, as to let him know, that (if it pleased him) he would come and do him reverence. But it was said withal; That the King might be pleased to appoint some place, that were out of any Walled Town or Fortress, for that he had denied the same upon like occasion to the

French King. And though he said, he made a great difference between the two Kings, yet he would be loth to give a President, that might make it after to be expected at his hands, by another whom he trusted less. The King accepted of the Courtesie, and admitted of his Excuse, and appointed the place to be at St. Peter's Church without Calice. But withal he did visit the ArchDuke with Ambassadors sent from himself, which were the Lord SaintJohn, and the Secretary; unto whom the ArchDuke did the honour, as (going to Mass at St. Omers) to set the Lord SaintJohn on his right hand, and the Secretary on his left, and so to ride between them to Church. The day appointed for the Enterview, the King went on Horse-back some distance from St. Peter's Church, to receive the ArchDuke. And upon their approaching, the ArchDuke made hast to light, and offered to hold the King's Stirrop at his alighting; which the King would not permit, but descending from Horse-back, they embraced with great affection, and withdrawing into the Church to a place prepared, they had long Conference, not only upon the Confirmation of former Treaties, and the of Commerce, but upon Cross Marriages, to be had between the Duke of York the King's second Son, and the ArchDuke's Daughter, And again between Charles the ArchDukes Son and Heir, and Mary the King's second Daughter. But these Blossoms of unripe Marriages, were but friendly wishes, and the Airs of loving Entertainment; though one of them came afterwards to Conclusion in Treaty, though not in Effect. But during the time that the two Princes conversed and commoned together in the Suburbs of Calice, the Demonstrations on both sides were passing hearty and affectionate, especially on the part of the ArchDuke. Who (besides that he was a Prince of an excellent good nature) being conscious to himself, how drily the King had been used by his Council in the matter of Perkin, did strive by all means to recover it in the King's affection. And having also his ears continually beaten with the Counsels of his Father and Fatherin-law, who (in respect of their jealous hatred against the French King) did always advise the ArchDuke to anchor himself upon the Amity of King Henry of England; was glad upon this occasion, to put in ure and practice their precepts, calling the King Patron, and Father, and Protector, (these very words the King

repeats; when he certified of the loving behaviour of the ArchDuke to the City) and what else he could devise, to express his love and observance to the King. There came also to the King the Governour of Picardy, and the Bailiff of Amiens, sent from Lewis the French King to do him honour, and to give him knowledge of his victory and winning of the Duchy of Millan. It seemeth the King was well pleased with the honours he received from those parts, while he was at Calice. For he did himself certifie all the News and Occurrents of them in every particular, from Calice, to the Mayor and Aldermen of London, which (no doubt) made no small talk in the City. For the King, though he could not entertain the good will of the Citizens, as Edward the Fourth did; yet by affability and other Princely Graces, did ever make very much of them, and apply himself to them.

This year also dyed John Morton, Archbishop of Canterbury, Chancellor of England, and Cardinal. He was a wise man, and an eloquent, but in his nature harsh, and haughty; much accepted by the King, but envied by the Nobility, and hated of the People. Neither was his name left out of Perkin's Proclamation for any good will, but they would not bring him in amongst the King's Casting-Counters, because he had the Image and Superscription upon him of the Pope, in his Honour of Cardinal. He wan the King with Secrecy and Diligence, but chiefly because he was his old Servant in his less Fortunes: And also for that (in his affections) he was not without an inveterate malice against the House of York, under whom he had been in trouble. He was willing also to take Envy from the King, more than the King was willing to put upon him. For the King cared not for Subterfuges, but would stand Envy, and appear in any thing that was to his mind; which made Envy still grow upon him more universal, but less daring. But in the matter of Exactions, time did after shew, that the Bishop in feeding the King's humour, did rather temper it. He had been by Richard the Third committed (as in custody) to the Duke of Buckingham, whom he did secretly incite to revolt from King Richard. But after the Duke was engaged, and thought the Bishop should have been his chief Pilot in the Tempest, the Bishop was gotten into the Cock-boat, and fled over beyond Seas. But whatsoever else

was in the Man, he deserveth a most happy Memory, in that he was the principal Mean of joyning the two Roses. He dyed of great years, but of strong health and Powers.

The next year, which was the Sixteenth year of the King, and the year of our Lord One thousand five hundred, was the year of Jubile at Rome. But Pope Alexander, to save the Hazard and Charges of mens Journeys to Rome, thought good to make over those Graces by exchange, to such as would pay a convenient Rate, seeing they could not come to fetch them. For which purpose was sent into England Jasper Pons, a Spaniard, the Pope's Commissioner, better chosen than were the Commissioners of Pope Leo, afterwards employed for Germany; for he carried the Business with great wisdom, and semblance of Holiness. In so much as he levied great summs of Money within this Land to the Pope's use, with little or no Scandal. It was thought the King shared in the Money. But it appeareth by a Letter which Cardinal Adrian, the King's Pensioner, wrote to the King from Rome some few years after, that this was not so. For this Cardinal, being to perswade Pope Julius on the King's behalf, to expedite the Bull of Dispensation for the Marriage between Prince Henry and the Lady Katherine, finding the Pope difficil in granting thereof, doth use it as a principal Argument concerning the King's merit toward that See, that he had touched none of those Deniers, which had been levied by Pons in England. But that it might the better appear (for the satisfaction of the Common people) that this was Consecrate Money, the same Nuncio brought unto the King a Brief from the Pope, wherein the King was exhorted and summoned to come in Person against the Turk. For that the Pope (out of the care of an Universal Father) seeing almost under his eyes the Successes and Progresses of that great Enemy of the Faith, had had in the Conclave, and with the Assistance of the Ambassadors of forein Princes, divers Consultations about an Holy War, and a General Expedition of Christian Princes against the Turk. Wherein it was agreed, and thought fit, that the Hungarians, Polonians, and Bobemians should make a War upon Thracia; the French and Spaniards upon Gracia; and that the Pope (willing to sacrifice himself in so good a Cause) in Person and in Company of the King of England, the Venetians, and

such other States as were great in maritim Power, would sail with a puissant Navy through the Mediterrane unto Constantinople. And that to this end, his Holiness had sent Nuncio's to all Christian Princes; As well for a Cessation of all Quarrels and Differences amongst themselves, as for speedy Preparations and Contributions of Forces and Treasure for this Sacred Enterprize.

To this the King, (who understood well the Court of Rome) made an Answer rather Solemn, than Serious: Signifying;

THat no Prince on Earth should be more forward and obedient, both by his Person, and by all his possible Forces, and Fortunes, to enter into this Sacred War, than himself. But that the distance of Place was such, as no Forces that he should raise for the Seas, could be levied or prepared, but with double the charge, and double the time (at the least) that they might be from the other Princes, that had their Territories nearer adjoyning. Besides, that neither the manner of his Ships (having no Galleys) nor the Experience of his Pilots and Mariners could be so apt for those Seas, as theirs. And therefore that his Holiness might do well, to move one of those other Kings, who lay fitter for the purpose, to accompany him by Sea. Whereby both all things would be sooner put in readiness, and with less Charge, and the Emulation and Division of Command, which might grow between those Kings of France and Spain, if they should both joyn in the War by Land upon Grecia, might be wisely avoided. And that for his part, he would not be wanting in Ayds and Contribution. Yet notwithstanding, if both these Kings should refuse, rather than his Holiness should go alone, he would wait upon him, as soon as he could be ready. Always provided, that he might first see all Differences of the Christian Princes amongst themselves, fully laid down and appeased (as for his own part he was in none.) And that he might have some good Towns upon the Coast in Italy put into his hands, for the Retrait and safeguard of his Men.

With this Answer Jasper Pons returned, nothing at all discontented. And yet this Declaration of the King (as superficial as it was) gave him that Reputation abroad, as he was not long after elected by the Knights of the Rhodes, Protector

of their Order; All things multiplying to Honour in a Prince, that had gotten such high Estimation for his Wisdom and Sufficiency.

There were these two last years some proceedings against Hereticks, which was rare in this King's Reign, and rather by Penances, than by Fire. The King had (though he were no good School-man) the Honour to convert one of them by Dispute at Canterbury.

This year also, though the King were no more haunted with Sprites, for that by the sprinkling, partly of Blood, and partly of Water, he had chased them away; yet nevertheless he had certain Apparitions that troubled him, still shewing themselves from one Region, which was the House of-York. It came so to pass, that the Earl of Suffolk, Son to Elizabeth, eldest Sister to King Edward the Fourth, by John Duke of Suffolk, her second Husband, and Brother to John Earl of Lincoln, that was slain at Stockfield, being of an hasty and Cholerick disposition, had killed a man in his fury; whereupon the King gave him his Pardon. But either willing to leave a Cloud upon him, or the better to make him feel his Grace, produced him openly to plead his Pardon. This wrought in the Earl, as in a haughty stomack it useth to do; for the Ignominy printed deeper than the Grace. Wherefore he being discontent, fled secretly into Flanders, unto his Aunt the Duchess of Burgundy. The King startled at it. But being taught by Troubles, to use fair and timely Remedies, wrought so with him by Messages, (the Lady Margaret also growing by often failing in her Alchymy, weary of her Experiments, and partly being a little sweetned, for that the King had not touched her name in the Confession of Perkin) that he came over again upon good terms, and was reconciled to the King.

In the beginning of the next year, being the Seventeenth of the King, the Lady Katherine fourth Daughter of Ferdinando and Isabella, King and Queen of Spain, arrived in England, at Plimouth, the second of October, and was married to Prince Arthur in Pauls the fourteenth of November following. The Prince being then about fifteen years of age, and the Lady about eighteen. The manner of her Receiving, the manner of her Entry into London, and the Celebrity of the Marriage were performed with great and true Magnificence, in regard of Cost,

Shew, and Order. The chief man that took the care was Bishop Fox; who was not only a grave Counsellor for War or Peace, but also a good Surveyor of Works, and a good Master of Ceremonies, and any thing else that was fit for the Active part, belonging to the service of Court, or State of a great King. This Marriage was almost seven years in Treaty; which was in part caused by the tender years of the Marriage-couple, especially of the Prince. But the true reason was, that these two Princes, being Princes of great Policy and profound Judgment, stood a great time looking one upon another's Fortunes, how they would go, knowing well that in the mean time, the very Treaty it self gave abroad in the World a Reputation of a strait Conjunction and Amity between them; which served on both sides to many purposes, that their several Affairs required, and yet they continued still free. But in the end, when the Fortunes of both the Princes did grow every day more and more prosperous and assured, and that looking all about them they saw no better Conditions, they shut it up.

The Marriage-Money the Princess brought (which was turned over to the King by Act of Renunciation) was two hundred thousand Ducats. Whereof one hundred thousand were payable ten days after the Solemnization, and the other hundred thousand at two payments Annual; but part of it to be in Jewels and Plate, and a due course set down to have them justly and indifferently prized. The Joynture or Advancement of the Lady, was the third part of the Principality of Wales, and of the Dukedom of Cornwal, and of the Earldom of Chester, to be after set forth in severalty. And in case she came to be Queen of England, her Advancement was left indefinite, but thus; That it should be as great, as ever any former Queen of England had.

In all the Devices and Conceits of the Triumphs of this Marriage, there was a great deal of Astronomy. The Lady being resembled to Hesperus, and the Prince to Arcturus, and the old King Alphonsus (that was the greatest Astronomer of Kings, and was Ancestor to the Lady) was brought in to be the Fortune-celler of the Match. And whosoever had those Toys in Compiling, they were not altogether Pedantical. But you may be sure that King Arthur, the Briton, and the descent of the Lady Katherine from the House of Lancaster, was in no wise

forgotten. But (as it should seem) it is not good to fetch Fortunes from the Stars. For this young Prince (that drew upon him at that time, not only the Hopes and Affections of his Countrey, but the Eyes and Expectation of Foreiners) after a few Months, in the beginning of April, deceased at Ludlow-Castle, where he was sent to keep his Resiance and Court, as Prince of Wales. Of this Prince, in respect he dyed so young, and by reason of his Father's manner of Education, that did cast no great Lustre upon his Children, there is little particular Memory. Only thus much remaineth, that he was very studious and learned, beyond his years, and beyond the Custom of great Princes.

There was a doubt ripped up in the times following, when the Divorce of King Henry the Eighth from the Lady Katherine did so much busie the world, whether Arthur was bedded with his Lady or no, whereby that matter in fact (of Carnal Knowledge) might be part of the Case. And it is true, that the Lady her self denyed it, or at least her Council stood upon it, and would not blanch that Advantage, although the plenitude of the Pope's power of Dispensing was the main Question. And this Doubt was kept long open, in respect of the two Queens that succeeded, Mary and Elizabeth, whose Legitimations were incompatible one with another, though their Succession was setled by Act of Parliament. And the Times that favoured Queen Maries Legitimation, would have it believed, that there was no Carnal Knowledge between Arthur and Katherine. Not that they would seem to derogate from the Pope's absolute power, to dispense even in that Case; but only in point of Honour, and to make the Case more favourable and smooth. And the Times that favoured Queen Elizabeths Legitimation (which were the longer, and the later) maintained the contrary. So much there remaineth in Memory, that it was half a years time between the Creation of Henry Prince of Wales, and Prince Arthur's death; which was construed to be, for to expect a full time, whereby it might appear, whether the Lady Katherine were with Child by Prince Arthur, or no. Again, the Lady her self procured a Bull, for the better Corroboration of the Marriage, with a Clause of (vel forsan cognitam) which was not in the first Bull. There was given in Evidence also, when the cause of the Divorce was handled, a pleasant passage, which was; That in a Morning

Prince Arthur, upon his up-rising from Bed with her, called for drink, which he was not accustomed to do, and finding the Gentleman of his Chamber that brought him the drink to smile at it and to note it, he said merrily to him, That he had been in the midst of Spain, which was an hot Region, and his Journey had made him dry, and that if the other had been in so hot a Clime, he would have been dryer than he. Besides, the Prince was upon the point of Sixteen years of Age when he dyed, and forward, and able in Body.

The February following, Henry Duke of York was created Prince of Wales, and Earl of Chester and Flint. For the Dukedom of Cornwal devolved to him by Statute. The King also being fasthanded, and loth to part with a second Dowry, but chiefly being affectionate both by his Nature, and out of Politick Considerations to continue the Alliance with Spain, prevailed with the Prince (though not without some Reluctation, such as could be in those years, for he was not twelve years of Age) to be contracted with the Princess Katherine. The secret Providence of God ordaining that Marriage, to be the Occasion of great Events and Changes.

The same year were the Espousals of James King of Scotland, with the Lady Margaret, the King's eldest Daughter, which was done by Proxy, and published at Paul's Cross, the five and twentieth of January, and Te Deum solemnly sung. But certain it is, that the Joy of the City thereupon shewed, by Ringing of Bells, and Bon-fires, and such other Incense of the People, was more than could be expected, in a Case of so great and fresh Enmity between the Nations; especially in London, which was far enough off from feeling any of the former calamities of the War. And therefore might be truly attributed to a Secret Instinct and Inspiring (which many times runneth not only in the Hearts of Princes, but in the Pulse and Veins of People) touching the happiness thereby to ensue in time to come. This Marriage was in August following consummate at Edenburgh. The King bringing his Daughter as far as Colly-Weston on the way, and then consigning her to the Attendance of the Earl of Northumberland; who with a great Troop of Lords and Ladies of Honour, brought her into Scotland, to the King her Husband.

This Marriage had been in Treaty by the space of almost three years, from the time that the King of Scotland did first open his mind to Bishop Fox. The Summ given in Marriage by the King, was ten thousand Pounds. And the Joynture and Advancement assured by the King of Scotland, was two thousand Pounds a year, after King James his Death, and one thousand Pounds a year in present, for the Ladys Allowance or Maintenance. This to be set forth in Lands, of the best and most certain Revenue. During the Treaty, it is reported, that the King remitted the matter to his Council; And that some of the Table in the Freedom of Counsellors (the King being present) did put the Case; that if God should take the King's two Sons without Issue, that then the Kingdom of England would fall to the King of Scotland, which might prejudice the Monarchy of England. Whereunto the King himself replied; That if that should be, Scotland would be but an Accession to England, and not England to Scotland, for that the greater would draw the less: And that it was a safer Union for England, than that of France. This passed as an Oracle, and silenced those that moved the Question.

The same year was fatal, as well for Deaths, as Marriages, and that with equal temper. For the Joys and Feasts of the two Marriages, were compensed with the Mournings, and Funerals of Prince Arthur (of whom we have spoken) and of Queen Elizabeth, who dyed in Child-bed in the Tower, and the Child lived not long after. There dyed also that year Sir Reginold Bray, who was noted to have had with the King the greatest Freedom of any Counsellor; but it was but a Freedom, the better to set off Flattery. Yet he bare more than his just part of Envy, for the Exactions.

At this time the King's Estate was very prosperous, secured by the Amity of Scotland, strengthned by that of Spain, cherished by that of Burgundy, all Domestick Troubles quenched, and all Noise of War (like a Thunder a-far-off) going upon Italy. Wherefore Nuture, which many times is happily contained, and refrained by some Bands of Fortune, began to take place in the King; carrying (as with a strong Tide) his Affections and Thoughts unto the gathering and heaping up of Treasure. And as Kings do more easily find Instruments for their Will and Humour, than for their Service and Honour; He had gotten for his

purpose, or beyond his purpose, two Instruments, Empson and Dudley, (whom the people esteemed as his Horse-Leeches and Shearers) bold men, and careless of Fame, and that took Toll of their Master's Grist. Dudley was of a good Family, Eloquent, and one that could put Hateful Business into good Language. But Empson, that was the Son of a Sieve-maker, triumphed always upon the Deed done, putting off all other respects whatsoever. These two Persons being Lawyers in Science, and Privy Counsellors in Authority (as the corruption of the best things is the worst) turned Law and Justice into Wormwood and Rapine. For first, their manner was to cause divers Subjects to be indicted of sundry Crimes, and so far forth to proceed in form of Law; But when the Bills were found, then presently to commit them. And nevertheless not to produce them to any reasonable time to their Answer, but to suffer them to languish long in Prison; and by sundry artificial Devices and Terrours, to extort from them great Fines and Ransoms, which they termed Compositions and Mitigations.

Neither did they (towards the end) observe so much as the Halfface of Justice, in proceeding by Indictment; but sent forth their Precepts to attach men, and convent them before themselves and some others, at their private Houses, in a Court of Commission, and there used to shuffle up a Summary Proceeding, by Examination, without tryal of Jury; assuming to themselves there, to deal both in Pleas of the Crown, and Controversies Civil.

Then did they also use to enthral and charge the Subjects Lands with Tenures in Capite, by finding False Offices, and thereby to work upon them for Wardships, Liveries, Primier Seisins, and Alienations, (being the fruits of those Tenures) refusing upon divers Pretexts and Delays, to admit men to traverse those False Offices, according to the Law. Nay, the King's Wards after they had accomplished their full Age, could not be suffered to have Livery of their Lands, without paying excessive Fines, far exceeding all reasonable Rates. They did also vex men with Informations of Intrusion upon scarce colourable Titles.

When men were Out-lawed in Personal Actions they would not permit them to purchase their Charters of Pardon, except they paid great and intolerable, summs; standing upon the strict Point of Law, which upon Out-lawries giveth

Forfeiture of Goods. Nay, contrary to all Law and Colour, they maintained, the King ought to have the half of mens Lands and Rents, during the space of full two years, for a Pain in Case of Out-lawry. They would also ruffle with Jurors, and enforce them to find as they would direct, and (if they did not) Convent them, Imprison them, and Fine them.

These and many other Courses, fitter to be buried than repeated, they had of Preying upon the People; both like Tame Hawks for their Master, and like Wild Hawks for themselves; in so much as they grew to great Riches and Substance. But their principal working was upon Penal Laws, wherein they spared none, great nor small; nor considered whether the Law were possible, or impossible, in Use or Obsolete. But raked over all old and new Statutes, though many of them were made with intention rather of Terrour, than of Rigour; having ever a Rabble of Promoters, Questmongers, and leading Jurors at their Command, so as they could have any thing found either for Fact, or Valuation.

There remaineth to this day a Report, that the King was on a time entertained by the Earl of Oxford (that was his principal Servant, both for War and Peace) nobly and sumptuously, at his Castle at Henningham. And at the King's going away, the Earl's Servants stood (in a seemly manner) in their Livery-Coats, with Cognisances, ranged on both sides, and made the King a . The King called the Earl to him, and said; My Lord, I have heard much of your Hospitality, but I see it is greater than the speech. These handsom Gentlemen and Yeomen, which I see on both sides of me, are sure your Menial Servants. The Earl smiled, and said, It may please your Grace, that were not for mine ease. They are most of them my Retainers, they are come to do me service at such a time as this, and chiefly to see your Grace. The King started a little, and said; By my faith (my Lord) I thank you for my good Cheer, but I may not endure to have my Laws broken in my sight. My Attorney must speak with you. And it is part of the Report, that the Earl compounded for no less than fifteen thousand Marks. And to shew further the Kings extreme Diligence; I do remember to have seen long since a Book of Accompt of Empson's, that had the King's hand almost to every

Leaf, by way of Signing, and was in some places Postilled in the Margin, with the King's hand likewise, where was this Remembrance:

Item, Received of such a one, five Marks for the Pardon to be procured; and if the Pardon do not pass, the Money to be re-paid, except the party be some other-ways satisfied.

And over against this Memorandum (of the King's own hand) Otherwise satisfied.

Which I do the rather mention, because it shews in the King a Nearness, but yet with a kind of Justness. So these little Sands and Grains of Gold and Silver (as it seemeth) helped not a little to make up the great Heap and Bank.

But mean while (to keep the King awake) the Earl of Suffolk having been too gay at Prince Arthur's Marriage, and sunk himself deep in Debt, had yet once more a mind to be a Knight-Errant; and to seek Adventures in Forein parts. And taking his Brother with him, fled again into Flanders. That (no doubt) which gave him Confidence, was the great Murmur of the People against the King's Government. And being a Man of a light and rash Spirit, he thought every Vapour would be a Tempest. Neither wanted he some Party within the Kingdom. For the Murmur of People awakes the Discontents of Nobles; and again, that calleth up commonly some Head of Sedition. The King resorting to his wonted and tryed Arts, caused Sir Robert Curson, Captain of the Castle at Hammes (being at that time beyond Sea, and therefore less likely to be wrought upon by the King) to flie from his Charge, and to feign himself a servant of the Earl's. This Knight, having insinuated himself into the Secrets of the Earl, and finding by him upon whom chiefly he had either Hope or Hold, advertised the King thereof in great secrecy. But nevertheless maintained his own Credit and inward trust with the Earl. Upon whose Advertisements, the King attached William Courtney, Earl of Devonshire, his Brother-in-Law, married to the Lady Katherine, Daughter to King Edward the Fourth; William de la Pole, Brother to the Earl of Suffolk; Sir James Tirrel, and Sir John Windham, and some other meaner Persons, and committed them to Custody. George, Lord Abergaveny, and Sir Thomas Green, were at the same time apprehended; but as upon less

Suspition, so in a freer Restraint, and were soon after delivered. The Earl of Devonshire, being interessed in the blood of York, that was rather Feared than Nocent; yet as One, that might be the Object of others Plots and Designs, remained Prisoner in the Tower, during the King's life. William de la Pole, was also long restrained, though not so straitly. But for Sir James Tirrel (against whom the Blood of the Innocent Princes, Edward the Fifth, and his Brother did still cry from under the Altar) and Sir John Windham, and the other meaner ones, they were attainted and executed; the two Knights beheaded. Nevertheless, to confirm the Credit of Curson (who belike had not yet done all his Feats of Activity) there was published at Paul's Cross, about the time of the said Executions, the Pope's Bull of Excommunication and Curse, against the Earl of Suffolk, and Sir Robert Curson, and some others by name, and likewise in general against all the Abettors of the said Earl. Wherein it must be confessed, that Heaven was made too much to bow to Earth, and Religion to Policy. But soon after, Curson (when he saw time) returned into England, and withal into wonted Favour with the King, but worse Fame with the People. Upon whose return the Earl was much dismayed, and seeing himself destitute of hopes (the Lady Margaret also by tract of Time, and bad Success, being now becom cool in those attempts) after some wandering in France, and Germany, and certain little Projects, no better than Squibs of an Exiled man, being tired out, retired again into the Protection of the ArchDuke Philip in Flanders, who by the death of Isabella was at that time King of Castile, in the right of Joan his Wife.

This year (being the Nineteenth of his Reign) the King called his Parliament. Wherein a man may easily guess, how absolute the King took himself to be with his Parliament, when Dudley that was so hateful, was made Speaker of the House of Commons. In this Parliament, there were not made any Statutes memorable, touching publick Government. But those that were, had still the Stamp of the King's Wisdom and Policy.

There was a Statute made for the disannulling of all Patents of Lease, or Grant, to such as came not upon lawful Summons, to serve the King in his Wars, against the Enemies or Rebels, or that should depart without the King's licence;

With an exception of certain Persons of the Long-robe. Providing nevertheless, That they should have the King's Wages, from their House, till their return home again. There had been the like made before for Offices, and by this Statute it was extended to Lands. But a man may easily see by many Statutes made in this King's time, that the King thought it safest, to assist Martial Law by Law of Parliament.

Another Statute was made, prohibiting the bringing in of Manufactures of Silk wrought by it self, or mixt with any other Thred. But it was not of Stuffs of whole piece (for that the Realm had of them no Manufacture in use at that time) but of Knit-Silk, or Texture of Silk; as Ribands, Laces, Cawls, Points, and Girdles, &c. which the people of England could then well skill to make. This Law pointed at a true Principle; That where forein materials are but Superfluities, forein Manufactures should be prohibited. For that will either banish the Superfluity, or gain the Manufacture.

There was a Law also of Resumption of Patents of Gaols, and the Reannexing of them to the Sherifwicks; Priviledged Officers being no less an Interruption of Justice, than Priviledged Places.

There was likewise a Law to restrain the By-laws or Ordinances of Corporations, which many times were against the Prerogative of the King, the Common-law of the Realm, and the Liberty of the Subject, being Fraternities in Evil. It was therefore Provided, that they should not be put in Execution, without the Allowance of the Chancellor, Treasurer, and the two Chief-Justices, or three of them, or of the two Justices of Circuit where the Corporation was.

Another Law was (in effect) to bring in the Silver of the Realm to the Mint, in making all clipped, minished, or impaired Coins of Silver, not to be currant in payments, without giving any Remedy of weight, but with an exception only of a reasonable wearing, which was as nothing in respect of the incertainty; and so (upon the matter) to set the Mint on work, and give way to New Coins of Silver, which should be then minted.

There likewise was a long Statute against Vagabonds, wherein two things may be noted; The one, the Dislike the Parliament had of Gaoling of them, as

that which was chargeable, pesterous, and of no open Example. The other, that in the Statutes of this King's time, (for this of the Nineteenth year is not the only Statute of that kind) there are ever coupled, the punishment of Vagabonds, and the forbidding of Dice, and Cards, and unlawful Games unto Servants and mean people, and the putting down and suppressing of Ale-houses, as Strings of one Root together, and as if the One were unprofitable, without the Other.

As for Riot and Retainers, there passed scarce any Parliament in this time without a Law against them, the King ever having an Eye to Might, and Multitude.

There was granted also that Parliament a Subsidy, both for the Temporalty and the Clergy. And yet nevertheless, ere the year expired, there went out Commissions for a general Benevolence, though there were no Wars, no Fears. The same year the City gave five thousand Marks, for Confirmation of their Liberties; A thing fitter for the Beginnings of King's Reigns, than the latter Ends. Neither was it a small matter, that the Mint gained upon the late Statute, by the Recoinage of Groats, and Half-Groats, now Twelve-pences and Sixpences. As for Empson and Dudley's Mills, they did grind more than ever. So that it was a strange thing, to see what Golden Showrs poured down upon the King's Treasury at once. The last payments of the Marriage-Money from Spain; The Subsidy; The Benevolence; The Recoinage; The Redemption of the Cities Liberties; The Casualties. And this is the more to be marvelled at, because the King had then no Occasions at all of Wars or Troubles. He had now but one Son and one Daughter unbestowed. He was Wise; He was of an High Mind; He needed not to make Riches his Glory. He did excel in so many things else; save that certainly Avarice doth ever find in it self matter of Ambition. Belike he thought to leave his Son such a Kingdom, and such a Mass of Treasure; as he might choose his Greatness where he would.

This year was also kept the Serjeants , which was the second Call in this Kings Days.

About this time Isabella, Queen of Castile, deceased; a right Noble Lady, and an Honour to her Sex, and Times, and the Corner-stone of the Greatness of

Spain, that hath followed. This Accident the King took not for News at large, but thought it had a great Relation to his own Affairs; especially in two points: The one for Example; the other for Consequence. First, he conceived that the Case of Ferdinando of Arragon, after the death of Queen Isabella, was his own Case, after the death of his own Queen: and the Case of Joan the Heir unto Castile, was the Case of his own Son Prince Henry. For if both of the Kings had their Kingdoms in the right of their Wives, they descended to the Heirs, and did not accrew to the Husbands. And although his own Case had both Steel and Parchment, more than the other (that is to say, a Conquest in the Field, and an Act of Parliament) yet, notwithstanding, that Natural Title of Descent in Blood, did (in the imagination even of a wise man) breed a Doubt, that the other two were not safe nor sufficient. Wherefore he was wonderful diligent to enquire and observe what became of the King of Arragon, in holding and continuing the Kingdom of Castile. And whether he did hold it in his own Right, or as Administrator to his Daughter; and whether he were like to hold it in Fast, or to be put out by his Son-in-Law. Secondly, he did revolve in his mind, that the State of Christendom might by this late Accident have a turn. For whereas before-time himself, with the Conjunction of Arragon and Castile (which then was one) and the Amity of Maximilian and Philip his Son the ArchDuke, was far too strong a Party for France; he began to fear, that now the French King (who had great Interest in the Affections of Philip the young King of Castile) and Philip himself, now King of Castile, (who was in ill terms with his Fatherin-Law about the present Government of Castile.) And thirdly Maximilian, Philip's Father (who was ever variable, and upon whom the surest Aim that could be taken, was that he would not be long, as he had been last before) would, all three being potent Princes, enter into some strait League and Confederation amongst themselves. Whereby though he should not be endangered, yet he should be left to the poor Amity of Arragon. And whereas he had been heretofore a kind of Arbiter of Europe, he should now go less, and be over-topped by so great a Conjunction. He had also (as it seems) an inclination to marry, and bethought himself of some fit Conditions abroad. And amongst others he had heard of the

Beauty and virtuous Behaviour of the young Queen of Naples, the Widow of Ferdinando the younger, being then of Matronal years of seven and twenty. By whose Marriage he thought that the Kingdom of Naples (having been a Goal for a time, between the King of Arragon, and the French King, and being but newly setled) might in some part be deposited in his hands, who was so able to keep the Stakes. Therefore he sent in Ambassage or Message three confident Persons; Francis Marsin, James Braybrook, and John Stile, upon two several Inquisitions rather than Negotiations. The One, touching the Person and Condition of the young Queen of Naples; the Other, touching all particulars of Estate, that concerned the Fortunes and Intentions of Ferdinando. And because they may observe best, who themselves are observed least, he sent them under Colourable Pretexts; giving them Letters of Kindness and Compliment from Katharine the Princess, to her Aunt, and Niece, the Old and Young Queen of Naples, and delivering to them also a Book of new Articles of Peace; which notwithstanding it had been delivered unto Doctor De Putbla, the Leigier Ambassador of Spain here in England, to be sent, yet for that the King had been long without hearing from Spain, he thought good those Messengers, when they had been with the two Queens, should likewise pass on to the Court of Ferdinando, and take a Copy of the Book with them. The Instructions touching the Queen of Naples were so curious and exquisite, being as Articles whereby to direct a Survey, or a Particular of her Person, for Complexion, Favour, Feature, Stature, Health, Age, Customs, Behaviour, Conditions, and Estate, as if the King had been young, a man would have judged him to be Amorous; but being ancient, it ought to be interpreted, that sure he was very Chast, for that he meant to find all things in one Woman, and so to settle his Affections, without ranging. But in this March he was soon cooled, when he heard from his Ambassadors, that this young Queen had had a goodly Joynture in the Realm of Naples, well answered during the time of her Uncle Frederick, yea, and during the time of Lewis the French King, in whose Division her Revenue fell; but since the time that the Kingdom was in Ferdinando's hands, all was assigned to the Army, and Garrisons there, and she received only a Pension or Exhibition out of his Coffers.

The other part of the Inquiry had a grave and diligent Return, informing the King at full of the present State of King Ferdinando. By this Report it appeared to the King, that Ferdinando did continue the Government of Castile as Administrator unto his Daughter Joan, by the Title of Queen Isabella's Will, and partly by the Custom of the Kingdom, as he pretended. And that all Mandates and Grants were expedited in the name of Joan his Daughter, and himself as Administrator, without mention of Philip, her Husband. And that King Ferdinando, howsoever he did dismiss himself of the name of King of Castile, yet meant to hold the Kingdom, without Accompt; and in absolute Command.

It appeareth also, that he flattered himself with hopes, that King Philip would permit unto him the Goverment of Castile during his life; which he had laid his Plot to work him unto, both by some Counsellors of his about him, which Ferdinando had at his devotion, and chiefly by promise, that in case Philip gave not way unto it, he would marry some young Lady, whereby to put him by the Succession of Arragon and Granada, in case he should have a Son. And lastly by representing unto him that the Government of the Burgundians, till Philip were by continuance in Spain made as Natural of Spain, would not be endured by the Spaniards. But in all those things (though wisely laid down and considered) Ferdinando failed; But that Pluto was better to him than Pallas.

In the same Report also, the Ambassadors being mean men, and therefore the more free, did strike upon a string which was somewhat dangerous. For they declared plainly, that the People of Spain, both Nobles and Commons, were better affected unto the part of Philip (so he brought his Wife with him) than to Ferdinando; and expressed the reason to be, because he had imposed upon them many Taxes; and Tallages, which was the King's own Case between him and his Son.

There was also in this Report a Declaration of an Overture of of Marriage, which Amason the Secretary of Ferdinando had made unto the Ambassadors in great secret, between Charles Prince of Castile and Mary the King's second Daughter; assuring the King, that the Treaty of Marriage then on foot, for the said Prince and the Daughter of France, would break, and that she the said

Daughter of France should be married to Angolesme, that was the Heir Apparant of France.

There was a touch also of a speech of Marriage between Ferdinando and Madam De Fois, a Lady of the Blood of France, which afterwards indeed succeeded. But this was reported as learned in France, and silenced in Spain.

The King by the return of this Ambassage, which gave great light unto his Affairs, was well instructed, and prepared how to carry himself between Ferdinando King of Arragon, and Philip his Son-in-law, King of Castile; resolving with himself, to do all that in him lay to keep them at one within themselves; But howsoever that succeeded, by a moderate Carriage and bearing the Person of a Common-friend, to lose neither of their Friendships; but yet to run a Course more entire with the King of Arragon, but more laboured and officious with the King of Castile. But he was much taken with the Overture of Marriage with his Daughter Mary; Both because it was the greatest Marriage of Christendom, and for that it took hold of both Allies.

But to corroborate his Alliance with Philip, the Winds gave him an Enterview. For Philip choosing the Winter-season, the better to surprise the King of Arragon, set forth with a great Navy out of Planders for Spain in the Month of January, the One and Twentieth year of the King's Reign. But himself was surprised with a cruel Tempest, that scattered his Ships upon the several Coasts of England. And the Ship wherein King and Queen were (with two other small Barques only) torn, and in great peril to escape the fury of the weather, thrust into Weymouth. King Philip himself, having not been used (as it seems) to Sea, all wearied and extreme sick, would needs land to refresh his Spirits, though it was against the Opinion of his Council, doubting it might breed Delay, his Occasions requiring Celerity.

The Rumour of the Arrival of a puissant Navy upon the Coast, made the Countrey Arm. And Sir Thomas Trenchard with Forces suddenly raised, not knowing what the matter might be, came to Weymouth. Where understanding the Accident, he did in all Humbleness and Humanity invite the King and Queen

to his House; and forthwith dispatched Posts to the Court. Soon after came Sir John Caroe likewise, with a great troop of Men well armed; using the like Humbleness and Respect towards the King, when he knew the Case. King Philip doubting that they, being but Subjects, durst not let him pass away again, without the King's Notice and Leave, yielded to their Entreaties, to stay till they heard from the Court. The King as soon as he heard the News, commanded presently the Earl of Arundel, to go to visit the King of Castile, and let him understand; That as he was very sorry for his Mishap, so he was glad that he had escaped the Danger of the Seas, and likewise of the Occasion himself had to do him Honour; and desiring him, to think himself as in his own Land; and that the King made all haste possible to come and embrace him. The Earl came to him in great Magnificence, with a brave Troop of three hundred Horse; and (for more State) came by Torch-light. After he had done the King's Message, King Philip seeing how the world went, the sooner to get away, went upon speed to the King at Windsor, and his Queen followed by easie journeys. The two Kings at their meeting used all the Caresses, and loving Demonstrations, that were possible. And the King of Castile said presently to the King; That he was now punished, for that he would not come within his walled Town of Calice, when they met last. But the King answered, That Walls and Seas were nothing, where Hearts were open, and that he was here no otherwise, but to be served. After a day or two's refreshing, the Kings entred into speech of renewing the Treaty; the King saying, That though King Philip's Person were the same, yet his Fortunes and State were raised. In which Case a Renovation of Treaty was used amongst Princes. But while these things were in handling, the King choosing a fit time, and drawing the King of Castile into a Room, where they two only were private, and laying his hand civilly upon his arm, and changing his Countenance a little from a Countenance of Entertainment, said to him; Sir, you have been saved upon my Coast, I hope you will not suffer me to wrack upon yours. The King of Castile asked him, What he meant by that speech? I mean it (saith the King) by that same Hare-brain wild Fellow, my Subject, the Earl of Suffolk, who is protected in your Countrey, and begins to play the Fool, when all others are

weary of it. The King of Castile answered; I had thought (Sir) your Felicity had been above those thoughts. But if it trouble you, I will banish him, The King replied; Those Hornets were best in their Nests, and worst when they did flie abroad, that his desire was, to have him delivered to him. The King of Castile herewith a little confused, and in a study, said; That can I not do with my honour, and less with yours; for you will be thought to have used me as a Prisoner. The King presently said; Then the matter is at an end. For I will take that dishonour upon me, and so your honour is saved. The King of Castile, who had the King in great Estimation, and besides remembred where he was, and knew not what use he might have of the King's Amity, for that himself was new in his Estate of Spain, and unsetled, both with his Fatherin-Law, and with his People, composing his Countenance, said; Sir, you give Law to me; but so will I to you. You shall have him, but (upon your honour) you shall not take his life. The King embracing him, said; Agreed. Saith the King of Castile, Neither shall it dislike you, if I send to him in such a fashion, as he may partly come with his own good will. The King said; It was well thought of; and if it pleased him, he would joyn with him, in sending to the Earl a Message to that purpose. They both sent severally, and mean while they continued Feasting and Pastimes. The King being (on his part) willing to have the Earl sure before the King of Castile went; and the King of Castile being as willing to seem to be enforced. The King also with many wise and excellent Perswasions, did advise the King of Castile, to be ruled by the counsel of his Fatherin-Law Ferdinando; a Prince so prudent, so experienced, so fortunate. The King of Castile (who was in no very good terms with his said Fatherin-Law) answered; That if his Father-inLaw would suffer him to govern his Kingdoms, he should govern him.

There were immediately Messengers sent from both Kings to recall the Earl of Suffolk: Who upon gentle words used to him was soon charmed, and willing enough to return; assured of his Life, and hoping of his Liberty. He was brought through Flanders to Calice, and thence landed at Dover, and with sufficient Guard delivered and received at the Tower of London. Mean while King Henry (to draw out the time) continued his Feastings and Entertainments, and after he

had received the King of Castile into the Fraternity of the Garter, and for a Reciprocal had his Son the Prince admitted to the Order of the Golden-fleece, he accompanied King Philip and his Queen to the City of London; where they were entertained with the greatest Magnificence and Triumph, that could be upon no greater warning. And as soon as the Earl of Suffolk had been conveyed to the Tower (which was the serious part) the Jollities had an end, and the Kings took leave. Nevertheless during their being here, they in substance concluded that Treaty, which the Flemings term Intercursus malus, and bears Date at Windsor; for that there be some things in it, more to the Advantage of the English, than of them; especially, for that the Free-fishing of the Dutch upon the Coasts and Seas of England, granted in the Treaty of Undecimo, was not by this Treaty confirmed. All Articles that confirm former Treaties being precisely and warily limited and confirmed to matter of Commerce only, and not otherwise.

It was observed, that the great Tempest which drave Philip into England, blew down the Golden Eagle, from the Spire of Pauls, and in the fall it fell upon a Sign of the Black Eagle, which was in Pauls Church-yard, in the place where the School-House now standeth, and battered it, and brake it down. Which was a strange stooping of a Hawk upon a Fowl. This the People interpreted to be an Ominous Prognostick upon the Imperial House, which was (by Interpretation also) fulfilled upon Philip the Emperor's Son, not only in the Present Disaster of the Tempest, but in that that followed. For Philip arriving into Spain, and attaining the Possession of the Kingdom of Castile without resistance, (insomuch as Ferdinando, who had spoke so great before, was with difficulty admitted to the speech of his Son-in-Law) sickned soon after, and deceased. Yet after such time as there was an Observation by the wisest of that Court, That if he had lived, his Father would have gained upon him in that sort, as he would have governed his Counsels and Designs, if not his Affections. By this all Spain returned into the power of Ferdinando in state as it was before; the rather, in regard of the infirmity of Joan his Daughter, who loving her Husband (by whom she had many Children) dearly well, and no less beloved of him) howsoever her Father, to make Philip ill beloved of the People of Spain, gave out that Philip

used her not well) was unable in strength of mind to bear the Grief of his Decease, and fell distracted of her Wits. Of which Malady her Father was thought no ways to endeavour the Cure, the better to hold his Regal Power in Castile. So that as the Felicity of Charles the Eighth was said to be a Dream; so the Adversity of Ferdinando was said likewise to be a Dream, it passed over so soon.

About this time the King was desirous to bring into the House of Lancaster Celestial Honour, and became Suitor to Pope Julius, to Canonize King Henry the Sixt for a Saint; the rather, in respect of that his famous Prediction of the King's own Assumption to the Crown. Julius referred the matter (as the manner is) to certain Cardinals, to take the verification of his Holy Acts and Miracles. But it dyed under the Reference. The general Opinion was, that Pope Julius was too dear, and that the King would not come to his Rates. But it is more probable, That that Pope (who was extremely jealous of the Dignity of the See of Rome, and of the Acts thereof) knowing that King Henry the Sixt was reputed in the World abroad but for a Simple Man, was afraid it would but diminish the Estimation of that kind of Honour, if there were not a distance kept between Innocents and Saints.

The same year likewise there proceeded a Treaty of Marriage between the King and the Lady Margaret Duchess Dowager of Savoy, only Daughter to Maximilian, and Sister to the King of Castile; a Lady wise, and of great good Fame. This Matter had been in speech between the two Kings at their meeting, but was soon after resumed; and therein was employed for his first piece the King's then Chaplain, and after the great Prelate Thomas Wolsey. It was in the end concluded, with great and ample Conditions for the King, but with promise De Futuro only. It may be the King was the rather induced unto it, for that he heard more and more of the Marriage to go on between his great Friend and Allie Ferdinando of Arragon, and Madam De Fois, whereby that King began to piece with the French King, from whom he had been always before severed. So fatal a thing it is, for the greatest and straitest Amities of Kings, at one time or other to have a little of the Wheel. Nay there is a further Tradition (in Spain,

though not with us) That the King of Arragon, after he knew that the Marriage between Charles, the young Prince of Castile, and Mary the King's second Daughter went roundly on (which though it was first moved by the King of Arragon, yet it was afterwards wholly advanced and brought to perfection by Maximilian, and the Friends on that side) entred into jealousie, that the King did aspire to the Government of Castilia, as Administrator during the Minority of his Son-inLaw; as if there should have been a Competition of Three for that Government; Ferdinando, Grand-father on the Mothers side; Maximilian, Grand-father on the Father's side; and King Henry, Fatherin-Law to the young Prince. Certainly, it is not unlike, but the King's Government (carrying the young Prince with him) would have been perhaps more welcom to the Spaniards, than that of the other Two. For the Nobility of Castilia, that so lately put out the King of Arragon, in favour of King Philip, and had discovered themselves so far, could not but be in a secret Distrust and Distast of that King. And as for Maximilian, upon Twenty respects he could not have been the Man. But this purpose of the King's seemeth to me (considering the King's safe Courses, never found to be enterprizing or adventurous) not greatly probable, except he should have had a Desire to breathe warmer, because he had ill Lungs. This Marriage with Margaret was protracted from time to time, in respect of the Infirmity of the King, who now in the Two and Twentieth year of his Reign began to be troubled with the Gout. But the Defluxion taking also into his Breast, wasted his Lungs, so that thrice in a Year (in a kind of Return, and especially in the Spring,) he had great Fitts and Labours of the Tissick. Nevertheless he continued to intend Business with as great diligence, as before in his Heath. Yet so, as upon this warning, he did likewise now more seriously think of the World to come, and of making himself a Saint, as well as King Henry the Sixth, by Treasure better employed, than to be given to Pope Julius. For this Year he gave greater Alms than accustomed, and discharged all Prisoners about the City, that lay for Fees or Debts, under forty Shillings. He did also make haste with Religious Foundations; and in the Year following (which was the Three and Twentieth) finished that of the Savoy. And hearing also of the bitter Cries of his People against the

Oppressions of Dudley and Empson, and their Complices; partly by Devout Persons about him, and partly by publick Sermons (the Preachers doing their Duty therein) he was touched with great Remorse for the same. Nevertheless, Empson and Dudley, though they could not but hear of these Scruples in the King's Conscience; yet as if the King's Soul and his Money were in several Offices, that the One was not to intermeddle with the Other, went on with as great rage as ever. For the same Three and Twentieth Year was there a sharp Prosecution against Sir William Capel now the second time; and this was for matters of Misgovernment in his Maioralty. The great Matter being, that in some Payments he had taken knowledge of False Moneys, and did not his diligence to examine, and beat it out, who were the Offendors. For this and some other things laid to his Charge, he was condemned to pay two thousand Pounds; and being a Man of stomach, and hardened by his former Troubles, refused to pay a Mite; and be-like used some untoward Speeches of the Proceedings, for which he was sent to the Tower, and there remained till the King's Death. Knesworth likewise, that had been lately Mayor of London, and both his Sheriffs, were, for Abuses in their Offices, questioned, and imprisoned, and delivered, upon one thousand four hundred Pounds paid. Hawis, an Alderman of London, was put in Trouble, and dyed with Thought and Anguish, before his Business came to an end. Sir Lawrence Ailmer, who had likewise been Mayor of London, and his two Sheriffs, were put to the Fine of one thousand Pounds. And Sir Lawrence, for refusing to make payment, was committed to Prison, where he stay'd till Empson himself was committed in his place.

It is no marvel (if the Faults were so light, and the Rates so heavy) that the King's Treasure of Store, that he left at his death, most of it in secret places, under his own key and keeping, at Richmond, amounted (as by Tradition it is reported to have done) unto the Summ of near eighteen hundred thousand Pounds Sterling; a huge Mass of Money, even for these times.

The last Act of State that concluded this King's Temporal Felicity, was the Conclusion of a Glorious Match between his Daughter Mary, and Charles Prince of Castile, afterwards the great Emperor, both being of tender years; which

Treaty was perfected by Bishop Fox, and other his Commissioners at Calice, the year before the King's Death. In which Alliance, it seemeth he himself took so high Contentment, as in a Letter which he wrote thereupon to the City of London, (Commanding all possible Demonstrations of Joy to be made for the same) he expresseth himself, as if he thought he had built a Wall of Brass about his Kingdom. When he had for his Sons-in-Law a King of Scotland, and a Prince of Castile and Burgundy. So as now there was nothing to be added to this great King's Felicity, being at the top of all worldly Bliss, (in regard of the high Marriages of his Children, his great Renown throughout Europe, and his scarce credible Riches, and the perpetual Constancy of his prosperous Successes) but an opportune Death, to withdraw him from any future blow of Fortune. Which certainly (in regard of the great Hatred of his People and the Title of his Son, being then come to Eighteen years of Age, and being a bold Prince and liberal, and that gained upon the People by his very Aspect and Presence) had not been impossible to have come upon him.

To crown also the last year of his Reign, as well as his first, he did an Act of Piety, rare, and worthy to be taken into Imitation. For he granted forth a General Pardon, as expecting a second Coronation in a better Kingdom. He did also declare in his Will, that his mind was, that Restitution should be made of those Summs, which had been unjustly taken by his Officers.

And thus this Solomon of England (for Solomon also was too heavy upon his People in Exactions) having lived Two and Fifty Years, and thereof Reigned Three and Twenty Years and Eight Months, being in perfect Memory, and in a most Blessed Mind, in a great Calm of a Consuming Sickness passed to a better World, the Two and Twentieth of April, 1508. at his Palace of Richmond, which himself had Built.

THis King (to speak of him in Terms equal to his Deserving) was one of the best sort of Wonders; a Wonder for Wise-men. He had parts (both in his Virtues, and his Fortune) not so for a Common-place, as for Observation. Certainly he was Religious, both in his Affection and Observance. But as he could see clear (for those times) through Superstition, so he would be blinded (now and than) by

Humane Policy. He advanced Church-men, he was tender in the Priviledge of Sanctuaries, though they wrought him much Mischief. He built and endowed many Religious Foundations, besides his Memorable Hospital of the Savoy. And yet was he a great Almsgiver in secret; which shewed, that his Works in publick were dedicated rather to God's glory, than his own. He professed always to love and seek Peace; and it was his usual Preface in his Treaties; That when Christ came into the World, Peace was sung; and when He went out of the World, Peace was bequeathed. And this Virtue could not proceed out of Fear, or Softness; for he was Valiant and Active, and therefore (no doubt) it was truly Christian and Moral. Yet he knew the way to Peace, was not to seem to be desirous to avoid Wars. Therefore would be make Offers, and Fames of Wars, till he had mended the Conditions of Peace. It was also much, that one that was so great a Lover of Peace, should be so happy in War. For his Arms (either in Forein or Civil Wars) were never Infortunate, neither did he know what a Disaster meant. The War of his Coming in, and the Rebellions of the Earl of Lincoln, and the Lord Awdley were ended by Victory. The Wars of France and Scotland, by Peaces sought at his hands. That of Britain, by accident of the Duke's death. The Insurrection of the Lord Lovel, and that of Perkin at Exceter, and in Kent, by flight of the Rebels, before they came to Blows. So that his Fortune of Arms was still Inviolate. The rather sure, for that in the quenching of the Commotions of his Subjects, he ever went in Person. Sometimes reserving himself to back and second his Lieutenants, but ever in Action; and yet that was not meerly Forwardness, but partly Distrust of others.

He did much maintain and countenance his Laws, which (nevertheless) was no Impediment to him to work his Will. For it was so handled, that neither Prerogative, nor Profit went to Diminution. And yet as he would sometimes strain up his Laws to his Prerogative, so would he also let down his Prerogative to his Parliament. For Mint, and Wars, and Martial Discipline, (things of absolute Power) he would nevertheless bring to Parliament. Justice was well administred in his time, save where the King was Party: Save also, that the CouncilTable intermedled too much with Meum and Tuum. For it was a very

Court of Justice during his time, especially in the Beginning. But in that part both of Justice and Policy, which is the Durable Part, and cut (as it were) in Brass or Marble (which is The making of good Laws) he did excell. And with his Justice, he was also a Merciful Prince, as in whose time, there were but three of the Nobility that suffered; the Earl of Warwick, the Lord Chamberlain, and the Lord Awdley. Though the first two were instead of Numbers, in the Dislike and Obloquie of the People. But there were never so great Rebellions, expiated with so little Blood, drawn by the hand of Justice, as the two Rebellions of Black-heath and Exceter. As for the Severity used upon those which were taken in Kent, it was but upon a Scum of People. His Pardons went ever both before, and after his Sword. But then he had withal a strange kind of Interchanging of large and inexpected Pardons, with severe Executions. Which (his Wisdom considered) could not be imputed to any Inconstancy, or Inequality; but either to some Reason which we do not now know, or to a Principle he had set unto himself, That he would vary, and try both ways in turn. But the less Blood he drew, the more he took of Treasure. And (as some construed it) he was the more sparing in the One, that he might be the more pressing in the Other; for both would have been intolerable. Of Nature assuredly he coveted to accumulate Treasure, and was a little Poor in admiring Riches. The People (into whom there is infused, for the preservation of Monarchies, a natural Desire to discharge their Princes, though it be with the charge of their Counsellors and Ministers) did impute this unto Cardinal Morton, and Sir Reginold Bray; who (as it after appeared) as Counsellors of ancient Authority with him, did so second his Humours, as nevertheless they did temper them. Whereas Empson, and Dudley that followed, being Persons that had no Reputation with him (otherwise than by the servile following of his Bent) did not give way only (as the first did) but shape him way to those Extremities, for which himself was touched with remorse at his Death, and which his Successor renounced, and sought to purge. This Excess of his, had at that time many Glosses and Interpretations. Some thought the continual Rebellions wherewith he had been vexed, had made him grow to hate his People. Some thought it was done to pull down their Stomachs,

and to keep them low. Some, for that he would leave his Son a Golden-fleece. Some suspected he had some high Design upon Forein parts. But those perhaps shall come nearest the truth, that fetch not their reasons so far off; but rather impute it to Nature, Age, Peace, and a Mind fixed upon no other. Ambition or Pursuit. Whereunto I should add, that having every day Occasion to take notice of the Necessities and Shifts for Money of other great Princes abroad, it did the better (by Comparison) set off to him the Felicity of full Coffers. As to his expending of Treasure, he never spared Charge which his Affairs required; and in his Buildings was Magnificent, but his Rewards were very limited. So that his Liberality was rather upon his own State and Memory, than upon the Deserts of others.

He was of an High Mind, and loved his own Will, and his own Way; as One that revered himself, and would Reign indeed. Had he been a Private-man, he would have been termed Proud. But in a wise Prince, it was but keeping of Distance, which indeed he did towards all; not admitting any near or full Approach, neither to his Power or to his Secrets. For he was governed by none. His Queen notwithstanding she had presented him with divers Children, and with a Crown also, (though he would not acknowledge it) could do nothing with him. His Mother he reverenced much, heard little. For any Person agreeable to him for Society (such as was Hastings to King Edward the Fourth, or Charles Brandon after to King Henry the Eighth) he had none: Except we should account for such Persons, Fox, and Bray, and Empson, because they were so much with him. But it was but as the Instrument is much with the Work-man. He had nothing in him of Vain-glory, but yet kept State and Majesty to the height; Being sensible, That Majesty maketh the People bow, but Vain-glory boweth to them.

To his Confederates abroad he was Constant and Just, but not Open. But rather such was his Inquiry, and such his Closeness, as they stood in the Light towards him, and he stood in the Dark to them. Yet without Strangeness, but with a semblance of mutual Communication of Affairs. As for little Envies or Emulations upon Forein Princes (which are frequent with many Kings) he had never any; but went substantially to his own Business. Certain it is, that though

his Reputation was great at home, yet it was greater abroad. For Foreiners that could not see the Passages of Affairs, but made their Judgments upon the Issues of them, noted that he was ever in Strife, and ever A-loft. It grew also from the Airs, which the Princes and States abroad received from their Ambassadors and Agents here; which were attending the Court in great number. Whom he did not only content with Courtesie, Reward, and Privateness; but (upon such Conferences as passed with them) put them in Admiration, to find his Universal Insight into the Affairs of the World. Which though he did suck chiefly from themselves; yet that which he had gathered from them all, seemed Admirable to every one: So that they did write ever to their Superiours in high terms, concerning his Wisdom and Art of Rule. Nay, when they were returned, they did commonly maintain Intelligence with him. Such a Dexterity he had to impropriate to himself all Forein Instruments.

He was careful and liberal to obtain good Intelligence from all parts abroad. Wherein he did not only use his Interest in the Liegers here, and his Pensioners which he had both in the Court of Rome, and other the Courts of Christendom; but the Industry and Vigilancy of his own Ambassadors in Forein parts. For which purpose, his Instructions were ever Extreme, Curious, and Articulate; and in them more Articles touching Inquisition, than touching Negotiation. Requiring likewise from his Ambassadors an Answer, in particular distinct Articles, respectively to his Questions.

As for his secret Spials, which he did employ both at home and abroad, by them to discover what Practices and Conspiracies were against him, surely his Case required it: He had such Moles perpetually working and casting to undermine him. Neither can it be reprehended. For if Spials be lawful against lawful Enemies, much more against Conspirators and Traytors. But indeed to give them Credence by Oaths or Curses, that cannot be well maintained; for those are too holy Vestments for a Disguise. Yet surely there was this further Good in his employing of these Flies and Familiars; That as the use of them was cause that many Conspiracies were revealed, so the Fame and Suspition of them kept (no doubt) many Conspiracies from being attempted.

Towards his Queen he was nothing Uxorious, nor scarce Indulgent; but Companiable, and Respective, and without Jealousie. Towards his Children he was full of Paternal Affection, Careful of their Education, aspiring to their High Advancement, regular to see that they should not want of any due Honour and Respect, but not greatly willing to cast any Popular Lustre upon them.

To his Council he did refer much, and sate oft in Person; knowing it to be the Way to assist his Power, and inform his Judgment. In which respect also he was fairly patient of Liberty, both of Advice, and of Vote, till himself were declared. He kept a strait hand on his Nobility, and chose rather to advance Clergy-men and Lawyers, which were more Obsequious to him, but had less Interest in the People; which made for his Absoluteness, but not for his Safety. In so much as (I am perswaded) it was one of the Causes of his Troublesom Reign; for that his Nobles, though they were Loyal and Obedient, yet did not Co-operate with him, but let every man go his own Way. He was not afraid of an Able Man, as Lewis the Eleventh was. But contrariwise, he was served by the Ablest Men that were to be found; without which his Affairs could not have prospered as they did. For War, Bedford, Oxford, Surrey, Dawbeney, Brook, Poynings. For other Affairs, Morton, Fox, Bray, the Prior of Lanthony, Warham, Urswick, Hussey, Frowick, and others. Neither did he care how Cunning they were, that he did employ; For he thought himself to have the Master-Reach. And as he chose well, so he held them up well. For it is a strange thing, that though he were a Dark Prince, and infinitely Suspitious, and his Times full of Secret Conspiracies and Troubles; yet in Twenty-four Years Reign, he never put down, or discomposed Counsellor, or near Servant, save only Stanley, the Lord Chamberlain. As for the Disposition of his Subjects in General towards him, it stood thus with him; That of the Three Affections, which naturally tye the Hearts of the Subjects to their Sovereigns, Love, Fear, and Reverence; he had the last in height, the second in good measure, and so little of the first, as he was beholding to the other Two.

He was a Prince, Sad, Serious, and full of Thoughts, and secret Observations, and full of Notes and Memorials of his own hand, especially touching Persons. As whom to Employ, whom to Reward, whom to Enquire of, whom to Beware

of, what were the Dependencies, what were the Factions, and the like; keeping (as it were) a Journal of his Thoughts. There is to this day a merry Tale; That his Monkey (set on as it was thought by one of his Chamber) tore his Principal NoteBook all to pieces, when by chance it lay forth. Whereat the Court (which liked not those Pensive Accompts) was almost tickled with sport.

He was indeed full of Apprehensions and Suspitions. But as he did easily take them, so he did easily check them, and master them: whereby they were not dangerous, but troubled himself more than others. It is true; his Thoughts were so many, as they could not well always stand together; but that which did good one way, did hurt another. Neither did he at some times weigh them aright in their proportions. Certainly, that Rumour which did him so much mischief (That the Duke of York should be saved, and alive) was (at the first) of his own nourishing; because he would have more Reason not to reign in the Right of his Wife. He was Affable, and both Well and Fair-spoken, and would use strange Sweetness and Blandishments of Words, where he desired to effect or perswade any thing that he took to heart. He was rather Studious than Learned; reading most Books that were of any worth, in the French Tongue. Yet he understood the Latin, as appeareth in that Cardinal Hadriah, and others, who could very well have written French; did usu to write to him in Latin.

For his Pleasures, there is no News of them. And yet by his Instructions to Marsin and Stile, touching the Queen of Naples, it seemeth he could Interrogate well touching Beauty. He did by Pleasures, as great Princes do by Banquets, come and look a little upon them, and turn away. For never Prince was more wholly given to his Affairs, nor in them more of himself. In so much, as in Triumphs of Justs and Tourneys, and Balls, and Masques (which they then called Disguises) he was rather a Princely and Gentle Spectator, than seemed much to be delighted.

No doubt, in bine as in all men (and most of all in Kings) his Fortune wrought upon his Nature, and his Nature upon his Fortune. He attained to the Crown, not only from a private Fortune, which might endow him with Moderation; but also from the Fortune of an Exiled Man, which had quickned in him all Seeds of

Observation and Industry. And his Times being rather Prosperous, than Calm, had raised his Confidence by Success, but almost marred his Nature by Troubles. His Wisdom, by often evading from Perils, was turned rather into a Dexterity to deliver himself from Dangers, when they pressed him, than into a Providence to prevent and remove them a far off. And even in Nature, the Sight of his Mind was like some Sights of Eyes; rather strong at hand, than to carry a far off. For his Wit increased upon the Occasion; and so much the more, if the Occasion were sharpened by Danger. Again, whether it were the shortness of his Foresight, or the strength of his Will, or the dazeling of his Suspitions, or what it was; Certain it is, that the perpetual Troubles of his Fortunes (there being no more matter out of which they grew) could not have been without some great Defects, and main Errours in his Nature, Customs, and Proceedings, which he had enough to do to save and help, with a thousand little Industries and Watches. But those do best appear in the Story it self. Yet take him with all his Defects if a Man should compare him with the Kings his Concurrents, in France, and Spain, he shall find him more Politick than Lewis the Twelfth of France, and more Entire and Sincere than Ferdinando of Spain. But if you shall change Lewis the Twelfth, for Lewis the Eleventh, who lived a little before; then the Consort is more perfect. For that Lewis the Eleventh, Ferdinando, and Henry, may be esteemed for the Tres Magi of Kings of those Ages. To conclude, If this King did no greater matters, it was long of himself; for what he minded, he compassed.

He was a Comely Personage, a little above Just Stature, well and straight limmed, but slender. His Countenance was Reverend, and a little like a Church-man: And as it was not strange or dark, so neither was it Winning or Pleasing, but as the Face of one well disposed. But it was to the Disadvantage of the Painter; for it was best when he spake.

His Worth may bear a Tale or two, that may put upon him somewhat that may seem Divine. When the Lady Margaret his Mother had divers great Suitors for Marriage, she dreamed one Night, That one in the likeness of a Bishop, in Pontificial habit, did tender her Edmund Earl of Richmond (the King’s Father)

for her Husband. Neither had she ever any Child but the King, though she had three Husbands. One day when King Henry the Sixth, (whose Innocency gave him Holiness) was washing his hands at a great Feast, and cast his Eye upon King Henry, then a young Youth, he said; This is the Lad, that shall possess quietly that that we now strive for. But that that was truly Divine in him, was, that he had the Fortune of a True Christian, as well as of a Great King, in living Exercised, and dying Repentant. So as he had an happy Warfare in both Conflicts, both of Sin, and the Cross.

He was born at Pembrook-Castle, and lyeth buried at Westminster, in one of the Stateliest and Daintiest Monuments of Europe, both for the Chappel, and for the Sepulchre. So that he dwelleth more richly Dead, in the Monument of his Tomb, than he did Alive in Richmond, or any of his Palaces. I could wish he did the like, in this Monument of his Fame.

FINIS.

Translation of Certain Psalms into English Verse

TO HIS VERY GOOD FRIEND, MR. GEORGE HERBERT.

The pains that it pleased you to take about some of my writings, I cannot forget; which did put me in mind to dedicate to you this poor exercise of my sickness. Besides, it being my manner for dedications, to choose those that I hold most fit for the argument, I thought, that in respect of divinity and poesy met, whereof the one is the matter, the other the style of this little writing, I could not make better choice: so, with signification of my love and acknowledgment, I ever rest Your affectionate friend, Fr. St. Alban

THE TRANSLATION OF THE Ist PSALM.

Who never gave to wicked reed
A yielding and attentive car;
Who never sinners paths did tread,
Nor sat him down in scorner's chair;
But maketh it his whole delight
On law of God to meditate;
And therein spendeth day and night:
That man is in a happy state.

He shall be like the fruitful tree,
Planted along a running spring,
Which, in due season, constantly
A goodly yield of fruit doth bring:
Whose leaves continue always green,
And are no prey to winter's power:
So shall that man not once be seen
Surprised with an evil hour.

With wicked men it is not so,
Their lot is of another kind:
All as the chaff, which to and fro
Is toss'd at mercy of the wind.
And when he shall in judgment plead,
A casting sentence bide he must:
So shall he not lift up his head
In the assembly of the just.

For why? the Lord hath special eye
To be the godly's stay at call:

And hath given over, righteously,
The wicked man to take his fall.

THE TRANSLATION OF THE XIIth PSALM.

Help, Lord, for godly men have took their flight,
And left the earth to be the wicked's den:
Not one that standeth fast to truth and right,
But fears, or seeks to please, the eyes of men.
When one with other falls in talk apart,
Their meaning go'th not with their words, in proof,
But fair they flatter, with a cloven heart,
By pleasing words, to work their own behoof.

But God cut off the lips, that are all set
To trap the harmless soul, that peace hath vow'd;
And pierce the tongues, that seek to counterfeit
The confidence of truth, by lying loud:
Yet so they think to reign, and work their will
By subtile speech, which enters everywhere;
And say: Our tongues are ours, to help us still;
What need we any higher pow'r to fear?

Now for the bitter sighing of the poor,
The Lord hath said, I will no more forbear
The wicked's kingdom to invade and scour,
And set at large the men restrain'd in fear.
And sure the word of God is pure and fine,
And in the trial never loseth weight;
Like noble gold, which, since it left the mine,
Hath seven times pass'd through the fiery strait.

And now thou wilt not first thy word forsake,
Nor yet the righteous man that leans thereto;

But wilt his safe protection undertake,
In spite of all their force and wiles can do.
And time it is, O Lord, thou didst draw nigh;
The wicked daily do enlarge their bands;
And that which makes them follow ill a vie,
Rule is betaken to unworthy hands.

THE TRANSLATION OF THE XCth PSALM.

O Lord, thou art our home, to whom we fly,
And so hast always been from age to age;
Before the hills did intercept the eye,
Or that the frame was up of earthly stage.
One God thou wert, and art, and still shalt be;
The line of time, it doth not measure thee.

Both death and life obey thy holy lore,
And visit in their turns, as they are sent;
A thousand years with thee they are no more
Than yesterday, which, ere it is, is spent:
Or as a watch by night, that course doth keep,
And goes, and comes, unwares to them that sleep.

Thou carryest man away as with a tide:
Then down swim all his thoughts that mounted high;
Much like a mocking dream, that will not bide,
But flies before the sight of waking eye;
Or as the grass, that cannot term obtain!
To see the summer come about again.

At morning, fair it musters on the ground;
At even it is cut down, and laid along:
And though it spared were, and favour found,
The weather would perform the mower's wrong:
Thus hast thou hang'd our life on brittle pins,
To let us know it will not bear our sins.

Thou buryest not within oblivion's tomb
Our trespasses, but enterest them aright;
Ev'n those that are conceived in darkness' womb,
To thee appear as done at broad day-light.
As a tale told, which sometimes men attend,
And sometimes not, our life steals to an end.

The life of man is threescore years and ten,
Or, if that he be strong, perhaps fourscore;
Yet all things are but labour to him then,
New sorrows still come on, pleasures no more.
Why should there be such turmoil and such strife.
To spin in length this feeble line of life?

But who considers duly of thine ire?
Or doth the thoughts thereof wisely embrace?
For thou, O God, art a consuming fire:
Frail man, how can he stand before thy face?
If thy displeasure thou dost not refrain,
A moment brings all back to dust again.

Teach us, O Lord, to number well our days,
Thereby our hearts to wisdom to apply;
For that which guides man best in all his ways,
Is meditation of mortality.
This bubble light, this vapour of our breath,
Teach us to consecrate to hour of death.

Return unto us, Lord, and balance now,
With days of joy, our days of misery;
Help us right soon, our knees to thee we bow,

Depending wholly on thy clemency;
Then shall thy servants both with heart and voice,
All the days of their life in thee rejoice.

Begin thy work, O Lord, in this our age,
Shew it unto thy servants that now live;
But to our children raise it many a stage,
That all the world to thee may glory give.
Our handy-work likewise, as fruitful tree
Let it, O Lord, blessed, not blasted be.

THE TRANSLATION OF THE CIVth PSALM.

Father and King of powers, both high and low,
Whose sounding fame all creatures serve to blow;
My soul shall with the rest strike up thy praise,
And carol of thy works and wondrous ways.
But who can blaze thy beauties, Lord, aright?
They turn the brittle beams of mortal sight.
Upon thy head thou wear'st a glorious crown,
All set with virtues, polish'd with renown:
Thence round about a silver veil doth fall
Of crystal light, mother of colours all.
The compass heaven, smooth without grain, or fold,
All set with spangs of glittering stars untold,
And striped with golden beams of power unpent,
Is raised up for a removing tent.
Vaulted and arched are his chamber beams
Upon the seas, the waters, and the streams:
The clouds as chariots swift do scour the sky;
The stormy winds upon their wings do fly.
His angels spirits are, that wait his will,
As flames of fire his anger they fulfil.
In the beginning, with a mighty hand,
He made the earth by counterpoise to stand,
Never to move, but to be fixed still;
Yet hath no pillars but his sacred will.
This earth, as with a veil, once cover'd was,
The waters over-flowed all the mass:
But upon his rebuke away they fled,
And then the hills began to show their head;
The vales their hollow bosoms open'd plain

The vales their hollow bosoms open'd plain,
The streams ran trembling down the vales again:
And that the earth no more might drowned be,
He set the sea his bounds of liberty;
And though his waves resound, and beat the shore,
Yet it is bridled by his holy lore.
Then did the rivers seek their proper places,
And found their heads, their issues, and their races;
The springs do feed the rivers all the way,
And so the tribute to the sea repay:
Running along through many a pleasant field,
Much fruitfulness unto the earth they yield:
That know the beasts and cattle feeding by,
Which for to slake their thirst do thither hie.
Nay, desert grounds the streams do not forsake,
But through the unknown ways their journey take:
The asses wild, that hide in wilderness,
Do thither come, their thirst for to refresh.
The shady trees along their banks do spring,
In which the birds do build, and sit, and sing;
Stroking the gentle air with pleasant notes,
Plaining, or chirping through their warbling throats.
The higher grounds, where waters cannot rise,
By rain and dews are water'd from the skies;
Causing the earth put forth the grass for beasts,
And garden herbs, served at the greatest feasts;
And bread, that is all viands firmament,
And gives a firm and solid nourishment;
And wine, man's spirits for to recreate;
And oil, his face for to exhilarate.
The sappy cedars, tall like stately towers,
High-flying birds do harbour in their bowers;

High-flying birds do harbour in their bowers.
The holy storks, that are the travellers,
Choose for to dwell and build within the firs;
The climbing goats hang on steep mountains' side;
The digging conies in the rocks do bide.
The moon, so constant in inconstancy,
Doth rule the monthly seasons orderly;
The sun, eye of the world, doth know his race,
And when to show, and when to hide his face.
Thou makest darkness, that it may be night,
When as the savage beasts, that fly the light,
As conscious of man's hatred, leave their den,
And range abroad, secured from sight of men.
Then do the forests ring of lions roaring,
That ask their meat of God, their strength restoring;
But when the day appears, they back do fly,
And in their dens again do lurking lie.
Then man goes forth to labour in the field,
Whereby his grounds more rich increase may yield.
O Lord, thy providence sufficeth all;
Thy goodness, not restrained, but general
Over thy creatures: the whole earth doth flow
With thy great largess pour'd forth here below.
Nor is it earth alone exalts thy name,
But seas and streams likewise do spread the same.
The rolling seas unto the lot doth fall
Of beasts innumerable, great and small;
There do the stately ships plow up the floods,
The greater navies look like walking woods;
The fishes there far voyages do make,
To divers shores their journey they do take.
There hast thou set the great Leviathan

There hast thou set the great Leviathan,
That makes the seas to seeth like boiling pan.
All these do ask of thee their meat to live,
Which in due season thou to them dost give.
Ope thou thy hand, and then they have good fare;
Shut thou thy hand, and then they troubled are.
All life and spirit from thy breath proceed,
Thy word doth all things generate and feed.
If thou withdraw'st it, then they cease to be,
And straight return to dust and vanity;
But when thy breath thou dost send forth again,
Then all things do renew and spring amain;
So that the earth, but lately desolate,
Doth now return unto the former state.
The glorious majesty of God above
Shall ever reign in mercy and in love:
God shall rejoice all his fair works to see,
For as they come from him all perfect be.
The earth shall quake, if aught his wrath provoke;
Let him but touch the mountains, they shall smoke.
As long as life doth last I hymns will sing,
With cheerful voice, to the eternal King;
As long as I have being, I will praise
The works of God, and all his wondrous ways.
I know that he my words will not despise,
Thanksgiving is to him a sacrifice.
But as for sinners they shall be destroy'd
From off' the earth, their places shall be void.
Let all his works praise him with one accord;
O praise the Lord, my soul; praise ye the Lord!

THE TRANSLATION OF THE CXXVIth PSALM

When God return'd us graciously
  Unto our native land,
We seem'd as in a dream to be,
  And in a maze to stand.

The heathen likewise they could say:
  The God, that these men serve,
Hath done great things for them this day,
  Their nation to preserve.

'Tis true; God hath pour'd out his grace
  On us abundantly,
For which we yield him psalms and praise,
  And thanks with jubilee.

O Lord, turn our captivity,
  As winds, that blow at south,
Do pour the tides with violence
  Back to the rivers mouth.

Who sows in tears shall reap in joy,
  The Lord doth so ordain;
So that his seed be pure and good,
  His harvest shall be gain.

THE TRANSLATION OF THE CXXXVIIth PSALM.

When as we sat, all sad and desolate,
By Babylon upon the river's side,
Easel from the tasks, which in our captive state
We were enforced daily to abide,
Our harps we had brought with us to the field,
Some solace to our heavy souls to yield.

But soon we found we fail'd of our account,
For when our minds some freedom did obtain,
Straightways the memory of Sion Mount
Did cause afresh our wounds to bleed again;
So that with present griefs, and future fears,
Our eyes burst forth into a stream of tears.

As for our harps, since sorrow struck them dumb,
We hang'd them on the willow-trees were near;
Yet did our cruel masters to us come,
Asking of us some Hebrew songs to hear:
Taunting us rather in our misery,
Than much delighting in our melody.

Alas, said we, who can once force or frame
His grieved and oppressed heart to sing
The praises of Jehovah's glorious name,
In banishment, under a foreign king?
In Zion is his seat and dwelling-place,
Thence doth he show the brightness of his face.

Jerusalem, where God his throne hath set,
Shall any hour absent thee from my mind?
Then let my right-hand quite her skill forget,
Then let my voice and words no passage find;
Nay, if I do not thee prefer in all,
That in the compass of my thoughts can fall.

Remember thou, O Lord, the cruel cry
Of Edom's children, which did ring and sound,
Inciting the Chaldean's cruelty,
"Down with it, down with it, even unto the ground."
In that good day repay it unto them,
When thou shalt visit thy Jerusalem.

And thou, O Babylon, shalt have thy turn
By just revenge, and happy shall he be,
That thy proud walls and tow'rs shall waste and burn,
And as thou didst by us, so do by thee.
Yea, happy he, that takes thy children's bones,
And dasheth them against the pavement stones.

THE TRANSLATION OF THE CXLIXth PSALM.

O Sing a new song to our God above,
Avoid prophane ones, 'tis for holy choir:
Let Israel sing songs of holy love
To him that made them, with their hearts on fire:
Let Zion's sons lift up their voice and sing
Carols and anthems to their heavenly King.

Let not your voice alone his praise forth tell,
But move withal, and praise him in the dance;
Cymbals and harps let them be tuned well,
'Tis he that doth the poor's estate advance:
Do this not only on the solemn days,
But on your secret beds your spirits raise.

O let the saints bear in their mouth his praise,
And a two-edged sword drawn in their hand,
Therewith for to revenge the former days
Upon all nations that their zeal withstand;
To bind their kings in chains of iron strong,
And manacle their nobles for their wrong.

Expect the time, for 'tis decreed in heaven,
Such honour shall unto his saints be given.

Preparative toward a Natural and Experimental History

Description of a Natural and Experimental History Such as May Serve for the Foundation of a True Philosophy

My object in publishing my *Instauration* by parts is that some portion of it may be put out of peril. A similar reason induces me to subjoin here another small portion of the work, and to publish it along with that which has just been set forth. This is the description and delineation of a natural and experimental history, such as may serve to build philosophy upon, and containing material true and copious and aptly digested for the work of the interpreter which follows. The proper place for it would be when I come in due course to the "Preparatives" of Inquiry. I have thought it better, however, to introduce it at once without waiting for that. For a history of this kind, such as I conceive and shall presently describe, is a thing of very great size and cannot be executed without great labor and expense, requiring as it does many people to help, and being (as I have said elsewhere) a kind of royal work. It occurs to me, therefore, that it may not be amiss to try if there be any others who will take these matters in hand, so that while I go on with the completion of my original design, this part which is so manifold and laborious may even during my life (if it so please the Divine Majesty) be prepared and set forth, others applying themselves diligently to it along with me; the rather because my own strength (if I should have no one to help me) is hardly equal to such a province. For as much relates to the work itself of the intellect, I shall perhaps be able to master that by myself; but the materials on which the intellect has to work are so widely spread that one must employ factors and merchants to go everywhere in search of them and bring them in. Besides I hold it to be somewhat beneath the dignity of an undertaking like mine that I should spend my own time in a matter which is open to almost every man's industry. That, however, which is the main part of the matter I will myself now supply, by diligently and exactly setting forth the method and

description of a history of this kind, such as shall satisfy my intention; lest men for want of warning set to work the wrong way and guide themselves by the example of the natural histories now in use, and so go far astray from my design. Meanwhile, what I have often said I must here emphatically repeat: that if all the wits of all the ages had met or shall hereafter meet together, if the whole human race had applied or shall hereafter apply themselves to philosophy, and the whole earth had been or shall be nothing but academies and colleges and schools of learned men, still without a natural and experimental history such as I am going to prescribe, no progress worthy of the human race could have been made or can be made in philosophy and the sciences. Whereas, on the other hand, let such a history be once provided and well set forth, and let there be added to it such auxiliary and light-giving experiments as in the very course of interpretation will present themselves or will have to be found out, and the investigation of nature and of all sciences will be the work of a few years. This, therefore, must be done or the business must be given up. For in this way, and in this way only, can the foundations of a true and active philosophy be established; and then will men wake as from deep sleep, and at once perceive what a difference there is between the dogmas and figments of the wit and a true and active philosophy, and what it is in questions of nature to consult nature herself.

First, then, I will give general precepts for the composition of this history; then I will set out the particular figure of it, inserting sometimes as well the purpose to which the inquiry is to be adapted and referred as the particular point to be inquired in order that a good understanding and forecast of the mark aimed at may suggest to men's minds other things also which I may perhaps have overlooked. This history I call "Primary History," or the "Mother History."

Aphorisms on the Composition of the Primary History

I

Nature exists in three states, and is subject, as it were, to three kinds of regimen. Either she is free and develops herself in her own ordinary course, or she is forced out of her proper state by the perverseness and insubordination of matter and the violence of impediments, or she is constrained and molded by art and human ministry. The first state refers to the "species" of things; the second to "monsters"; the third to "things artificial." For in things artificial nature takes orders from man and works under his authority; without man, such things would never have been made. But by the help and ministry of man a new face of bodies, another universe or theater of things, comes into view. Natural history therefore is threefold. It treats of the "liberty" of nature, or the "errors" of nature, or the "bonds" of nature, so that we may fairly distribute it into history of "generations," of "pretergenerations," and of "arts"; which last I also call "mechanical" or "experimental" history. And yet I do not make it a rule that these three should be kept apart and separately treated. For why should not the history of the monsters in the several species be joined with the history of the species themselves? And things artificial again may sometimes be rightly joined with the species, though sometimes they will be better kept separate. It will be best, therefore, to consider these things as the case arises. For too much method produces iterations and prolixity as well as none at all.

II

Natural history, which in its subject (as I said) is threefold, is in its use twofold. For it is used either for the sake of the knowledge of the particular things which it contains or as the primary material of philosophy and the stuff and subject matter of true induction. And it is this latter which is now in hand — now, I say,

for the first time; nor has it even been taken in hand till now. For neither Aristotle, nor Theophrastus, nor Dioscorides, nor Gaius Plinius ever set this before them as the end of natural history. And the chief part of the matter rests in this, that they who shall hereafter take it upon them to write natural history should bear this continually in mind — that they ought not to consult the pleasure of the reader, no, nor even that utility which may be derived immediately from their narrations, but to seek out and gather together such store and variety of things as may suffice for the formation of true axioms. Let them but remember this, and they will find out for themselves the method in which the history should be composed. For the end rules the method.

III

But the more difficult and laborious the work is, the more ought it to be discharged of matters superfluous. And therefore there are three things upon which men should be warned to be sparing of their labor, as those which will immensely increase the mass of the work and add little or nothing to its worth.

First then, away with antiquities, and citations or testimonies of authors, and also with disputes and controversies and differing opinions — everything, in short, which is philological. Never cite an author except in a matter of doubtful credit; never introduce a controversy unless in a matter of great moment. And for all that concerns ornaments of speech, similitudes, treasury of eloquence, and such like emptinesses, let it be utterly dismissed. Also let all those things which are admitted be themselves set down briefly and concisely, so that they may be nothing less than words. For no man who is collecting and storing up materials for ship building or the like, thinks of arranging them elegantly, as in a shop, and displaying them so as to please the eye; all his care is that they be sound and good, and that they be so arranged as to take up as little room as possible in the warehouse. And this is exactly what should be done here.

Secondly, that superfluity of natural histories in descriptions and pictures of species, and the curious variety of the same, is not much to the purpose. For

small varieties of this kind are only a kind of sports and wanton freaks of nature and come near to the nature of individuals. They afford a pleasant recreation in wandering among them and looking at them as objects in themselves, but the information they yield to the sciences is slight and almost superfluous.

Thirdly, all superstitious stories (I do not say stories of prodigies, when the report appears to be faithful and probable, but superstitious stories) and experiments of ceremonial magic should be altogether rejected. For I would not have the infancy of philosophy, to which natural history is as a nursing mother, accustomed to old wives' fables. The time will perhaps come (after we have gone somewhat deeper into the investigation of nature) for a light review of things of this kind, that if there remain any grains of natural virtue in these dregs, they may be extracted and laid up for use. In the meantime they should be set aside. Even the experiments of natural magic should be sifted diligently and severely before they are received, especially those which are commonly derived from vulgar sympathies and antipathies, with great sloth and facility both of believing and inventing.

And it is no small thing to relieve natural history from the three superfluities above mentioned, which would otherwise fill volumes. Nor is this all. For in a great work it is no less necessary that what is admitted should be written succinctly than that what is superfluous should be rejected, though no doubt this kind of chastity and brevity will give less pleasure both to the reader and the writer. But it is always to be remembered that this which we are now about is only a granary and storehouse of matters, not meant to be pleasant to stay or live in, but only to be entered as occasion requires, when anything is wanted for the work of the interpreter which follows.

IV

In the history which I require and design, special care is to be taken that it be of wide range and made to the measure of the universe. For the world is not to be narrowed till it will go into the understanding (which has been done hitherto),

but the understanding to be expanded and opened till it can take in the image of the world as it is in fact. For that fashion of taking few things into account, and pronouncing with reference to a few things, has been the ruin of everything. To resume then the divisions of natural history which I made just now — viz., that it is a history of generations, Pretergenerations, and arts — I divide the history of generations into five parts. The first, of ether and things celestial. The second, of meteors and the regions (as they call them) of air, viz., of the tracts which lie between the moon and the surface of the earth; to which part also (for order's sake, however the truth of the thing may be) I assign comets of whatever kind, both higher and lower. The third, of earth and sea. The fourth, of the elements (as they call them), flame or fire, air, water, earth, understanding, however, by elements, not the first principles of things, but the greater masses of natural bodies. For the nature of things is so distributed that the quantity or mass of some bodies in the universe is very great, because their configurations require a texture of matter easy and obvious, such as are those four bodies which I have mentioned; while of certain other bodies the quantity is small and weakly supplied, because the texture of matter which they require is very complex and subtle, and for the most part determinate and organic, such as are the species of natural things — metals, plants, animals. Hence I call the former kind of bodies the "greater colleges," the latter the "lesser colleges." Now the fourth part of the history is of those greater colleges — under the name of elements, as I said. And let it not be thought that I confound this fourth part with the second and third, because in each of them I have mentioned air, water, and earth. For the history of these enters into the second and third, as they are integral parts of the world, and as they relate to the fabric and configuration of the universe. But in the fourth is contained the history of their own substance and nature, as it exists in their several parts of uniform structure, and without reference to the whole. Lastly, the fifth part of the history contains the lesser colleges, or species, upon which natural history has hitherto been principally employed.

As for the history of pretergenerations, I have already said that it may be most conveniently joined with the history of generations — I mean the history of

prodigies which are natural. For the superstitious history of marvels (of whatever kind) I remit to a quite separate treatise of its own; which treatise I do not wish to be undertaken now at first, but a little after, when the investigation of nature has been carried deeper.

History of arts, and of nature as changed and altered by man, or experimental history, I divide into three. For it is drawn either from mechanical arts, or from the operative part of the liberal arts, or from a number of crafts and experiments which have not yet grown into an art properly so called, and which sometimes indeed turn up in the course of most ordinary experience and do not stand at all in need of art.

As soon, therefore, as a history has been completed of all these things which I have mentioned — namely, generations, pretergenerations, arts, and experiments, it seems that nothing will remain unprovided whereby the sense can be equipped for information of the understanding. And then shall we be no longer kept dancing within little rings, like persons bewitched, but our range and circuit will be as wide as the compass of the world.

V

Among the parts of history which I have mentioned, the history of arts is of most use because it exhibits things in motion and leads more directly to practice. Moreover, it takes off the mask and veil from natural objects, which are commonly concealed and obscured under the variety of shapes and external appearance. Finally, the vexations of art are certainly as the bonds and handcuffs of Proteus, which betray the ultimate struggles and efforts of matter. For bodies will not be destroyed or annihilated, rather than that they will turn themselves into various forms. Upon this history, therefore, mechanical and illiberal as it may seem (all fineness and daintiness set aside), the greatest diligence must be bestowed.

Again, among the particular arts those are to be preferred which exhibit, alter, and prepare natural bodies and materials of things, such as agriculture, cookery,

chemistry, dyeing, the manufacture of glass, enamel, sugar, gunpowder, artificial fires, paper, and the like. Those which consist principally in the subtle motion of the hands or instruments are of less use, such as weaving, carpentry, architecture, manufacture of mills, clocks, and the like, although these too are by no means to be neglected, both because many things occur in them which relate to the alterations of natural bodies, and because they give accurate information concerning local motion, which is a thing of great importance in very many respects.

But in the whole collection of this history of arts it is especially to be observed and constantly borne in mind that not only those experiments in each art which serve the purpose of the art itself are to be received, but likewise those which turn up anyhow by the way. For example, that locusts or crabs, which were before of the color of mud, turn red when baked is nothing to the table; but this very instance is not a bad one for investigating the nature of redness, seeing that the same thing happens in baked bricks. In like manner the fact that meat is sooner salted in winter than in summer is not only important for the cook that he may know how to regulate the pickling, but is likewise a good instance for showing the nature and impression of cold. Therefore, it would be an utter mistake to suppose that my intention would be satisfied by a collection of experiments of arts made only with the view of thereby bringing the several arts to greater perfection. For though this be an object which in many cases I do not despise, yet my meaning plainly is that all mechanical experiments should be as streams flowing from all sides into the sea of philosophy. But how to select the more important instances in every kind (which are principally and with the greatest diligence to be sought and as it were hunted out) is a point to be learned from the prerogatives of instances.

VI

In this place also is to be resumed that which in the 99th, 119th, and 120th aphorisms of the first book I treated more at large, but which it may be enough

here to enjoin shortly by way of precept — namely, that there are to be received into this history, first, things the most ordinary, such as it might be thought superfluous to record in writing because they are so familiarly known; secondly, things mean, illiberal, filthy (for "to the pure all things are pure," and if money obtained from Vespasian's tax smelt well, much more does light and information from whatever source derived); thirdly, things trifling and childish (and no wonder, for we are to become again as little children); and lastly, things which seem over subtle, because they are in themselves of no use. For the things which will be set forth in this history are not collected (as I have already said) on their own account; and therefore neither is their importance to be measured by what they are worth in themselves, but according to their indirect bearing upon other things and the influence they may have upon philosophy.

VII

Another precept is that everything relating both to bodies and virtues in nature be set forth (as far as may be) numbered, weighed, measured, defined. For it is works we are in pursuit of, not speculations; and practical working comes of the due combination of physics and mathematics. And therefore the exact revolutions and distances of the planets — in the history of the heavenly bodies; the compass of the land and the superficial space it occupies in comparison of the waters — in the history of earth and sea; how much compression air will bear without strong resistance — in the history of air; how much one metal outweighs another — in the history of metals; and numberless other particulars of that kind are to be ascertained and set down. And when exact proportions cannot be obtained, then we must have recourse to indefinite estimates and comparatives. As for instance (if we happen to distrust the calculations of astronomers as to the distances of the planets), that the moon is within the shadow of the earth, that Mercury is beyond the moon, and the like. Also when mean proportions cannot be had, let extremes be proposed, as that a weak magnet will raise so many times its own weight of iron, while the most powerful

will raise sixty times its own weight (as I have myself seen in the case of a very small armed magnet). I know well enough that these definite instances do not occur readily or often, but that they must be sought for as auxiliaries in the course of interpretation itself when they are most wanted. But nevertheless if they present themselves accidentally, provided they do not too much interrupt the progress of the natural history, they should also be entered therein.

VIII

With regard to the credit of the things which are to be admitted into the history, they must needs be either certainly true, doubtful whether true or not, or certainly not true. Things of the first kind should be set down simply; things of the second kind with a qualifying note, such as “it is reported,” “they relate,” “I have heard from a person of credit,” and the like. For to add the arguments on either side would be too laborious and would certainly interrupt the writer too much. Nor is it of much consequence to the business in hand because (as I have said in the 118th aphorism of the first book) mistakes in experimenting, unless they abound everywhere, will be presently detected and corrected by the truth of axioms. And yet if the instance be of importance, either from its own use or because many other things may depend upon it, then certainly the name of the author should be given, and not the name merely, but it should be mentioned withal whether he took it from report, oral or written (as most of Pliny’s statements are), or rather affirmed it of his own knowledge; also whether it was a thing which happened in his own time or earlier; and again, whether it was a thing of which, if it really happened, there must needs have been many witnesses; and finally, whether the author was a vain-speaking and light person or sober and severe; and the like points, which bear upon the weight of the evidence. Lastly, things which though certainly not true are yet current and much in men’s mouths, having either through neglect or from the use of them in similitudes prevailed now for many ages (as that the diamond binds the magnet, garlic weakens it, that amber attracts everything except basil, and other things of

that kind), these it will not be enough to reject silently; they must be in express words proscribed, that the sciences may be no more troubled with them.

Besides, it will not be amiss, when the source of any vanity or credulity happens to present itself, to make a note of it, as, for example, that the power of exciting Venus is ascribed to the herb Satyrion because its root takes the shape of testicles — when the real cause of this is that a fresh bulbous root grows upon it every year, last year's root still remaining; whence those twin bulbs. And it is manifest that this is so, because the new root is always found to be solid and succulent, the old withered and spongy. And therefore it is no marvel if one sinks in water and the other swims — which nevertheless goes for a wonder and has added credit to the other virtues ascribed to this herb.

IX

There are also some things which may be usefully added to the natural history, and which will make it fitter and more convenient for the work of the interpreter, which follows. They are five.

First, questions (I do not mean as to causes but as to the fact) should be added in order to provoke and stimulate further inquiry, as in the history of earth and sea, whether the Caspian ebbs and flows, and at how many hours' interval; whether there is any southern continent or only islands, and the like.

Secondly, in any new and more subtle experiment the manner in which the experiment was conducted should be added, that men may be free to judge for themselves whether the information obtained from that experiment be trustworthy or fallacious, and also that men's industry may be roused to discover, if possible, methods more exact.

Thirdly, if in any statement there be anything doubtful or questionable, I would by no means have it suppressed or passed in silence, but plainly and perspicuously set down by way of note or admonition. For I want this primary history to be compiled with a most religious care, as if every particular were stated upon oath, seeing that it is the book of God's works and (so far as the

majesty of heavenly may be compared with the humbleness of earthly things) a kind of second Scripture.

Fourthly, it would not be amiss to intersperse observations occasionally, as Pliny has done; as in the history of earth and sea, that the figure of the earth (as far as it is yet known) compared with the seas is narrow and pointed toward the south, wide and broad toward the north, the figure of the sea contrary; that the great oceans intersect the earth in channels running north and south, not east and west, except perhaps in the extreme polar regions. It is also very good to add canons (which are nothing more than certain general and catholic observations), as in the history of the heavenly bodies, that Venus is never distant more than 46 parts from the sun, Mercury never more than 23, and that the planets which are placed above the sun move slowest when they are furthest from the earth, those under the sun fastest. Moreover, there is another kind of observation to be employed, which has not yet come into use, though it be of no small importance. This is, that to the enumeration of things which are should be subjoined an enumeration of things which are not. As in the history of the heavenly bodies, that there is not found any star oblong or triangular, but that every star is globular — either globular simply, as the moon, or apparently angular, but globular in the middle, as the other stars, or apparently radiant but globular in the middle, as the sun — or that the stars are scattered about the sky in no order at all, so that there is not found among them either quincunx or square, or any other regular figure (howsoever the names be given of Delta, Crown, Cross, Chariot, etc.) scarcely so much as a straight line, except perhaps in the belt and dagger of Orion.

Fifthly, that may perhaps be of some assistance to an inquirer which is the ruin and destruction of a believer; viz., a brief review, as in passage, of the opinions now received, with their varieties and sects, that they may touch and rouse the intellect and no more.

X

And this will be enough in the way of general precepts which, if they be diligently observed, the work of the history will at once go straight toward its object and be prevented from increasing beyond bounds. But if even as here circumscribed and limited it should appear to some poor-spirited person a vast work — let him turn to the libraries; and there among other things let him look at the bodies of civil and canonical law on one side, and at the commentaries of doctors and lawyers on the other, and see what a difference there is between the two in point of mass and volume. For we (who as faithful secretaries do but enter and set down the laws themselves of nature and nothing else) are content with brevity, and almost compelled to it by the condition of things; whereas opinions, doctrines, and speculations are without number and without end.

And whereas in the Plan of the Work I have spoken of the *cardinal virtues* in nature, and said that a history of these must also be collected and written before we come to the work of Interpretation, I have not forgotten this, but I reserve this part for myself since until men have begun to be somewhat more closely intimate with nature, I cannot venture to rely very much on other people's industry in that matter.

And now should come the delineation of the particular histories. But I have at present so many other things to do that I can only find time to subjoin a Catalogue of their titles. As soon, however, as I have leisure for it, I mean to draw up a set of questions on the several subjects, and to explain what points with regard to each of the histories are especially to be inquired and collected, as conducing to the end I have in view — like a kind of particular topics. In other words, I mean (according to the practice in civil causes) in this great plea or suit granted by the divine favor and providence (whereby the human race seeks to recover its right over nature), to examine nature herself and the arts upon interrogatories.

CATALOGUE OF PARTICULAR HISTORIES BY TITLES

1. History of the Heavenly Bodies; or Astronomical History.

2. History of the Configuration of the Heaven and the parts thereof toward the Earth and the parts thereof; or Cosmographical History.

3. History of Comets.

4. History of Fiery Meteors.

5. History of Lightnings, Thunderbolts, Thunders, and Coruscations.

6. History of Winds and Sudden Blasts and Undulations of the Air.

7. History of Rainbows.

8. History of Clouds, as they are seen above.

9. History of the Blue Expanse, of Twilight, of Mock-Suns, Mock-Moons, Haloes, various colors of the Sun; and of every variety in the aspect of the heavens caused by the medium.

10. History of Showers, Ordinary, Stormy, and Prodigious; also of Waterspouts (as they are called); and the like.

11. History of Hail, Snow, Frost, Hoar-frost, Fog, Dew, and the like.

12. History of all other things that fall or descend from above, and that are generated in the upper region.

13. History of Sounds in the upper region (if there be any), besides Thunder.

14. History of Air as a whole, or in the Configuration of the World.

15. History of the Seasons or Temperatures of the Year, as well according to the variations of Regions as according to accidents of Times and periods of Years; of Floods, Heats, Droughts, and the like.

16. History of Earth and Sea; of the Shape and Compass of them, and their Configurations compared with each other; and of their broadening or narrowing; of Islands in the Sea; of Gulfs of the Sea, and Salt Lakes within the Land; Isthmuses and Promontories.

17. History of the Motions (if any be) of the Globe of Earth and Sea; and of the Experiments from which such motions may be collected.

18. History of the greater Motions and Perturbations in Earth and Sea; Earthquakes, Tremblings and Yawnings of the Earth, Islands newly appearing; Floating Islands; Breakings off of Land by entrance of the Sea, Encroachments and Inundations and contrariwise Recessions of the Sea; Eruptions of Fire from the Earth; Sudden Eruptions of Waters from the Earth; and the like.

19. Natural History of Geography; of Mountains, Valleys, Woods, Plains, Sands, Marshes, Lakes, Rivers, Torrents, Springs, and every variety of their course, and the like; leaving apart Nations, Provinces, Cities, and such like matters pertaining to Civil life.

20. History of Ebbs and Flows of the Sea; Currents, Undulations, and other Motions of the Sea.

21. History of the other Accidents of the Sea; its Saltness, its various Colors, its Depth; also of Rocks, Mountains and Valleys under the Sea, and the like.

Next come Histories of the Greater Masses.

22. History of Flame and of things Ignited.

23. History of Air, in Substance, not in the Configuration of the World.

24. History of Water, in Substance, not in the Configuration of the World.

25. History of Earth and the diversity thereof, in Substance, not in the Configuration of the World.

Next come Histories of Species.

26. History of perfect Metals, Gold, Silver; and of the Mines, Veins, Marcasites of the same; also of the Working in the Mines.

27. History of Quicksilver.

28. History of Fossils; as Vitriol, Sulphur, *etc.*

29. History of Gems; as the Diamond, the Ruby, *etc.*

30. History of Stones; as Marble, Touchstone, Flint, *etc.*

31. History of the Magnet.

32. History of Miscellaneous Bodies, which are neither entirely Fossil nor Vegetable; as Salts, Amber, Ambergris, *etc.*

33. Chemical History of Metals and Minerals.

34. History of Plants, Trees, Shrubs, Herbs; and of their parts, Roots, Stalks, Wood, Leaves, Flowers, Fruits, Seeds, Gums, *etc.*

35. Chemical History of Vegetables.

36. History of Fishes, and the Parts and Generation of them.

37. History of Birds, and the Parts and Generation of them.

38. History of Quadrupeds, and the Parts and Generation of them.

39. History of Serpents, Worms, Flies, and other insects; and of the Parts and Generation of them.

40. Chemical History of the things which are taken by Animals.

Next come Histories of Man.

41. History of the Figure and External Limbs of Man, his Stature, Frame, Countenance and Features; and of the variety of the same according to Races and Climates, or other smaller differences.

42. Physiognomical History of the same.

43. Anatomical History, or of the Internal Members of Man; and of the variety of them, as it is found in the Natural Frame and Structure, and not merely as regards Diseases and Accidents out of the course of Nature.

44. History of the parts of Uniform Structure in Man; as Flesh, Bones, Membranes, *etc.*

45. History of Humors in Man; Blood, Bile, Seed, *etc.*

46. History of Excrements; Spittle, Urine, Sweats, Stools, Hair of the Head, Hairs of the Body, Whitlows, Nails, and the like.

47. History of Faculties; Attraction, Digestion, Retention, Expulsion, Sanguification, Assimilation of Aliment into the members, conversion of Blood and Flower of Blood into Spirit, *etc.*

48. History of Natural and Involuntary Motions; as Motion of the Heart, the Pulses, Sneezing, Lungs, Erection, *etc.*

49. History of Motions partly Natural and partly Violent; as of Respiration, Cough, Urine, Stool, *etc.*

50. History of Voluntary Motions; as of the Instruments of Articulation of Words; Motions of the Eyes, Tongue, Jaws, Hands, Fingers; of Swallowing, *etc.*

51. History of Sleep and Dreams.

52. History of different habits of Body — Fat, Lean; of the Complexions (as they call them), *etc.*

53. History of the Generation of Man.

54. History of Conception, Vivification, Gestation in the Womb, Birth, *etc.*

55. History of the Food of Man; and of all things Eatable and Drinkable; and of all Diet; and of the variety of the same according to nations and smaller differences.

56. History of the Growth and Increase of the Body, in the whole and in its parts.

57. History of the Course of Age; Infancy, Boyhood, Youth, Old Age; of Length and Shortness of Life, and the like, according to nations and lesser differences.

58. History of Life and Death.

59. History Medicinal of Diseases, and the Symptoms and Signs of them.

60. History Medicinal of the Treatment and Remedies and Cures of Diseases.

61. History Medicinal of those things which preserve the Body and the Health.

62. History Medicinal of those things which relate to the Form and Comeliness of the Body.

63. History Medicinal of those things which alter the Body, and pertain to Alternative Regimen.

64. History of Drugs.

65. History of Surgery.

66. Chemical History of Medicines.

67. History of Vision, and of things Visible.

68. History of Painting, Sculpture, Modelling, *etc.*

69. History of Hearing and Sound.

70. History of Music.

71. History of Smell and Smells.

72. History of Taste and Tastes.

73. History of Touch, and the objects of Touch.

74. History of Venus, as a species of Touch.

75. History of Bodily Pains, as species of Touch.

76. History of Pleasure and Pain in general.

77. History of the Affections; as Anger, Love, Shame, *etc.*

78. History of the Intellectual Faculties; Reflection, Imagination, Discourse, Memory, *etc.*

79. History of Natural Divinations.

80. History of Diagnostics, or Secret Natural Judgments.

81. History of Cookery, and the arts thereto belonging, as of the Butcher, Poulterer, *etc.*

82. History of Baking, and the Making of Bread, and the arts thereto belonging, as of the Miller, *etc.*

83. History of Wine.

84. History of the Cellar and of different kinds of Drink.

85. History of Sweetmeats and Confections.

86. History of Honey.

87. History of Sugar.

88. History of the Dairy.

89. History of Baths and Ointments.

90. Miscellaneous History concerning the care of the body — as of Barbers, Perfumers, *etc.*

91. History of the working of Gold, and the arts thereto belonging.

92. History of the manufactures of Wool, and the arts thereto belonging.

93. History of the manufactures of Silk, and the arts thereto belonging.

94. History of manufactures of Flax, Hemp, Cotton, Hair, and other kinds of Thread, and the arts thereto belonging.

95. History of manufactures of Feathers.

96. History of Weaving, and the arts thereto belonging.

97. History of Dyeing.

98. History of Leather-making, Tanning, and the arts thereto belonging.

99. History of Ticking and Feathers.

100. History of working in Iron.

101. History of Stone-cutting.

102. History of the making of Bricks and Tiles.

103. History of Pottery.

104. History of Cements, *etc.*

105. History of working in Wood.

106. History of working in Lead.

107. History of Glass and all vitreous substances, and of Glass-making.

108. History of Architecture generally.

109. History of Wagons, Chariots, Litters, *etc.*

110. History of Printing, of Books, of Writing, of Sealing; of Ink, Pen, Paper, Parchment, *etc.*

111. History of Wax.

112. History of Basket-making.

113. History of Mat-making, and of manufactures of Straw, Rushes, and the like.

114. History of Washing, Scouring, *etc.*

115. History of Agriculture, Pasturage, Culture of Woods, *etc.*

116. History of Gardening.

117. History of Fishing.

118. History of Hunting and Fowling.

119. History of the Art of War, and of the arts thereto belonging, as Armory, Bow-making, Arrow-making, Musketry, Ordnance, Cross-bows, Machines, *etc.*

120. History of the Art of Navigation, and of the crafts and arts thereto belonging.

121. History of Athletics and Human Exercises of all kinds.

122. History of Horsemanship.

123. History of Games of all kinds.

124. History of Jugglers and Mountebanks.

125. Miscellaneous History of various Artificial Materials, — as Enamel, Porcelain, various Cements, *etc.*

126. History of Salts.

127. Miscellaneous History of various Machines and Motions.

128. Miscellaneous History of Common Experiments which have not grown into an Art.

Histories must also be written of Pure Mathematics; though they are rather observations than experiments.

129. History of the Natures and Powers of Numbers.

130. History of the Natures and Powers of Figures.

It may not be amiss to observe that, whereas many of the experiments must come under more titles than one (as the history of plants and the history of the art of gardening have many things in common), it will be more convenient to investigate them with reference to arts, and to arrange them with reference to bodies. For I care little about the mechanical arts themselves: only about those things which they contribute to the equipment of philosophy. But these things will be better regulated as the case arises.

New Atlantis

An incomplete utopian work of fiction, first published in 1627, *New Atlantis* concerns a vision of the future of human discovery and knowledge, expressing Bacon's aspirations and ideals for humankind. The text depicts the creation of a utopian land where "generosity and enlightenment, dignity and splendour, piety and public spirit" are the commonly held qualities of the inhabitants of the mythical Bensalem. The narrative describes how the island is discovered by the crew of a European ship after they are lost in the Pacific Ocean, somewhere west of Peru.

Many aspects of the society and history of the island are described, such as the Christian religion – which is reported to have been born there as a copy of the Bible and a letter from the Apostle Saint Bartholomew arrived there miraculously, a few years after the Ascension of Jesus; a cultural feast in honour of the family institution, called "the Feast of the Family"; a college of sages, the Salomon's House, "the very eye of the kingdom", to which order "God of heaven and earth had vouchsafed the grace to know the works of Creation, and the secrets of them", as well as "to discern between divine miracles, works of nature, works of art, and impostures and illusions of all sorts"; and a series of instruments, process and methods of scientific research that were employed in the island by the Salomon's House.

New Atlantis may have been Bacon's vision for a Utopian New World in North America. He portrays a land where there would be freedom of religion – showing a Jew treated fairly and equally in an island of Christians, but it has been debated whether this work had influenced others reforms, such as greater rights for women, the abolition of slavery, elimination of debtors' prisons, separation of church and state, and freedom of political expression, although there is no hint of these reforms in the text itself. The author played a leading role in creating the English colonies, especially in Virginia, the Carolinas, and Newfoundland in north-eastern Canada.

INTRODUCTORY NOTE
THE NEW ATLANTIS

INTRODUCTORY NOTE

Bacon's literary executor, Dr. Rowley, published "The New Atlantis" in 1627, the year after the author's death. It seems to have been written about 1623, during that period of literary activity which followed Bacon's political fall. None of Bacon's writings gives in short apace so vivid a picture of his tastes and aspirations as this fragment of the plan of an ideal commonwealth. The generosity and enlightenment, the dignity and splendor, the piety and public spirit, of the inhabitants of Bensalem represent the ideal qualities which Bacon the statesman desired rather than hoped to see characteristic of his own country; and in Solomon's House we have Bacon the scientist indulging without restriction his prophetic vision of the future of human knowledge. No reader acquainted in any degree with the processes and results of modern scientific inquiry can fail to be struck by the numerous approximations made by Bacon's imagination to the actual achievements of modern times. The plan and organization of his great college lay down the main lines of the modern research university; and both in pure and applied science he anticipates a strikingly large number of recent inventions and discoveries. In still another way is "The New Atlantis" typical of Bacon's attitude. In spite of the enthusiastic and broad-minded schemes he laid down for the pursuit of truth, Bacon always had an eye to utility. The advancement of science which he sought was conceived by him as a means to a practical end the increase of man's control over nature, and the comfort and convenience of humanity. For pure metaphysics, or any form of abstract thinking that yielded no "fruit," he had little interest; and this leaning to the useful is shown in the practical applications of the discoveries made by the scholars of Solomon's House. Nor does the interest of the work stop here. It contains much, both in its political and in its scientific ideals, that we have as yet by no means achieved, but which contain valuable elements of suggestion and stimulus for the future.

THE NEW ATLANTIS

We sailed from Peru, (where we had continued for the space of one whole year) for China and Japan, by the South Sea; taking with us victuals for twelve months; and had good winds from the east, though soft and weak, for five months space, and more. But the wind came about, and settled in the west for many days, so as we could make little or no way, and were sometime in purpose to turn back. But then again there arose strong and great winds from the south, with a point east, which carried us up (for all that we could do) towards the north; by which time our victuals failed us, though we had made good spare of them. So that finding ourselves, in the midst of the greatest wilderness of waters in the world, without victuals, we gave ourselves for lost men and prepared for death. Yet we did lift up our hearts and voices to God above, who showeth his wonders in the deep, beseeching him of his mercy, that as in the beginning he discovered the face of the deep, and brought forth dry land, so he would now discover land to us, that we might not perish.

And it came to pass that the next day about evening we saw within a kenning before us, towards the north, as it were thick clouds, which did put us in some hope of land; knowing how that part of the South Sea was utterly unknown; and might have islands, or continents, that hitherto were not come to light. Wherefore we bent our course thither, where we saw the appearance of land, all that night; and in the dawning of the next day, we might plainly discern that it was a land; flat to our sight, and full of boscage; which made it show the more dark. And after an hour and a half's sailing, we entered into a good haven, being the port of a fair city; not great indeed, but well built, and that gave a pleasant view from the sea: and we thinking every minute long, till we were on land, came close to the shore, and offered to land. But straightways we saw divers of the people, with bastons in their hands (as it were) forbidding us to land; yet without any cries of fierceness, but only as warning us off, by signs that they

made. Whereupon being not a little discomforted, we were advising with ourselves, what we should do.

During which time, there made forth to us a small boat, with about eight persons in it; whereof one of them had in his hand a tipstaff of a yellow cane, tipped at both ends with blue, who came aboard our ship, without any show of distrust at all. And when he saw one of our number, present himself somewhat before the rest, he drew forth a little scroll of parchment (somewhat yellower than our parchment, and shining like the leaves of writing tables, but otherwise soft and flexible,) and delivered it to our foremost man. In which scroll were written in ancient Hebrew, and in ancient Greek, and in good Latin of the school, and in Spanish, these words: Land ye not, none of you; and provide to be gone from this coast, within sixteen days, except you have further time given you. Meanwhile, if you want fresh water or victuals, or help for your sick, or that your ship needeth repairs, write down your wants, and you shall have that, which belongeth to mercy. This scroll was signed with a stamp of cherubim: wings, not spread, but hanging downwards; and by them a cross. This being delivered, the officer returned, and left only a servant with us to receive our answer.

Consulting hereupon amongst ourselves, we were much perplexed. The denial of landing and hasty warning us away troubled us much; on the other side, to find that the people had languages, and were so full of humanity, did comfort us not a little. And above all, the sign of the cross to that instrument was to us a great rejoicing, and as it were a certain presage of good. Our answer was in the Spanish tongue; that for our ship, it was well; for we had rather met with calms and contrary winds than any tempests. For our sick, they were many, and in very ill case; so that if they were not permitted to land, they ran danger of their lives. Our other wants we set down in particular; adding, That we had some little store of merchandise, which if it pleased them to deal for, it might supply our wants, without being chargeable unto them. We offered some reward in pistolets unto the servant, and a piece of crimson velvet to be presented to the officer; but the servant took them not, nor would scarce look upon them; and so left us, and went back in another little boat, which was sent for him.

About three hours after we had dispatched our answer, there came towards us a person (as it seemed) of place. He had on him a gown with wide sleeves, of a kind of water chamolet, of an excellent azure colour, fair more glossy than ours; his under apparel was green; and so was his hat, being in the form of a turban, daintily made, and not so huge as the Turkish turbans; and the locks of his hair came down below the brims of it. A reverend man was he to behold. He came in a boat, gilt in some part of it, with four persons more only in that boat; and was followed by another boat, wherein were some twenty. When he was come within a flightshot of our ship, signs were made to us, that we should send forth some to meet him upon the water; which we presently did in our ship-boat, sending the principal man amongst us save one, and four of our number with him.

When we were come within six yards of their boat, they called to us to stay, and not to approach farther; which we did. And thereupon the man, whom I before described, stood up, and with a loud voice, in Spanish, asked, “Are ye Christians?” We answered, “We were;” fearing the less, because of the cross we had seen in the subscription. At which answer the said person lifted up his right hand towards Heaven, and drew it softly to his mouth (which is the gesture they use, when they thank God;) and then said: “If ye will swear (all of you) by the merits of the Saviour, that ye are no pirates, nor have shed blood, lawfully, nor unlawfully within forty days past, you may have licence to come on land.” We said, “We were all ready to take that oath.” Whereupon one of those that were with him, being (as it seemed) a notary, made an entry of this act. Which done, another of the attendants of the great person which was with him in the same boat, after his Lord had spoken a little to him, said aloud: “My Lord would have you know, that it is not of pride, or greatness, that he cometh not aboard your ship; but for that in your answer you declare that you have many sick amongst you, he was warned by the Conservator of Health of the city that he should keep a distance.” We bowed ourselves towards him, and answered, “We were his humble servants; and accounted for great honour, and singular humanity towards us, that which was already done; but hoped well, that the nature of the sickness of our men was not infectious.” So he returned; and a while after came the

Notary to us aboard our ship; holding in his hand a fruit of that country, like an orange, but of color between orange-tawney and scarlet; which cast a most excellent odour. He used it (as it seemeth) for a preservative against infection. He gave us our oath; “By the name of Jesus, and his merits:” and after told us, that the next day, by six of the Clock, in the Morning, we should be sent to, and brought to the Strangers’ House, (so he called it,) where we should be accommodated of things, both for our whole, and for our sick. So he left us; and when we offered him some pistolets, he smiling said, “He must not be twice paid for one labour:” meaning (as I take it) that he had salary sufficient of the State for his service. For (as I after learned) they call an officer that taketh rewards, “twice paid.”

The next morning early, there came to us the same officer that came to us at first with his cane, and told us, He came to conduct us to the Strangers’ House; and that he had prevented the hour, because we might have the whole day before us, for our business. “For,” said he, “if you will follow my advice, there shall first go with me some few of you, and see the place, and how it may be made convenient for you; and then you may send for your sick, and the rest of your number, which ye will bring on land.” We thanked him, and said, “That this care, which he took of desolate strangers, God would reward.” And so six of us went on land with him: and when we were on land, he went before us, and turned to us, and said, “He was but our servant, and our guide.” He led us through three fair streets; and all the way we went, there were gathered some people on both sides, standing in a row; but in so civil a fashion, as if it had been, not to wonder at us, but to welcome us: and divers of them, as we passed by them, put their arms a little abroad; which is their gesture, when they did bid any welcome.

The Strangers’ House is a fair and spacious house, built of brick, of somewhat a bluer colour than our brick; and with handsome windows, some of glass, some of a kind of cambric oiled. He brought us first into a fair parlour above stairs, and then asked us, “What number of persons we were? And how many sick?” We answered, “We were in all, (sick and whole,) one and fifty persons, whereof

our sick were seventeen." He desired us to have patience a little, and to stay till he came back to us; which was about an hour after; and then he led us to see the chambers which were provided for us, being in number nineteen: they having cast it (as it seemeth) that four of those chambers, which were better than the rest, might receive four of the principal men of our company; and lodge them alone by themselves; and the other fifteen chambers were to lodge us two and two together. The chambers were handsome and cheerful chambers, and furnished civilly. Then he led us to a long gallery, like a dorture, where he showed us all along the one side (for the other side was but wall and window), seventeen cells, very neat ones, having partitions of cedar wood. Which gallery and cells, being in all forty, many more than we needed, were instituted as an infirmary for sick persons. And he told us withal, that as any of our sick waxed well, he might be removed from his cell, to a chamber; for which purpose there were set forth ten spare chambers, besides the number we spake of before. This done, he brought us back to the parlour, and lifting up his cane a little, (as they do when they give any charge or command) said to us, "Ye are to know, that the custom of the land requireth, that after this day and to-morrow, (which we give you for removing of your people from your ship,) you are to keep within doors for three days. But let it not trouble you, nor do not think yourselves restrained, but rather left to your rest and ease. You shall want nothing, and there are six of our people appointed to attend you, for any business you may have abroad." We gave him thanks, with all affection and respect, and said, "God surely is manifested in this land." We offered him also twenty pistolets; but he smiled, and only said; "What? twice paid!" And so he left us.

Soon after our dinner was served in; which was right good viands, both for bread and treat: better than any collegiate diet, that I have known in Europe. We had also drink of three sorts, all wholesome and good; wine of the grape; a drink of grain, such as is with us our ale, but more clear: And a kind of cider made of a fruit of that country; a wonderful pleasing and refreshing drink. Besides, there were brought in to us, great store of those scarlet oranges, for our sick; which (they said) were an assured remedy for sickness taken at sea. There was given us

also, a box of small gray, or whitish pills, which they wished our sick should take, one of the pills, every night before sleep; which (they said) would hasten their recovery.

The next day, after that our trouble of carriage and removing of our men and goods out of our ship, was somewhat settled and quiet, I thought good to call our company together; and when they were assembled, said unto them; "My dear friends, let us know ourselves, and how it standeth with us. We are men cast on land, as Jonas was, out of the whale's belly, when we were as buried in the deep: and now we are on land, we are but between death and life; for we are beyond, both the old world, and the new; and whether ever we shall see Europe, God only knoweth. It is a kind of miracle bath brought us hither: and it must be little less, that shall bring us hence. Therefore in regard of our deliverance past, and our danger present, and to come, let us look up to God, and every man reform his own ways. Besides we are come here amongst a Christian people, full of piety and humanity: let us not bring that confusion of face upon ourselves, as to show our vices, or unworthiness before them. Yet there is more. For they have by commandment, (though in form of courtesy) cloistered us within these wall, for three days: who knoweth, whether it be not, to take some taste of our manners and conditions? And if they find them bad, to banish us straightways; if good, to give us further time. For these men that they have given us for attendance, may withal have an eye upon us. Therefore for God's love, and as we love the weal of our souls and bodies, let us so behave ourselves, as we may be at peace with God, and may find grace in the eyes of this people." Our company with one voice thanked me for my good admonition, and promised me to live soberly and civilly, and without giving any the least occasion of offence. So we spent our three days joyfully, and without care, in expectation what would be done with us, when they were expired. During which time, we had every hour joy of the amendment of our sick; who thought themselves cast into some divine pool of healing; they mended so kindly, and so fast.

The morrow after our three days were past, there came to us a new man, that we had not seen before, clothed in blue as the former was, save that his turban

was white, with a small red cross on the top. He had also a tippet of fine linen. At his coming in, he did bend to us a little, and put his arms abroad. We of our parts saluted him in a very lowly and submissive manner; as looking that from him, we should receive sentence of life, or death: he desired to speak with some few of us: whereupon six of us only staid, and the rest avoided the room. He said, "I am by office governor of this House of Strangers, and by vocation I am a Christian priest: and therefore am come to you to offer you my service, both as strangers and chiefly as Christians. Some things I may tell you, which I think you will not be unwilling to hear. The State hath given you license to stay on land, for the space of six weeks; and let it not trouble you, if your occasions ask further time, for the law in this point is not precise; and I do not doubt, but my self shall be able, to obtain for you such further time, as may be convenient. Ye shall also understand, that the Strangers' House is at this time rich, and much aforehand; for it hath laid up revenue these thirty-seven years; for so long it is since any stranger arrived in this part: and therefore take ye no care; the State will defray you all the time you stay; neither shall you stay one day the less for that. As for any merchandise ye have brought, ye shall be well used, and have your return, either in merchandise, or in gold and silver: for to us it is all one. And if you have any other request to make, hide it not. For ye shall find we will not make your countenance to fall by the answer ye shall receive. Only this I must tell you, that none of you must go above a karan," (that is with them a mile and an half) "from the walls of the city, without especial leave."

We answered, after we had looked awhile one upon another, admiring this gracious and parent-like usage; "That we could not tell what to say: for we wanted words to express our thanks; and his noble free offers left us nothing to ask. It seemed to us, that we had before us a picture of our salvation in Heaven; for we that were a while since in the jaws of death, were now brought into a place, where we found nothing but consolations. For the commandment laid upon us, we would not fail to obey it, though it was impossible but our hearts should be enflamed to tread further upon this happy and holy ground." We added, "That our tongues should first cleave to the roofs of our mouths, ere we

should forget, either his reverend person, or this whole nation, in our prayers." We also most humbly besought him, to accept of us as his true servants; by as just a right as ever men on earth were bounden; laying and presenting, both our persons, and all we had, at his feet. He said; "He was a priest, and looked for a priest's reward; which was our brotherly love, and the good of our souls and bodies." So he went from us, not without tears of tenderness in his eyes; and left us also confused with joy and kindness, saying amongst ourselves; "That we were come into a land of angels, which did appear to us daily, and prevent us with comforts, which we thought not of, much less expected."

The next day about ten of the clock, the Governor came to us again, and after salutations, said familiarly; "That he was come to visit us;" and called for a chair, and sat him down: and we, being some ten of us, (the rest were of the meaner sort, or else gone abroad,) sat down with him, And when we were set, he began thus: "We of this island of Bensalem," (for so they call it in their language,) "have this; that by means of our solitary situation; and of the laws of secrecy, which we have for our travellers, and our rare admission of strangers; we know well most part of the habitable world, and are ourselves unknown. Therefore because he that knoweth least is fittest to ask questions, it is more reason, for the entertainment of the time, that ye ask me questions, than that I ask you."

We answered; "That we humbly thanked him that he would give us leave so to do: and that we conceived by the taste we had already, that there was no worldly thing on earth, more worthy to be known than the state of that happy land. But above all," (we said,) "since that we were met from the several ends of the world, and hoped assuredly that we should meet one day in the kingdom of Heaven, (for that we were both parts Christians,) we desired to know, (in respect that land was so remote, and so divided by vast and unknown seas, from the land where our Saviour walked on earth,) who was the apostle of that nation, and how it was converted to the faith?" It appeared in his face that he took great contentment in this our question: he said; "Ye knit my heart to you, by asking

this question in the first place; for it sheweth that you first seek the kingdom of heaven; and I shall gladly, and briefly, satisfy your demand.

"About twenty years after the ascension of our Saviour, it came to pass, that there was seen by the people of Renfusa, (a city upon the eastern coast of our island,) within night, (the night was cloudy, and calm,) as it might be some mile into the sea, a great pillar of light; not sharp, but in form of a column, or cylinder, rising from the sea a great way up towards heaven; and on the top of it was seen a large cross of light, more bright and resplendent than the body of the pillar. Upon which so strange a spectacle, the people of the city gathered apace together upon the sands, to wonder; and so after put themselves into a number of small boats, to go nearer to this marvellous sight. But when the boats were come within (about) sixty yards of the pillar, they found themselves all bound, and could go no further; yet so as they might move to go about, but might not approach nearer: so as the boats stood all as in a theatre, beholding this light as an heavenly sign. It so fell out, that there was in one of the boats one of the wise men, of the society of Salomon's House; which house, or college (my good brethren) is the very eye of this kingdom; who having awhile attentively and devoutly viewed and contemplated this pillar and cross, fell down upon his face; and then raised himself upon his knees, and lifting up his hands to heaven, made his prayers in this manner.

"'LORD God of heaven and earth, thou hast vouchsafed of thy grace to those of our order, to know thy works of Creation, and the secrets of them: and to discern (as far as appertaineth to the generations of men) between divine miracles, works of nature, works of art, and impostures and illusions of all sorts. I do here acknowledge and testify before this people, that the thing which we now see before our eyes is thy Finger and a true Miracle. And forasmuch as we learn in our books that thou never workest miracles, but to divine and excellent end, (for the laws of nature are thine own laws, and thou exceedest them not but upon great cause,) we most humbly beseech thee to prosper this great sign, and to give us the interpretation and use of it in mercy; which thou dost in some part secretly promise by sending it unto us.'

“When he had made his prayer, he presently found the boat he was in, moveable and unbound; whereas all the rest remained still fast; and taking that for an assurance of leave to approach, he caused the boat to be softly and with silence rowed towards the pillar. But ere he came near it, the pillar and cross of light brake up, and cast itself abroad, as it were, into a firmament of many stars; which also vanished soon after, and there was nothing left to be seen, but a small ark, or chest of cedar, dry, and not wet at all with water, though it swam. And in the fore-end of it, which was towards him, grew a small green branch of palm; and when the wise man had taken it, with all reverence, into his boat, it opened of itself, and there were found in it a Book and a Letter; both written in fine parchment, and wrapped in sindons of linen. The Book contained all the canonical books of the Old and New Testament, according as you have them; (for we know well what the churches with you receive); and the Apocalypse itself, and some other books of the New Testament, which were not at that time written, were nevertheless in the Book. And for the Letter, it was in these words:

“‘I, Bartholomew, a servant of the Highest, and Apostle of Jesus Christ, was warned by an angel that appeareth to me, in a vision of glory, that I should commit this ark to the floods of the sea. Therefore I do testify and declare unto that people where God shall ordain this ark to come to land, that in the same day is come unto them salvation and peace and good-will, from the Father, and from the Lord Jesus.’

“There was also in both these writings, as well the Book, as the Letter, wrought a great miracle, conform to that of the Apostles, in the original Gift of Tongues. For there being at that time in this land Hebrews, Persians, and Indians, besides the natives, every one read upon the Book, and Letter, as if they had been written in his own language. And thus was this land saved from infidelity (as the remainder of the old world was from water) by an ark, through the apostolical and miraculous evangelism of Saint Bartholomew.” And here he paused, and a messenger came, and called him from us. So this was all that passed in that conference.

The next day, the same governor came again to us, immediately after dinner, and excused himself, saying; “That the day before he was called from us, somewhat abruptly, but now he would make us amends, and spend time with us if we held his company and conference agreeable.” We answered, “That we held it so agreeable and pleasing to us, as we forgot both dangers past and fears to come, for the time we hear him speak; and that we thought an hour spent with him, was worth years of our former life.” He bowed himself a little to us, and after we were set again, he said; “Well, the questions are on your part.”

One of our number said, after a little pause; that there was a matter, we were no less desirous to know, than fearful to ask, lest we might presume too far. But encouraged by his rare humanity towards us, (that could scarce think ourselves strangers, being his vowed and professed servants,) we would take the hardiness to propound it: humbly beseeching him, if he thought it not fit to be answered, that he would pardon it, though he rejected it. We said; “We well observed those his words, which he formerly spake, that this happy island, where we now stood, was known to few, and yet knew most of the nations of the world; which we found to be true, considering they had the languages of Europe, and knew much of our state and business; and yet we in Europe, (notwithstanding all the remote discoveries and navigations of this last age), never heard of the least inkling or glimpse of this island. This we found wonderful strange; for that all nations have inter-knowledge one of another, either by voyage into foreign parts, or by strangers that come to them: and though the traveller into a foreign country, doth commonly know more by the eye, than he that stayeth at home can by relation of the traveller; yet both ways suffice to make a mutual knowledge, in some degree, on both parts. But for this island, we never heard tell of any ship of theirs that had been seen to arrive upon any shore of Europe; nor of either the East or West Indies; nor yet of any ship of any other part of the world, that had made return from them. And yet the marvel rested not in this. For the situation of it (as his lordship said) in the secret conclave’ of such a vast sea might cause it. But then, that they should have knowledge of the languages, books, affairs, of those that lie such a distance from them, it was a thing we could not tell what to make of;

for that it seemed to us a conditioner and propriety of divine powers and beings, to be hidden and unseen to others, and yet to have others open and as in a light to them."

At this speech the Governor gave a gracious smile, and said; "That we did well to ask pardon for this question we now asked: for that it imported, as if we thought this land, a land of magicians, that sent forth spirits of the air into all parts, to bring them news and intelligence of other countries." It was answered by us all, in all possible humbleness, but yet with a countenance taking knowledge, that we knew that he spake it but merrily, "That we were apt enough to think there was somewhat supernatural in this island; but yet rather as angelical than magical. But to let his lordship know truly what it was that made us tender and doubtful to ask this question, it was not any such conceit, but because we remembered, he had given a touch in his former speech, that this land had laws of secrecy touching strangers." To this he said; "You remember it aright and therefore in that I shall say to you, I must reserve some particulars, which it is not lawful for me to reveal; but there will be enough left, to give you satisfaction."

"You shall understand (that which perhaps you will scarce think credible) that about three thousand years ago, or somewhat more, the navigation of the world, (especially for remote voyages,) was greater than at this day. Do not think with yourselves, that I know not how much it is increased with you, within these six-score years: I know it well: and yet I say greater then than now; whether it was, that the example of the ark, that saved the remnant of men from the universal deluge, gave men confidence to adventure upon the waters; or what it was; but such is the truth. The Phoenicians, and especially the Tyrians, had great fleets. So had the Carthaginians their colony, which is yet further west. Toward the east the shipping of Egypt and of Palestine was likewise great. China also, and the great Atlantis, (that you call America,) which have now but junks and canoes, abounded then in tall ships. This island, (as appeareth by faithful registers of those times,) had then fifteen hundred strong ships, of great content. Of all this,

there is with you sparing memory, or none; but we have large knowledge thereof.

“At that time, this land was known and frequented by the ships and vessels of all the nations before named. And (as it cometh to pass) they had many times men of other countries, that were no sailors, that came with them; as Persians, Chaldeans, Arabians; so as almost all nations of might and fame resorted hither; of whom we have some stirps, and little tribes with us at this day. And for our own ships, they went sundry voyages, as well to your straits, which you call the Pillars of Hercules, as to other parts in the Atlantic and Mediterrane Seas; as to Paguin, (which is the same with Cambaline,) and Quinzy, upon the Oriental Seas, as far as to the borders of the East Tartary.

“At the same time, and an age after, or more, the inhabitants of the great Atlantis did flourish. For though the narration and description, which is made by a great man with you; that the descendants of Neptune planted there; and of the magnificent temple, palace, city, and hill; and the manifold streams of goodly navigable rivers, (which as so many chains environed the same site and temple); and the several degrees of ascent, whereby men did climb up to the same, as if it had been a scala coeli, be all poetical and fabulous: yet so much is true, that the said country of Atlantis, as well that of Peru, then called Coya, as that of Mexico, then named Tyrambel, were mighty and proud kingdoms in arms, shipping and riches: so mighty, as at one time (or at least within the space of ten years) they both made two great expeditions; they of Tyrambel through the Atlantic to the Mediterrane Sea; and they of Coya through the South Sea upon this our island: and for the former of these, which was into Europe, the same author amongst you (as it seemeth) had some relation from the Egyptian priest whom he cited. For assuredly such a thing there was. But whether it were the ancient Athenians that had the glory of the repulse and resistance of those forces, I can say nothing: but certain it is, there never came back either ship or man from that voyage. Neither had the other voyage of those of Coya upon us had better fortune, if they had not met with enemies of greater clemency. For the king of this island, (by name Altabin,) a wise man and a great warrior, knowing

well both his own strength and that of his enemies, handled the matter so, as he cut off their land-forces from their ships; and entoiled both their navy and their tamp with a greater power than theirs, both by sea and land: arid compelled them to render themselves without striking stroke and after they were at his mercy, contenting himself only with their oath that they should no more bear arms against him, dismissed them all in safety.

"But the divine revenge overtook not long after those proud enterprises. For within less than the space of one hundred years, the great Atlantis was utterly lost and destroyed: not by a great earthquake, as your man saith; (for that whole tract is little subject to earthquakes;) but by a particular' deluge or inundation; those countries having, at this day, far greater rivers and far higher mountains to pour down waters, than any part of the old world. But it is true that the same inundation was not deep; not past forty foot, in most places, from the ground; so that although it destroyed man and beast generally, yet some few wild inhabitants of the wood escaped. Birds also were saved by flying to the high trees and woods. For as for men, although they had buildings in many places, higher than the depth of the water, yet that inundation, though it were shallow, had a long continuance; whereby they of the vale that were not drowned, perished for want of food and other things necessary.

"So as marvel you not at the thin population of America, nor at the rudeness and ignorance of the people; for you must account your inhabitants of America as a young people; younger a thousand years, at the least, than the rest of the world: for that there was so much time between the universal flood and their particular inundation. For the poor remnant of human seed, which remained in their mountains, peopled the country again slowly, by little and little; and being simple and savage people, (not like Noah and his sons, which was the chief family of the earth;) they were not able to leave letters, arts, and civility to their posterity; and having likewise in their mountainous habitations been used (in respect of the extreme cold of those regions) to clothe themselves with the skins of tigers, bears, and great hairy goats, that they have in those parts; when after they came down into the valley, and found the intolerable heats which are there,

and knew no means of lighter apparel, they were forced to begin the custom of going naked, which continueth at this day. Only they take great pride and delight in the feathers of birds; and this also they took from those their ancestors of the mountains, who were invited unto it by the infinite flights of birds that came up to the high grounds, while the waters stood below. So you see, by this main accident of time, we lost our traffic with the Americans, with whom of, all others, in regard they lay nearest to us, we had most commerce.

"As for the other parts of the world, it is most manifest that in the ages following (whether it were in respect of wars, or by a natural revolution of time,) navigation did every where greatly decay; and specially far voyages (the rather by the use of galleys, and such vessels as could hardly brook the ocean,) were altogether left and omitted. So then, that part of intercourse which could be from other nations to sail to us, you see how it hath long since ceased; except it were by some rare accident, as this of yours. But now of the cessation of that other part of intercourse, which might be by our sailing to other nations, I must yield you some other cause. For I cannot say (if I shall say truly,) but our shipping, for number, strength, mariners, pilots, and all things that appertain to navigation, is as great as ever; and therefore why we should sit at home, I shall now give you an account by itself: and it will draw nearer to give you satisfaction to your principal question.

"There reigned in this land, about nineteen hundred years ago, a king, whose memory of all others we most adore; not superstitiously, but as a divine instrument, though a mortal man; his name was Solamona: and we esteem him as the lawgiver of our nation. This king had a large heart, inscrutable for good; and was wholly bent to make his kingdom and people happy. He therefore, taking into consideration how sufficient and substantive this land was to maintain itself without any aid (at all) of the foreigner; being five thousand six hundred miles in circuit, and of rare fertility of soil in the greatest part thereof; and finding also the shipping of this country might be plentifully set on work, both by fishing and by transportations from port to port, and likewise by sailing unto some small islands that are not far from us, and are under the crown and

laws of this state; and, recalling into his memory the happy and flourishing estate wherein this land then was; so as it might be a thousand ways altered to the worse, but scarce any one way to the better; thought nothing wanted to his noble and heroical intentions, but only (as far as human foresight might reach) to give perpetuity to that which was in his time so happily established. Therefore amongst his other fundamental laws of this kingdom, he did ordain the interdicts and prohibitions which we have touching entrance of strangers; which at that time (though it was after the calamity of America) was frequent; doubting novelties, and commixture of manners. It is true, the like law against the admission of strangers without licence is an ancient law in the kingdom of China, and yet continued in use. But there it is a poor thing; and hath made them a curious, ignorant, fearful, foolish nation. But our lawgiver made his law of another temper. For first, he hath preserved all points of humanity, in taking order and making provision for the relief of strangers distressed; whereof you have tasted."

At which speech (as reason was) we all rose up and bowed ourselves. He went on.

"That king also, still desiring to join humanity and policy together; and thinking it against humanity, to detain strangers here against their wills, and against policy that they should return and discover their knowledge of this estate, he took this course: he did ordain that of the strangers that should be permitted to land, as many (at all times) might depart as would; but as many as would stay should have very good conditions and means to live from the state. Wherein he saw so far, that now in so many ages since the prohibition, we have memory not of one ship that ever returned, and but of thirteen persons only, at several times, that chose to return in our bottoms. What those few that returned may have reported abroad I know not. But you must think, whatsoever they have said could be taken where they came but for a dream. Now for our travelling from henna into parts abroad, our Lawgiver thought fit altogether to restrain it. So is it not in China. For the Chinese sail where they will or can; which sheweth that their law of keeping out strangers is a law of pusillanimity and fear. But this

restraint of ours hath one only exception, which is admirable; preserving the good which cometh by communicating with strangers, and avoiding the hurt; and I will now open it to you. And here I shall seem a little to digress, but you will by and by find it pertinent.

"Ye shall understand (my dear friends) that amongst the excellent acts of that king, one above all hath the pre-eminence. It was the erection and institution of an Order or Society, which we call Salomon's House; the noblest foundation (as we think) that ever was upon the earth; and the lanthorn of this kingdom. It is dedicated to the study of the works and creatures of God. Some think it beareth the founder's name a little corrupted, as if it should be Solamona's House. But the records write it as it is spoken. So as I take it to be denominate of the king of the Hebrews, which is famous with you, and no stranger to us. For we have some parts of his works, which with you are lost; namely, that natural history, which he wrote, of all plants, from the cedar of Libanus to the moss that groweth out of the wall, and of all things that have life and motion. This maketh me think that our king, finding himself to symbolize in many things with that king of the Hebrews (which lived many years before him), honored him with the title of this foundation. And I am rather induced to be of this opinion, for that I find in ancient records this Order or Society is sometimes called Salomon's House, and sometimes the College of the Six Days Works; whereby I am satisfied that our excellent king had learned from the Hebrews that God had created the world and all that therein is within six days: and therefore he instituting that House for the finding out of the true nature of all things, (whereby God might have the more glory in the workmanship of them, and insert the more fruit in the use of them), did give it also that second name.

"But now to come to our present purpose. When the king had forbidden to all his people navigation into any part that was not under his crown, he made nevertheless this ordinance; that every twelve years there should be set forth, out of this kingdom two ships, appointed to several voyages; That in either of these ships there should be a mission of three of the Fellows or Brethren of Salomon's House; whose errand was only to give us knowledge of the affairs and state of

those countries to which they were designed, and especially of the sciences, arts, manufactures, and inventions of all the world; and withal to bring unto us books, instruments, and patterns in every kind: That the ships, after they had landed the brethren, should return; and that the brethren should stay abroad till the new mission. These ships are not otherwise fraught, than with store of victuals, and good quantity of treasure to remain with the brethren, for the buying of such things and rewarding of such persons as they should think fit. Now for me to tell you how the vulgar sort of mariners are contained from being discovered at land; and how they that must be put on shore for any time, color themselves under the names of other nations; and to what places these voyages have been designed; and what places of rendezvous are appointed for the new missions; and the like circumstances of the practique; I may not do it: neither is it much to your desire. But thus you see we maintain a trade not for gold, silver, or jewels; nor for silks; nor for spices; nor any other commodity of matter; but only for God's first creature, which was Light: to have light (I say) of the growth of all parts of the world."

And when he had said this, he was silent; and so were we all. For indeed we were all astonished to hear so strange things so probably told. And he, perceiving that we were willing to say somewhat but had it not ready in great courtesy took us off, and descended to ask us questions of our voyage and fortunes and in the end concluded, that we might do well to think with ourselves what time of stay we would demand of the state; and bade us not to scant ourselves; for he would procure such time as we desired: Whereupon we all rose up, and presented ourselves to kiss the skirt of his tippet; but he would not suffer us; and so took his leave. But when it came once amongst our people that the state used to offer conditions to strangers that would stay, we had work enough to get any of our men to look to our ship; and to keep them from going presently to the governor to crave conditions. But with much ado we refrained them, till we might agree what course to take.

We took ourselves now for free men, seeing there was no danger of our utter perdition; and lived most joyfully, going abroad and seeing what was to be seen

in the city and places adjacent within our tedder; and obtaining acquaintance with many of the city, not of the meanest quality; at whose hands we found such humanity, and such a freedom and desire to take strangers as it were into their bosom, as was enough to make us forget all that was dear to us in our own countries: and continually we met with many things right worthy of observation and relation: as indeed, if there be a mirror in the world worthy to hold men's eyes, it is that country.

One day there were two of our company bidden to a Feast of the Family, as they call it. A most natural, pious, and reverend custom it is, shewing that nation to be compounded of all goodness. This is the manner of it. It is granted to any man that shall live to see thirty persons descended of his body alive together, and all above three years old, to make this feast which is done at the cost of the state. The Father of the Family, whom they call the Tirsan, two days before the feast, taketh to him three of such friends as he liketh to choose; and is assisted also by the governor of the city or place where the feast is celebrated; and all the persons of the family, of both sexes, are summoned to attend him. These two days the Tirsan sitteth in consultation concerning the good estate of the family. There, if there be any discord or suits between any of the family, they are compounded and appeased. There, if any of the family be distressed or decayed, order is taken for their relief and competent means to live. There, if any be subject to vice, or take ill courses, they are reproved and censured. So likewise direction is given touching marriages, and the courses of life, which any of them should take, with divers other the like orders and advices. The governor assisteth, to the end to put in execution by his public authority the decrees and orders of the Tirsan, if they should be disobeyed; though that seldom needeth; such reverence and obedience they give to the order of nature. The Tirsan doth also then ever choose one man from among his sons, to live in house with him; who is called ever after the Son of the Vine. The reason will hereafter appear.

On the feast day, the father or Tirsan cometh forth after divine service into a large room where the feast is celebrated; which room hath an half-pace at the upper end. Against the wall, in the middle of the half-pace, is a chair placed for

him, with a table and carpet before it. Over the chair is a state, made round or oval, and it is of ivy; an ivy somewhat whiter than ours, like the leaf of a silver asp; but more shining; for it is green all winter. And the state is curiously wrought with silver and silk of divers colors, broiding or binding in the ivy; and is ever of the work of some of the daughters of the family; and veiled over at the top with a fine net of silk and silver. But the substance of it is true ivy; whereof, after it is taken down, the friends of the family are desirous to have some leaf or sprig to keep.

The Tirsan cometh forth with all his generation or linage, the males before him, and the females following him; and if there be a mother from whose body the whole linage is descended, there is a traverse placed in a loft above on the right hand of the chair, with a privy door, and a carved window of glass, leaded with gold and blue; where she sitteth, but is not seen. When the Tirsan is come forth, he sitteth down in the chair; and all the linage place themselves against the wall, both at his back and upon the return of the half-pace, in order of their years without difference of sex; and stand upon their feet. When he is set; the room being always full of company, but well kept and without disorder; after some pause, there cometh in from the lower end of the room, a taratan (which is as much as an herald) and on either side of him two young lads; whereof one carrieth a scroll of their shining yellow parchment; and the other a cluster of grapes of gold, with a long foot or stalk. The herald and children are clothed with mantles of sea-water green satin; but the herald's mantle is streamed with gold, and hath a train.

Then the herald with three curtesies, or rather inclinations, cometh up as far as the half-pace; and there first taketh into his hand the scroll. This scroll is the king's charter, containing gifts of revenew, and many privileges, exemptions, and points of honour, granted to the Father of the Family; and is ever styled and directed, To such do one our well beloved friend and creditor: which is a title proper only to this case. For they say the king is debtor to no man, but for propagation of his subjects. The seal set to the king's charter is the king's image, imbossed or moulded in gold; and though such charters be expedited of course,

and as of right, yet they are varied by discretion, according to the number and dignity of the family. This charter the herald readeth aloud; and while it is read, the father or Tirsan standeth up supported by two of his sons, such as he chooseth. Then the herald mounteth the half-pace and delivereth the charter into his hand: and with that there is an acclamation by all that are present in their language, which is thus much: Happy are the people of Bensalem.

Then the herald taketh into his hand from the other child the cluster of grapes, which is of gold, both the stalk and the grapes. But the grapes are daintily enamelled; and if the males of the family be the greater number, the grapes are enamelled purple, with a little sun set on the top; if the females, then they are enamelled into a greenish yellow, with a crescent on the top. The grapes are in number as many as there are descendants of the family. This golden cluster the herald delivereth also to the Tirsan; who presently delivereth it over to that son that he had formerly chosen to be in house with him: who beareth it before his father as an ensign of honour when he goeth in public, ever after; and is thereupon called the Son of the Vine.

After the ceremony endeth the father or Tirsan retireth; and after some time cometh forth again to dinner, where he sitteth alone under the state, as before; and none of his descendants sit with him, of what degree or dignity soever, except he hap to be of Salomon's House. He is served only by his own children, such as are male; who perform unto him all service of the table upon the knee; and the women only stand about him, leaning against the wall. The room below the half-pace hath tables on the sides for the guests that are bidden; who are served with great and comely order; and towards the end of dinner (which in the greatest feasts with them lasteth never above an hour and an half) there is an hymn sung, varied according to the invention of him that composeth it (for they have excellent posy) but the subject of it is (always) the praises of Adam and Noah and Abraham; whereof the former two peopled the world, and the last was the Father of the Faithful: concluding ever with a thanksgiving for the nativity of our Saviour, in whose birth the births of all are only blessed.

Dinner being done, the Tirsan retireth again; and having withdrawn himself alone into a place, where he makes some private prayers, he cometh forth the third time, to give the blessing with all his descendants, who stand about him as at the first. Then he calleth them forth by one and by one, by name, as he pleaseth, though seldom the order of age be inverted. The person that is called (the table being before removed) kneeleth down before the chair, and the father layeth his hand upon his head, or her head, and giveth the blessing in these words: Son of Bensalem, (or daughter of Bensalem,) thy father with it: the man by whom thou hast breath and life speaketh the word: the blessing of the everlasting Father, the Prince of Peace, and the Holy Dove, be upon thee, and make the days of thy pilgrimage good and many. This he saith to every of them; and that done, if there be any of his sons of eminent merit and virtue, (so they be not above two,) he calleth for them again; and saith, laying his arm over their shoulders, they standing; Sons, it is well ye are born, give God the praise, and persevere to the end. And withall delivereth to either of them a jewel, made in the figure of an ear of wheat, which they ever after wear in the front of their turban or hat. This done, they fall to music and dances, and other recreations, after their manner, for the rest of the day. This is the full order of that feast.

By that time six or seven days were spent, I was fallen into straight acquaintance with a merchant of that city, whose name was Joabin. He was a Jew and circumcised: for they have some few stirps of Jews yet remaining among them, whom they leave to their own religion. Which they may the better do, because they are of a far differing disposition from the Jews in other parts. For whereas they hate the name of Christ; and have a secret inbred rancour against the people among whom they live: these (contrariwise) give unto our Saviour many high attributes, and love the nation of Bensalem extremely. Surely this man of whom I speak would ever acknowledge that Christ was born of a virgin and that he was more than a man; and he would tell how God made him ruler of the seraphims which guard his throne; and they call him also the Milken Way, and the Eliah of the Messiah; and many other high names; which though

they be inferior to his divine majesty, yet they are far from the language of other Jews.

And for the country of Bensalem, this man would make no end of commending it; being desirous, by tradition among the Jews there, to have it believed that the people thereof were of the generations of Abraham, by another son, whom they call Nachoran; and that Moses by a secret Cabala ordained the Laws of Bensalem which they now use; and that when the Messiah should come, and sit in his throne at Hierusalem, the king of Bensalem should sit at his feet, whereas other kings should keep a great distance. But yet setting aside these Jewish dreams, the man was a wise man, and learned, and of great policy, and excellently seen in the laws and customs of that nation.

Amongst other discourses, one day I told him I was much affected with the relation I had, from some of the company, of their custom, in holding the Feast of the Family; for that (methought) I had never heard of a solemnity wherein nature did so much preside. And because propagation of families proceedeth from the nuptial copulation, I desired to know of him what laws and customs they had concerning marriage; and whether they kept marriage well and whether they were tied to one wife; for that where population is so much affected,' and such as with them it seemed to be, there is commonly permission of plurality of wives.

To this he said, "You have reason for to commend that excellent institution of the Feast of the Family. And indeed we have experience that those families that are partakers of the blessing of that feast do flourish and prosper ever after in an extraordinary manner. But hear me now, and I will tell you what I know. You shall understand that there is not under the heavens so chaste a nation as this of Bensalem; nor so free from all pollution or foulness. It is the virgin of the world. I remember I have read in one of your European books, of an holy hermit amongst you that desired to see the Spirit of Fornication; and there appeared to him a little foul ugly Aethiop. But if he had desired to see the Spirit of Chastity of Bensalem, it would have appeared to him in the likeness of a fair beautiful Cherubim. For there is nothing amongst mortal men more fair and admirable,

than the chaste minds of this people. Know therefore, that with them there are no stews, no dissolute houses, no courtesans, nor anything of that kind. Nay they wonder (with detestation) at you in Europe, which permit such things. They say ye have put marriage out of office: for marriage is ordained a remedy for unlawful concupiscence; and natural concupiscence seemeth as a spar to marriage. But when men have at hand a remedy more agreeable to their corrupt will, marriage is almost expulsed. And therefore there are with you seen infinite men that marry not, but chose rather a libertine and impure single life, than to be yoked in marriage; and many that do marry, marry late, when the prime and strength of their years is past. And when they do marry, what is marriage to them but a very bargain; wherein is sought alliance, or portion, or reputation, with some desire (almost indifferent) of issue; and not the faithful nuptial union of man and wife, that was first instituted. Neither is it possible that those that have cast away so basely so much of their strength, should greatly esteem children, (being of the same matter,) as chaste men do. So likewise during marriage, is the case much amended, as it ought to be if those things were tolerated only for necessity? No, but they remain still as a very affront to marriage. The haunting of those dissolute places, or resort to courtesans, are no more punished in married men than in bachelors. And the depraved custom of change, and the delight in meretricious embracements, (where sin is turned into art,) maketh marriage a dull thing, and a kind of imposition or tax. They hear you defend these things, as done to avoid greater evils; as advoutries, deflowering of virgins, unnatural lust, and the like. But they say this is a preposterous wisdom; and they call it Lot's offer, who to save his guests from abusing, offered his daughters: nay they say farther that there is little gained in this; for that the same vices and appetites do still remain and abound; unlawful lust being like a furnace, that if you stop the flames altogether, it will quench; but if you give it any vent, it will rage. As for masculine love, they have no touch of it; and yet there are not so faithful and inviolate friendships in the world again as are there; and to speak generally, (as I said before,) I have not read of any such chastity, in any people as theirs. And their usual saying is, That whosoever is unchaste cannot reverence

himself; and they say, That the reverence of a man's self, is, next to religion, the chiefest bridle of all vices."

And when he had said this, the good Jew paused a little; whereupon I, far more willing to hear him speak on than to speak myself, yet thinking it decent that upon his pause of speech I should not be altogether silent, said only this; "That I would say to him, as the widow of Sarepta said to Elias; that he was come to bring to memory our sins; and that I confess the righteousness of Bensalem was greater than the righteousness of Europe." At which speech he bowed his head, and went on in this manner:

"They have also many wise and excellent laws touching marriage. They allow no polygamy. They have ordained that none do intermarry or contract, until a month be past from their first interview. Marriage without consent of parents they do not make void, but they mulct it in the inheritors: for the children of such marriages are not admitted to inherit above a third part of their parents' inheritance. I have read in a book of one of your men, of a Feigned Commonwealth, where the married couple are permitted, before they contract, to see one another naked. This they dislike; for they think it a scorn to give a refusal after so familiar knowledge: but because of many hidden defects in men and women's bodies, they have a more civil way; for they have near every town a couple of pools, (which they call Adam and Eve's pools,) where it is permitted to one of the friends of the men, and another of the friends of the woman, to see them severally bathe naked."

And as we were thus in conference, there came one that seemed to be a messenger, in a rich huke, that spake with the Jew: whereupon he turned to me and said; "You will pardon me, for I am commanded away in haste." The next morning he came to me again, joyful as it seemed, and said; "There is word come to the Governor of the city, that one of the Fathers of Salomon's House will be here this day seven-night: we have seen none of them this dozen years. His coming is in state; but the cause of his coming is secret. I will provide you and your fellows of a good standing to see his entry." I thanked him, and told him, I was most glad of the news.

The day being come, he made his entry. He was a man of middle stature and age, comely of person, and had an aspect as if he pitied men. He was clothed in a robe of fine black cloth, with wide sleeves and a cape. His under garment was of excellent white linen down to the foot, girt with a girdle of the same; and a sindon or tippet of the same about his neck. He had gloves, that were curious,'' and set with stone; and shoes of peach-coloured velvet. His neck was bare to the shoulders. His hat was like a helmet, or Spanish montera; and his locks curled below it decently: they were of colour brown. His beard was cut round, and of the same colour with his hair, somewhat lighter. He was carried in a rich chariot without wheels, litter-wise; with two horses at either end, richly trapped in blue velvet embroidered; and two footmen on each side in the like attire. The chariot was all of cedar, gilt, and adorned with crystal; save that the fore-end had panels of sapphires, set in borders of gold; and the hinder-end the like of emeralds of the Peru colour. There was also a sun of gold, radiant, upon the top, in the midst; and on the top before, a small cherub of gold, with wings displayed. The chariot was covered with cloth of gold tissued upon blue. He had before him fifty attendants, young men all, in white satin loose coats to the mid leg; and stockings of white silk; and shoes of blue velvet; and hats of blue velvet; with fine plumes of diverse colours, set round like hat-bands. Next before the chariot, went two men, bare-headed, in linen garments down the foot, girt, and shoes of blue velvet; who carried, the one a crosier, the other a pastoral staff like a sheep-hook; neither of them of metal, but the crosier of balm-wood, the pastoral staff of cedar. Horsemen he had none, neither before nor behind his chariot: as it seemeth, to avoid all tumult and trouble. Behind his chariot went all the officers and principals of the companies of the city. He sat alone, upon cushions of a kind of excellent plush, blue; and under his foot curious carpets of silk of diverse colours, like the Persian, but far finer. He held up his bare hand as he went, as blessing the people, but in silence. The street was wonderfully well kept: so that there was never any army had their men stand in better battle-array than the people stood. The windows likewise were not crowded, but every one stood in them as if they had been placed.

When the shew was past, the Jew said to me; “I shall not be able to attend you as I would, in regard of some charge the city hath laid upon me, for the entertaining of this great person.” Three days after the Jew came to me again, and said; “Ye are happy men; for the Father of Salomon’s House taketh knowledge of your being here, and commanded me to tell you that he will admit all your company to his presence, and have private conference with one of you, that ye shall choose: and for this hath appointed the next day after to-morrow. And because he meaneth to give you his blessing, he hath appointed it in the forenoon.”

We came at our day and hour, and I was chosen by my fellows for the private access. We found him in a fair chamber, richly hanged, and carpeted under foot without any degrees to the state. He was set upon a low Throne richly adorned, and a rich cloth of state over his head, of blue satin embroidered. He was alone, save that he had two pages of honour, on either hand one, finely attired in white. His under garments were the like that we saw him wear in the chariot; but instead of his gown, he had on him a mantle with a cape, of the same fine black, fastened about him. When we came in, as we were taught, we bowed low at our first entrance; and when we were come near his chair, he stood up, holding forth his hand ungloved, and in posture of blessing; and we every one of us stooped down, and kissed the hem of his tippet. That done, the rest departed, and I remained. Then he warned the pages forth of the room, and caused me to sit down beside him, and spake to me thus in the Spanish tongue.

“God bless thee, my son; I will give thee the greatest jewel I have. For I will impart unto thee, for the love of God and men, a relation of the true state of Salomon’s House. Son, to make you know the true state of Salomon’s House, I will keep this order. First, I will set forth unto you the end of our foundation. Secondly, the preparations and instruments we have for our works. Thirdly, the several employments and functions whereto our fellows are assigned. And fourthly, the ordinances and rites which we observe.

“The end of our foundation is the knowledge of causes, and secret motions of things; and the enlarging of the bounds of human empire, to the effecting of all

things possible.

“The Preparations and Instruments are these. We have large and deep caves of several depths: the deepest are sunk six hundred fathom: and some of them are digged and made under great hills and mountains: so that if you reckon together the depth of the hill and the depth of the cave, they are (some of them) above three miles deep. For we find, that the depth of a hill, and the depth of a cave from the flat, is the same thing; both remote alike, from the sun and heaven’s beams, and from the open air. These caves we call the Lower Region; and we use them for all coagulations, indurations, refrigerations, and conservations of bodies. We use them likewise for the imitation of natural mines; and the producing also of new artificial metals, by compositions and materials which we use, and lay there for many years. We use them also sometimes, (which may seem strange,) for curing of some diseases, and for prolongation of life in some hermits that choose to live there, well accommodated of all things necessary, and indeed live very long; by whom also we learn many things.

“We have burials in several earths, where we put diverse cements, as the Chineses do their porcellain. But we have them in greater variety, and some of them more fine. We have also great variety of composts and soils, for the making of the earth fruitful.

“We have high towers; the highest about half a mile in height; and some of them likewise set upon high mountains; so that the vantage of the hill with the tower is in the highest of them three miles at least. And these places we call the Upper Region; accounting the air between the high places and the low, as a Middle Region. We use these towers, according to their several heights, and situations, for insolation, refrigeration, conservation; and for the view of divers meteors; as winds, rain, snow, hail; and some of the fiery meteors also. And upon them, in some places, are dwellings of hermits, whom we visit sometimes, and instruct what to observe.

“We have great lakes, both salt, and fresh; whereof we have use for the fish and fowl. We use them also for burials of some natural bodies: for we find a

difference in things buried in earth or in air below the earth, and things buried in water. We have also pools, of which some do strain fresh water out of salt; and others by art do turn fresh water into salt. We have also some rocks in the midst of the sea, and some bays upon the shore for some works, wherein is required the air and vapor of the sea. We have likewise violent streams and cataracts, which serve us for many motions: and likewise engines for multiplying and enforcing of winds, to set also on going diverse motions.

"We have also a number of artificial wells and fountains, made in imitation of the natural sources and baths; as tincted upon vitriol, sulphur, steel, brass, lead, nitre, and other minerals. And again we have little wells for infusions of many things, where the waters take the virtue quicker and better, than in vessels or basins. And amongst them we have a water which we call Water of Paradise, being, by that we do to it made very sovereign for health, and prolongation of life.

"We have also great and spacious houses where we imitate and demonstrate meteors; as snow, hail, rain, some artificial rains of bodies and not of water, thunders, lightnings; also generations of bodies in air; as frogs, flies, and divers others.

"We have also certain chambers, which we call Chambers of Health, where we qualify the air as we think good and proper for the cure of divers diseases, and preservation of health.

"We have also fair and large baths, of several mixtures, for the cure of diseases, and the restoring of man's body from arefaction: and others for the confirming of it in strength of sinewes, vital parts, and the very juice and substance of the body.

"We have also large and various orchards and gardens; wherein we do not so much respect beauty, as variety of ground and soil, proper for divers trees and herbs: and some very spacious, where trees and berries are set whereof we make divers kinds of drinks, besides the vineyards. In these we practise likewise all conclusions of grafting, and inoculating as well of wild-trees as fruit-trees, which produceth many effects. And we make (by art) in the same orchards and

gardens, trees and flowers to come earlier or later than their seasons; and to come up and bear more speedily than by their natural course they do. We make them also by art greater much than their nature; and their fruit greater and sweeter and of differing taste, smell, colour, and figure, from their nature. And many of them we so order, as they become of medicinal use.

"We have also means to make divers plants rise by mixtures of earths without seeds; and likewise to make divers new plants, differing from the vulgar; and to make one tree or plant turn into another.

"We have also parks and enclosures of all sorts of beasts and birds which we use not only for view or rareness, but likewise for dissections and trials; that thereby we may take light what may be wrought upon the body of man. Wherein we find many strange effects; as continuing life in them, though divers parts, which you account vital, be perished and taken forth; resuscitating of some that seem dead in appearance; and the like. We try also all poisons and other medicines upon them, as well of chirurgery, as physic. By art likewise, we make them greater or taller than their kind is; and contrariwise dwarf them, and stay their growth: we make them more fruitful and bearing than their kind is; and contrariwise barren and not generative. Also we make them differ in colour, shape, activity, many ways. We find means to make commixtures and copulations of different kinds; which have produced many new kinds, and them not barren, as the general opinion is. We make a number of kinds of serpents, worms, flies, fishes, of putrefaction; whereof some are advanced (in effect) to be perfect creatures, like bests or birds; and have sexes, and do propagate. Neither do we this by chance, but we know beforehand, of what matter and commixture what kind of those creatures will arise.

"We have also particular pools, where we make trials upon fishes, as we have said before of beasts and birds.

"We have also places for breed and generation of those kinds of worms and flies which are of special use; such as are with you your silk-worms and bees.

"I will not hold you long with recounting of our brewhouses, bake-houses, and kitchens, where are made divers drinks, breads, and meats, rare and of

special effects. Wines we have of grapes; and drinks of other juice of fruits, of grains, and of roots; and of mixtures with honey, sugar, manna, and fruits dried, and decocted; Also of the tears or woundings of trees; and of the pulp of canes. And these drinks are of several ages, some to the age or last of forty years. We have drinks also brewed with several herbs, and roots, and spices; yea with several fleshes, and white-meats; whereof some of the drinks are such, as they are in effect meat and drink both: so that divers, especially in age, do desire to live with them, with little or no meat or bread. And above all, we strive to have drink of extreme thin parts, to insinuate into the body, and yet without all biting, sharpness, or fretting; insomuch as some of them put upon the back of your hand will, with a little stay, pass through to the palm, and yet taste mild to the mouth. We have also waters which we ripen in that fashion, as they become nourishing; so that they are indeed excellent drink; and many will use no other. Breads we have of several grains, roots, and kernels; yea and some of flesh and fish dried; with divers kinds of leavenings and seasonings: so that some do extremely move appetites; some do nourish so, as divers do live of them, without any other meat; who live very long. So for meats, we have some of them so beaten and made tender and mortified,' yet without all corrupting, as a weak heat of the stomach will turn them into good chylus; as well as a strong heat would meat otherwise prepared. We have some meats also and breads and drinks, which taken by men enable them to fast long after; and some other, that used make the very flesh of men's bodies sensibly' more hard and tough and their strength far greater than otherwise it would be.

"We have dispensatories, or shops of medicines. Wherein you may easily think, if we have such variety of plants and living creatures more than you have in Europe, (for we know what you have,) the simples, drugs, and ingredients of medicines, must likewise be in so much the greater variety. We have them likewise of divers ages, and long fermentations. And for their preparations, we have not only all manner of exquisite distillations and separations, and especially by gentle heats and percolations through divers strainers, yea and substances; but

also exact forms of composition, whereby they incorporate almost, as they were natural simples.

“We have also divers mechanical arts, which you have not; and stuffs made by them; as papers, linen, silks, tissues; dainty works of feathers of wonderful lustre; excellent dies, and, many others; and shops likewise, as well for such as are not brought into vulgar use amongst us as for those that are. For you must know that of the things before recited, many of them are grown into use throughout the kingdom; but yet, if they did flow from our invention, we have of them also for patterns and principals.

“We have also furnaces of great diversities, and that keep great diversity of heats; fierce and quick; strong and constant; soft and mild; blown, quiet; dry, moist; and the like. But above all, we have heats, in imitation of the Sun’s and heavenly bodies’ heats, that pass divers inequalities, and (as it were) orbs, progresses, and returns, whereby we produce admirable effects. Besides, we have heats of dungs; and of bellies and maws of living creatures, and of their bloods and bodies; and of hays and herbs laid up moist; of lime unquenched; and such like. Instruments also which generate heat only by motion. And farther, places for strong insulations; and again, places under the earth, which by nature, or art, yield heat. These divers heats we use, as the nature of the operation, which we intend, requireth.

“We have also perspective-houses, where we make demonstrations of all lights and radiations; and of all colours: and out of things uncoloured and transparent, we can represent unto you all several colours; not in rain-bows, (as it is in gems, and prisms,) but of themselves single. We represent also all multiplications of light, which we carry to great distance, and make so sharp as to discern small points and lines. Also all colourations of light; all delusions and deceits of the sight, in figures, magnitudes, motions, colours all demonstrations of shadows. We find also divers means, yet unknown to you, of producing of light originally from divers bodies. We procure means of seeing objects afar off; as in the heaven and remote places; and represent things near as afar off; and things afar off as near; making feigned distances. We have also helps for the

sight, far above spectacles and glasses in use. We have also glasses and means to see small and minute bodies perfectly and distinctly; as the shapes and colours of small flies and worms, grains and flaws in gems, which cannot otherwise be seen, observations in urine and blood not otherwise to be seen. We make artificial rain-bows, halo's, and circles about light. We represent also all manner of reflexions, refractions, and multiplications of visual beams of objects.

"We have also precious stones of all kinds, many of them of great beauty, and to you unknown; crystals likewise; and glasses of divers kinds; and amongst them some of metals vitrificated, and other materials besides those of which you make glass. Also a number of fossils, and imperfect minerals, which you have not. Likewise loadstones of prodigious virtue; and other rare stones, both natural and artificial.

"We have also sound-houses, where we practise and demonstrate all sounds, and their generation. We have harmonies which you have not, of quarter-sounds, and lesser slides of sounds. Divers instruments of music likewise to you unknown, some sweeter than any you have, together with bells and rings that are dainty and sweet. We represent small sounds as great and deep; likewise great sounds extenuate and sharp; we make divers tremblings and warblings of sounds, which in their original are entire. We represent and imitate all articulate sounds and letters, and the voices and notes of beasts and birds. We have certain helps which set to the ear do further the hearing greatly. We have also divers strange and artificial echoes, reflecting the voice many times, and as it were tossing it: and some that give back the voice louder than it came, some shriller, and some deeper; yea, some rendering the voice differing in the letters or articulate sound from that they receive. We have also means to convey sounds in trunks and pipes, in strange lines and distances.

"We have also perfume-houses; wherewith we join also practices of taste. We multiply smells, which may seem strange. We imitate smells, making all smells to breathe outs of other mixtures than those that give them. We make divers imitations of taste likewise, so that they will deceive any man's taste. And in this house we contain also a confiture-house; where we make all sweet-meats, dry

and moist; and divers pleasant wines, milks, broths, and sallets; in far greater variety than you have.

"We have also engine-houses, where are prepared engines and instruments for all sorts of motions. There we imitate and practise to make swifter motions than any you have, either out of your muskets or any engine that you have: and to make them and multiply them more easily, and with small force, by wheels and other means: and to make them stronger and more violent than yours are; exceeding your greatest cannons and basilisks. We represent also ordnance and instruments of war, and engines of all kinds: and likewise new mixtures and compositions of gunpowder, wild-fires burning in water, and unquenchable. Also fireworks of all variety both for pleasure and use. We imitate also flights of birds; we have some degrees of flying in the air. We have ships and boats for going under water, and brooking of seas; also swimming-girdles and supporters. We have divers curious clocks, and other like motions of return: and some perpetual motions. We imitate also motions of living creatures, by images, of men, beasts, birds, fishes, and serpents. We have also a great number of other various motions, strange for equality, fineness, and subtilty.

"We have also a mathematical house, where are represented all instruments, as well of geometry as astronomy, exquisitely made.

"We have also houses of deceits of the senses; where we represent all manner of feats of juggling, false apparitions, impostures, and illusions; and their fallacies. And surely you will easily believe that we that have so many things truly natural which induce admiration, could in a world of particulars deceive the senses, if we would disguise those things and labour to make them seem more miraculous. But we do hate all impostures, and lies; insomuch as we have severely forbidden it to all our fellows, under pain of ignominy and fines, that they do not show any natural work or thing, adorned or swelling; but only pure as it is, and without all affectation of strangeness.

"These are (my son) the riches of Salomon's House.

"For the several employments and offices of our fellows; we have twelve that sail into foreign countries, under the names of other nations, (for our own we

conceal); who bring us the books, and abstracts, and patterns of experiments of all other parts. These we call Merchants of Light.

“We have three that collect the experiments which are in all books. These we call Depredators.

“We have three that collect the experiments of all mechanical arts; and also of liberal sciences; and also of practices which are not brought into arts. These we call Mystery-men.

“We have three that try new experiments, such as themselves think good. These we call Pioneers or Miners.

“We have three that draw the experiments of the former four into titles and tables, to give the better light for the drawing of observations and axioms out of them. These we call Compilers.

“We have three that bend themselves, looking into the experiments of their fellows, and cast about how to draw out of them things of use and practise for man’s life, and knowledge, as well for works as for plain demonstration of causes, means of natural divinations, and the easy and clear discovery of the virtues and parts of bodies. These we call Dowry-men or Benefactors.

“Then after divers meetings and consults of our whole number, to consider of the former labours and collections, we have three that take care, out of them, to direct new experiments, of a higher light, more penetrating into nature than the former. These we call Lamps.

“We have three others that do execute the experiments so directed, and report them. These we call Inoculators.

“Lastly, we have three that raise the former discoveries by experiments into greater observations, axioms, and aphorisms. These we call Interpreters of Nature.

“We have also, as you must think, novices and apprentices, that the succession of the former employed men do not fail; besides, a great number of servants and attendants, men and women. And this we do also: we have consultations, which of the inventions and experiences which we have discovered shall be published, and which not: and take all an oath of secrecy, for

the concealing of those which we think fit to keep secret: though some of those we do reveal sometimes to the state and some not.

"For our ordinances and rites: we have two very long and fair galleries: in one of these we place patterns and samples of all manner of the more rare and excellent inventions in the other we place the statues of all principal inventors. There we have the statue of your Columbus, that discovered the West Indies: also the inventor of ships: your monk that was the inventor of ordnance and of gunpowder: the inventor of music: the inventor of letters: the inventor of printing: the inventor of observations of astronomy: the inventor of works in metal: the inventor of glass: the inventor of silk of the worm: the inventor of wine: the inventor of corn and bread: the inventor of sugars: and all these, by more certain tradition than you have. Then have we divers inventors of our own, of excellent works; which since you have not seen, it were too long to make descriptions of them; and besides, in the right understanding of those descriptions you might easily err. For upon every invention of value, we erect a statue to the inventor, and give him a liberal and honourable reward. These statues are some of brass; some of marble and touch-stone; some of cedar and other special woods gilt and adorned; some of iron; some of silver; some of gold.

"We have certain hymns and services, which we say daily, of Lord and thanks to God for his marvellous works: and forms of prayers, imploring his aid and blessing for the illumination of our labours, and the turning of them into good and holy uses.

"Lastly, we have circuits or visits of divers principal cities of the kingdom; where, as it cometh to pass, we do publish such new profitable inventions as we think good. And we do also declare natural divinations of diseases, plagues, swarms-of hurtful creatures, scarcity, tempests, earthquakes, great inundations, comets, temperature of the year, and divers other things; and we give counsel thereupon, what the people shall do for the prevention and remedy of them."

And when he had said this, he stood up; and I, as I had been taught, kneeled down, and he laid his right hand upon my head, and said; "God bless thee, my son; and God bless this relation, which I have made. I give thee leave to publish

it for the good of other nations; for we here are in God's bosom, a land unknown." And so he left me; having assigned a value of about two thousand ducats, for a bounty to me and my fellows. For they give great largesses where they come upon all occasions.

[The rest was not perfected.]

SYLVA SYLVARVM or A NATVRALL HISTORY In ten Centuries.
Written by the right Hon^{ble} Francis Lo: Verulam Viscount S^{ct} Alban.
Published after Y^{e} Autho^{rs} Death by W. RAWLEY D^{r} of Diuinity
LONDON Printed for W. Lee and are to be sould at the Great Turks head next to the Mytre Taurne in Fleetstreet
Anno ——

TO THE MOST HIGH AND MIGHTY PRINCE CHARLES, BY THE GRACE OF GOD, King of Great Britaine, France, and Ireland, Defender of the Faith, &c.

May it please your most Excellent Maiestie; THe whole Body of the Naturall Historie, either designed, or written, by the late Lo. Viscount S. Alban, was dedicated to your Maiestie, in his Booke De Ventis, about foure yeeres past, when your Maiestie was Prince: So as there needed no new Dedication of this Worke, but only, in all humblenesse, to let your Maiestie know, it is yours. It is true, if that Lo. had liued; your Maiestie, ere long, had beene inuoked, to the Protection of another Historie; Whereof, not Natures Kingdome, as in this, but these of your Maiesties, (during the Time and Raigne of King Henry the Eighth) had beene the Subiect: Which since it died vnder the Designation meerely, there is nothing left, but your Maiesties Princely Goodnesse, graciously to accept of the Vndertakers Heart, and Intentions; who was willing to haue parted, for a while, with his Darling Philosophie, that hee might haue attended your Royall Commandement, in that other Worke. Thus much I haue beene bold, in all lowlinesse, to represent vnto your Maiestie, as one that was trusted with his Lordships Writings, euen to the last. And as this Worke affecteth the Stampe of your Maiesties Royall Protection, to make it more currant to the World; So vnder the Protection of this Worke, I presume in all humblenesse to approach your Maiesties presence; And to offer it vp into your Sacred Hands.

Your MAIESTIES most Loyall and Deuoted Subiect, W. RAWLEY.

SYLVA SYLVARVM: OR A Naturall Historie. IN TEN CENTURIES.

WRITTEN BY THE RIGHT Honourable FRANCIS Lo. Verulam Viscount S^{t}. ALBAN.

Published after the Authors death, By WILLIAM RAWLEY Doctor of Diuinitie, late his Lordships Chaplaine.

LONDON, ¶Printed by I. H. for William Lee at the Turks Head in Fleet-street, next to the Miter. 1626.

To the Reader.

HAuing had the Honour to be continually with my Lord, in compiling of this Worke; And to be employed therein; I haue thought it not amisse, (with his Lordships good leaue and liking,) for the better satisfaction of those that shall reade it, to make knowne somewhat of his Lordships Intentions, touching the Ordering, and Publishing of the same. I haue heard his Lordship often say; that if hee should haue serued the glory of his owne Name, he had been better not to haue published this Naturall History: For it may seeme an Indigested Heap of Particulars; And cannot haue that Lustre, which Bookes cast into Methods haue: But that he resolued to preferre the good of Men, and that which might best secure it, before any thing that might haue Relation to Himselfe. And hee knew well, that ther was no other way open, to vnloose Mens mindes, being bound; and (as it were) Maleficiate, by the Charmes of deceiuing Notions, and Theories; and therby made Impotent for Generation of VVorkes; But onely no wher to depart from the Sense, and cleare experience; But to keepe close to it, especially in the beginning: Besides, this Naturall History was a Debt of his, being Designed and set downe for a third part of the Instauration. I haue also heard his Lordship discourse, that Men (no doubt) will thinke many of the Experiments conteined in this Collection, to bee Vulgar and Triuiall; Meane and Sordid; Curious and Fruitlesse: And therfore he wisheth, that they would haue perpetually before their Eyes, what is now in doing; And the Difference betweene this Naturall History, and others. For those Naturall Histories, which are Extant, being gathered for Delight and Vse, are full of pleasant Descriptions and Pictures; and affect and seeke after Admiration, Rarities, and Secrets. But contrariwise, the Scope which his Lordship intendeth, is to write such a Naturall History, as may be Fundamentall to the Erecting and Building of a true Philosophy: For the Illumination of the Vnderstanding; the Extracting of Axiomes; and the producing of many Noble Works, and Effects. For he hopeth, by this meanes, to acquit Himselfe of that, for which hee taketh Himselfe in a sort bound; And that is, the Aduancement of all Learning and Sciences. For

hauing in this present VVorke Collected the Materialls for the Building; And in his Novum Organum (of which his Lordship is yet to publish a Second Part,) set downe the Instruments and Directions for the Worke; Men shall now bee wanting to themselues, if they raise not Knowledge to that perfection, whereof the Nature of Mortall men is capable. And in this behalfe, I haue heard his Lordship speake complainingly; That his Lordship (who thinketh hee deserueth to be an Architect in this building,) should be forced to be a VVork-man and a Labourer; And to digge the Clay, and burne the Brick; And more then that, (according to the hard Condition of the Israelites at the latter end) to gather the Strawe and Stubble, ouer all the Fields, to burn the Bricks withall. For he knoweth, that except hee doe it, nothing will be done: Men are so sett to despise the Meanes of their owne good. And as for the Basenes of many of the Experiments; As long as they be Gods VVorks, they are Honourable enough. And for the Vulgarnes of them; true Axiomes must be drawne from plaine Experience, and not from doubtfull; And his Lordships course is, to make VVonders Plaine, and not Plaine things VVonders; And that Experience likewise must be broken and grinded, and not whole, or as it groweth. And for Vse; his Lordship hath often in his Mouth, the two kindes of Experiments; Experimenta Fructifera, and Experimenta Lucifera: Experiments of Vse, and Experiments of Light; And he reporteth himself, whether he were not a strange Man, that should thinke that Light hath no Vse, because it hath no Matter. Further, his Lordship thought good also, to add vnto many of the Experiments themselues, some Glosse of the Causes; that in the succeeding work of Interpreting Nature, and Framing Axiomes, all things may be in more Readines. And for the Causes herein by Him assigned; his Lordship perswadeth Himselfe, they are farr more certaine, then those that are rendred by Others; Not for any Excellency of his owne Witt, (as his Lordship is wont to say) but in respect of his continuall Conuersation with Nature, and Experience. He did consider likewise, that by this Addition of Causes, Mens mindes (which make so much hast to find out the Causes of things;) would not think themselues vtterly lost, in a Vast VVood of Experience, but stay vpon these Causes, (such as they are) a little, till true

Axiomes may be more fully discouered. I haue heard his Lordship say also, that one great Reason, why he would not put these Particulars into any exact Method, (though he that looketh attentiuely into them, shall finde that they haue a secret Order) was, because hee conceiued that other men would now thinke, that they could doe the like; And so goe on with a further Collection: which if the Method had been Exact, many would haue despaired to attaine by Imitation. As for his Lordships loue of Order, I can referr any Man to his Lordships Latine Booke, De Augmentis Scientiarum; which (if my Iudgment be any thing) is written in the Exactest Order, that I know any Writing to bee. I will conclude with an vsuall Speech of his Lordships. That this Worke of his Naturall History, is the World, as GOD made it, and not as Men haue made it; For that it hath nothing of Imagination.

W: Rawley.

I. Century.

DIGG a Pitt vpon the Sea shore, somewhat aboue the High-water Marke, and sincke it as deepe as the Low-Water marke; And as the Tide commeth in, it will fill with Water, Fresh and Potable. This is commonly practized vpon the Coast of Barbary, where other fresh Water is wanting. And CAESAR knew this well, when he was besieged in Alexandria: For by Digging of Pitts in the Sea shoare, hee did frustrate the Laborious Workes of the Enemies, which had turned the Sea-Water vpon the Wells of Alexandria; And so saued his Army, being then in Desperation. But Caesar mistooke the Cause, For he thought that all Sea-Sandes had Naturall Springs of Fresh Water. But it is plaine, that it is the Sea-Water; because the Pitt filleth according to the Measure of the Tide: And the Sea-water passing or Strayning through the Sandes, leaueth the Saltnesse.

I remember to haue Read, that Triall hath beene made of Salt Water passed through Earth; through Tenn Vessells, one within an other, and yet it hath not lost his Saltnesse, as to become potable: But the same Man saith, that (by the Relation of Another,) Salt Water drained through twenty Vessells, hath become Fresh. This Experiment seemeth to crosse that other of Pitts, made by the Sea side; And yet but in part, if it be true, that twentie Repetitions doe the Effect. But it is worth the Note, how poore the Imitations of Nature are, in Common course of Experiments, except they be led by great Iudgement, and some good Light of Axiomes. For first, ther is no small difference betweene a Passage of Water through twenty small Vessells; And through such a distance, as betweene the Low water, and High water Marke. Secondly, there is a great difference betweene Earth and Sand. For all Earth hath in it a kinde of Nitrous Salt, from which Sand is more free: And besides Earth doth not straine the Water so finely, as Sand doth. But ther is a Third Point, that I suspect as much, or more, then the other Two: And that is, that in the Experiment of Transmission of the Sea-water into the Pitts, the Water riseth; But in the Experiment of Transmission of the Water through the Vessells, it falleth: Now certaine it is, that the Salter Part of

Water, (once Salted throughout) goeth to the Bottome. And therfore no meruaile, if the Draining of Water by descent, doth not make it fresh: Besides, I doe somewhat doubt, that the very Dashing of the Water, that commeth from the Sea, is more proper to strike of the Salt part, then wher the Water slideth of her owne Motion.

It seemeth Percolation or Transmission, (which is commonly called Straining,) is a good kinde of Separation; Not onely of Thicke from Thin, and Grosse from Fine,; But of more subtile Natures; And varieth according to the Bodie through which the Transmission is made. As if through a wollen Bagg, the Liquour leaueth the Fatnesse; If through Sand, the Saltnesse; &c. They speake of Seuering Wine from Water, passing it through Iuy wood, or through other the like porous Body; But Non Constat.

The Gumm of Trees (which wee see to be commonly shining and cleare) is but a fine Passage or Straining of the Iuice of the Tree, through the Wood and Bark. And in like manner, Cornish Diamonds, and Rock Rubies, (which are yet more resplendent then Gumms) are the fine Exudations of Stone.

Aristotle giueth the Cause, vainely, why the Feathers of Birdes are of more liuely Colours, then the Haires of Beastes; for no Beast hath any fine Azure, or Carnation, or Greene Haire. He saith, It is, because Birds are more in the Beames of the Sunn, then Beasts; But that is manifestly vntrue; For Cattle are more in the Sun then Birds, that liue commonly in the Woods, or in some Couert. The true Cause is, that the Excrementious Moisture of liuing Creatures, which maketh as well the Feathers in Birds, as the Haire in Beasts, passeth in Birds through a finer and more delicate Strainer, then it doth in Beastes: For Feathers passe through Quills; And Haire through Skin.

The Clarifying of Liquors by Adhesion is an Inward Percolation; And is effected, when some Cleauing Body is Mixed and Agitated with the Liquours; wherby the grosser Part of the Liquor sticks to that Cleauing Body; And so the finer Parts are freed from the Grosser. So the Apothecaries clarify their Sirrupes by whites of Eggs, beaten with the Iuices which they would clarify; which Whites of Eggs, gather all the Dreggs and grosser Parts of the Iuyce to them;

And after the Sirrupe being sett on the Fire, the whites of Egges themselues harden, and are taken forth. So Ippocrasse is clarified by mixing with Milke; And stirring it about; And then passing it through a Wollen Bagge, which they call Hippocrates Sleeue: And the Cleauing Nature of the Milke draweth the Powder of the Spices, and Grosser parts of the Liquour to it; And in the passage they stick vpon the Woollen Bagge.

The Clarifying of Water, is an Experiment tending to Health; besides the pleasure of the Eye, when Water is Crystaline. It is effected by casting in and placing Pebbles, at the Head of a Current; that the Water may straine through them.

It may be, Percolation doth not onely cause Clearenesse and Splendour, but Sweetnes of Sauour; For that also followeth, as well as Clearenes, when the Finer Parts are seuered from the Grosser. So it is found, that the Sweates of Men that haue much Heat, and exercise much, and haue cleane Bodies, and fine Skins, doe smell sweet; As was said of Alexander; And we see, commonly, that Gumms haue sweet Odours.

TAke a Glasse, and put Water into it, and wett your Finger, and draw it round about the Lipp of the Glasse, pressing it somewhat hard; And after you haue drawne it some few times about; it will make the Water friske and sprinckle vp, in a fine Dew. This Instance doth excellently Demonstrate the Force of Compression in a Solid Body. For whensoeuer a Solid Body (as Wood, Stone, Mettall, &c.) is pressed, ther is an inward Tumult in the parts therof; seeking to deliuer themselues from the Compression: And this is the Cause of all Violent Motion. Wherin it is strange in the highest Degree, that this Motion hath neuer been obserued, nor inquired; It being of all Motions, the most Common, and the Chiefe Roote of all Mechanicall Operations. This Motion worketh in round at first, by way of Proofe, and Search, which way to deliuer it selfe; And then worketh in Progresse, wher it findeth the Deliuerance easiest. In Liquours this Motion is visible: For all Liquours strucken make round Circles, and withall Dash; but in Solids, (which breake not,) it is so subtile, as it is inuisible; But neuertheless bewrayeth it selfe by many Effects; As in this Instance wherof we

speake. For the Pressure of the Finger furthered by the wetting (because it sticketh so much the better vnto the Lipp of the Glasse,) after some continuance, putteth all the small Parts of the Glasse, into worke; that they strike the Water sharpely; from which Percussion that Sprinkling commeth.

If you strike or pierce a Solid Body, that is brittle, as Glasse, or Sugar, it breaketh not onely, wher the immediate force is; but breaketh all about into shiuers and fitters; The Motion, vpon the Pressure, searching all wayes; and breaking where it findeth the Body weakest.

The Powder in Shot, being Dilated into such a Flame, as endureth not Compression; Moueth likewise in round, (The Flame being in the Nature of a liquid Body:) Sometimes recoyling; Sometimes breaking the Piece; But generally discharging the Bullett, because ther it findeth easiest Deliuerance.

This Motion vpon Pressure, and the Reciprocall therof, which is Motion vpon Tensure; we vse to call (by one common Name) Motion of Libertie; which is, when any Body, being forced to a PreterNaturall Extent, or Dimension, deliuereth and restoreth it selfe to the Naturall: As when a Blowne Bladder (Pressed) riseth againe; or when Leather or Cloath tentured spring backe. These two Motions (of which ther be infinite Instances,) we shall handle in due place.

This Motion vpon Pressure is excellently also demonstrated in Sounds; As when one Chimeth vpon a Bell, it soundeth; But as soon as he layeth his hand vpon it, the Sound ceaseth: And so, the Sound of a Virginall String, as soone as the Quill of the Iack falleth vpon it, stoppeth. For these Sounds are produced, by the subtile Percussion of the Minute parts, of the Bell, or String, vpon the Aire; All one, as the Water is caused to leape by the subtile Percussion of the Minute parts of the Glasse, vpon the Water, wherof we spake a little before in the 9th. Experiment. For you must not take it to be, the locall Shaking of the Bell, or String, that doth it. As we shall fully declare, when we come hereafter to handle Sounds.

TAke a Glasse with a Belly and a long Nebb; fill the Belly (in part) with Water: Take also another Glasse, whereinto put Claret Wine and Water mingled; Reverse the first Glasse, with the Belly vpwards, Stopping the Nebb with your

fingar; Then dipp the Mouth of it within the Second Glasse, and remoue your Fingar: Continue it in that posture for a time; And it will vnmingle the VVine from the Water: The VVine ascending and setling in the topp of the vpper Glasse; And the VVater descending and setling in the bottome of the lower Glasse. The passage is apparent to the Eye; For you shall see the VVine, as it were, in a small veine, rising through the VVater. For handsomnesse sake (because the Working requireth some small time) it were good you hang the vpper Glasse vpon a Naile. But as soone as ther is gathered so much pure and vnmixed water in the Bottome of the Lower Glasse, as that the Mouth of the vpper Glasse dippeth into it, the Motion ceaseth

Let the Vpper Glasse be VVine, and the Lower VVater; ther followeth no Motion at all. Lett the Vpper Glasse be VVater pure, the Lowwer VVater coloured; or contrariwise; ther followeth no Motion at all. But it hath been tried, that though the Mixture of VVine and VVater, in the Lower Glasse, be three parts VVater, and but one VVine; yet it doth not dead the Motion. This Separation of VVater and VVine appeareth to be made by Weight; for it must be of Bodies of vnequall Weight, or ells it worketh not; And the Heauier Body must euer be in the vpper Glasse. But then note withall, that the VVater being made pensile, and ther being a great VVeight of VVater in the Belly of the Glasse, sustained by a small Pillar of VVater in the Neck of the Glasse; It is that, which sesteth the Motion on worke: For VVater and VVine in one Glasse, with long standing, will hardly seuer.

This Experiment would be Extended from Mixtures of seuerall Liquors, to Simple Bodies, which Consist of seuerall Similare Parts: Try it therfore with Broyne or Salt water, and Fresh water; Placing the Salt water (which is the heauier) in the vpper Glasse; And see whether the Fresh will come aboue. Try it also with VVater thick Sugred, and Pure water; and see whether the water which commeth aboue, will loose his Sweetnes: For which purpose it were good ther were a little Cock made in the Belly of the vpper Glasse.

IN Bodies containing Fine Spirits, which doe easely dissipate, when you make Infusions, the Rule is; A short Stay of the Body in the Liquour receyueth

the Spiritt; And a longer Stay confoundeth it; because it draweth forth the Earthy Part withall; which embaseth the finer. And therfore it is an Errour in Phisicians, to rest simply vpon the Length of stay, for encreasing the vertue. But if you will haue the Infusion strong, in those kinde of Bodies, which haue fine Spiritts, your way is, not to giue Longer time, but to repeat the Infusion of the Body oftner. Take Violetts, and infuse a good Pugill of them in a Quart of Vineger; Lett them stay three quarters of an houre, and take them forth; And refresh the Infusion with like quantity of new Violetts, seuen times; And it will make a Vineger so fresh of the Flower, as if a Twelue-moneth after, it be brought you in a Saucer, you shall smell it before it come at you. Note, that it smelleth more perfectly of the Flower, a good while after, then at first.

This Rule, which wee haue giuen, is of singular vse, for the Preparations of Medecines, and other Infusions. As for Example; the Leafe of Burrage hath an Excellent Spiritt, to represse the fuliginous Vapour of Dusky Melancholy, and so to cure Madnes: But neuerthelesse, if the Leafe be infused long, it yieldeth forth but a raw substance, of no Vertue; Therfore I suppose, that if in the Must of Wine, or Wort of Beere, while it worketh, before it be Tunned, the Burrage stay a small time, and be often changed with fresh; It will make a Soueraigne Drink for Melancholy Passions. And the like I conceyue of Orenge Flowers.

Rubarb hath manifestly in it Parts of contrary Operations: Parts that purge; And parts that binde the body: And the first lay looser, and the latter lay deeper: So that if you infuse Rubarb for an houre, and crush it well, it will purge better, and binde the Body lesse after the purging, then if it stood twenty foure houres; This is tried: But I conceiue likewise, that by Repeating the Infusion of Rubarb, seuerall times, (as was said of Violetts,) letting each stay in but a small time; you may make it as strong a Purging Medecine, as Scammony. And it is not a small thing wonn in Phisick, if you can make Rubarb, and other Medecines that are Benedict, as strong Purgers, as those that are not without some Malignity.

Purging Medecines, for the most part, haue their Purgatine Vertue, in a fine Spirit; As appeareth by that they indure not boiling, without much losse of vertue. And therfore it is of good vse in Phisick, if you can retaine the Purging

Vertue, and take away the Vnpleasant tast of the Purger; which it is like you may doe, by this Course of Infusing oft, with little stay. For it is probable, that the Horrible and Odious Tast, is in the Grosser part.

Generally, the working by Infusions, is grosse and blinde, except you first try the Issuing of the seuerall Parts of the Body, which of them Issue more speedily, and which more slowly; And so by apportioning the time, can take and leaue that Quality, which you desire. This to know, ther be two waies; The one to try what long stay, and what short stay worketh, as hath been said: The other to try in Order, the succeding Infusions, of one and the same Body, successiuely, in seuerall Liquors. As for example; Take Orenge-Pills, or Rose-Mary, or Cinnamon, or what you will; And let them Infuse halfe an houre in VVater: Then take them out, and Infuse them againe in other VVater; And so the third time: And then tast and consider the First water, the Second, and the Third: And you will find them differing, not only in Strength and Weaknes, but otherwise in Tast, or Odour; For it may bee the First water will haue more of the Sent, as more Fragrant; And the Second more of the Tast, as more bitter or Biting, &c.

Infusions in Aire, (for so we may well call Odours) haue the same diuersities with Infusions in VVater; In that the seuerall Odours (which are in one Flower, or other Body) issue at seuerall times; Some earlier, some later: So we finde that Violetts, Woodbines, Strawberries, yield a pleasing Sent, that commeth forth first; But soone after an ill Sent, quite differing from the Former; Which is caused, not so much by Mellowing, as by the late Issuing of the Grosser Spirit.

As we may desire to extract the finest Spirits in some Cases; So we may desire also to discharge them (as hurtfull) in some other. So VVine burnt, by reason of the Evaporating of the finer Spirit, enslameth lesse, and is best in Agues: Opium leeseth some of his poisonous Quallity, if it be vapoured out, mingled with Spirit of Wine, or the like: Sean leeseth somewhat of his windines by Decocting; And (generally) subtile or windy Spirits are taken off by Incension, or Evaporation. And euen in Infusions in things that are of too high a Spirit, you were better poure off the first Infusion, after a small time, and vse the latter.

BVbbles are in the forme of a Hemisphere; Aire within, and a little Skin of VVater without: And it seemeth somewhat strange, that the Aire should rise so swiftly, while it is in the VVater; And when it commeth to the topp, should be staid by so weake a Couer as that of the Bubble is. But as for the swift Ascent of the Aire, while is vnder the VVater, that is a Motion of Percussion from the VVater; which it selfe descending, driueth vpp the Aire; and no Motion of Leuity in the Aire. And this Democritus called Motus Plaga. In this Common Experiment, the Cause of the Enclosure of the Bubble is, for that the Appetite to resist Separation, or Discontinuance, (which in solide Bodies is strong) is also in Liquours, though fainter and weaker; As wee see in this of the Bubble: we see it also in little Glasses of Spittle that children make of Rushes; And in Castles of Bubbles, which they make by blowing into water, hauing obtained a little Degree of Tenacity by Mixture of Soape: Wee see it also in the Stillicides of water, which if ther be water enough to follow, will Drawe themselues into a small thredd, because they will not discontinue; But if ther be no Remedy, then they cast themselues into round Dropps; which is the Figure, that saueth the Body most from Discontinuance: The same Reason is of the Roundnes of the Bubble, as well for the Skin of water, as for the Aire within: For the Aire likewise auoideth Discontinuance; And therfore casteth it self into a Round Figure. And for the stopp and Arrest of the Aire a little while, it sheweth that the Aire of it selfe hath little, or no Appetite, of Ascending.

THE Reiection, which I continually vse, of Experiments, (though it appeareth not) is infinit; But yet if an Experiment be probable in the Worke, and of great Vse, I receyue it, but deliuer it as doubtfull. It was reported by a Sober Man, that an Artificiall Spring may be made thus: Finde out a hanging Ground, wher ther is a good quick Fall of Raine-water. Lay a Half-Trough of Stone, of a good length, 3. or 4. foote deep within the same Ground; with one end vpon the high Ground, the other vpon the lowe. Couer the Trough with Brakes a good thicknes, and cast Sand vpon the Topp of the Brakes: You shall see, (saith he) that after some showers are past, the lower End of the Trough will runn like a Spring of water: which is no maruaile, if it hold, while the Raine-water lasteth; But he said

it would continue long time after the Raine is past: As if the water did multiply it self vpon the Aire, by the helpe of the Coldnesse and Condensation of the Earth, and the Consort of the first Water.

THE French, (which put off the Name of the French Disease; vnto the Name of the Disease of Naples,) doe report, that at the Siege of Naples, ther were certaine wicked Merchants, that Barrelled vpp Mans flesh, (of some that had been, lately slaine in Barbary) and sold it for Tunny; And that vpon that foule and high Nourishment, was the Originall of that Disease. Which may well be; For that it is certaine, that the Caniballs in the West Indies, eate Mans flesh; And the West Indies were full of the Pockes when they were first discouered: And at this day the Mortallest poisons, practised by the West Indians, haue some Mixture of the Bloud, or Fatt, or Flesh of Man: And diuers Witches, and Sorceresles, aswell amongst the Heathen, as amongst the Christians, haue fedd vpon Mans flesh, to aid (as it seemeth) their Imagination, with High and foule Vapours.

IT seemeth that ther be these waies (in likelihood) of Version of Vapours, or Aire, into Water and Moisture. The first is Cold; which doth manifestly Condense; As wee see in the Contracting of the Aire in the Weather-Glasse; whereby it is a Degree nearer to water. Wee see it also in the Generation of Springs, which the Ancients thought (very probably) to be made by the Version of Aire into water, holpen by the Rest, which the Aire hath in those Parts; wherby it cannot dissipate. And by the Coldnes of Rockes; for ther Springs are chiefly generated. Wee see it also in the Effects of the Cold of the Middle Region (as they call it) of the Aire; which produceth Dews, and Raines. And the Experiment of Turning water into Ice, by Snow, Nitre, and Salt, (wherof wee shall speake hereafter,) would be transferred to the Turning of Aire into Water. The Second way is by Compression; As in Stillatories, wher the Vapour is turned back, vpon it self, by the Encounter of the Sides of the Stillatory; And in the Dew vpon the Couers of Boyling Potts; And in the Dew towards Raine, vpon Marble, and Wainscott. But this is like to doe no great effect; Except it be vpon Vapours, and grosse Aire, that are allready very neare in Degree to Water. The

Third is that, which may be searched into, but doth not yet appeare; which is, by Mingling of moist Vapours with Aire; And trying if they will not bring a Returne of more Water, then the water was at first: For if so; That Increase is a version of the Aire: Therfore putt water into the Bottome of a Stillatory, with the Nebb stopped; Weigh the Water first; Hang in the Middle of the Stillatory a large Spunge; And see what Quantitie of Water you can crush out of it; And what it is more, or lesse, compared with the water spent; For you must vnderstand, that if any Version can be wrought, it will be easeliest done in small Pores: And that is the Reason why wee prescribe a Spunge. The Fourth way is Probable also, though not Appearing; Which is, by Receiuing the Aire into the small Pores of Bodies; For (as hath been said) euery thing in small Quantity is more easy for version; And Tangible Bodies haue no pleasure in the Consort of Aire, but endeauour to subact it into a more Dense Body: But in Entire Bodies it is checked; because if the Aire should Condense, ther is nothing to succeed: Therfore it must be in loose Bodies, as Sand, and Powder; which wee see, if they lye close, of themselues gather Moisture.

IT is reported by some of the Ancients; That Whelps, or other Creatures, if they be put Young, into such a Cage, or Boxe, as they cannot rise to their Stature, but may encrease in Breadth, or length; will growe accordingly, as they can gett Roome: which if it be true, and faisible, and that the young Creature so pressed, and straightened, doth not therupon die; It is a Meanes to produce Dwarfe Creatures, and in a very Strange Figure. This is certaine, and noted long since; That the Pressure or Forming of Parts of Creatures, when they are very young, doth alter the Shape not a little; As the Stroaking of the Heads of Infants, between the Hands, was noted of Old, to make Macrocephali; which shape of the Head, at that time, was esteemed. And the Raising gently of the Bridge of the Nose, doth preuent the Deformity of a Saddle Nose. Which obseruation well weighed, may teach a Meanes, to make the Persons of Men, and Women, in many kindes, more comely, and better featured, then otherwise they would be; By the Forming and Shaping of them in their Infancy: As by Stroaking vp the Calues of the Leggs, to keepe them from falling downe too lowe; And by

Stroaking vp the Forehead to keepe them from being lowforeheaded. And it is a common Practise to swath Infants, that they may growe more straight, and better shaped: And wee see Young Women, by wearing straight Bodies, keepe themselues from being Grosse, and Corpulent.

ONions, as they hang, will many of them shoot forth; And so will Penniroiall; And so will an Herb called Orpin; with which they vse, in the Country, to trimme their Houses, binding it to a Lath, or Stick, and setting it against a wall. We see it like wise, more especially, in the greater Semper-vine, which will put out Branches, two or three yeares: But it is true, that commonly they wrapp the Root in a Cloth besmeared with Oyle, and renue it once in halfe a Yeare. The like is reported by some of the Ancients, of the Stalks of Lillies. The Cause is; For that these Plants haue a Strong, Dense, and Succulent Moisture, which is not apt to exhale; And so is able, from the old store, without drawing helpe from the Earth, to suffice the sprouting of the Plant: And this Sprouting is chiefly in the late Spring, or early Sommer; which are the Times of Putting forth. We see also, that Stumps of Trtes, lying out of the ground, will put forth Sprouts for a Time. But it is a Noble Triall, and of very great Consequence, to try whether these things, in the Sprouting, doe increase Weight; which must be tried, by weighing them before they be hangd vp; And afterwards againe, when they are sprouted. For if they encrease not in Weight; Then it is no more but this; That what they send forth in the Sprout, they leese in some other Part: But if they gather Weight, then it is Magnale Naturae; For it sheweth that Aire may be made so to be Condensed, as to be conuerted into a Dense Body; wheras the Race and Period of all things, here aboue the Earth, is to extenuate and turne things to be more Penumaticall, and Rare; And not to be Retrograde, from Pneumaticall to that which is Dense. It sheweth also, that Aire can Nourish; which is another great Matter of Consequence. Note, that to try this, the Experiment of the Semper-viue must be made without Oiling the Cloth; For els, it may be, the Plant receiueth Nourishment from the Oile.

FLame and Aire doe not Mingle, except it be in an Instant; Or in the vitall Spiritts of vegetables, and liuing Creatures. In Gunpowder, the Force of it hath

been ascribed, to Rarefaction of the Earthy Substance into Flame; And thus farr it is true: And then (forfooth) it is become another Element; the Forme wherof occupieth more place; And so, of Necessity, followeth a Dilatation: And therfore, lest two Bodies should be in one place, ther must needes also follow an Expulsion of the pellet; Or Blowing vp of the Mine. But these are Crude and Ignorant Speculations. For Flame, if ther were nothing els, except it were in very great quantity, will be suffocate with any hard Body, such as a Pellet is, Or the Barrell of a Gunn; So as the Flame would not expell the hard Body; But the hard Body would kill the Flame, and not suffer it to kindle, or spread. But the Cause of this so potent a Motion, is the Nitre, (which wee call otherwise Salt-Petre;) which hauing in it anotable Crude and windy Spirit, first by the Heate of the Fire suddainly dilateth it self; (And wee knowe that simple Aire, being preternaturally attenuated by Heate, will make it self Roome, and breake and blowe vp that which resisteth it;) And Secondly, when the Nitre hath Dilated it self, it bloweth abroad the Flame, as an Inward Bellowes. And therfore wee see that Brimstone, Pitch, Camphire, Wilde-Fire, and diuers other Inflammable Matters, though they burne cruelly, and are hard to quench; Yet they make no such fiery winde, as Gunpowder doth: And on the other side, wee see that Quick Siluer, (which is a most Crude and Watry Body) heated, and pent in, hath the like force with Gunpowder. As for liuing Creatures, it is certaine, their Vitall Spiritts are a Substance Compounded of an Airy and Flamy Matter; And though Aire and Flame being free, will not well mingle; yet bound in by a Body that hath some fixing, they will. For that you may best see in those two Bodies, (which are their Aliments,) water, and Oyle; For they likewise will not well mingle of themselues, but in the Bodies of Plants, and liuing Creatures, they will. It is no maruaile therfore, that a small Quantity of Spiritts, in the Cells of the Braine, and Canales of the Sinewes, are able to moue the whole Body, (which is of so great Masse,) both with so great Force, as in Wrestling, Leaping; And with so great Swiftnes, As in playing Diuision vpon the Lute. Such is the force of these two Natures, Aire and Flame, when they incorporate.

TAke a small waxe Candle, and putt it in a Socket, of Brasse, or Iron; Then sett it vpright in a Porringer full of Spirits of Wine, heated: Then sett both the Candle, and Spiritt of Wine, on fire, and you shall see the Flame of the Candle, open it self, and become 4. or 5. times bigger then otherwise it would haue been; and appeare in Figure Globular and not in Piramis. You shall see also, that the Inward Flame of the Candle keepeth Colour, and doth not waxe any whitt blewe towardes the Colour of the Outward flame of the Spiritt of Wine. This is a Noble Instance; where in two things are most remarkable; The one; that one Flame within another quencheth not; but is a fixed Body, and continueth as Aire, or Water doe. And therefore Flame would still ascend vpwards in one greatnesse, if it were not quenched on the Sides: And the greater the Flame is at the Bottome, the higher is the Rise. The other, that Flame doth not mingle with Flame, as Aire doth with Aire, or Water with Water, but only remaineth contiguous; As it commeth to passe betwixt Consisting Bodies. It appeareth also, that the forme of a Piramis in Flame, which we vsually see, is meerely by Accident, and that the Aire about, by quenching the Sides of the Flame, crusheth it, and extenuateth it into that Forme; For of it selfe it would be Round: And therefore Smoake is in the Figure of a Piramis Reuersed; For the Aire quencheth the Flame, and receiueth the Smoake. Note also, that the Flame of the Condle, within the Flame of the Spirit of Wine, is troubled; And doth not onely open and moue vpwards, but moueth wauing, and to and fro: As if Flame of his owne Nature (if it were not quenched,) would rowle and turne, as well as moue vpwards. By all which, it should seeme, that the Caelestiall Bodies, (most of them,) are true Fires or Flames, as the Stoicks held; More fine (perhaps) and Rarified, than our Flame is. For they are all Globular, and Determinate,; They haue Rotation; And they haue the Colour and Splendour of Flame: So that Flame aboue is Durable, and Consistent, and in his Naturall place; But with vs, it is a Stranger, and Momentany, and Impure; Like Vulcan that haked with his Fall.

Take an Arrow, and hold it in Flame, for the space of ten pulses; And when it commeth forth, you shall finde those Parts of the Arrow, which were on the Outsides of the Flame, more burned, blacked, and turned almost into a Coale;

whereas that in the Middest of the Flame, will be, as if the Fire had scarce touched it. This is an Instance of great consequence for the discouery of the Nature of Flame; And sheweth manifestly, that Flame burneth more violently towards the Sides, than in the Middest: And, which is more, that Heat or Fire is not violent or furious, but where it is checked, and pont. And therfore the Peripatetickes (howsoeuer their opinion of an Element of Fire aboue the Aire is iustly exploded;) in that Point they acquit themselues well: For being opposed, that if there were a Spbeare of Fire, that incompassed the Earth so neare hand, it were impossible but all things should be burnt vp; They answer, that the pure Elementall Fire, in his owne place, and not irritate, is but of a Moderate Heat.

It is affirmed constantly by many, as an vsuall Experiment; That a Lampe of Vre, in the Bottome of a Mine, will be tumbled, and stirred, by two Mens strength; which if you bring it to the Topp of the Earth, will aske Six Mens strength at the least to stirre it. It is a Noble Instance, and is fit to be tried to the full: For it is very probable, that the Motion of Grauitie worketh weakly, both farre from the Earth, and also within the Earth: The former, because the Appetite of Vnion of Dense Bodies with the Earth, in respect of the distance, is more dull; The latter, because the Body hath in part attained his Nature, when it is some Depth in the Earth. For as for the Mouing to a Point or Place (which was the Opinion of the Ancients) it is a meere Vanity.

It is strange, how the Ancients tooke vp Experiments vpon credit, and yet did build great Matters vpon them. The Obseruation of some of the best of them, deliuered confidently, is That a Vessell filled with Ashes, will receiue the like quantity of Water, that it would haue done, if it had been empty. But this is vtterly vntrue; for the Water will not goe in by a Fifth part. And I suppose, that that Fifth part is the difference of the lying close, or open, of the Ashes; As we see that Ashes alone, if they be hard pressed, will lye in lesse roome: And so the Ashes with Aire betweene, lye looser; and with Water, closer. For I haue not yet found certainly, that the Water, it selfe, by mixture of Ashes, or Dust, will shrinke or draw into lesse Roome.

It is reported of credit, that if you lay good store of Kernells of Grapes, about the Root of a Vine; it will make the Vine come earlier, and prosper better. It may be tried with other Kernells, laid about the Root of a Plant of the same kinde; As Figgs, Kernells of Apples, &c. The Cause may be, for that the Kernells draw out of the Earth Iuice fit to nourish the Tree, as those that would be Trees of themselues, though there were no Root; But the Root being of greater strength, robbeth and deuoureth the Nourishment, when they haue drawne it: As great Fishes deuoure little.

The Operation of Purging Medicines, and the Causes thereof, haue béene thought to be a great Secret; And so according to the slothfull manner of Men, it is referred to a Hidden Propriety, a Specificall vertue, and a Fourth Qualitie, and the like Shifts of Ignorance. The Causes of Purging are diuers; All plaine and perspicuous; And throughly maintained by Experience. The first is, That whatsoeuer cannot be ouercome and disgested by the Stomacke, is by the Stomacke, either put vp by Vomit, or put downe to the Guts; And by that Motion of Expulsion in the Stomacke, and Guts, other Parts of the Body, (as the Orifices of the Veines, and the like) are moued to expell by Consent. For nothing is more frequent than Motion of Consent in the Body of Man. This Surcharge of the Stomacke, is caused either by the Qualitie of the Medicine, or by the Quantitie. The Qualities are three: Extreme Bitter, as in Aloes, Coloquintida, &c. Loathsome and of horrible taste; As in Agarick, Black Hellebore, &c. And of secret Malignity, and disagreement towards Mans Bodie, many times not appearing much in the Taste; As in Scammony, Mechoacham, Antimony, &c. And note well, that if there be any Medicine, that Purgeth, and hath neither of the first two Manifest Qualities; it is to be held suspected, as a kinde of Poysons; For that it worketh either by Corrosion; or by a secret Malignitie and Enmitie to Nature: And therfore such Medicines are warily to be prepared, and vsed. The Quantitie of that which is taken, doth also cause Parging; As we see in a great Quantitie of New Milke from the Cow; yea and a great Quantitie of Meat; For Surfets many times turne to Purges, both vpwards, and downwards. Therefore we see generally, that the working of Purging Medicines, commeth two or three

houres after the Medicines taken; For that the Stomacke first maketh a proofe, whether it can concoct them. And the like happeneth after Surfets; or Milke in too great Quantitie.

A second Cause is Mordication of the Orifices of the Parts; Especially of the Mesentery veines; As it is seene, that Salt, or any such thing that is sharpe and biting, put into the Fundament, doth prouoke the Part to expell; And Mustard prouoketh Sneezing: And any Sharpe Thing to the Eyes, prouoketh Teares. And therfore we see that almost all Purgers haue a kinde of Twiching and vellication, besides the Griping which commeth of wind. And if this Mordication be in an ouer-high Degree, it is little better than the Corrosion of Poyson; And it commeth to passe sometimes in Antimony; Especially if it be giuen, to Bodies not repleat with Humors; For where Humors abound, the Humors saue the Parts.

The third Cause is Attraction: For I doe not deny, but that Purging Medicines haue in them a direct Force of Attraction; As Drawing Plasters haue in Surgery: And we see Sage, or Bettony brused, Sneezing-powder, and other Powders or Liquors (which the Physitians call Errhines,) put into the Nose, draw Flegme, and water from the Head; And so it is in Apophlegmatismes, and Gargarismes, that draw the Rheume downe by the Pallate. And by this Vertue, no doubt, some Purgers draw more one Humour, and some another, according to the Opinion receiued: As Rubarb draweth Choller; Sean Melancholy; Agarick Flegme; &c. But yet, (more or lesse) they draw promiscuously. And note also, that besides Sympathy, between the Purger and the Humour, there is also another Cause, why some Medicines draw some Humour more than another. And it is, for that some Medicines work quicker than others: And they that draw quick, draw only the Lighter, & more fluide Humours; they that draw flow, worke vpon the more Tough, and Viscous Humours. And therfore Men must beware, how they take Rubarb, and the like, alone, familiarly; For it taketh only the Lightest part of the Humour away, and leaueth the Masse of Humours more obstinate. And the like may be said of Wormewood, which is so much magnified.

The fourth Cause is Flatnosity; For Wind stirred moueth to expell: And we finde that (in effect) all Purgers haue in them a raw Spirit, or Wind; which is the

Principall Cause of Tortion in the Stomach, and Belly. And therfore Purgers leese (most of them) the vertue, by Decoction vpon the Fire; And for that Cause are gluen chiefly in Infusion, Iuyce, or Powder.

The fifth Cause is Compression, or Crushing: As when Water is Crushed out of a Spunge: So we see that Taking Cold moueth Loosenesse by Contraction of the Skinn, and outward Parts; And so doth Cold likewise cause Rheumes, and Defluxions from the Head; And some Astringent Plasters crush out purulent Matter. This kind of Operation is not found in many Medicines: Mirabalanes haue it; And it may be the Barkes of Peaches; For this Vertue requireth an Astriction; but such an Astriction, as is not gratefull to the Body; (For a pleasing Astriction doth rather Binde in the Humours, than Expell them:) And therfore such Astriction is found in Things of an Harrish Taste.

The Sixth Cause is Lubrefaction, and Relaxation. As we see in Medicines Emollient; Such as are Milke, Honey, Mallowes, Lettuce, Mercuriall, Pelletory of the Wall, and others. There is also a secret Vertue of Relaxation in Cold: For the Heat of the Body bindeth the Parts and Humours together, which Cold relaxeth: As it is seene in Vrine, Bloud, Pottage, or the like; which, if they be Cold, breake, and dissolue. And by this kinde of Relaxation, Feare looseneth the Belly; because the Heat retiring inwards towards the Heart, the Gutts and other Parts are relaxed; In the same manner, as Feare also causeth Trembling in the Sinewes. And of this Kinde of Purgers are some Medicines made of Mercury.

The Seuenth Cause is Abstersion; which is plainly a Scouring off, or Incision of the more viscous Humors, and making the Humors more fluide; And Cutting betweene them, and the Part. As is found in Nitrous Water, which scoureth Linnen Cloth (speedily) from the Foulenesse. But this Incision must be by a Sharpnesse, without Astriction: Which wee finde in Salt, Worm-wood, Oxymel, and the like.

There be Medicines, that moue Stooles, and not Vrine; Some other, Vrine, and not Stooles, Those that Purge by Stoole are such as enter not at all, or little into the Mesentery Veines; But either at the first are not digestible by the Stomach, and therefore moue immediatly downwards to the Gutts; Or else are

afterwards reiected by the Mesentery Veines, and so turne likewise downwards to the Gutts; and of these two kindes are most Purgers. But those that moue Vrine, are such, as are well digested of the Stomach, and well receiued also of the Mesenfery Veines; So they come as farre as the Liuer, which sendeth Vrine to the Bladder, as the Whey of Bloud: And those Medicines being Opening and Piercing, doe fortifie the Operation of the Liuer, in sending downe the wheyey Part of the Bloud to the Reines. For Medicines Vrinatiue doe not worke by Reiection, and Indigestion, as Solutiue doe.

There be diuers Medicines, which in greater Quantity, moue Stock, and in smaller, Vrine: And so contrariwise, some that in greater Quantity, moue Vrine, and in Smaller, Stoole. Of the former sort is Rubarb, and some others. The Cause is, for that Rubarb is a Medicine, which the Stomach in a small Quantity doth digest, and ouercome, (being not Flatuous, nor Loathsome;) and so sendeth it to the Mesentery Veines; And so being opening, it helpeth downe Vrine: But in a greater Quantitie, the Stomach cannot ouercome it, and so it goeth to the Gutts. Pepper by some of the Ancients is noted to be of the second sort; which being in small Quantity, moueth wind in the Stomach and Gutts, and so expelleth by Stoole; But being in greater Quantity, dissipateth the Wind; And it selfe gotteth to the Mesentery veines; And so to the Liuer, and Reines; where, by Heating and Opening, it sendeth downe Vrine more plentifully.

Wee haue spoken of Euacuating of the Body; wee will now speake something of the Filling of it by Restoratines in Consumptions, and Emaciating Diseases. In Vegetables, there is one Part that is more Nourishing than another; As Graines, and Roots nourish more, than the Leaues; In so much as the Order of the Foliatanes was put downe by the Pope, as finding Leaues vnable to Nourish Mans Body. Whether there be that difference in the Flesh of Liuing Creatures, is not well inquired: As whether Liuers, and other Entrails, be not more Nourishing, than the Outward Flesh. We find that amongst the Romans, a Gooses Liuer was a great Delicacy; In so much as they had Artificiall Meanes to make it faire, and great; But whether it were more Nourishing, appeareth not. It is certaine, that Marrow is more Nourishing than Fat. And I conceiue that some

Decoction of Bones, and Sinewes, stamped, and well strained, would bee a very Nourishing Broth: Wee finde also that Scotch Skinck, (which is a Pottage of strong Nourishment,) is made with the Knees, and Sinewes of B-est, but long boiled: letty also, which they vse for a Restoratiue, is chiefly made of K-uckles of Veale. The Pulp that is within the Crafish or Crabb, which they spice and butter, is more Nourishing than the Flesh of the Crabb or Crafish. The Yolkes of Egges are clearely more Nourishing than the Whites. So that it should seeme, that the Parts of Liuing Creatures, that lye more Inwards, nourish more than the Outward Flesh: Except it bee the Braine; which the Spirits prey too much vpon, to leaue it any great Vertue of Nourishing. It seemeth for the Nourishing of Aged Men, or Men in Consumptions, some such thing should be Deuised, as should be halfe Chylus, before it be put into the Stomach.

Take two large Capons; perboile them vpon a soft fire, by the space of an houre, or more, till in effect all the Bloud be gone. Adde in the Decoction the Pill of a Sweet Limon, or a good part of the Pill of a Citron, and a little Mace. Cut off the Shanckes, and throw them away. Then with a good strong Chopping-knife, mince the two Capons, bones and all, as small as ordinary Minced Meat; Put them into a large neat Boulter; Then take a Kilderkin, sweet, and well feasoned, of foure gallons of Beere, of 8.-. strength, new as it commeth from the Tunning; Make in the Kilderkin a great Bung-hole of purpose: Then thrust into it, the Boulter (in which the Capons are) drawne out in length; Let it steepe in it three Dayes, and three Nights, the Bung-hole open, to worke; Then close the Bung-hole, and so let it continue, a Day and a halfe; Then draw it into bottles, and you may drinke it well after three dayes Botteling; And it will last six weeks (approued.) It drinketh fresh, flowreth and mantleth exceedingly; It drinketh not newish at all; It is an excellent Drinke for a Consumption, to be drunke either alone, or Carded with some other Beere. It quencheth Thirst, and hath no whit of windinesse. Note, that it is not possible, that Meat and Bread, either in Broths, or taken with Drink, as is vsed, should get forth into the veines, and outward Parts, so finely, and easily, as when it is thus Incorporate, and made almost a Chylus aforehand.

Triall would bee made of the like Brew with Potado Roots, or Burr Roots, or the Pith of Artichoakes, which are nourishing Meats: It may be tried also, with other flesh; As Phesant, Partridge, Young Porke, Pigge, Venison, especially of young Deere, &c.

A Mortresse made with the Brawne of Capons, stamped, and strained, and mingled (after it is made) with like quantitie, (at the least,) of Almond Butter; is an excellent Meat to Nourish those that are weake; Better than Blanck-Manger, or Ielly: And so is the Cullice of Cocks, boyled thick with the like Mixture of Almond Butter: For the Mortresse, or Cullice, of it selfe, is more Sauoury and strong; And not so fit for Nourishing of weake Bodies; But the Almonds that are not of so high a taste as Flesh, doe excellently qualifie it.

Indian Maiz hath (of certaine) an excellent Spirit of Nourishment; But it must be throughly boyled, and made into a Maiz-Creame like a Barley Creame. I iudge the same of Rize, made into a Creame; For Rize is in Turky, and other Countries of the East, most fed vpon; But it must be throughly boyled in respect of the Hardnesse of it: And also because otherwise it bindeth the Body too much.

Pistachoes, so they be good, and not musty, ioyned with Almonds in Almond Milke; Or made into a Milke of themselues, like vnto Almond Milke, but more greene, are an excellent Nourisher. But you shall doe well, to adde a little Ginger, scraped, because they are not without some subtill windinesse

Milke warme from the Cow, is found to be a great Nourisher, and a good Remedy in Consumptions: But then you must put into it, when you milke the Cow, two little bagges; the one of Powder of Mint, the other of Powder of Red Roses; For they keepe the Milke somewhat from Turning, or Crudling in the stomach; And put in Sugar also, for the same cause, and partly for the Tasts sake; But you must drinke a good draught that it may stay lesse time in the stomach, left it Cruddle: And let the Cup into which you milke the Cow, bee set in a greater Cup of hot water, that you may take it warme. And Cow-milke thus prepared, I iudge to be better for a Consumption, than Asse-milke, which (it is true) turneth not so easily, but it is a little harrish; Marry it is more proper for Sharpnesse of Vrine, and Exulceration of the Bladder, and all manner of

Lenifyings. Womans milke likewise is prescribed, when all faile; but I commend it not; as being a little too neere the Iuyce of Mans Body, to be a good Nourisher; Except it be in Infants, to whom it is Naturall.

Oyle of Sweet Almonds, newly drawen, with Sugar, and a little Spice, spread vpon Bread tosted, is an Excellent Nourisher; But then to keepe the Oyle from frying in the Stomach, you must drinke a good draught of Milde Beere after it; And to keepe it from relaxing the Stomach too much, you must put in a little Powder of Cinnamon.

The Yolkes of Eggs are of themselues so well prepared by Nature for Nourishment; As (so they be Potched, or Reare boiled) they need no other Preparation, or Mixture; yet they may be taken also rawe, when they are new laid, with Malmesey, or Sweet wine; You shall doe well to put in some few Slices of Eryngium Roots, and a little Amber-grice; For by this meanes, besides the immediate Facultie of Nourishment, such Drinke will strengthen the Backe; So that it will not draw downe the Vrine too fast; For too much Vrine doth alwaies hinder Nourishment.

Mincing of meat, as in Pies, and buttered Minced Meat, saueth the Grinding of the Teeth; And therefore, (no doubt) it is more Nourishing; Especially in Age; Or to them that haue weake Toeth; But the Butter is not so proper for weake Bodies; And therfore it were good to moisten it with a little Claret wine, Pill of Limon, or Orenge, cut small, Sugar, and a very little Cinnamon, or Nutmegg. As for Chaetts, which are likewise minced Meat, in stead of Butter, and Fat, it were good to moisten them, partly with Creame, or Almond, or Pistachomilke, or Barly, or Maiz Creame; Adding a little Coriander Seed, and Carraway Seed, and a very little Saffron. The more full Handling of Alimentation we reserue to the due place.

Wee haue hitherto handled the Particulars which yeeld best, and easiest, and plentifullest Nourishment; And now we will speake of the best Meanes of Conueying, and Conuerting the Nourishment.

The First Meanes is, to procure that the Nourishment may not be robbed, and drawen away; wherin that, which we haue already said, is very Materiall; To

prouide, that the Reines draw not too strongly an ouer-great Part of the Bloud into Vrine. To this adde that Precept of Aristotle, that Wine be forborne in all Consumptions; For that the Spirits of the Wine, doe prey vpon the Roseide Iuyce of the Body, and inter-common with the Spirits of the Body, and so deceiue and robbe them of their Nourishment. And therefore if the Consumption growing from the weaknes of the Stomach, doe force you to vse Wine; let it alwaies be burnt, that the Quicker Spirits may euaporate; or at the least quenched with two little wedges of Gold, six or seuen times repeated. Adde also this Prouision, That there be not too much Expence of the Nourishment, by Exhaling, and Sweating: And therfore if the Patient be apt to sweat, it must be gently restrained. But chiefly Hippocrates Rule is to bee followed; who aduiseth quite contrary to that which is in vse: Namely, that the Linnen, or Garment next the Flesh, be in Winter drie, and oft changed; And in Sommer seldome changed, and smeared ouer with Oyle; For certaine it is, that any Substance that is fat, doth a little fill the Pores of the Body, and stay Sweat, in some Degree. But the more cleanly way is, to haue the Linnen smeared lightly ouer, with Oyle of Sweet Almonds; And not to forbeare shifting as oft as is fit.

The Second Meanes is, to send forth the Nourishment into the Parts, more strongly; For which, the working must be by Strengthening of the Stomach; And in this, because the Stomach is chiefly comforted by Wine, and Hot things, which otherwise hurt; it is good to resort to Outward Applications to the Stomach: Wherin it hath beene tried, that the Quilts of Roses, Spices, Mastick, Wormewood, Mint, &c. are nothing so helpfull, as to take a Cake of New bread, and to bedew it with a little Sack, or Alegant; And to drie it; And after it be dried a little before the Fire, to put it within a cleane Napkin, and to lay it to the Stomach: For it is certaine, that all Flower hath a potent Vertue of Astriction; In so much as it hardeneth a peece of flesh, or a Flower, that is laid in it: And therefore a Bagge quilted with Bran, is likewise very good; but it drieth somewhat too much; and therefore it must not lye long.

The Third Meanes (which may be a Branch of the former) is to send forth the Nourishment the better by Sleepe. For we see, that Beares, and other Creatures

that sleepe in the Winter, wax exceeding fat: And certaine it is, (as it is commonly beleeued) that Sleepe doth Nourish much; Both for that the Spirits do lesse spend the Nourishment in Sleepe, then when liuing Creatures are awake: And because (that which is to the present purpose) it helpeth to thrust out the Nourishment into the Parts. Therefore in Aged men, and weake Bodies, and such as abound not with Choller, a short Sleepe after dinner doth helpe to Nourish; For in such Bodies there is no feare of an ouer-hastie Disgestion, which is the Inconuenience of Postmeridian Sleepes. Sleepe also in the Morning, after the taking of somewhat of easie Digestion; As Milke from the Cow, Nourishing Breth, or the like; doth further Nourishment: But this would bee done, sitting vpright, that the Milke or Broth may passe the more speedily to the bottome of the Stomach.

The Fourth Meanes is to prouide that the Parts themselues may draw to them the Nourishment strongly. There is an Excellent Obseruation of Aristotle; That a great Reason, why Plants (some of them) are of greater Age, than Liuing Creatures, is, for that they yearely put forth new Leaues, and Boughes; whereas Liuing Creatures put forth (after their Period of Growth,) nothing that is young, but Haire and Nailes; which are Excrements, and no Parts. And it is most certaine, that whatsoeuer is young, doth draw Nourishment better, than that which is Old; And then (that which is the Mystery of that Obseruation) young Boughes, and Leaues, calling the Sap vp to them; the same Nourisheth the Body, in the Passage. And this we see notably proued also, in that the oft Cutting, or Polling of Hedges, Trees, and Herbs, doth conduce much to their Lasting. Transferre therefore this Obseruation to the Helping of Nourishment in Liuing Creatures: The Noblest and Principall Vse whereof is, for the Prolongation of Life; Restauration of some Degree of Youth; and Inteneration of the Parts: For certaine it is, that there are in Liuing Creatures Parts that Nourish, and Repaire easily; And Parts that Nourish and repaire hardly, And you must refresh, and renew those that are easie to Nourish, that the other may be refreshed, and (as it were) Drinke in Nourishment, in the Passage. Now wee see that Draught Oxen, put into good Pasture, recouer the Flesh of young Beese; And Men after long

Emaciating Diets, wax plumpe, and fat, and almost New: So that you may surely conclude, that the frequent and wise Vse of those Emaciating Diets, and of Purgings; And perhaps of some kinde of Bleeding; is a principall Meanes of Prolongation of Life; and Restoring some Degree of Youth: For as we haue often said, Death commeth vpon Liuing Creatures like the Torment of McZentius;

Mortua quinetiam iungebat Corporavinis,

Componens Manibus{que} Manus, at{que} Oribus Ora.

For the Parts in Mans Body easily reparable, (as Spirits, Bloud, and Flesh,) die in the Embracement of the Parts hardly reparable, (as Bones, Nerues, and Membranes;) And likewise some Entrails (which they reckon amongst the Spermaticall Parts) are hard to repaire: Though that Diuision of Spermaticall, and Menstrnall Parts, be but a Conceit. And this same Obseruation also may be drawne to the present purpose of Nourishing Emaciated Bodies: And therefore Gentle Frication draweth forth the Nourishment, by making the Parts a little hungry, and heating them; whereby they call forth Nourishment the better. This Frication I wish to be done in the Morning. It is also best done by the Hand, or a peece of Scarlet wooll, wet a little with Oile of Almonds, mingled with a small Quantity of Bay-sals, or Saffron. We see that the very Currying of Horses doth make them fat, and in good liking.

The Fifth Meanes is, to further the very Act of Assimilation of Nourishment; which is done by some outward Emollients, that make the Parts more apt to Assimilate. For which I haue compounded an Ointment of Excellent Odour, which I call Roman Ointment, vide the Receit. The vse of it would be betweene Sleepes; For in the latter Sleepe the Parts Assimilate chiefly.

There be many Medicines, which by themselues would doe no Cure, but perhaps Hurt; but being applyed in a certaine Order, one after another, doe great Cures. I haue tried (my selfe) a Remedy for the Gout, which hath seldome failed, but driuen it away in 24. Houres space: It is first to apply a Pultasse; Of which vide the Receit; And then a Bath or Fomentation, of which vide the Receit; And then a Plaister, vide the Receit. The Pultasse relaxeth the Pores, and maketh the Humour apt to Exhale. The Fomentation calleth forth the Humour by Vapours;

But yet in regard of the way made by the Pultasse. Draweth gently; And therfore draweth the Humour out; and doth not draw more to it; For it is a Gentle Fomentation, and hath withall a Mixture, (though very little) of some Stupefactine. The Plaister is a Moderate Astringent Plaister, which repelleth New Humour from falling. The Pultasse alone would make the Part more soft, and weake; And apter to take the Defluxion and Impression of the Humour. The Fomentation alone, if it were too weake, without way made by the Pultasse, would draw forth little; If too strong, it would draw to the Part, as well as draw from it. The Plaister alone, would pen the Humour already contained in the Part, and so exasperate it, as well as forbid new Humour. Therefore they must be all taken in Order, as is said. The Pultasse is to be laid to for two or three Houres: The Fomentation for a Quarter of an Houre, or somewhat better, being vsed hot, and seuen or eight times repeated: The Plaister to continue on still, till the Part be well confirmed.

There is a secret Way of Cure, (vnpractized;) By Assuetude of that which in it selfe hurteth.Poysons haue beene made, by some, Familiar, as hath beene said. Ordinary keepers of the Sicke of the Plague, are seldome infected. Enduring of Torture, by Custome, hath been made more casie: The Brooking of Enormous Quantity of Meats, and so of Wine or Strong Drinke, hath beene, by Custome, made to be without Surfet, or Drunkennesse. And generally Diseases that are Chronicall, as Coughes., Phthisickes, some kindes of Palseyes, Lunacies, &c. are most dangerous at the first: Therefore a wise Physitian will consider whether a Disease be Incurable; Or whether the Iust Cure of it be not full of perill; And if he finde it to bee such, let him resort to Palliation; And alleuiate the Symptome, without busying himselfe too much with the perfect Cure: And many times, (if the Patient be indeed patient,) that Course will exceed all Expectation. Likewise the Patient himselfe may striue, by little and little, to Ouercome the Symptome, in the Exacerbation, and so, by time, turne Suffering into Nature.

Diuers Diseases, especially Chronicall, (such as Quartan Agues;) are somtimes cured by Surset, and Excesses; As Excesse of Meat, Excesse of Drinke, Extraordinary Fasting, Extraordinary Stirring, or Lassitude, & the like.

The Cause is, for that Diseases of Cotinuance get an Adue¯titious Strength fro¯ Custome, besides their Materiall Cause from the Humours: So that the Breaking of the Custome doth leaue them only to their first Cause; which if it be any thing weake will fall off. Besides, such Excesses doe Excite and Spur Nature, which thereupon riseth more forcibly against the Disease.

There is in the Body of Man a great Consent in the Motion of the seuerall Parts. We see, it is Childrens sport, to proue whether they can rub vpon their Brest with one hand, and pat vpon their Forehead with another; And straight-waies, they shall sometimes rubbe with both Hands, or pat with both hands. We see, that when the Spirits, that come to the Nosthrills, expell a bad Sent, the Stomach is ready to Expell by Vomit. We finde that in Consumptions of the Lungs, when Nature cannot expell by Cough, Men fall into Fluxes of the Belly, and then they dye. So in Pestilent Diseases, if they cannot be expelled by Sweat, they fall likewise into Loosenesse, and that is commonly Mortall. Therfore Physitians should ingeniously contriue, how by Motions that are in their Power, they may excite Inward Motions that are not in their Power, by Consent: As by the Stench of Feathers, or the like, they cure the Rising of the Mother.

Hippocrates Aphorisme, In Morbis minus, is a good profound Aphorisme. It importeth, that Diseases, contrary to the Complexion, Age, Sexe, Season of the yeare, Diet, &c. are more dangerous, than those that are Concurrent. A Man would thinke it should be otherwise; For that, when the Accident of Sicknesse, and the Naturall Disposition, doe second the one the other, the Disease should be more forcible: And so (no doubt) it is; if you suppose like Quantity of Matter. But that, which maketh good the Aphorisine, is; Because such Diseases doe shew a greater Collection of Matter, by that they are able to ouercome those Naturall Inclinations to the Contrary. And therefore in Diseases of that kinde, let the Physitian apply himselfe more to Purgation, than to Alteration; Because the Offence is in the Quantity; and the Qualities are rectified of themselues.

Physitians do wisely prescribe, that there be Preparatiues vsed before Iust Purgations; For certaine it is, that Purgers doe many times great Hurt, if the Body be not accommodated, both before, and after the Purging. The Hurt that

they doe, for want of Preparation before Purging, is by the Sticking of the Humours, and their not comming faire away; Which causeth in the Body great Perturbations, and ill Accidents, during the Purging; And also, the diminishing, and dulling of the Working of the Medicine it selfe, that it purgeth not sufficiently. Therefore the worke of Preparation is double; To make the Humours fluide, and mature; And to make the Passages more open: For both those helpe to make the Humours passe readily. And for the former of these, Sirrups are most profitable; And for the Latter, Apozumes, or Preparing Broaths; Clisters also helpe, lest the Medicine stop in the Guts, and worke gripingly. But it is true, that Bodies abounding with Humours; And fat Bodies; And Open weather; are Preparatines in themselues; because they make the Humours more fluide. But let a Physitian beware, how he purge after hard Frostie Weather, and in a Leane Body, without Preparation. For the Hurt, that they may doe after Purging; It is caused by the Lodging of some Humours in ill Places: For it is certaine, that there be Humours, which somewhere placed in the Body, are quiet, and doe little hurt; In other Places, (especially Passages,) doe much mischiefe. Therefore it is good, after Purging, to vse Apozumes, and Broths, not so much Opening as those vsed before Purging, but Absterfine and Mundifying Clisters also are good to conclude with, to draw away the Reliques of the Humours, that may haue descended to the Lower Region of the Body.

Bloud is stanched diuers waies. First by Astringents, and Repercussiue Medicines. Secondly by Drawing of the Spirits and Bloud inwards; which is done by Cold; As Iron, or a Stone laid to the neck doth stanch the Bleeding at the Nose; Also it hath beene tryed, that the Testicles, being put into sharp Vineger, hath made a suddaine Recesse of the Spirits, and stanched Bloud. Thirdly by the Recesse of the Bloud by Sympathy. So it hath beene tried, that the part that bleedeth, being thrust into the Body of a Capon, or Sheepe, new ript and bleeding, hath stanched Bloud; The Bloud, as it seemeth, sucking and drawing vp, by similitude of substance, the Bloud it meeteth with, and so it selfe going backe. Fourthly by Custome and Time; So the Prince of Aurange, in his first hurt, by the Spanish Boy, could finde no meanes to stanch the Bloud, either by

Medicine or Ligament; but was faine to haue the Orifice of the Wound stopped by Mens Thumbes, succeeding one another, for the space at least of two Dayes; And at the last the bloud by Custome onely retired. There is a fifth Way also in vse, to let Bloud in an Aduerse Part, for a Revulsion.

It helpeth, both in Medicine, and Aliment, to Change and not to continue the same Medicine & Aliment still. The Cause is, for that Nature by continuall Vso of any Thing, groweth to a Sacietie, and Dulnesse, either of Appetite, or Working. And we see that Assuetude of Things Hurtfull doth make them leese their force to Hurt; As Poyson, which with vse some haue brought themselues to brooke. And therefore it is no maruaile, though Things helpfull, by Custome, leese their force to Helpe. I count Intermission almost the same thing with Change; For that, that hath beene intermitted, is after a fort new.

It is found by Experience, that in Diets of Guaiacum, Sarza, and the like (especially if they be strict,) the Patient is more troubled in the beginning, then after continuance; Which hath made some of the more delicate Sort of patients, giue them ouer in the middest; Supposing that if those Diets trouble them so much at first, they shall not be able to endure them to the End. But the Cause is, for that all those Diets, doe drie vp Humours, Rheumes, and the like; And they cannot Drie vp vntil they haue first attenuated; And while the Humour is attenuated, it is more Fluid, then it was before, and troubleth the Body a great deale more vntill it be dried vp, and consumed. And therefore Patients must expect a due time, and not checke at them at the first.

The Producing of Cold is a thing very worthy the Inquisition; both for Vse, and Disclosure of Causes. For Heat and Cold are Natures two Hands, whereby she chiefly worketh: And Heat we haue in readinesse, in respect of the Fire; But for Cold we must staie till it commeth; or seecke it in deepe Caues, or high Mountaines: And when all is done, we cannot obtaine it in any great degree: For Furnaces of Fire are farre hotter, then a Sommers Sunne; But Vaults, or Hills are not much Colder then a Winters Frost.

The first Meanes of Producing Cold, is that which Nature presenteth vs withall; Namely the Expiring of Cold out of the Inward Parts of the Earth in

Winter, when the Sun hath no power to ouercome it; the Earth being (as hath beene noted by some) Primum Frigidum. This hath beene asserted, as well by Auncient as by Moderne Philosophers: It was the Tenet of Parmenides. It was the opinion of the Authour of the discourse in Plutarch (for I take it that booke was not Plutarches owne) De prime Frigide. It was the opinion of Telesius, who hath renewed the Philosophy of Parmenides, and is the best of the Nouellists.

The Second Cause of Cold is the Contact of Cold Bodies; For Cold is Actiue and Transitiue into Bodies Adiacent, as well as Heat: which is seene in those things that are touched with Snow or Cold water. And therefore, whosoeuer will be an Inquirer into Nature, let him resort to a Conseruatory of Snow and Ice; Such as they vse for delicacy, to coole Wine in Summer: Which is a Poore and Contemptible vse, in respect of other vses, that may bee made of such Conseruatories.

The Third Cause is the Primary Nature of all Tangible bodies: For it is well to be noted, that all Things whatsoeuer (Tangible) are of themselues Cold; Except they haue an Accessory Heat by fire; Life; or Motion: For euen the Spirit of Wine, or Chy-icall Oyles, which are so hot in Operation, are to the first Touch Cold; And Aire it selfe compressed, and Condensed a little by blowing, is Cold.

The Fourth Cause is the Density of the Body; For all Dense Bodies are Colder then most other Bodies; As Mettalls, Stone, Glasse; And they are longer in Heating than Softer Bodies. And it is certaine, that Earth, Dense, Tangible, hold all of the Nature of Cold. The Cause is, for that all Matters Tangible being Cold, it must needs follow, that where the Matter is moist Congregate, the Cold is the greater.

The Fifth Cause of Cold, or rather of increase and vehemence of Cold, is a Quicke Spirit inclosed in a Cold Body: As will appeare to any that shall attentiuely consider of Nature in many Instances. Wee see Nitre (which hath a Quicke Spirit) is Cold; more Cold to the Tongue, then a Stone; So Water is Colder then Oile, because it hath a Quicker Spirit; For all Oile, though it hath the Tangible Parts better digested then Water, yet hath it a duller Spirit: So Snow is Colder then Water, because it hath more Spirit within it: So we see that Salt put

to Ice (as in the producing of the Artificiall Ice) increaseth the Actiuity of Cold: So some In — cta which haue Spirit of Life, as Snakes, and Silkwormes, are, to the touch, Cold. So Quick-filuer is the Coldest of Mettals, because it is Fullest of Spirit.

The Sixth Cause of Cold is the Chasing and Driuing away of Spirits, such as haue some Degree of Heat: For the Banishing of the Heat must needs leaue any Body Cold. This we see in the Operation of Opium, and Stupefactiues, vpon the Spirits of liuing Creatures: And it were not amisse to trie Opium, by laying it vpon the Top of a Weather-glasse, to see whether it will contract the Aire: But I doubt it will not succeed: For besides that the vertue of Opium will hardly penetrate thorow such a Body as Glasse, I conceiue that Opium, and the like, make the Spirits fly rather by Malignity, then by Cold.

Seuenthly, the same Effect must follow vpon the Exhaling or Drawing out of the warme Spirits, that doth vpon the Flight of the Spirits. There is an Opinion, that the Moone is Magneticall of Heat, as the Sun is of Cold, and Moisture: It were not amisse therefore to trie it, with Warme waters; The one exposed to the Beames of the Moone; the other with some Skreene betwixt the Beames of the Moone and the water; As we vse to the Sunne for Shade; And to see whether the former will coole sooner. And it were also good to inquire, what other Meanes there may be, to draw forth the Exile heat, which is in the Aire; for that may be a Secret of great Power to Produce Cold weather.

We haue formerly set downe the Meanes of turning Aire into water, in the Experiment 27. But because it is Magnale Nature; And tendeth to the subduing of a very great effect; And is also of Manifold vse; we will adde some Instances in Consort that giue light thereunto.

It is reported by some of the Ancients, that Sailers haue vsed, euery Night, to hang Fleeces of wooll on the sides of their Ships, the Wooll towards the water; And that they haue crushed fresh Water out of them, in the Morning, for their vse. And thus much we haue tried, that a Quantitie of Wooll tied loose together, being let downe into a deepe Well; And hanging in the Middle, some three

Fathome from the water, for a night, in the Winter time; increased in weight, (as I now remember) to a fifth Part.

It is reported by one of the Ancients, that in Lydia, neare Pergamus, there were certaine Worke-men, in time of Warres, fled into Caues; And the Mouth of the Caues being stopped by the Enemies, they were famished. But long time after the dead Bones were found; And some Vessels which they had carried with them; And the vessels full of Water; And that Water, thicker, and more towards Ice, than Common Water: which is a Notable Instance of Condensation, and Induration, by Buriall under Earth, (in Caues,) for long time; And of version also (as it should seeme,) of Aire into Water; if any of those vessels were Emptie. Trie therefore a small Bladder hung in Snow; And the like in Nitre; And the like in Quick-filuer: And if you finde the Bladders fallen, or shrunke; you may be sure the Aire is condensed by the Cold of those Bodies; As it would be in a Caue vnder Earth.

It is reported of very good credit, that in the East Indies, if you set a Tub of Water open, in a Roome where Cloues are kept, it will be drawne dry in 24 houres; Though it stand at some distance from the Cloues. In the Countrey, they vse many times, in deceit, when their wooll is new shorne, to set some Pailes of water by, in the same Roome; to increase the weight of the wooll: But it may be, that the Heat of the Wooll, remaining from the body of the Sheepe; or the Heat gathered by the lying close of the wooll, helpeth to draw the watry Vapour; But that is nothing to the Version.

It is Reported also credibly, that Wooll new shorne, being laid casually vpon a Vessell of Verinyce, after some time, had drunke vp a great part of the Veriuyce, though the Vessell were whole without any Flaw and had not the Bung-hole open. In this Instance, there is (vpon the by) to be noted, the Percolation, or Suing of the Veriuyce through the wood; For Veriuyce of it selfe would neuer haue passed thorow the wood: So as, it seemeth, it must be first in a kinde of Vapour, before it passe.

It is especially to be noted, that the Cause, that doth facilitate the Version of Aire into water, when the Aire is not in grosse, but subtilly mingled with

Tangible Bodies, is, (as hath beene partly touched before,) for that Tangible Bodies haue an Antipathy with Aire; And if they finde and Liquid Body, that is more dense, neare them, they will draw it: And after they haue drawne it, they will condense it more, and in effect incorporate it; For wee see that a Spunge, or Wooll, or Sugar, or a Woollen cloth, being put but in part, in Water, or Wine, will draw the Liquour higher, and beyond the place, where the Water or wine commeth. We see also, that Wood, Lute-strings, and the like, doe swell in moist Seasons: As appeareth by the Breaking of the Strings, the Hard Turning of the Pegs, and the Hard drawing forth of Boxes, and Opening of Wainseet deeres; which is a kinde of Infusion: And is much like to an Infusion in water, which will make wood to swell: As we see in the Filling of the Chops of Boules, by laying them in water. But for that part of these Experiments, which concerneth Attraction; we will reserue it to the proper Title of Attraction.

There is also a Version of Aire into water, seene in the Sweating of Marbles, and other Stones. And of Wainsces before and in moist weather: This must be, either by some Moisture the Body yeeldeth; Or else by the Moist Aire thickned against the hard body. But it is plaine, that it is the latter; For that we see Wood painted with Oyle Colour, will sooner gather drops in a moist Night, than Wood alone: which is caused by the Smoothnesse and Closenesse; which letteth in no part of the Vapour, and so turneth it backe, and thickeneth it into Dew. We see also, that Breathing vpon a Glasse, or Smooth body, giueth a Dew; And in Frosty Mornings (such as we call Rime frosts) you shall finde drops of Dew vpon the Inside of Glasse-windowes; And the Frost it selfe vpon the ground is but a Version or Condensation, of the Moist vapours of the Night, into a watry substance: Dewes likewise, and Raine, are but the Returnes of Moist vapours Condensed; The Dew, by the Cold onely of the Sunnes departure, which is the gentler Cold; Raines, by the Cold of that, which they call the Middle Region of the Aire; which is the more violent Cold.

It is very probable (as hath beene touched) that that, which will turne Water into Ice, will likewise turne Aire Some Degree nearer vnto water. Therefore trie the Experiment of the Artificiall Turning water into Ice (whereof we shall speake

in another place) with Aire in place of water, and the Ice about it. And although it be a greater Alteration to turne Aire into water, than water into Ice: yet there is this Hope, that by Continuing the Aire longer time, the effect will follow; For that Artificiall Conuersion of water into Ice, is the worke of a few Houres; And this of Aire may be tried by a Moneths space, or the like.

Induration, or Lapidification, of Substances more Soft, is likewise another degree of Condensation; And is a great Alteration in Nature. The Effecting and Accelerating thereof is very worthy to be inquired. It is effected by three Meanes. The first is by Cold; vvhose Property is to Condense, and constipate, as hath beene said. The Second is by Heat; which is not proper, but by consequence; For the Heat doth attenuate; And by Attenuation doth send forth the Spirit and moister Part of a Body; And vpon that, the more grosse of the Tangible Parts doe contract and serre themselues together; Both to Auoid Vacuums (as they call it;) And also to Munite themselues against the Force of the Fire, which they haue suffered. And the Third is by Assimilation; when a Hard Body Assimilateth a Soft, being contiguous to it.

The Examples of Induration, taking them promiscuously, are many: As the Generation of Stones within the Earth, which at the first are but Rude Earth, or Clay: And so of Mineralls, which come (no doubt) at first, of luyces Concrete, which afterward indurate: And so of Porcellane, which is an Artificiall Cement, buried in the Earth a long time: And so the Making of Bricke, and Tile: Also the Making of Glasse, of a certaine Sand, and Brake-Roots, and some other Matters: Also the Exudations of Rock-Diamonds, and Crystall, which harden with time: Also the Induration of Bead-Amber, which at first is a soft Substance; As appeareth by the Flies, and Spiders, which are found in it; And many more: But wee will speake of them distinctly.

For Indurations by Cold, there bee few Trialls of it; For wee haue no strong or intense Cold here on the Surface of the Earth, so neare the Beames of the Sunne, and the Heauens. The likeliest Triall is by Snow, and Ice; For as Snow and Ice, especially being holpen, and their Cold actiuated by Nitre, or Salt, will turne Water into Ice, and that in a few houres; So it may be, it will turne wood,

or Stiffe Clay, into Stone, in longer time. Put therefore, into a Conseruing Pit of Snow, and Ice, (adding some quantity of Salt, and Nitre,) a Peece of Wood, or a Peece of Tough Clay, and let it lye a Moneth, or more.

Another Triall is by Metalline Waters, which haue virtuall Cold in them. Put therefore Wood, or Clay, into Smiths water, or other Metalline water; And try whether it will not harden in some reasonable time. But I vnderstand it, of Metalline waters, that come by Washing, or Quenching; And not of Strong Waters that come by dissolution; for they are too Corrosiue to consolidate.

It is already found, that there are some Naturall Spring-waters, that will Inlapidate Wood; So as you shall see one peece of Wood, whereof the Part aboue the Water shall continue Wood; And the Part vnder the Water shall be turned into a kinde of Grauelly Stons. It is likely those Waters are of some Metalline Mixture; But there would be more particular Inquiry made of them. It is certaine, that an Egge was found, hauing lien many yeeres in the bottome of a Moate, where the Earth had somewhat ouergrowen it; And this Egge was comen to the Hardnesse of a Stone; And had the Colours of the white and Yolke perfect: And the Shell shining in small graines like Sugar, or Alablaster.

Another Experience there is of Induration by Cold, which is already found; which is, that Metalls, themselues are hardned by often Heating and Quenching in Cold Water: For Cold euer worketh most potently vpon Heat Precedene.

For Induration by Heat it must be considered, that Heat, by the Exhaling of the Moister Parts, doth either harden the Body; As in Bricks, Tiles, &c; Or if the Heat be more fierce, maketh the grosser part it selfe, Runne and Melt; As in the making of ordinary Glosse; And in the Vitrification of Earth, (As wee see in the Inner Parts of Farneces;) And in the Vitrification of Brick; And of Mettals. And in the former of these, which is the Hardening by baking, without Melting, the Heat hath these degrees; First it Indurateth; and then maketh Fragile; And lastly it doth Inciuerate and Calcinate.

But if you desire to make an Induration with Toughnesse, and lesse Fragility; A middle way would be taken; Which is that which Artistotle hath well noted; But would be throughly verified. It is, to decoct Bodies in water, for two or three

dayes; But they must bee such Bodies, into which the Water will not enter; As Stone, and Metall. For if they be Bodies into which the Water will enter, then long Seething, will rather Soften than indurate them. As hath beene tried in Eggs &c. Therefore, Softer Bodies must be put into Bottles; And the Bottles hung into Water seething, with the mouths open, aboue the Water; that no Water may get in; For by this Meaues, the virtuall Heat of the Water will enter; And such a Heat, as will not make the Body adust, or fragile; But the Substance of the Water will be shut out. This Experiment wee made; And it sorted thus. It was tried with a Peece of Free-stone, and with Pewter, put into the Water at large. The Free-stone we found receiued in some water; For it was softer, and easier to scrape, then a peece of the same Stone kept drie. But the Pewter into which no water could enter, became more white, and liker to Siluer, and lesse flexible, by much. There were also put into an Earthen Bottle, placed as before, a good Pellet of Clay, a Peece of Cheese, a Peece of Chalke, and a Peece of Free-stone. The Clay, came forth almost of the Hardnesse of Stone; The Cheese likewise very hard, and not well to be cut: The Chalke and the Free-stone much harder than they were. The colour of the Clay inclined not a whit to the Colour of Bricke, but rather to white, as in ordinary Drying by the Sunne. Note, that all the former Trialls were made by a Boyling vpon a good hot Fire, renewing the water as it consumed, with other hot water; But the Boyling was but for twelue houres onely; And it is like that the Experiment would haue beene more effectuall, if the Boyling had beene for two or three daies, as we prescribed before.

As touching Assimilation, (for there is a degree of Assimilation euen in Inanimate bodies) wee see Examples of it in some Stones in ClayGrounds, lying neare to the top of the Earth, where Pebble is; In which you may manifestly see diuers Pebbles gathered together, and a Crust of Cement or Stone betweene them, as hard as the Pebbles themselues: And it were good to make a Triall of purpose, by taking Clay, and putting in it diuers Pebble-Stones, thicke set, to see whether in continuance of time, it will not be harder then other Clay of the same lump, in which no Pebbles are set. Wee see also in Ruines of old Walls, especially towards the bottome, the Morter will become as hard as the Brick;

wee see also, that the Wood on the sides of Vessles of Wine, gathereth a Crust of Tartar, harder then the wood it selfe; And Scales likewise grow to the Teeth, harder then the Teeth themselues.

Most of all, Induration by Assimilation appeareth in the Bodies of Trees, and liuing Creatures: For no Nourishment that the Tree receiueth, or that the liuing Creature receiueth, is so hard as Wood, Bone, or Horne, &c. but is Indurated after by Assimilation.

The Eye of the vnderstanding, is like the Eye of the Sense: For as you may see great Obiects through small Crannies, or Leuells, So you may see great Axiomes of Nature, through small and Contemptible Instances. The Speedy Depredation of Aire vpon watry Moisture, and Version of the same into Aire, appeareth in nothing more visible, than in the sudden Discharge, or vanishing, of a little Cloud of Breath, or Vapour, from Glasse, or the Blade of a Sword, or any such Polished Body; Such as doth not at all Detaine, or Imbibe the Moisture; For the Mistinesse scattereth and breaketh vp suddenly. But the like Cloud, if it were Oyly, or Fatty, will not discharge; Not because it sticketh faster; But because Aire preyeth vpon Water; And Flame, and Fire, vpon Oyle; And therefore, to take out a Spot of Grease, they vse a Coale vpon browne Paper; because Fire worketh vpon Grease, or Oyle, as Aire doth vpon Water. And we see Paper oyled, or Wood oyled, or the like last long moist; but Wet with Water, drie, or putrifie sooner, The Cause is, for that Aire meddleth little with the Moisture of Oyle.

There is an Admirable demonstration, in the same trifling Instance of the little Cloud vpon Glasse, or Gemmes or Blades of Swords, of the Force of Vnion, euen in the least Quantities, and weakest Bodies, how much it Conduceth to Preseruation of the present Forme; And the Resisting of a New. For marke well the discharge of that Cloud; And you shall see it euer breake vp, first in the Skirts, and last in the middest. We see likewise, that much Water draweth forth the Iuyce of the Body Infused; But little water, is imbibed by the Body: And this is a Principall Cause, why in Operation vpon Bodies, for their Version or Alteration, the Triall in great Quantities, doth not answer the Triall in small; And

so deceiueth many; For that (I say) the greater Body, resisteth more any Alteration of Forme, and requireth farre greater Strength in the Actiue Body, that should subdue it.

We haue spoken before, in the fifth Instance, of the Cause of Orient Colours, in Birds; which is by the Finenesse of the Strainer; we will now endeuour to reduce the same Axione to a Worke. For this Writing of our Sylue Syluerum, is (to speake properly) not Neturall History, but a high kinde of Naturall Magicke. For it is not a Description only of Nature, but a Breaking of Nature, into great and strange Workes. Trie therefore, the Anointing ouer of Pigeons, or other Birds, when they are but in their downe; Or of Whelps, cutting their Haire as short as may be; Or of some other Beast; with some oyntment, that is not hurtfull to the Flesh; And that will harden, and sticke very close; And see whether it will not alter the Colours of the Feathers, or Haire. It is receiued, that the Pulling off, the first Feathers of Birds, cleane, will make the new come forth white: And it is certaine, that White is a penurious Colour, & where Moisture is scant. So Blew Violets, & other Flowers, if they be starued, turne Pale and White; Birds, and Horses, by Age, or Scarres, turne white: And the Hoare Haires of Men, come by the same reason, And therefore in Birds, it is very likely, that the Feathers that come first, will be many times of diuers Colours, according to the Nature of the Bird; For that the Skin is more porous; But when the Skin is more shut, and close, the Feathers will come White. This is a good Experiment, not only for the Producing of Birds, and Beasts of strange Colours; but also, for the Disclosure of the Nature of Colours themselues; which of them require a finer Porositie, and which a grosser.

It is a worke of Prouidence, that hath beene truly obserued by some; That the Yolke of the Egge, conduceth little to the Generation of the Bird; But onely to the Nourishment of the same: For if a Chicken be opened, when it is new hatched; you shall finde much of the Yolke remaining. And it is needfull, that Birds, that are shaped without the Females Wombe; haue in the Egge, as well Matter of Nourishment, as Matter of generation for the Body. For after the Egge is laid, and seuered from the Body of the Hen; It hath no more Nourishment

from the Hen; But onely a quickening Heat when shee sitteth. But Beasts, and Men need not the matter of Nourishment within themselues; Because they are shaped within the Wombe of the Female, and are Nourished continually from her Body.

It is an Inueterate and receiued Opinion, that Cantharides applyed to any Part of the Body, touch the Bladder, and exulcerate it, if they stay on long. It is likewise Receiued, that a kinde of Stone, which they bring out of the West Indies, hath a peculiar force to moue Grauell, and to dissolue the Stone; In so much, as laid but to the wrest, it hath so forcibly sent downe Grauell, as Men haue beene glad to remoue it; It was so violent.

It is receiued and confirmed by daily Experience, that the Soales of the Feet haue great Affinity with the Head, and the Mouth of the Stomach: As we see, Going wet-shod, to those that vse it not, affecteth both: Applications of hot Powders to the Feet attenuate first, and after drie the Rheume: And therefore a Physitian, that would be Mysticall, prescribeth, for the Cure of the Rheume, that a Man should walke Continually vpon a Camomill Alley; Meaning, that he should put Camomill within his Sockes. Likewise Pigeons bleeding, applyed to the Soales of the Feet, ease the Head: And Soporiferous Medicines applied vnto them, prouoke Sleepe.

It seemeth, that as the Feet haue a Sympathy with the Head; So the Wrests and Hands, haue a Sympathy with the Heart; We see the Affects and Passions of the Heart, and Spirits, are notably disclosed by the Pulse: And it is often tried, that Iuyces of Stock-Gilly-Flowers, Rose-Campian, Garlicke, and other things; applied to the Wrests, and renewed; haue cured long Agues. And I conceiue, that washing with certaine Liquours, the Palmes of the Hands, doth much good: And they doe well in Heats of Agues, to hold in the Hands, Egges of Alablaster, and Balls of Crystall.

Of these things we shall speake more, when we handle the Title of Sympathy and Antipathy, in the proper Place.

The Knowledge of man (hitherto) hath beene determined by the View, or Sight; So that whatsoeuer is Inuisible, either in respect of the Finenesse of the

Body it selfe; Or the Smallnesse of the Parts; Or of the Subtilty of the Motion; is little inquired. And yet these be the Things that Gouerne Nature Principally; And without which, you cannot make any true Analysis and Indication of the Proceedings of Nature. The Spirits or Pneumaticals, that are in all Tangible Bodies, are searce knowne. Sometimes they take them for Vacuum; wheras they are the most Actiue of Bodies. Sometimes they take them for Aire; From which they differ exceedingly, as much as Wine from Water; And as Wood from Earth. Sometimes they will haue them to be Naturall Heat, or a Portion of the Element of Fire; Wheras some of them are crude, and cold. And Sometimes they will haue them to be the Vertues and Qualities of the Tangible Parts, which they see; whereas they are Things by themselues. And then, when they come to Plants and liuing Creatures, they call them Soules. And such Superficiall Speculations they haue; Like Prospectiues, that shew things inward, when they are but Paintings. Neither is this a Question of Words, but infinitely materiall in Nature. For Spirits are nothing else but a Naturall Body, rarified to a Proportion, & included in the Tangible Parts of Bodies, as in an Integument. And they be no lesse differing one from the other, than the Dense or Tangible Parts: And they are in all Tangible Bodies whatsoeuer, more or lesse: And they are neuer (almost) at rest: And from them, and their Motions, principally proceed Arefaction, Colliquation, Concoction, Maturation, Putrefaction, Viuification, and most of the Effects of Nature: For, as we haue figured them in our Sapientiâ Veterum, in the Fable of Proserpina, you shall in the Infernall Regiment heare little Doings of Pluto, but most of proserpina: For Tangible Parts in Bodies are Stupide things; And the Spirits doe (in effect) all. As for the differences of Tangible Parts in Bodies, the industry of the Chymists hath giuen some light, in discerning by their Separations, the Oily, Crude, Pure, Impure, Fine, grosse Parts of Bodies, and the like. And the Physitians are content to acknowledge, that Herbs, and Drugs haue diuers parts; As that Opiums hath a Stupefactiue Part, and a Heating Part; The one mouing Sleepe, the other a Sweat following; And that Rubarb hath Purging Parts, and Astringent Parts, &c. But this whole Inquisition is weakly and Negligently handled. And for the more subtill differences of the Minute Parts,

and the Posture of them in the Body, (which also hath great Effects) they are not at all touched: As for the Motions of the Minute Parts of Bodies, which doe so great Effects, they haue not beene obserued at all; because they are Inuisible, and incurre not to the Eye; but yet they are to be deprehended by Experience: As Democritus said well, when they charged him to hold, that the World was made of such little Moats, as were seene in the Sunne; Atomus (saith he) necessitate Rationis & Experientia esse connincitur; Atomum enim nemo vnquam vidit. And therefore the Tumult in the parts of Solide Bodies, when they are compressed, which is the Cause of all Flight of Bodies thorow the Aire, and of other Mechanicall Motions, (as hath beene partly touched before, and shall be throughly handled in due place,) is not seene at all. But neuerthelesse, if you know it not, or enquire it not attentiuely and diligently, you shall neuer be able to discerne, and much lesse to produce, a Number of Mechanicall Motions. Againe, as to the Motions Corporall, within the Enclosures of Bodies, wherby effects (which were mentioned before) passe betweene the Spirits, and the Tangible Parts; (which are, Arefaction, Colliquation, Concoction, Maturation, &c.) they are not at all handled. But they are put off by the Names of Vertues, and Natures, and Actions, and Passions, and such other Logicall Words.

It is certaine, that all Powers in Nature, Heat is the chiefe; both in the Frame of Nature, and in the workes of Art. Certaine it is likewise, that the Effects of Heat, are most aduanced, when it worketh vpon a Body, without losse or dissipation of the Matter; for that euer betrayeth the Account. And therefore it is true, that the power of Heat is best perceiued in Distillations, which are performed in close Vessels, and Receptacles. But yet there is a higher Degree; For howsoeuer Distillations doe keepe the Body in Cells, and Cloisters, without Going abroad; yet they giue space vnto Bodies to turne into Vapour; To returne into Liquour; And to Separate one part from another. So as Nature doth Expatiate, although it hath not full Liberty: wherby the true and Vltime Operations of Heat are not attained. But if Bodies may be altered by Heat, and yet no such Reciprocation of Rarefaction, and of Condensation, and of Separation, admitted; then it is like that this Proteus of Matter, being held by the

Sleeues, will turne and change into many Metaworphoses. Take therefore a Square Vessell of Iron, in forme of a Cube, and let it haue good thicke and strong Sides. Put into it a Cube of Wood, that may fill it as close as may be; And let it haue a Couer of Iron, as strong (at least) as the Sides; And let it be well Luted, after the manner of the Chymists. Then place the Vessell within burning Coales, kept quicke kindled, for some few houres space. Then take the Vessell from the Fire, and take off the Couer, and see what is become of the Wood. I conceiue that since all Inflammation, and Euaporation are vtterly prohibited, and the Body still turned vpon it Selfe, that one of these two Effects will follow: Either that the Body of the Wood will be turned into a kinde of Amalgama, (as the Chymists call it;) Or that the Finer Part will bee turned into Aire, and the Grosser sticke as it were baked, and incrustate vpon the Sides of the Vessell; being become of a Denser Matter, than the Wood it selfe, Crude. And for another Triall, take also Water, and put it in the like Vessell, stopped as before; But vse a gentler Heat, and remoue the vessell sometimes from the Fire; And againe, after some small time, when it is Cold, renue the Heating of it: And repeat this Aloeration some few times: And if you can once bring to passe, that the Water, which is one of the Simplest of Bodies, be changed in Colour, Odour, or Taste, after the manner of Compound Bodies, you may be sure that there is a great Worke wrought in Nature, and a Notable Entrance made into strange Changes of Bodies, and productions: And also a Way made, to doe that by Fire, in small time, which the Sunne and Age do in long time. But of the Admirable Effects of this Distillation in Close, (for so we will call it) which is like the Wombes and Matrices of liuing creatures, where nothing Expireth, nor Separateth; We will speake fully, in the due place; Not that we Aime at the making of Paracelsus Pigmey's; Or any such Prodigious Follies; But that we know the Effects of Heat will be such, as will scarce fall vnder the Conceit of Man; If the force of it be altogether kept in.

There is nothing more Certaine in Nature, than that it is impossible for any Body, to be vtterly Annibilated; But that, as it was the worke of the Omnipotency of God, to make Somewhat of Nothing; So it requireth the like

Omnipotency, to turne Somewhat into Nothing. And therefore it is well said, by an Obscure Writer of the Sect of the Chymists; That there is no such way to effect the Strange Transmutations of Bodies, as to endeuour and vrge by all meanes, the Reducing of them to Nothing. And herein is contained also a great Secret of Preseruation of Bodies from Change; For if you can prohibit, that they neither turne into Aire, because no Aire commeth to them; Not goe into the Bodies Adiacent, because they are vtterly Heterogeneall; Nor make a Round and Circulation within themselues; they will neuer change, though they be in their Nature neuer so Perishable, or Mutable. We see, how Flies, and Spiders, and the like, get a Sepulcher in Amber, more Durable, than the Monument, and Embalming of the Body of any King. And I conceiue the like will be of Bodies put into Quick-siluer. But then they must be but thinne; As a leafe, or a peece of Paper, or Parchment; For if they haue a greater Crassitude, they will alter in their owne Body, though they spend not. But of this, We shall speake more, when we handle the Title of Conseruation of Bodies.

II. Century.

MVSICKE in the Practise, hath bin well pursued; And in good Variety; But in the Theory, and especially in the Yeelding of the Causes of the Practique, very weakly; Being reduced into certaine Mysticall Subtilties, of no vse, and not much Truth. We shall therefore, after our manner, ioyne the Contemplatiue and Actiue Part together.

All Sounds, are either Musicall Sounds, which we call Tones; Wherunto there may be an Harmony; which Sounds are euer Equall; As Singing, the Sounds of Stringed, and Wind-Instruments, the Ringing of Bells, &c. Or Immusicall Sounds; which are euer Vnequall; Such as are the Voice in Speaking, all Whisperings, all Voices of Beasts, and Birds, (except they bee Singing Birds;) all Percussions, of Stones, Wood, Parchment, Skins (as in Drummes;) and infinite others.

The Sounds that produce Tones, are euer from such Bodies, as are in their Parts and Pores Equall; As well as the Sounds themselues are Equall; And such are the Percussions of Metall, as in Bells; Of Glasse, as in the Fillipping of a Drinking Glasse; Of Aire, as in Mens voices whilest they Sing, in Pipes, Whistles, Organs, Stringed Instruments, &c. And of Water; as in the Nightingale-Pipes of Regalls, or Organs, and other Hydranlickes; which the Ancients had, and Nere did so much esteeme, but are now lost. And if any Man thinke, that the String of the Bowe, and the String of the Viall, are neither of them Equall Bodies; And yet produce Tones; he is in an errour. For the Sound is not created between the Bowe or Plectrum, and the String; But between the String and the Aire; No more then it is between the Finger or Quill, and the String, in other Instruments. So there are (in effect) but three Percussions that create Tones; Percussions of Metalls, (comprehending Glasse, and the like;) Percussions of Aire; and Percussions of Water.

The Diapason or Eight in Musicke is the sweetest Concord; Insomuch, as it is in effect an Vnison; As we see in Lutes, that are strung in the Base Strings with

two strings, one an Eight aboue another; Which make but as one Sound. And euery Eighth Note in Ascent, (as from Eight to Fifteene: from Fifteene to twenty two, and so in infinitum,) are but Scales of Diapason. The Cause is darke, and hath not beene rendred by any; And therfore would be better contemplated. It seemeth that Aire, (which is the Subiect of Sounds) in Sounds that are not Tones, (which are all vnequall, as hath beene said) admitteth much Varietie; As wee see in the Voices of Liuing Creatures; And likewise in the Voices of seuerall Men; (for we are capable to discerne seuerall Men by their Voices;) And in the Coniugation of Letters, whence Articulate Sounds proceed; Which of all others are most various. But in the Sounds which we call Tones, (that are euer Equall) the Aire is not able to cast it selfe into any such varietie; But is forced to recurre into one and the same Posture or Figure, onely differing in Greatnesse and Smalnesse. So we see Figures may be made of lines, Crooked and Straight, in infinite Varietie, where there is Inequalitie; But Circles, or Squares, or Triangles Equilaterall, (which are all Figures, of Equall lines) can differ but in Greater, or Lesser.

It is to be noted (the rather left any Man should thinke, that there is any thing in this Number of Eight, to create the Diapason), that this Computation of Eight, is a thing rather receiued, than any true Computation. For a true Computation ought euer to bee, by Distribution into equall Portions. Now there be interuenient in the Rise of Eight (in Tones) two Beemolls, or Halfe-notes; So as if you diuide the Tones equally, the Eight is but Seuen whole and equall Notes; And if you subdiuide that into Halfe Notes, (as it is in the Stops of a Lute), it maketh the Number of thirteene.

Yet this true; That in the ordinary Rises and Falles of the Voice of Man, (not measuring the Tone by whole Notes, and halfe Notes, which is the Equall Measure;) there fall out to be two Beemols (as hath beene said) betweene the Vnison and the Diapason: And this Varying is naturall. For if a Man would endeuour to raise or fall his Voice, still by HalfeNotes, like the Stops of a Lute; or by whole Notes alone, without Halfes; as farre as an Eight; he will not be able

to frame his Voice vnto it. Which sheweth, that after euery three whole Notes Nature requireth, for all Harmonicall vse, one halfe Note to be interposed.

It is to be considered, that whatsoeuer Vertue is in Numbers, for Conducing to Concent of Notes, is rather to bee ascribed to the Ante-Number, than to the Entire Number; As namely, that the Sound retarneth after Six, or after Twelue; So that the Seuenth, or the Thirteenth, is not the Matter, but the Sixth, or the Twelfth; And the Seuenth and the Thirteenth are but the limits and Boundaries of the returne.

The Concords in Musick which are Perfect, or Semiperfect, betweene the Vnison, and the Diapason, are the Fifth, which is the most Perfect; the Third next; And the Sixth which is more harsh: And as the Ancients esteemed, and so doe my selfe and some Other yet, the Fourth which they call Diatessaron. As for the Tenth, Twelfth, Thirteenth, and so in infinitum; they be but Recurrences of the Former; *viz.* of the Third, the Fifth, and the Sixth; being an Eight respectiuely from them.

For Discords, the Second, and the Seuenth, are of all others the most odious, in Harmony, to the Sense; whereof the One is next aboue the Vnison, the Other next vnder the Diapason: which may shew, that Harmony requireth a competent distance of Notes.

In Harmony, if there be not a Discord to the Base, it doth not disturbe the Harmony, though there be a Discord to the Higher Parts; So the Discord be not of the Two that are Odious; And therfore the ordinary Concent of Foure Parts consisteth of an Eight, a Fifth, and a Third to the Base: But that Fifth is a Fourth to the Treble, and the Third is a Sixth. And the Cause is, for that the Base striking more Aire, doth ouercome and drowne the Treble. (vnlesse the Discord be very Odious;) And so hideth a small Imperfection. For we see, that in one of the lower Strings of a Lute, there soundeth not the Sound of the Treble, not any Mixt Sound, but onely the Sound of the Base.

We haue no Musicke of Quarter-Notes; And it may be, they are not capable of Harmony; For we see the HalfeNotes themselues doe but interpose sometimes. Neuerthelesse we haue some Slides, or Relishes, of the Voice, or

Strings, as it were continued without Notes, from one Tone to another, rising or falling, which are delightfull.

The Causes of that which is Pleasing, or Ingrate to the Hearing, may receiue light by that, which is Pleasing or Ingrate to the Sight. There be two Things Pleasing to the Sight, (leauing Pictures, and Shapes aside, which are but Secondary Obiects; And please or displease but in Memory;) these two are, Colours, and Order. The Pleasing of Colour symbolizeth with the Pleasing of any Single Tone to the Eare; But the Pleasing of Order doth symbolize with Harmony. And therfore we see in Garden-knots, and the Frets of Houses, and all equall and well-answering Figures, (as Globes, Pyramides, Cones, Cylinders, &c.) how they please; whereas Vnequall Figures are but Deformities. And both these Pleasures, that of the Eye, and that of the Eare, are but the Effects of Equality; Good Proportion, or Correspondence: So that (out of Question,) Equality, and Correspondence, are the Causes of Harmony. But to finde the Proportion of that Correspondence, is more abstruse; wherof notwithstanding we shall speake somewhat, (when we handle Tones,) in the generall Enquiry of Sounds.

Tones are not so apt altogether to procure Sleep, as some other Sounds; As the Wind, the Purling of Water, Humming of Bees, a Sweet Voice of one that readeth, &c. The Cause whereof is, for that Tones, because they are Equall, and slide not, doe more strike and erect the Sense, than the other. And Ouermuch Attention hindreth Sleepe.

There be in Musick certaine Figures, or Tropes; almost agreeing with the Figures of Rhetoricke; And with the Affections of the Minde, and other Senses. First, the Diuision and Quauering, which please so much in Musick, haue an Agreement with the Glittering of Light; As the MooneBeames playing vpon a Waue. Againe, the Falling from a Discord to a Concord, which maketh great Sweetnesse in Musick, hath an Agreement with the Affections, which are reintegrated to the better, after some dislikes: It agreeth also with the Taste, which is soone glutted with that which is sweet alone. The Sliding from the Close or Cadence, hath an Agreement with the Figure in Rhetoricke, which they

call Praeter Expectatum; For there is a Pleasure euen in Being deceined. The Reports, and Fuges, haue an Agreement with the Figures in Rhetorick, of Repetition, and Traduction. The Tripla's, and Changing of Times, haue an Agreement with the Changes of Motions; As when Galliard Time, and Measure Time, are in the Medley of one Dance.

It hath been anciently held, and obserued, that the Sense of Hearing, and the Kinds of Musick, haue most Operation vpon Manners; As to Incourage Men, and make them warlike; To make them Soft and Effeminate; To make them Graue; To make them Light; To make them Gentle and inclined to Pitty, &c. The Cause is, for that the Sense of Hearing striketh the Spirits more immediatly, than the other Senses; And more incorporeally than the Smelling: For the Sight, Taste, and Feeling, haue their Organs, not of so present and immediate Accesse to the Spirits, as the Hearing hath. And as for the Smelling, (which indeed worketh also immediatly vpon the Spirits, and is sorcible while the Obiect remaineth,) it is with a Communication of the Breath, or Vapour of the Obiect Odorate: But Harmony entring easily, and Mingling not at all, and Comming with a manifest Motion; doth by Custome of often Affecting the Spirits, and Putting them into one kinde of Posture, alter not a little the Nature of the Spirits, euen when the Obiect is remoued. And therefore we see, that Tunes and Aires, euen in their owne Nature, haue in themselues some Affinity with the Affections; As there be Merry Tunes, Dolefull Tunes, Solemne Tunes; Tunes inclining Mens mindes to Pitty; Warlike Tunes; &c. So as it is no Maruell, if they alter the Spirits; considering that Tunes haue a Predisposition to the Motion of the Spirits in themselues. But yet it hath been noted, that though this variety of Tunes, doth dispose the Spirits to variety of Passions, conforme vnto them; yet generally, Musick feedeth that disposition of the Spirits which it findeth. We see also that seuerall Aires, and Tunes, doe please seuerall Nations, and Persons, according to the Sympathy they haue with their Spirits.

Perspectiue hath been with some diligence inquired; And so hath the Nature of Sounds, in some sort, as far as concerneth Musick. But the Nature of Sounds in generall, hath been superficially obserued. It is one of the subrillest Peeces of

Nature. And besides, I practise, as I doe aduise; which is, after long Inquiry of Things, Immerse in Matter, to interpose some Subiect, which is Immateriate, or lesse Materiate; Such as this of Sounds; To the end, that the Intellect may be Rectified, and become not Partiall.

It is first to be considered, what Great Motions there are in Natute, which passe without Sound, or Noise. The Heauens turne about, in a most rapide Motion, without Noise to vs perceiued; Though in some Dreames they haue been said to make an excellent Musick. So the Motions of the Comets, and Fiery Meteors (as Stella Cadens, &c.) yeeld no Noise. And if it be thought, that it is the Greatnesse of distance from vs, whereby the Sound cannot be heard; We see that Lightnings, and Coruscations, which are neere at hand, yeeld no Sound neither. And yet in all these, there is a Percussion and Diuision of the Aire. The Windes in the Vpper Region (which moue the Clouds aboue (which we call the Racke) and are not perceiued below) passe without Noise. The lower Windes in a Plaine, except they be strong, make no Noise; But amongst Trees, the Noise, of such Windes will be perceiued. And the Windes (generally) when they make a Noise, doe euer make it vnequally, Rising and Falling, and sometimes (when they are vehement,) Trembling at the Height of their Blast. Raine, or Haile falling, (though vehemently,) yeeldeth no Noise, in passing through the Aire, till it fall vpon the Ground, Water, Houses, or the like. Water in a Riuer (though a swift Streame) is not heard in the Channell, but runneth in Silence, if it be of any depth; But the very Streame vpon Shallowes, of Grauell, or Pebble, will be heard. And Waters, when they beat vpon the Shore, or are straitned, (as in the falls of Bridges;) Or are dashed against themselues, by Windes, giue a Roaring Noise. Any peece of Timber, or Hard Body, being thrust forwards by another Body Contiguous, without knocking, giueth no Noise. And so Bodies in weighing, one vpon another, though the Vpper Body presse the lower Body downe, make no Noise. So the Motion in the Minute Parts of any solide Body, (which is the Principall Cause of Violent Motion, though vnobserued;) passeth without Sound; For that Sound, that is heard sometimes, is produced onely by the Breaking of the Aire; And not by the Impulsion of the Parts. So it is

manifest; That where the Anteriour Body giueth way, as fast as the Posteriour commeth on, it maketh no Noise; be the Motion neuer so great, or swift.

Aire open, and at large, maketh no Noise, except it be sharply percussed; As in the Sound of a String, where Aire is percussed by a hard, and stiffe Body; And with a sharp loose; For if the String be not strained, it maketh no Noise. But where the Aire is pent, and straitned, there Breath, or other Blowing, (which carry but a gentle Percussion,) suffice to create Sound; As in Pipes, and windeInstruments. But then you must note, that in Recorders, which goe with a gentle Breath, the Concaue of the Pipe, were it not for the Fipple, that straitneth the Aire, (much more than the Simple Concaue;) would yeeld no Sound. For as for other windeInstruments, they require a forcible Breath; As Trumpets, Cornets, Hunters-hornes, &c. Which appeareth by the blowne-cheeks of him that windeth them. Organs also are blowne with a strong winde, by the Bellowes. And note againe, that some kinde of windeInstruments, are blowne at a small Hole in the side, which straitneth the Breath at the first Entrance; The rather, in respect of their Trauerse, and Stop aboue the Hole, which performeth the Fipples Part; As it is seene in Flutes, and Fifes, which will not giue Sound, by a Blast at the end, as Recorders, &c. doe. Likewise in all Whistling, you contract the Mouth; And to make it more sharp, Men sometimes vse their Finger. But in Open Aire, if you throw a Stone, or a Dart, they giue no Sound: No more doe Bullets, except they happen to be a little hollowed in the Casting; Which Hollownesse penneth the Aire: Not yet Arrowes, except they be ruffled in their Feathers, which likewise penneth the Aire. As for Small whistles, or Shepheards Oa — Pipes; they giue a Sound, because of their extreame Slendernesse, whereby the Aire is more pent, than in a Wider Pipe. Againe, the Voices of Men, and Liuing Creatures, passe through the throat, which penneth the Breath. As for the Iewes Harpe, it is a sharp Percussion; And besides, hath the vantage of penning the Aire in the Mouth.

Solide Bodies, if they be very softly percussed, giue no Sound; As when a man treadeth very softly vpon Boards. So Chests or Doores in faire weather,

when they open easily, giue no Sound. And Cart-wheeles squeak not, when they are liquoured.

The Flame of Tapers, or Candles, though it be a swift Motion, and breaketh the Aire, yet passeth without Sound. Aire in Ouens, though (no doubt) it doth (as it were) boyle, and dilate it selfe, and is repercussed; yet it is without Noise.

Flame percussed by Aire, giueth a Noise; As in Blowing of the Fire by Bellowes; Greater, than if the Bellowes should blow vpon the Aire it selfe. And so likewise Flame percussing the Aire strongly, (as when Flame suddenly taketh, and openeth,) giueth a Noise; So, Great Flames, whiles the one impelleth the other, giue a bellowing Sound.

There is a Conceit runneth abroad, that there should be a white Powder, which will discharge a Peece without Noise; which is a dangerous Experiment, if it should be true: For it may cause secret Murthers. But it seemeth to me vnpossible; For, if the Aire pent, be driuen forth, and strike the Aire open, it will certainly make a Noise. As for the white Powder (if any such thing be, that may extinguish, or dead the Noise,) it is like to be a Mixture of Petre, and Sulphur, without Coale. For Petre alone will not take Fire. And if any Man thinke, that the Sound may be extinguished, or deaded, by discharging the Pent Aire, before it commeth to the Mouth of the Peece, and to the Open Aire; That is not probable; For it will make more diuided Sounds; As if you should make a Crosse Barrell hollow, thorow the Barrell of a Peece, it may be, it would giue seuerall Sounds, both at the Nose, and at the Sides. But I conceiue, that if it were possible, to bring to passe, that there should be no Aire pent at the Mouth of the Peece, the Bullet might fly with small, or no Noise, For first it is certaine, there is no Noise in the Percussion of the Flame vpon the Bullet. Next the Bullet, in piercing thorow the Aire, maketh no Noise; As hath beene said. And then, if there be no Pent Aire that striketh vpon Open Aire, there is no Cause of Noise; And yet the Flying of the Bullet will not be stayed. For that Motion (as hath beene oft said) is in the Parts of the Bullet, and not in the Aire. So as triall must be made by taking some small Concaue of Metall, no more than you mean to fill with Powder; And laying the Bullet in the Mouth of it, halfe out into the Open Aire.

I heard it affirmed by a Man, that was a great Dealer in Secrets, but he was but vaine; That there was a Conspiracy (which himselfe hindred,) to haue killed Queene Mary, Sister to Queene Elizabeth, by BurningGlasse, when shee walked in Saint Iames Parke, from the Leads of the House. But thus much (no doubt) is true; That if BurningGlasses could be brought to a great strength, (as they talke generally of BurningGlasses, that are able to burne a Nauy,) the Percussion of the Aire alone, by such a BurningGlasse, would make no Noise; No more than is found in Cornscations, and Lightnings, without Thunders.

I suppose, that Impression of the Aire with Sounds, asketh a time to be conueighed to the Sense; As well as the Impression of Species visible: Or else they will not be heard. And therefore, as the Bullet moueth so swift, that it is Inuisible; So the same Swiftnesse of Motion maketh it Inaudible: For we see, that the Apprehension of the Eye, is quicker than that of the Eare.

All Eruptions of Aire, though small and slight, giue an Entity of Sound; which we call Crackling, Pussing, Spitting, &c. As in Bay-salt, and Bayleaues, cast into the Fire; So in Chesnuts, when they leape forth of the Ashes; So in Greene Wood laid vpon the Fire, especially Roots; So in Candles that spit Flame, if they be wet; So in Rasping, Sneezing, &c. So in a Rose-leafe gathered together into the fashion of a Purse, and broken vpon the Fore-head, or Backe of the Hand, as Children vse.

The Cause giuen of Sound, that it should be an Elision of the Aire (wherby, if they meane any thing, they meane a Cutting, or Diuiding, or else an Attenuating of the Aire) is but a Terme of Ignorance: And the Motion is but a Catch of the Wit vpon a few Instances; As the Manner is in the Philosophy Receiued. And it is common with Men, that if they haue gotten a Pretty Expression, by a Word of Art, that Expression, goeth currant; though it be empty of Matter. This Conceit of Elision, appeareth most manifestly to befalse, in that the Sound of a Bell, String, or the like, continueth melting, some time, after the Percussion; But ceaseth straight-waies, if the Bell, or String, be touched and stayed: wheras, if it were the Elision of the Aire, that made the Sound, it could not be, that the Touch of the Bell, or String, should extinguish so suddenly that Motion, caused by the

Elision of the Aire. This appeareth yet more manifestly, by Chiming with a Hammer, vpon the Outside of a Bell; For the Sound will be according to the inward Concaue of the Bell; whereas the Elision, or Attenuation of the Aire, cannot be but onely betweene the Hammer, and the Outside of the Bell, So againe, if it were an Elision, a broad Hammer, and a Bodkin, strucke vpon Metall, would giue a diuers Tone; As well as a diuers Loudnesse: But they doe not so; For though the Sound of the one be Louder, and of the other Softer, yet the Tone is the same. Besides, in Eccho's, (wherof some are as loud as the Originall Voice, there is no new Elision; but a Repercussion onely. But that which conuinceth it most of all, is, that Sounds are generated, where there is no Aire at all. But these and the like Conceits, when Men haue cleared their vnderstanding, by the light of Experience, will scatter, and breake vp like a Mist.

It is certaine, that Sound is not produced at the first, but with some Locall Motion of the Aire, or Flame, or some other Medium; Nor yet without some Resistance, either in the Aire, or the Body Percussed. For if there be a meere Yeelding, or Cession, it produceth no Sound; As hath beene said. And therin Sounds differ from Light, and Colours; which passe thorow the Aire, or other Bodies, without any Locall Motion of the Aire; either at the first, or after. But you must attentiuely distinguish, betweene the Locall Motion of the Aire, (which is but Vehiculum Caussae, A Carrier of the Sounds,) and the Sounds themselues, Conueighed in the Aire. For as to the former, we see manifestly, that no Sound is produced (no not by Aire it selfe against other Aire, as in Organs, &c.) but with a perceptible Blast of the Aire; And with some Resistance of the Aire strucken. For euen all Speech, (which is one of the gentlest Motions of Aire,) is with Expulsion of a little Breath. And all Pipes haue a Blast, as well as a Sound. We see also manifestly, that Sounds are carried with Wind: And therefore Sounds will be heard further with the Wind, than against the Wind; And likewise doe rise and fall with the Intension or Remission of the Wind. But for the Impression of the Sound, it is quite another Thing; And is vtterly without any Locall Motion of the Aire, Perceptible; And in that resembleth the Species visible: For after a Man hath lured, or a Bell is rung, we cannot discerne any Perceptible Motion (at

all) in the Aire, a long as the Sound goeth; but only at the first. Neither doth the Wind (as far as it carrieth a Voice,) with the Motion therof, confound any of the Delicate, and Articulate Figurations of the Aire, in Variety of Words. And if a Man speake a good loudnesse, against the Flame of a Candle, it will not make it tremble much; though most, when those Letters are pronounced, which contract the Mouth; As F, S,V, and some others. But Gentle Breathing, or Blowing without speaking, will moue the Candle far more. And it is the more probable, that Sound is without any Locall Motion of the Aire, because as it differeth from the Sight, in that it needeth a Locall Motion of the Aire at first; So it paralleleth in so many other things with the Sight, and Radiation of Things visible; Which (without all question) induce no Locall Motion in the Aire, as hath beene said.

Neuerthelesse it is true, that vpon the Noise of Thunder, and great Ordnance; Glasse windowes will shake; and Fishes are thought to be frayed with the Motion, caused by Noise vpon the water. But these Effects are from the Locall Motion of the Aire, which is a Concomitant of the Sound, (as hath beene said;) and not from the Sound.

It hath beene anciently reported, and is still receiued, that Extreme Applanses, and Shouting of People assembled in great Multitudes, haue so rarified, and broken the Aire, that Birds flying ouer, haue fallen downe, the Aire being not able to support them. And it is beleeued by some, that Great Ringing of Bells in populous Cities, hath chased away Thunder: and also dissipated Pestilent Aire: All which may be also from the Concussion of the Aire, and not from the Sound.

A very great Sound, neare hand, hath strucken many Dease; And at the Instant they haue found, as it were, the breaking of a Skin or Parchment in their Eare: And my Selfe standing neare one that Lured loud, and shrill, had suddenly an Offence, as if somewhat had broken, or beene dislocated in my Eare; And immediately after, a loud Ringing; (Not an ordinary Singing, or Hissing, but far louder, and differing;) so as I feared some Deafenesse. But after some halfe Quarter of an Houre it vanished. This Effect may be truly referred vnto the Sound: For (as is commonly receiued) an ouer-potent Obiect doth destroy the

Sense; And Spirituall Species, (both Visible, and Audible,) will worke vpon the Sensories, though they moue not any other Body.

In Delation of Sounds, the Enclosure of them preserueth them, and causeth them to be heard further. And wee finde in Roules of Parchment, or Trunckes, the Mouth being laid to the one end of the Rowle of Parchment, or Truncke, and the Eare to the other, the Sound is heard much further, than in the Open Aire; The Cause is, for that the Sound spendeth, and is dissipated in the Open Aire; But in such Concaues it is conserued, and contracted. So also in a Peece of Ordnance, if you speak in the Touch-hole, and another lay his Eare to the Mouth of the Peece, the Sound passeth, and is farre better heard, than in the Open Aire.

It is further to be considered, how it proueth and worketh, when the Sound is not enclosed all the Length of his Way, but passeth partly through open Aire; As where you speake some distance from a Truncke; or where the Eare is some distance from the Truncke; at the other End; Or where both Mouth and Eare are distant from the Truncke. And it is tried, that in a long Truncke, of some eight or ten foot, the Sound is holpen, though both the Mouth, and the Eare be a handfull, or more, from the Ends of the Truncke; And somewhat more holpen, when the Eare of the Hearer is neare, than when the Mouth of the Speaker. And it is certaine, that the Voice is better heard in a Chamber from abroad, than abroad from within the Chamber.

As the Enclosure, that is Round about and Entire, preserueth the Sound; So doth a Semi-Concaue, though in a lesse degree. And therefore, if you diuide a Truncke, or a Cane into two, and one speake at the one end, and you lay your Eare at the other, it will carry the Voice further, than in the Aire at large. Nay further, if it be not a full Semi-Concaue; but if you doe the like vpon the Mast of a Ship, or a long Pole, or a Peece of Ordnance (though one speake vpon the Surface of the Ordnance, and not at any of the Bores;) the Voice will be heard further, than in the Aire at large.

It would be tried, how, and with what proportion of disaduantage, the Voice will be carried in an Horne, which is a line Arched; Or in a Trumpet, which is a line Retorted; Or in some Pipe that were Sinuous.

It is certaine, (howsoeuer it crosse the Receiued Opinion) that Sounds may be created without Aire, though Aire be the most fauourable Deferent of Sounds. Take a Vessell of Water, and knap a paire of Tongs some depth within the Water, and you shall heare the Sound of the Tongs well, and not much diminished; And yet there is no Aire at all present.

Take one Vessell of Siluer, and another of Wood, and fill each of them full of Water, and then knap the Tongs together, as before, about an handfull from the Bottome, and you shall finde the Sound much more Resounding from the Vessell of Siluer, than from that of Wood; And yet if there be not water in the Vessell, so that yo knap the Tongs in the Aire, you shall finde no difference, betweene the Siluer and Woodden Vessell. Whereby, beside the maine point of creating Sound without Aire, you may collect two Things: The one, that the Sound communicateth with the Bottome of the Vessell: The other, that such a Communication passeth farre better, thorow Water, than Aire.

Strike any Hard Bodies together, in the Middest of a Flame, and you shall heare the Sound, with little difference, from the Sound in the Aire.

The Pneumaticall Part, which is in all Tangible Bodies, and hath some Affinity with the Aire, performeth, in some degree, the Parts of the Aire; As when you knocke vpon an Emptie Barrell, the Sound is (in part) created by the Aire on the Outside; And (in part) by the Aire in the Inside; For the Sound will be greater or lesser, as the Barrell is more Emptie, or more full; But yet the Sound participateth also with the Spirit in the Wood, thorow which it passeth, from the Outside to the Inside: And so it commeth to passe, in the Chiming of Bells, on the Outside; where also the Sound passeth to the Inside: And a number of other like Instances, whereof we shall speake more, when we handle the Communication of Sounds.

It were extreame Grossenesse to thinke, (as wee haue partly touched before,) that the Sound in Strings is made, or produced, betweene the Hand and the String, or the Quill and the String, or the Bow and the String: For those are but Vehicula Motûs, Passages to the Creation of the Sound; the Sound being produced betweene the String and the Aire; And that not by any Impulsion of the

Aire from the first Motion of the String; but by the Returne or Result of the String, which was strained by the Touch, to his former Place: which Motion of Result is quicke and sharpe; Wheras the first Motion, is soft and dull. So the Bow tortureth the String continually, and thereby holdeth it in a Continuall Trepidation.

Take a Truncke, and let one whistle at the one End, and bold your Eare at the other, and you shall finde the Sound strike so sharpe, as you can scarce endure it. The Cause is, for that Sound diffuseth it selfe in round; And so spendeth it Selfe; But if the Sound, which would scatter in Open Aire, be made to goe all into a Canale; It must needs giue greater force to the Sound. And so you may note, that Enclosures doe not onely preserue Sound, but also Encrease and Sharpen it.

A Hunters Horne, being greater at one end, than at the other, doth encrease the Sound more, than if the Horne were all of an equall Bore. The Cause is, for that the Aire, and Sound, being first contracted at the leffer End, and afterwards hauing more Roome to spread at the greater End; doe dilate themselues; And in Comming out strike more Aire; whereby the Sound is the Greater, and Baser. And euen Hunters Hornes, which are sometimes made straight, and not Oblique, are euer greater at the lower end. It would be tried also in Pipes, being made far larger at the lower End: Or being made with a Belly towards the lower End, And then issuing into a straight Concaue againe.

There is in Saint Iames Fields, a Conduit of Bricke, vnto which ioyneth a low Vault; And at the End of that, a Round House of Stone: And in the Bricke Conduit there is a Window; And in the Round House a Slit or Rift of some little breadth: If you crie out in the Rift, it will make a fearfull Roaring at the Window. The Cause is the same with the former; For that all Concaues, that proceed from more Narrow to more Broad, doe amplifie the Sound at the Comming out.

Hawkes Bells, that haue Holes in the sides, giue a greater Ring, than if the Pellet did strike vpon Brasse, in the Open Aire. The Cause is the same with the first Instance of the Trancke; Namely, for that the Sound Enclosed with the Sides of the Bell, commeth forth at the Holes vnspent, and more strong.

In Drums, the Closenesse round about, that preserueth the Sound from dispersing, maketh the Noise come forth at the Drum-Hole, farre more loud, and strong, than if you should strike vpon the like Skin, extended in the Open Aire. The Cause is the same with the two precedent.

Sounds are better heard, and further off, in an Euening, or in the Night, than at the Noone, or in the Day. The Cause is, for that in the Day, when the Aire is more Thin, (no doubt) the Sound pierceth better; But when the Aire is more Thicke, (as in the Night) the Sound spendeth and spreadeth abroad lesse: And so it is a Degree of Enclosure. As for the Night, it is true also, that the Generall Silence helpeth.

There be two Kinds of Reflexions of Sounds; The one at Distance, which is the Eccho; Wherein the Originall is heard distinctly, and the Reflexion also distinctly; Of which we shall speake hereafter: The other in Concurrence; When the Sound Reflecting (the Reflexion being neare at hand) returneth immediatly vpon the Originall, and so iterateth it not, but amplifieth it. Therefore we see, that Musicke vpon the water soundeth more; And so likewise Musicke is better in Chambers Wainscotted, than Hanged.

The Strings of a Lute, or Violl, or Virginalls, doe giue a far greater Sound, by reason of the Knot, and Board, and Concaue vnderneath, than if there were nothing but onely the Flat of a Board, without that Hollow and Knot, to let in the Vpper Aire into the Lower. The Cause is, the Communication of the Vpper Aire with the Lower; And Penning of both from Expence, or Dispersing.

An Irish Harpe hath Open Aire on both sides of the Strings: And it hath the Concaue or Belly, not along the Strings, but at the End of the Strings. It maketh a more Resounding Sound, than a Bandora, Orpharion, or Citterne, which haue likewise Wire-strings. I iudge the Cause to be, for that Open Aire on both Sides helpeth, so that there be a Concaue; Which is therefore best placed at the End.

In a Virginall, when the Lid is downe, it maketh a more exile Sound, than when the Lid is open. The Cause is, for that all Shutting in of Aire, where there is no competent Vent, dampeth the Sound. Which maintaineth likewise the former Instance; For the Belly of the Lute, or Vi-ll, doth pen the Aire somewhat.

There is a Church at Glocester, (and as I haue heard the like is in some other places;) where if you speake against a Wall, softly, another shall heare your Voice better a good way off, than neare hand. Enquire more particularly of the Frame of that Place. I suppose there is some Vault, or Hollow, or Isle, behinde the Wall, and some Passage to it towards the further end of that Wall, against which you speake; So as the Voice, of him that speaketh, slideth along the Wall, and then entreth at some Passage, and communicateth with the Aire of the Hollow; For it is preserued somewhat by the plaine wall; but that is too weake to giue a Sound Audible, till it hath communicated with the backe Aire.

Strike vpon a Bowstring, and lay the Horne of the Bow neare your Eare, and it will encrease the Sound, and make a degree of a Tone. The Cause is, for that the Sensory, by reason of the Close Holding, is percussed before the Aire disperseth. The like is, if yo hold the Horne betwixt your Teeth. But that is a plaine Delation of the Sound; from the Teeth, to the Instrument of Hearing; For there is a great Entercourse betweene those two Parts; As appeareth by this; That a Harsh Grating Tune setteth the Teeth on edge. The like falleth out, if the Horne of the Bow be put vpon the Temples; But that is but the Slide of the Sound from thence to the Eare.

If you take a Rod of Iron, or Brasse, and hold the one end to your Eare, and strike vpon the other, it maketh a fat greater Sound, than the like Stroke vpon the Rod, not so made Contiguous to the Eare. By which, and by some other Instances, that haue beene partly touched, it should appeare; That Sounds doe not onely slide vpon the Surface of a Smooth Body, but doe also communicate with the Spirits, that are in the Pores of the Body.

I remember in Trinity Colledge in Cambridge, there was an Vpper Chamber, which being thought weake in the Roofe of it, was supported by a Pillar of Iron, of the bignesse of ones Arme, in the middest of the Chamber; Which if you had strucke, it would make a little flat Noise in the Roome where it was strucke; But it would make a great Bombe in the Chamber beneath.

The Sound which is made by Buckets in a Well, when they touch vpon the Water; Or when they strike vpon the side of the Well; Or when two Buckets

dash the one against the other; These Sounds are deeper, and suller, than if the like Percussion were made in the Open Aire. The Cause is, the Penning and Enclosure of the Aire, in the Concaue of the Well.

Barrells placed in a Roome vnder the Floare of a Chamber, make all Noises in the same Chamber, more Full and Resounding.

So that there be fine wayes (in generall,) of Maioration of Sounds: Enclosure Simple; Enclosure with Dilatation; Communication; Reflexion Concurrent; and Approach to the Sensory.

For Exility of the Voice, or other Sounds: It is certaine, that the Voice doth passe thorow Solide and Hard Bodies, if they be not too thick. And thorow Water; which is likewise a very Close Body, and such an one, as letteth not in Aire. But then the Voice, or other Sound, is reduced, by such passage, to a great Weaknesse, or Exility. If therefore you stop the Holes of a Howkes Bell, it will make no Ring, but a flat Noise, or Rattle. And so doth the Aëtites, or Eagles Stone, which hath a little Stone within it.

And as for Water, it is a certaine Triall: Let a Man goe into a Bath, and take a Paile, and turne the Bottome vpward, and carry the Mouth of it, (Euen,) downe to the Leuell of the Water; and so presse it downe vnder the Water, some handfull and an halfe, still keeping it euen, that it may not tilt on either side, & so the Aire get out: Then let him that is in the Bath, diue with his Head so far vnder Water, as he may put his Head into the Paile; & there wil come as much Aire bubling forth, as will make Roome for his Head. Then let him speak; and any that shal stand without, shal heare his Voice plainly; but yet made extreme sharp and exile, like the Voice of Puppets: But yet the Articulate Sounds of the Words will not be co¯founded. Note that it may be much more handsomely done, if the Paile be put ouer the Mans head aboue Water, and then he cowre downe, and the Paile be pressed downe with him. Note that a Man must kneele or sit, that he may be lower than the Water. A Man would thinke, that the Sicilian Poet had knowledge of this Experiment; For he saith; That Hercules Page Hylas went with a Water-pot, to fill it at a pleasant Fountaine, that was neere the Shore, and that the Nymphs of the Fountaine fell in loue with the Boy,

and pulled him vnder Water, keeping him aliue; And that Hercules missing his Page, called him by his Name, aloud, that all the Shore rang of it; And that Hylas from within the Water, answered his Master; But (that which is to the present purpose) with so small and exile a Voice, as Hercules thought he had beene three miles off, when the Fountaine (indeed) was fast by.

In Lutes, and Instruments of Strings, if you stop a String high, (whereby it hath lesse Scope to tremble) the Sound is more Treble, but yet more dead.

Take two Sawcers, and strike the Edge of the one against the Bottome of the other, within a Paile of Water; And you shall finde, that as you put the Sawcers lower, and lower, the Sound groweth more flat; euen while Part of the Sawcer is aboue the Water; But that Flatnesse of Sound is ioyned with a Harshnesse of Sound; which (no doubt) is caused by the Inequalitie of the Sound, which commeth from the Part of the Sawcer vnder the Water, and from the Part aboue. But when the Sawcer is wholly vnder the Water, the Sound becommeth more cleare, but farre more low; And as if the Sound came from a farre off.

A Soft Body dampeth the Sound, much more than a Hard; As if a Bell hath Cloth, or Silke wrapped about it, it deadeth the Sound more, than if it were Wood. And therefore in Clericalls, the Keyes are lined; And in Colledges they vse to line the Tablemen.

Triall was made in a Recorder, after these seuerall manners. The Bottome of it was set against the Palme of the Hand; stopped with Wax round about; set against a Damaske Cushion; Thrust into Sand; Into Ashes; Into Water, (halfe an Inch vnder the Water;) Close to the Bottome of a Siluer Basin; And still the Tone remained: But the Bottome of it was set against a Woollen Carpet; A Lining of Plush; A Locke of Wooll, (though loosely put in;) Against Snow; And the Sound of it was quite deaded, and but Breath.

Iron Hot produceth not so full a Sound, as when it is Cold; For while it is hot, it appeareth to be more Soft, and lesse Resounding. So likewise Warme Water, when it falleth, maketh not so full a Sound, as Cold: And I conceiue it is softer, and neerer the Nature of Oyle; For it is more slippery; As may be perceiued, in that it scowreth better.

Let there be a Recorder made, with two Fipples at each end one; The Truncke of it of the length of two Recorders, and the Holes answerable toward each end; And let two play the same Lesson vpon it, at an Vnison; And let it be noted, whether the Sound be confounded; or amplified; or dulled. So likewise let a Crosse be made, of two Trunckes (thorow-out) hollow; And let two speake, or sing, the one long-waies, the other trauerse: And let two heare at the opposite Ends; And note, whether the Sound be confounded; amplified; or dulled. Which two Instances will also giue light to the Mixture of Sounds; wherof we shall speake hereafter.

A Bellowes blowne in at the Hole of a Drum, and the Drum then strucken, maketh the Sound a little flatter, but no other apparent Alteration. The Cause is manifest; Partly for that it hindreth the Issue of the Sound; And partly for that it maketh the Aire, being blowne together, lesse moueable.

The Loudnesse, and Softnesse of Sounds, is a Thing distinct from the Magnitude and Exility of Sounds; For a Base String, though softly strucken, giueth the greater Sound; But a Treble String, if hard strucken, will be heard much further off. And the Cause is, for that the Base String striketh more Aire; And the Treble lesse Aire, but with a sharper Percussion.

It is therefore the Strength of the Percussion, that is a Principall Cause of the Loudnesse or Softnesse of Sounds: As in knocking harder or softer; Winding of a Horne stronger or weaker; Ringing of a Hand-bell harder or softer, &c. And the Strength of this Percussion, consisteth, as much, or more, in the Hardnesse of the Body Percussed, as in the Force of the Body Percussing: For if you strike against a Cloth, it will giue a lesse Sound; If against Wood, a greater; If against Metall, yet a greater; And in Metals, if you strike against Gold, (which is the more pliant,) it giueth the flatter Sound; If against Siluer, or Brasse, the more Ringing Sound. As for Aire, where it is strongly pent, it matcheth a Hard Body. And therefore we see in discharging of a Peece, what a great Noise it maketh. We see also, that the Charge with Bullet; Or with Paper wet, and hard stopped; Or with Powder alone, rammed in hard; maketh no great difference in the Loudnesse of the Report.

The Sharpnesse or Quicknesse of the Percussion, is a great Cause of the Loudnesse, as well as the Strength: As in a Whip, or Wand, if you strike the Aire with it; the Sharper and Quicker you strike it, the Louder Sound it giueth. And in playing vpon the Lute, or Virginalls, the quicke Stroke or Touch, is a great life to the Sound. The Cause is, for that the Quicke Striking cutteth the Aire speedily; wheras the Soft Striking doth rather beat, than cut.

The Communication of Sounds (as in Bellies of Lutes, Empty Vessells, &c.) hath beene touched obiter, in the Maioration of Sounds: But it is fit also to make a Title of it apart.

The Experiment for greatest Demonstration of Communication of Sounds, is the Chiming of Bells; where if you strike with a Hammer vpon the Vpper Part, and then vpon the Midst, and then vpon the Lower, you shall finde the Sound to be more Treble, and more Base, according vnto the Concaue, on the Inside; though the Percussion be onely on the Outside.

When the Sound is created betweene the Blast of the Mouth, and the Aire of the Pipe, it hath neuerthelesse some Communication with the Matter of the Sides of the Pipe, and the Spirits in them contained; for in a Pipe, or Trumpet, of Wood, and Brasse, the Sound will be diuers; So if the Pipe be couered with Cloth, or Silke, it will giue a diuers Sound, from that it would doe of it selfe; So, if the Pipe be a little wet on the Inside, it will make a differing Sound, from the same Pipe dry.

That Sound made within Water, doth communicate better with a hard Body thorow Water, than made in Aire, it doth with Aire; Vide Experimentum, 134.

We haue spoken before (in the Inquisition touching Musicke,) of Musicall Sounds, wherunto there may be a Concord or Discord in two Parts; Which Sounds vve call Tones: And likewise of Immusicall Sounds; And haue giuen the Cause, that the Tone proceedeth of Equality, and the other of Inequality. And we haue also expressed there, what are the Equall Bodies that giue Tones, and what are the Vnequall that giue none. But now we shall speake of such Inequality of Sounds, as proceedeth, not from the Nature of the Bodies themselues, but is

Accidentall; Either from the Roughnesse, or Obliquity of the Passage; Or from the Doubling of the Percutient; Or from the Trepidation of the Motion.

A Bell, if it haue a Rift in it, whereby the Sound hath not a cleare Passage, giueth a Hoarse and Iarring Sound; So the Voice of Man, when by Cold taken the Wesill groweth rugged, and (as we call it) furred, becommeth hoarse. And in these two Instances, the Sounds are Ingrate; because they are meerely Vnequall: But, if they be Vnequall in Equality, then the Sound is Gratefull, but Purling.

All Instruments, that haue either Returnes, as Trumpets; Or Flexions, as Cornets; Or are Drawne vp, and put from, as Sackbuts; haue a Purling Sound; But the Recorder, or Flute, that haue none of these Inequalities, giue a cleare Sound. Neuerthelesse, the Recorder it selfe, or Pipe moistened a little in the Inside, soundeth more solemnly, and with a little Purling, or Hissing. Againe, a Wreathed String, such as are in the Base Strings of Banderaes, giueth also a Purling Sound.

But a Lute-string, if it be meerely Vnequall in his Parts, giueth a Harsh and Vntuneable Sound; which Strings we call False, being bigger in one Place than in another; And therefore Wire-strings are neuer False. We see also, that when we try a False Lute-string, wee vse to extend it hard betweene the fingers, and to fillip it; And if it giueth a double Species, it is True; But if it giueth a treble, or more, it is False.

Waters, in the Noise they make as they runne, represent to the Eare a Trembling Noise; And in Regalls, (where they haue a Pipe, they call the Nightingale-Pipe, which containeth Water) the Sound hath a continuall Trembling: And Children haue also little Things they call Cockes, which haue Water in them; And when they blow, or whistle in them, they yeeld a Trembling Noise; Which Trembling of Water, hath an assinity with the Letter L. All which Inequalities of Trepidation, are rather pleasant, than otherwise.

All Base Notes, or very Treble Notes, giue an Asper Sound; For that the Base striketh more Aire, than it can well strike equally: And the Treble cutteth the Aire so sharpe, as it returneth too swift, to make the Sound Equall: And therefore a Meane, or Tenor, is the sweetest Part.

We know Nothing, that can at pleasure make a Musicall, or Immusicall Sound, by voluntary Motion, but the Voice of Man, and Birds. The Cause is, (no doubt) in the Weasill or Wind-pipe, (which we call Aspera Arteria,) which being well extended, gathereth Equality; As a Bladder that is wrinckled, if it be extended, becommeth smooth. The Extension is alwaies more in Tones, than in Speech: Therefore the Inward Voice of Whisper can neuer a giue Tone: And in Singing, there is (manifestly) a greater Working and Labour of the Throat, than in Speaking; As appeareth in the Thrusting out, or Drawing in of the Chinne, when we sing.

The Humming of Bees, is an Vnequall Buzzing; And is conceiued, by some of the Ancients, not to come forth at their Mouth, but to be an Inward Sound, But (it may be) it is neither; But from the motion of their Wings; For it is not heard but when they stirre.

All Metalls quenched in Water, giue a Sibilation or Hissing Sound; (which hath an Affinity with the letter Z.) notwithstanding the Sound be created betweene the Water or Vapour, and the Aire. Seething also, if there be but small Store of Water, in a Vessell, giueth a Hissing Sound; But Boyling in a full Vessell, giueth a Bubling Sound, drawing somewhat neare to the Cocks vsed by Children.

Triall would be made, whether the Inequality, or Interchange of the Medium, will not produce an Inequality of Sound; As if three Bells were made one within another, and Aire betwixt Each; And then the outermost Bell were chimed with a Hammer, how the Sound would differ from a Simple Bell. So likewise take a Plate of Brasse, and a Plancke of Wood, and ioyne them close together, and knock vpon one of them, and see if they doe not giue an vnequall Sound. So make two or three Partitions or Wood in a Hogshead, with Holes or Knots in them; And marke the difference of their Sound, from the Sound of an Hogshead, without such Partitions.

It is euident, that the Percussion of the Greater Quantity of Aire, causeth the Baser Sound; And the lesse Quantity, the more Treble Sound. The Percussion of the Greater Quantity of Aire, is produced by the Greatnesse of the Body

Percussing; By the Latitude of the Concaue, by which the Sound passeth; and by the Longitude of the same Concaue. Therfore we see that a Base string, is greater than a Treble; A Base Pipe hath a greater Bore than a Treble; And in Pipes, and the like, the lower the Note Holes be, and the further off from the Mouth of the Pipe, the more Base Sound they yeeld; And the nearer the Mouth, the more Treble. Nay more, if you strike an Entire Body, as an Andiron of Brasse, at the Top, it maketh a more Treble Sound; And at the Bottome a Baser.

It is also euident, that the Sharper or Quicker Percussion of Aire causeth the more Treble Sound; And the Slower or Heauier, the more Base Sound. So we see in Strings; the more they are wound vp, and strained; (And thereby giue a more quicke Start-backe;) the more Treble is the Sound; And the slacker they are, or lesse wound vp, the Baser is the Sound. And therfore a Bigger String more strained, and a Lesser String, lesse strained, may fall into the same Tone.

Children, Women, Eunuchs haue more small and shrill Voices, than Men. The Reason is, not for that Men haue greater Heat, which may make the Voice stronger, (for the strength of a Voice or Sound, doth make a difference in the Loudnesse or Softnesse, but not in the Tone;) But from the Dilatation of the Organ; which (it is true) is likewise caused by Heat. But the Cause of Changing the Voice, at the yeares of Puberty, is more obscure. It seemeth to be, for that when much of the Moisture of the Body, which did before irrigate the Parts, is drawne downe to the Spermaticall vessells; it leaueth the Body more hot than it was; whence commeth the Dilatation of the Pipes: For we see plainly, all Effects of Heat, doe then come on; As Pilosity, more Roughnesse of the Skinne, Hardnesse of the Flesh, &c.

The Industry of the Musitian, hath produced two other Meanes of Strayning, or Intension of Strings, besides their Winding vp. The one is the Stopping of the String with the Finger; As in the Necks of Lutes, Viols, &c. The other is the Shortnesse of the String; As in Harps, Virginalls, &c. Both these haue one, and the same reason; For they cause the String to giue a quicker Start.

In the Straining of a String, the further it is strained, the lesse Superstraining goeth to a Note; For it requireth good Winding of a String, before it will make

any Note at all: And in the Stops of Lutes, &c. the higher they goe, the lesse Distance is betweene the Frets.

If you fill a Drinking-Glasse with Water, (especially one Sharp below, and Wide aboue,) and fillip vpon the Brim, or Outside; And after empty Part of the Water, and so more and more, and still try the Tone by Fillipping; you shall finde the Tone fall, and be more Base, as the Glasse is more Empty.

The Iust and Measured Proportion of the Aire Percussed, towards the Basenesse or Treblenesse of Tones, is one of the greatest Secrets in the Contemplation of Sounds. For it discouereth the true Coincidence of Tones into Diapasons; Which is the Returne of the same Sound. And so of the Concords and Discords, betweene the Vnison, and Diapason; Which we haue touched before, in the Experiments of Musicke; but thinke fit to resume it here, as a principall Part of our Enquiry touching the Nature of Sounds. It may be found out in the Proportion of the Winding of Strings; In the Proportion of the Distance of Frets; And in the Proportion of the Concaue of Pipes, &c. But most commodiously in the last of these.

Try therfore the Winding of a String once about, as soone as it is brought to that Extension, as will giue a Tone; And then of twice about; And thrice about, &c. And marke the Scale or Difference of the Rise of the Tone: Wherby you shall discouer, in one, two Effects; Both the Proportion of the Sound towards the Dimension of the Winding; And the Proportion likewife of the Sound towards the String, as it is more or lesse strained. But note that to measure this, the way will be, to take the Length in a right Line of the String, vpon any Winding about of the Pegge.

As for the Steps, you are to take the Number of Frets; And principally the Length of the Line, from the first Stop of the String, vnto such a Stop as shall produce a Diapason to the former Stop, vpon the same String.

But it will best (as it is said) appeare, in the Bores of Wind-Instruments: And therfore cause some halfe dozen Pipes, to be made, in length, and all things else, alike, with a single, double, and so on to a sextuple Bore; And so marke what Fall of Tone euery one giueth. But still in these three last Instances, you must

diligently obserue, what length of String, or Distance of Stop, or Concaue of Aire, maketh what Rise of Sound. As in the last of these (which (as we said) is that, which giueth the aptest demonstration,) you must set downe what Encrease of Concaue goeth to the Making of a Note higher; And what of two Notes; And what of three Notes; And so vp to the Diapason: For then the great Secret of Numbers, and Proportions, will appeare. It is not vnlike, that those that make Recorders, &c. know this already: for that they make them in Sets. And likewise Bell-founders in fitting the tune of their Bells. So that Enquiry may saue Triall. Surely, it hath beene obserued by one of the Ancients, that an Empty Barrell knocked vpon with the finger, giueth a Diapason to the Sound of the like Barrellfull; But how that should be, I doe not well vnderstand; For that the knocking of a Barrellfull, or Empty, doth scarce giue any Tone.

There is required some sensible Difference in the Proportion of creating a Note, towards the Sound it selfe, which is the Passiue: And that it be not too neare, but at a distance. For in a Recorder, the three vppermost Holes, yeeld one Tone; which is a Note lower than the Tone of the first three. And the like (no doubt) is required in the Winding or Stopping of Strings.

There is another Difference of Sounds, which we will call Exteriour, and Interiour. It is not Soft, nor Loud: Nor it is not Base, nor Treble: Nor it is not Musicall, nor Immusicall: Though it be true, that there can be no Tone in an Interiour Sound: But on the other side, in an Exteriour Sound, there may be both Musicall and Immusicall. We shall therfore enumerate them, rather than precisely distinguish them; Though (to make some Adumbration of that we meane) the Interiour is rather an Impulsion or Contusion of the Aire, than an Elision or Section of the same. So as the Percussion of the one, towards the other, differeth, as a Blow differeth from a Cut.

In Speech of Man, the Whispering, (which they call Susurrus in Latine,) whether it be louder or softer, is an Interiour Sound; But the Speaking out, is an Exteriour Sound; And therfore you can neuer make a Tone, not sing in Whispering; But in Speech you may: So Breathing, or Blowing by the Mouth, Bellowes, or Wind, (though loud) is an Interiour Sound; But the Blowing thorow

a Pipe, or Concaue, (though soft) is an Exteriour. So likewise, the greatest Winds, if they haue no Coarctation, or blow not hollow, giue an Interiour Sound; The Whistling or hollow Wind yeeldeth a Singing, or Exteriour Sound; The former being pent by some other Body; The latter being pent in by his owne Density: And therfore we see, that when the Wind bloweth hollow, it is a Signe of Raine. The Flame, as it moueth within it selfe, or is blowne by a Bellowes, giueth a Murmur or Interiour Sound.

There is no Hard Body, but strucke against another Hard Body, will yeeld an Exteriour Sound, greater or lesser: In so much as if the Percussion be ouer-soft, it may induce a Nullity of Sound; But neuer an Interiour Sound; As when one treadeth so softly, that he is not heard.

Where the Aire is the Percutient, pent, or not pent, against a Hard Body, it neuer giueth an Exteriour Sound; As if you blow strongly with a Bellowes against a Wall.

Sounds (both Exteriour and Interiour,) may be made, as well by Suction, as by Emission of the Breath: As in Whistling, or Breathing.

It is euident, and it is one of the strangest Secrets in Sounds, that the whole Sound is not in the whole Aire onely; But the whole Sound is also in euery small Part of the Aire. So that all the curious Diuersity of ArticulateSounds, of the Voice of Man, or Birds, will enter at a small Cranny, Inconfused.

The Vnequall Agitation of the Winds, and the like, though they bee materiall to the Carriage of the Sounds, further, or lesse way; yet they doe not confound the Articulation of them at all, within that distance that they can be heard; Though it may be, they make them to be heard lesse Way, than in a Still; as hath beene partly touched.

Ouer-great Distance confoundeth the Articulation of Sounds; As we see, that you may heare the Sound of a Preachers voice, or the like, when you cannot distinguish what he saith. And one Articulate Sound will confound another; As when many speake at once.

In the Experiment of Speaking vnder Water, when the Voice is reduced to such an Extreme Exility, yet the Articulate Sounds, (which are the Words,) are

not confounded; as hath beene said.

I conceiue, that an Extreme Small, or an Extreme Great Sound, cannot be Articulate; But that Articulation requireth a Mediocrity of Sound: For that the Extreme Small Sound confoundeth the Articulation by Contracting; And the Great Sound, by Dispersing: And although (as was formerly said) a Sound Articulate, already created, will be contracted into a small Cranny; yet the first Articulation requireth more Dimension.

It hath beene obserued, that in a Roome, or in a Chappell, Vaulted below, and Vaulted likewise in the Roofe, a Preacher cannot be heard so well, as in the like Places not so Vaulted. The Cause is, for that the Subsequent Words come on, before the Precedent words vanish: And therfore the Articulate Sounds are more confused, though the Grosse of the Sound be greater.

The Motions of the Tongue, Lips, Throat, Pallat, &c. which goe to the Making of the seuerall Alphabeticall Letters, are worthy Enquiry, and pertinent to the present Inquisition of Sounds: But because they are subtill, and long to describe, we will refer them ouer, and place them amongst the Experiments of Speech. The Hebrewes haue beene diligent in it, and haue assigned, which Letters are Labiall, which Dentall, which Gutturall, &c. As for the Latines, and Grecians, they haue distinguished betweene Semi-vowels, and Mutes; And in Mutes, betweene Mute Tenues, Media, and Aspirata; Not amisse; But yet not diligently enough. For the speciall Strokes, & Motions, that create those Sounds, they haue little enquired: As that the Letters, B. P. F. M. are not expressed, but with the Contracting, or Shutting of the Mouth; That the Letters N. and B. cannot be pronounced, but that the Letter N. will turne into M. As Hecatonba, will be Hecatomba. That M. and T. cannot be pronounced together, but P. will come betweene; as Emtus, is pronounced Emptus; And a Number of the like. So that if you enquire to the full; you will finde, that to the Making of the whole Alphabet, there will be fewer Simple Motions required, than there are Letters.

The Lungs are the most Spongy Part of the Body; And therefore ablest to contract, and dilate it selfe: And where it contracteth it selfe, it expelleth the Aire; which thorow the Artire, Throat, and Mouth, maketh the Voice: But yet

Articulation is not made, but with the helpe of the Tongue, Pallate, and the rest of those they call Instruments of voice.

There is sound a Similitude, betweene the Sound that is made by Inanimate Bodies, or by Animate Bodies, that haue no Voice Articulate; and diuers Letters of Articulate Voices: And commonly Men haue giuen such Names to those Sounds, as doe allude vnto the Articulate Letters. As Trembling of Water hath Resemblance with the Letter L; Quenching of Hot Mettalls, with the Letter Z; Snarling of Dogs, with the Letter R; The Noise of Scritchowles, with the Letter Sh; Voice of Cats, with the Dypthong Eu; Voice of Cuckoes, with the Dypthong On; Sounds of Strings, with the Letter Ng: So that if a Man, (for Curiosity, or Strangenesse sake,) would make a Puppet, or other Dead Body, to pronounce a Word; Let him consider, on the one Part, the Motion of the Instruments of Voice; and on the other part the like Sounds made in Inanimate Bodies; And what Conformity there is that causeth the Similitude of Sounds; And by that he may minister light to that Effect.

III. Century.

ALL Sounds (whatsoeuer) moue Round; That is to say; On all Sides; Vpwards; Downwards; Forwards; and Backwards. This appeareth in all Instances.

Sounds doe not require to bee conueyed to the Sense, in a Right Line, as Visibles doe, but may be Arched; Though it be true, they moue strongest in a Right Line; Which neuerthelesse is not caused by the Rightnesse of the Line, but by the Shortnesse of the distance; Linea recta breuissima. And therefore we see, if a Wall be betweene, and you speake on the one Side, you heare it on the other; Which is not because the Sound Passeth thorow the Wall; but Archeth ouer the Wall.

If the Sound be Stopped and Reperenssed, it commeth about on the other Side, in an Oblique Line. So, if in a Coach, one side of the Boot be downe, and the other vp; And a Begger beg on the Close Side; you would thinke that he were on the Open Side. So likewise, if a Bell or Clocke, be (for Example) on the North-side of a Chamber; And the Window of that Chamber be vpon the South; He that is in the Chamber, will thinke the Sound came from the South.

Sounds, though they spread round, (so that there is an Orbe, or Spherical Area of the Sound;) yet they moue strongest, and goe furthest in the Fore-lines, from the first Locall Impulsion of the Aire. And therefore in Preaching, you shall heare the Preachers Voice, better, before the Pulpit, than behinde it, or on the Sides, though it stand open. So a Plarquebuz, or Ordnance, will be further heard, forwards, from the Mouth of the Peece, than backwards, or on the Sides.

It may bee doubted, that Sounds doe moue better, Downwards than Vpwards, Pulpits are placed high aboue the People. And when the Ancient Generalls spake to their Armies, they had euer a Mount of Turfe cast vp, whereupon they stood: But this may be imputed to the Stops and Obstacles, which the voice meeteth with, when one speaketh vpon the leuell. But there seemeth to be more in it: For it may bee, that Spirituall Species, both of Things Visible and Sounds, doe moue better Downewards than Vpwards. It is a strange Thing, that to Men standing

below on the Ground, those that be on the Top of Pauls, seeme much lesse then they are, and cannot bee knowne; But to Men aboue, those below seeme nothing so much lessened, and may bee knowne; yet it is true, that all things to them aboue, seeme also somewhat contracted, and better collected into Figure: as Knots in Gardens shew best from an Vpper window, or Tarras.

But to make an exact Triall of it, let a Man stand in a Chamber, not much aboue the Ground, and speake out at the window, through a Trunke, to one standing on the Ground, as softly as he can, the other laying his Eare close to the Truncke: Then viâ versa, let the other speake below keeping the same Proportion of Softnesse; And let him in the Chamber lay his Eare to the Trunck: And this may be the aptest Meanes, to make a Iudgement, whether Sounds descend, or ascend, better.

After that Sound is created, (which is in a moment,) wee finde it continueth some small time, melting by little and little. In this there is a wonderfull Errour amongst Men, who take this to be a Continuance of the First Sound; whereas (in truth) it is a Renouation, and not a Continuance: For the Body percussed, hath by reason of the Percussion, a Trepidation wrought in the Minute Parts; and so reneweth the Percussion of the Aire. This appeareth manifestly, because that the Melting Sound of a Bell, or of a String strucken, which is thought to be a Continuance, ceaseth as soone as the Bell or String are touched. As in a Virginall, as soone as euer the Iacke falleth, and toucheth the String, the Sound ceaseth; And in a Bell, after you haue chimed vpon it, if you touch the Bell, the Sound ceaseth, And in this you must distingush, that there are two Trepidations: The one Manifest, and Locall; As of the Bell, when it is Pensile: The other Secret, of the Minute Parts; such as is described in the 9th Instance. But it is true, that the Locall helpeth the Secret great'y. We see likewise that in Pipes, and other winde Instruments, the Sound lasteth no longer, than the breath bloweth. It is true, that in Organs, there is a confused Murmur for a while, after you haue plaied; But that is but while the Bellowes are in Falling.

It is certaine, that in the Noise of great Ordnance, where many are shot off together, the Sound will be carried, (at the least) twenty Miles vpon the land, and

much further vpon the Water. But then it will come to the Eare; Not in the Instant of the Shooting off, but it will come an Houre, or more later. This must needs be a Continuance of the First Sound; For there is no Trepidation which should renew it. And the Touching of the Ordnance would not extinguish the Sound the sooner: So that in great Sounds the Continuance is more than Momentany.

To try exactly the time wherein Sound is Delated. Let a Man stand in a Steeple, and haue with him a Taper; And let some Vaile be put before the Tapar; And let another Man stand in the Field a Mile off. Then let him in the Steeple strike the Bell; And in the same Instant withdraw the Vaile; And so let him in the Field tell by his Pulse what distance of Time there is, betweene the Light seene, and the Sound heards For it is certaine that the Delation of Light is in an Instant. This may be tried in farre greater Distances, allowing greater Lights and Sounds.

It is generally knowne and obserued, that Light, and the Obiect of Sight, moue swifter than Sound; For we see the Flash of a Peece is seene sooner, than the Noise is heard. And in Flewing wood, if one be some distance off, he shall see the Arme lifted vp for a second Stroke, before he heare the Noise of the first. And the greater the Distance, the greater is the Preuention: As we see in Thunder, which is farre off; where the Lightning Precedeth the Cracke a good space.

Colours, when they represent themselues to the Eye, fade not, nor melt not by Degrees, but appeare still in the same Strength; But Sounds melt, and vanish, by little and little. The Cause is, for that Colours participate nothing with the Motion of the Aire; but Sounds doe. And it is a plaine Argument, that Sound participateth of some Locall Motion, of the Aire, (as a Cause Sinè quônon.) in that, it perisheth so suddenly; For in euery Section, or Impulsion of the Aire, the Aire doth suddenly restore and reunite it selfe; which the Water also doth, but nothing so swiftly.

In the Trialls of the Passage, or Not Passage of Sounds, you must take heed, you mistake not the Passing By the Sides of a Body, for the Passing thorow a

Body: And therefore you must make the Intercepting Body very close; For Sound will passe thorow a small Chincke.

Where Sound passeth thorow a Hard, or Close Body (as thorow Water; thorow a Wall; thorow Metall, as in Hawkes Bells stopped; &c.) the Hard, or Close Body, must be but thinne and small; For else it deadeth and extinguisheth the Sound vtterly. And therefore, in the Experiment of Speaking in Aire vnder Water, the Voice must not be very deepe within the Water: For then the Sound pierceth not. So if you speake on the further side of a Close Wall, if the Wall be very thicke, you shall not be heard: And if there were an Hogshead emptie, whereof the Sides were some two Foot thicke, and the Bunghole stopped; I conceiue the Resounding Sound, by the Communication of the Outward Aire, with the Aire within, would be little or none, But onely you shall heare the Noise of the Outward Knocke, as if the Vessell were full.

It is certaine, that in the Passage of Sounds thorow Hard Bodies, the Spirit of Pneumaticall Part of the Hard body it selfe, doth cooperate; But much better, when the Sides of that Hard Body are strucke, than when the Percussion is onely within, without: Touch of the Sides: Take therefore a Hawkes Bell, the holes; stopped vp, and hang it by a threed, within a Bottle Glasse; And stop the Mouth of the Glasse, very close with Wax; And then shake the Glasse, and see whether the Bell giue any Sound at all, or how weake? But note, that you must in stead of the Threed, take a Wire; Or else let the Glasse haue a great Belly; lest when you shake the Bell, it dash vpon the Sides of the Glasse.

It is plaine, that a very Long, and Downe-right Arch, for the Sound to passe, will extinguish the Sound quite; So that that Sound, which would be heard ouer a wall, will not be heard ouer a Church; Nor that Sound, which will be heard, if you stand some distance from the wall, will be heard if you stand close vnder the Wall.

Soft and Foraminous Bodies, in the first Creation of the Sound, will dead it; For the Striking against Cloth, or Furre, will make little Sound; As hath beene said: But in the Passage of the Sound, they will admit it better than Harder Bodies; As we see, that Curtaines, and Hangings, will not stay the Sound much;

But Glasse-windowes, if they be very Close, will checke a Sound more, than the like Thicknesse of Cloth. Wee see also, in the Rumbling of the Belly, how easily the Sound passeth thorow the Guts, and Skin.

It is worthy the Enquiry, whether Great Sounds, (As of Ordnance, or Bells,) become not more Weake, and Exile, when they passe thorow Small Crannies. For the Subtilties of Articulate Sounds, (it may be,) may passe thorow Small Crannies, not confused; But the Magnitude of the Sound (perhaps,) not so well.

The Mediums of Sounds are Aire; Soft and Porous Bodies; Also Water. And Hard Bodies refuse not altogether to be Mediums of Sounds. But all of them are dull and vnapt Deferents, except the Airè.

In Aire, the Thinner or Drier Aire, carrieth not the Sound so well, as the more Dense; As appeareth in Night Sounds; And Euening Sounds; And Sounds in moist Weather, and Southerne Winds. The reason is already mentioned in the Title of Maioration of Sounds; Being for that Thinne Aire is better pierced; but Thicke Aire preserueth the Sound better from Wast; Let further Triall be made by Hollowing in Mists, and Gentle Showers: For (it may be) that will somewhat dead the Sound.

How farreforth Flame may be a Medium of Sounds, (especially of such Sounds as are created by Aire, and not betwixt Hard Bodies) let it be tried, in Speaking where a Bonsire is betweene; But then you must allow, for some disturbance, the Noise that the Flame it selfe maketh.

Whether any other Liquours, being made Mediums, cause a Diuersity of Sound from Water, it may be tried: As by the Knapping of the Tongs; Or Striking of the Bottome of a vessell, filled either with Milke, or with Oyle; which though they be more light, yet are they more vnequall Bodies than Aire.

Of the Natures of the Mediums, we haue now spoken; As for the Disposition of the said Mediums, it doth consist in the Penning, or not Penning of the Aire; Of which we haue spoken before, in the Title of Delation of Sounds: It consisteth also in the Figure of the Concaue, through which it passeth; Of which we will speake next.

How the Figures of Pipes, or Concaues, through which Sounds passe; Or of other Bodies deferent; conduce to the Varietie and Alteration of the Sounds; Either in respect of the Greater Quantitie, or lesse Quantitie of Aire, which the Concaues receiue; Or in respect of the Carrying of Sounds longer or shorter way; Or in respect of many other Circumstances; they haue beene touched, as falling into other Titles. But those Figures, which we now are to speake of, wee intend to be, as they concerne the Lines, through which Sound passeth; As Straight; Crooked; Angular; Circular; &c.

The Figure of a Bell pertaketh of the Pyramis, but yet comming off, and dilating more suddenly. The Figure of a Hunters Horne, and Cornet, is oblique; yet they haue likewise Straight Heroes; which if they be of the same Bore with the Oblique, differ little in Sound; Saue that the Straight require somewhat a stronger Blast. The Figures of Recorders, and Flates, and Pipes are straight; But the Recorder hath a lesse Bore, and a greater; Aboue, and below. The Trumpts hath the Figure of the Letter S: which maketh that Purling Sound, &c. Generally, the Straight Like hath the cleanest and roundest Sound, And the Crooked the more Hoarse, and larring.

Of a Sinnous Pipe, that may haue some foure Flexions, Triall would be made, Likewise of a Pipe, made like a Crosse, open in the middest. And so likewise of an Angular Pipe: And see what will be the Effects of these seuerall Sounds. And so againe of a Circular Pipe; As if you take a Pipe perfect Round, and make a Hole whereinto you shall blow; And another Hole not farre from that; But with a Trauerse or Stope betweene them; So that your Breath may goe the Round of the Circle, and come forth at the second Hole. You may trie likewise Per — ssions of Solide Bodies of seuerall Figures; As Globes, Flare, Cobes, Croffes, Triangles, &c. And their Combinasions; As Flat against Flat; And Co — ex against Con — ; And Conn — against Flat, &c. And marks well the diversities of the Sounds. Tri —— the difference in Sound of seuerall Crasitudre of Hard Bodies percussed; And take knowledge of the — of the Sounds. I my selfe haue tried, that a Bell of Gold yeeldeth an excellent Sound, not infariour to that of Siluer, or Brasse, but rather better: yet wee see that a

peece of Money of Gold soundeth farre more flat than a peece of Money of Siluer.

The Harpe hath the Concaue, not along the Strings, but acrosse the Strings; And no Instrument hath the Sound so Melting, and Prolonged, as the Irish Harpe. So as I suppose, that if a Virginall were made with a double Concaue; the one all the length as the Virginall hath; the other at the End of the Strings, as the Harpe hath; It must needs make the Sound perfecter, and not so Shallow, and Iarring. You may trie it, without any Sound-Board along, but only Harpe-wise, at one End of the Strings: Or lastly with a double Concaue, at Each end of the Strings one.

There is an apparent Diuersitie betweene the Species Visible, and Audible, in this; That the Visible doth not mingle in the Medium, but the Audible doth. For if wee looke abroad, wee see Heauen, a number of Stars, Trees, Hills, Men, Beasts, at once. And the Species of the one doth not confound the other. But if so many Sounds came from seuerall Parts, one of them would vtterly confound the other. So wee see, that Voices or Consorts of Musicke doe make an Harmony by Mixture, which Colours doe not. It is true neuerthelesse, that a great Light drowneth a smaller, that it cannot be seene; As the Sunne that of a Gloworme; as well as a Great Sound drowneth a lesser. And I suppose likewise, that if there were two Lanthornes of Glasse, the one a Grimsin, and the other an Azure, and a Candle within either of them, those Coloured Lights would mingle and cast vpon a White Paper - Purple Colour. And euen in Colours, they yeeld a faint and weake Mixture: For white walls make Roomes more lightsome than blacke, &c. But the Cause of the Confusion in Sounds, and the Inconfusion in Species Visible, is, For that the Sight worketh in Right Lines, and maketh seuerall Cones; And so there can be no Coincidence in the Eye, or Visuall Point: But Sounds, that moue in Oblique and Arcuate Lines, must needs encounter, and disturbe the one the other.

The sweetest and best Harmony is, when euery Part, or Instrument, is not heard by it selfe, but a Conflation of them all; Which requireth to stand some

distance off. Euen as it is in the Mixture of Perfumes; Or the Taking of the Smells of seuerall Flowers in the Aire.

The Disposition of the Aire, in other Qualities, except it be ioyned with Sound, hath no great Operation vpon Sounds: For whether the Aire be lightsome or darke, hot or cold, quiet or stirring, (except it be with Noise) sweet-smelling, or stinking, or the like: it importeth not much: Some petty Alteration or difference it may make.

But Sounds doe disturbe and alter the one the other: Sometimes the one drowning the other, and making it not heard; Sometimes the one larring and discording with the other, and making a Confusion; Sometimes the one Mingling and Compounding with the other; and making an Harmony.

Two Voices of like lowdnesse, will not be heard, twice as farre, as one of them alone; And two Candles of like light, will not make Things seene twice as farre off, as one. The Cause is profound. But it seemeth that the Impressions from the Obiects of the Senses, doe mingle respectiu-ly, euery one with his kinde; But not in proportion, as is before demonstrated: And the reason may be, because the first Impression, which is from Priuatiue to Actiue, (As from Silence to Noise, or from Darknesse to Light,) is a greater Degree, than from Lesse Noise, to More Noise, or from Lesse Light, to More Light. And the Reason of that againe may be; For that the Aire, after it hath receiued a Charge, doth not receiue a Surcharge, or greater Charge, with like Appetite, as it doth the first Charge. As for the Encrease of Vertue, generally, what Proportion it beareth to the Encrease of the Matter, it is a large Field, and to be handled by it selfe.

All Reflexions Concurrent doe make Sounds Greater; But if the Body that createth, either, the Originall Sound, or the Reflexion, be cleane and smooth, it maketh them Sweeter. Triall may be made of a Lute, or Violl, with the Belly of polished Brasse, in stead of Wood. We see that euen in the Open Aire, the Wire String is sweeter, than the String of Guts. And we see that for Reflexion, Water excelleth; As in Musick neare the Water; Or in Eccho's.

It hath beene tried, that a Pipe a little moistened on the inside, but yet so as there be no Drops left, maketh a more solemne Sound, than if the Pipe were dry:

But yet with a sweet Degree of Sibilation, or Purling. As we touched it before in the title of Equality. The Cause is, for that all Things Porous, being superficially wet, and (as it were) betweene dry and wet, become a little more Euen and Smooth; But the Purling, (which must needs proceed of Inequality,) I take to be bred betweene the Smoothnesse of the in ward Surface of the Pipe, which is wet; And the Rest of the Wood of the Pipe, vnto which the Wet commeth nor, but it remaineth dry.

In Frosty weather, Mosicke within doores soundeth better. Which may be, by reason, not of the Disposition of the Aire, but of the Wood or String of the Instrument; which is made more Crispe, and so more porous and hollow: And we see that Old Lutes sound better than New, for the same reason. And so doe Lute Strings that haue beene kept long.

Sound is likewise Meliorated by the Mingling of open Aire with Pent Aire; Therefore Triall may be made, of a Lute or Violl with a double Belly; Making another Belly with a Knot oliet the Strings; yet so, as there be Roome enough for the Strings, and Roome enough to play below that Belly. Triall may be made also of an Irish Harpe, with a Concaue on both Sides; Whereas — seth to haue it but on one Side. The doubt may be, lest it should make too much Resounding; wherby one Note would ouertake anot —

If you sing into the Hole of a Drum, it maketh the Singing more sweet. And so I conceiue it would, if it were a Song in Parts, sung into seuerall Drums; And for handsomnesse and strangeness sake, it would not be amisse to haue a Curtaine betweene the Place where the Drums are, and the Hearers.

When a Sound is created in a Wind-Instrument, betweene the Breath and the Aire, yet if the Sound be communicate with a more equall Body of the Pipe, it meliorateth the Sound. For (no doubt) there would be a differing Sound in a Trumpet, or Pipe of Wood; And againe in a Trumpet or Pipe of Brasse. It were good to try Recorders and Hunters Hornes of Brasse, what the Sound would be.

Sounds are meliorated by the Intension of the Sense; where the Common Sense is collected most, to the particular Sense of Hearing, and the Sight suspended: And therefore, Sounds are sweeter, (as well as greater,) in the Night,

than in the Day; And I suppose, they are sweeter to blinde Men, than to Others: And it is manifest, that betweene Sleeping and Waking, (when all the Senses are bound and suspended) Musicke is farre sweeter, than when one is fully Waking.

It is Thing strange in Nature, when it is attentiuely considered; How Children, and some Birds, learne to imitate Speech. They take no Marke (at all) of the Motion of the Mouth of Him that speaketh; For Birds are as well taught in Darke, as by Light. The Sounds of Speech are very Curious and Exquisite: So one would thinke it were a Lesson hard to learne. It is true, that it is done with time, and by little and little, and with many Essayes and Proffers: But all this dischargeth not the Wonder. It would make a Man thinke (though this which we shall say may seeme exceeding strange) that there is some Transmission of Spirits; and that the Spirits of the Teacher put in Motion, should worke with the Spirits of the Learner, a Predisposition to offer to Imitate; And so to perfect the Imitation by degrees. But touching Operations by Transmissions of Spirits, (which is one of the highest Secrets in Nature,) we shall speake in due place; Chiefly when we come to enquire of Imagination. But as for Imitation, it is certaine, that there is in Men, and other Creatures, a predisposition to Imitate We see how ready Apes and Monkies are, to imitate all Motions of Man: And in the Catching of Dottrells, we see, how the Foolish Bird playeth the Ape in Gestures: And no Man (in effect) doth accompany with others, but he learneth, (ere he is aware,) some Gesture, or Voice, or Fashion of the other.

In Imitation of Sounds, that Man should be the Teacher, is no Part of the Matter; For Birds will learne one of another; And there is no Reward, by feeding, or the like, giuen them for the Imitation; And besides, you shall haue Parrots, that will not only Iimitate Voices, but Laughing, Knocking, Squeaking of a Doore vpon the Hinges, or of a Cart-wheele; And (in effect) any other Noise they heare.

No Beast can imitate the Speech of Men, but Birds onely; For the Ape it selfe that is so ready to imitate otherwise, attaineth not any degree of Imitation of Speech. It is true, that I haue knowne a Dog, that if one how led in his Eare, he would fall a how ling a great while. What should be the Aptnesse of Birds, in

comparison of Beasts, to imitate the Speech of Man, may be further enquired. We see that Beasts haue those Parts, which they count the Instruments of Speech, (as Lips, Teeth, &c.) liker vnto Man, than Birds. As for the Necke, by which the Throat passeth; we see many Beasts haue it, for the Length, as much as Birds. What better Gorge, or Attire, Birds haue, may be further enquired. The Birds that are knowne to be Speakers, are, Parrots, Pyes, layes, Dawes, and Rauens. Of which Parrots haue an adunque Bill, but the rest not.

But I conceiue, that the Apinesse of Birds, is not so much in the Conformitie of the Organs of Speech, as in their Attention. For Speech must come by Hearing, and Learning; And Birds giue more heed, and marke Sounds, more than Beasts; Because naturally they are more delighted with them, and practise them more; As appeareth in their Singing. We see also, that those that teach Birds to sing, doe keepe them Waking, to increase their Attention. We see also, that Cock-Birds, amongst SingingBirds, are euer the better Singers; which may be, because they are more liuely, and listen more.

Labour, and Intention to imitate voices, doth conduce much to Imitation: And therfore we see, that there be certaine P-nt-vimi that will represent the voices of Players of Enterludes, so to life, as if you see them not, you would thinke they were those Players themselues; and so the Voices of other Men that they heare.

There haue beene some, that could counterfeit the Distance of Voices, (which is a Secondary Obiect of Hearing,) in such sort; As when they stand fast by you, you would thinke the Speech came from a farre off, in a fearefull manner. How this is done, may be further enquired. But I see no great vse of it, but for Imposture, in counterseiting Ghosts or Spirits.

There be three Kindes of Reflexions of Sounds, A Reflexion Concurrent; A Reflexion Iterant, which we call Eccho; And a Super-reflexion, or an Eccho of an Eccho, wherof the first hath beene handled in the Title of Magnitude of Sounds: The Latter two we will now speake of.

The Reflexion of Species Visible, Mirrours, you may command; Because passing in Right Lines, they may be guided to any Point: But the Reflexion of

Sounds is hard to master; Because the Sound filling great Spaces in Arched Lines, cannot be so guided: and therfore we see there hath not beene practised, any Meanes to make Artificiall Eccho's. And no Eccho already knowne returneth in a very narrow Roome.

The Naturall Eccho's are made vpon Walls, Woods, Rockes, Hills, and Banckes; As for Waters, being neare, they make a Concurrent Eccho; But being further off, (as vpon a large Riuer) they make an Iterant Eccho: For there is no difference betweene the Concurrent Eccho, and the Iterant, but the Quicknesse, or Slownesse of the Returne. But there is no doubt, but Water doth helpe the Delation of Eccho; as well as it helpeth the Delution of Originall Sounds.

It is certaine, (as hath beene formerly touched,) that if you speake thorow a Truncke, stopped at the further end, you shall finde a Blast returne vpon your Mouth, but no Sound at all. The Cause is, for that the Closenesse, which preferueth the Originall, is not able to preserue the Reflected Sound: Besides that Eccho's are seldom created, but by loud Sounds. And therfore there is lesse hope of Artificiall Eccho's in Aire, pent in a narrow Concaue. Neuerthelesse it hath beene tried, that One leaning ouer a Well, of 25. Fathome deepe, and speaking, though but softly, (yet not so soft as a whisper,) the Water returned a good Audible Eccho. It would be tried, whether Speaking in Caues, where there is no Issue, faue where you speake, will not yeeld Eccho's, as Wells doe.

The Eccho commeth as the Originall Sound doth, in a Round Orbe of Aire: It were good to try the Creating of the Eccho, where the Body Repercussing maketh an Angle: As against the Returne of a Wall, &c. Also we see that in Mirrours, there is the like Angle of Incidence, from the Obiect to the Glasse, and from the Glasse to the Eye. And if you strike a Ball side-long, nor full vpon the Surface, the Rebound will be as much the contrary way; Whether there be any such Re-ilience in Eccho's, (that is, whether a Man shall heare better, if he stand aside the Body Repercussing, than if he stand where he speaketh, or any where in a right Line betweene;) may be tried. Triall likewise would be made, by Standing nearer the Place of Repercussing, than he that speaketh; And againe by

Standing further off, than hee that speaketh; And so Knowledge would be taken, whether Eccho's, as well as Originall Sounds, be not strongest neare hand.

There be many Places, where you shall heare a Number of Eccho's, one after another: And it is, when there is Variety of Hills, or Woods, some nearer, some further off: So that the Returne from the further, being last created, will be likewise last heard.

As the Voice goeth round, as well towards the Backe, as towards the Front of him that speaketh; So likewise doth the Eccho; For you haue many Back-Eccho's to the Place where you stand.

To make an Eccho, that will report, three, or foure, or fiue Words, distinctly, it is requisite, that the Body Repercussing, be a good distance off: For if it be neare, and yet not so neare, as to make a Concurrent Eccho, it choppeth with you vpon the sudden. It is requisite likewise, that the Aire be not much pent. For Aire, at a great distance, pent, worketh the same effect with Aire, at large, in a small distance. And therefore in the Triall of Speaking in the Well, though the Well was deepe, the Voice came backe, suddenly; And would beare the Report but of two Words.

For Eccho's vpon Eccho's, there is a rare Instance thereof in a Place, which I will now exactly describe. It is some three or foure Miles from Paris, neere a Towne called Pont-charenton; And some Bird-bolt shot, or more, from the Riuer of Seane. The Roome is a Chappell, or small Church. The Walls all standing, both at the Sides, and at the Ends. Two Rowes of Pillars, after the manner of Isles of Churches, also standing; The Roofe all open, not so much as any Embowment neere any of the walls left. There was against euery Pillar, a Stacke of Billets, aboue a Mans Height; which the Watermen, that bring Wood downe the Seane, in Stacks, and not in Boats, laid there (as it seemeth) for their ease. Speaking at the one End, I did heare it returne the Voice thirteene seuerall times; And I haue heard of others, that it would returne sixteene times: For I was there about three of the Clocke in the Afternoone: And it is best, (as all other Eccho's are) in the Euening. It is manifest, that it is not Eccho's from seuerall places, but a Tossing of the Voice, as a Ball, to and fro; Like to Reflexions in Looking-

glasses; where if you place one Glasse before, and another behinde, you shall see the Glasse behinde with the Image, within the Glasse before; And againe, the Glasse before in that; and diuers such Super-Reflexions, till the species speciei at last die. For it is euery Returne weaker, and more shady. In like manner, the Voice in that Chappell, createth speciem, speciei, and maketh succeeding Super-Reflexions; For it melteth by degrees, and euery Reflexion is weaker than the former: So that, if you speake three Words, it will (perhaps) some three times report you the whole three Words; And then the two latter Words for some times; And then the last Word alone for some times; Still fading, and growing weaker. And whereas in Eccho's of one Returne, it is much to heare foure or fiue Words; In this Eccho of so many Returnes, vpon the matter, you heare aboue twenty Words, for three.

The like Eccho vpon Eccho, but only with two Reports, hath beene obserued to be, if you stand betweene a House, and a Hill, and lure towards the Hill. For the House will giue a Backe-Eccho; One taking it from the other, and the latter the weaker.

There are certaine Letters, that an Eccho will hardly expresse; As S, for one; Especially being Principiall in a Word. I remember well, that when I went to the Eccho at Pont-Charenton, there was an Old Parisian, that tooke it to be the Worke of Spirits, and of good Spirits. For, (said he) call Saten, and the Eccho will not deliuer backe the Deuils name; But will say, Va-'on; Which is as much in French, as Apage, or A-oid. And thereby I did hap to finde, that an Eccho would not returne S, being but a Hissing and an Interiour Sound.

Eccho's are some more sudden, and chop againe, as soone as the Voice is deliuered; As hath beene partly said: Others are more deliberate, that is, giue more Space betweene the Voice, and the Eccho; which is caused by the locall Nearenesse, or Distance: Some will report a longer Traine of Words; And some a shorter: Some more loud (full as loud as the Originall, and sometimes more loud;) And some weaker and fainter.

Where Eccho's come from seuerall Parts, at the same distance, they must needs make (as it were) a Quire of Eccho's, and so make the Report greater, and

euen a Continued Eccho; which you shall finde in some Hills, that stand encompassed, Theater-like.

It doth not yet appeare, that there is Refraction in Sounds, as well as in Species Visible. For I doe not thinke, that if a Sound should passe through diuers Mediums, (as Aire, Cloth, Wood) it would deliuer the Sound, in a differing Place, from that vnto which it is deferred; which is the Proper Effect of Refraction. But Maioration, which is also the Worke of Refraction, appeareth plainly in Sounds, (as hath beene handled at full;) But it is not by Diuersitie of Mediums.

We haue obitèr, for Demonstrations sake, vsed in diuers Instances, the Examples of the Sight, and Things Visible, to illustrate the Nature of Sounds. But wee thinke good now to prosecute that Comparison more fully.

CONSENT OF VISIBLES, and Audibles.

BOth of them spread themselues in Round, and fill a whole Floare or Orbe, vnto certaine Limits: And are carried a great way: And doe languish and lessen by degrees, according to the Distance of the Obiects from the Sensories.

Both of them haue the whole Species in euery small Portion of the Aire, or Medium; So as the Species doe passe through small Crannies, without Confusion: As we see ordinarily in Leuels, as to the Eye; And in Crannies, or Chinks, as to the Sound.

Both of them are of a sudden and easie Generation and Delation; And likewise perish swiftly, and suddenly; As if you remoue the Light; Or touch the Bodies that giue the Sound.

Both of them doe receiue and carry exquisite and accurate Differences; As of Colours, Figures, Motions, Distances, in Visibles; And of Articulate Voices, Tones, Songs, and Quauerings, in Audibles.

Both of them in their Vertue and Working, doe not appeare to emit any Corporall Substance into their Mediums, or the Orbe of their Vertue; Neither againe to raise or stirre any euident locall Motion in their Mediums, as they passe; But only to carrry certaine Spirituall Species; The Perfect Knowledge of the Cause whereof, being hitherto scarcely attained, wee shall search and handle in due place.

Both of them seeme not to generate or produce any other Effect in Nature, but such as appertaineth to their proper Obiects, and Senses, and are otherwise Barren.

But Both of them in their owne proper Action, doe worke three manifest Effects. The First, in that the Stronger Species drawneth the E-sser; As the Light of the Sunne, the light of a Glow-worme; The Report of an Ordnance, the Voice; The Second, in that an Obiect of Surcharge or Excesse destroyeth the Sense; As the Light of the Sunne the Eye, a violent Sound (neare the Eare) the Hearing:

The Third, in that both of them will be reuerberate; As in Mirrours; And in Eccho's.

Neither of them doth destroy or hinder the Species of the other, although they encounter in the same Medium; As Light or Colour hinder not Sound; Nor -contr-.

Both of them affect the Sense in Liuing Creatures, and yeeld Obiects of Pleasure and Dislike: Yet neuerthelesse, the Obiects of them doe also (if it be well obserued) affect and worke vpon dead Things; Namely, such as haue some Conformity with the Organs of the two Senses; As Visibles worke vpon a Looking-glasse, which is like the Pupill of the Eye; And Audibles vpon the Places of Eccho, which resemble, in some sort, the Cauerne and structure of the Eare.

Both of them doe diuersly worke, as they haue their Medium diuersly disposed. So a Trembling Medium (as Smoake) maketh the Obiect seeme to tremble; and a Rising or Falling Medium (as Winds) maketh the Sounds to rise, or fall.

To Both, the Medium, which it the most Prop-out- and Conducible, is Aire; For Glasse or Water, &c. are not comparable.

In Both of them, where the Obiect is Fine and Accurate, it conduceth much to haue the Sense Intentiue, and Erect; In so much as you contract your Eye, when you would see sharply; And erect your Eare, when you would heare attentiuely; which in Beasts that haue Eares moueable, is most manifest.

The Beames of Light, when they are multiplyed, and conglomerate, generate Heat; which is a different Action, from the Action of Sight: And the Multiplication and Conglomeration of Sounds doth generate an extreme Rarefaction of the Aire; which is an Action materiate, differing from the Action of Sound; If it be true (which is anciently reported) that Birds, with great shouts, haue fallen downe.

DISSENTS OF VISIBLES, and Audibles.

THe Species of Visibles soeme to be Emissions of Beames from the Obiect seene; Almost like Odours; saue that they are more Incorporecall: But the Species of Audibles seeme to Participate more with Locall Motion, like Percussions or Impressions made vpon the Aire. So that whereas all Bodies doe seeme to worke in two manners; Either by the Communication of their Natures; Or by the Impressions and Signatures of their Motions; The Diffusion of Species Visible seemeth to participate more of the former Operation; and the Species Audible of the latter.

The Species of Audibles seeme to be carried more manifestly thorow the Aire, than the Species of Visibles: For (I conceiue) that a Contrary strong Wind will not much hinder the Sight of Visibles, as it will doe the Hearing of Sounds.

There is one Difference, aboue all others, betweene Visibles and Audibles, that is the most remarkable; As that wherupon many smaller Differences doe depend: Namely, that Visibles, (except Lights,) are carried in Right Lines; and Audibles in Ar — Lines. Heriee it commeth to passe, that Visibles doe not intermingle; and confound one another, as hath beene said before; But Sounds doe. Hence it commeth, that the Solidity of Bodies doth not much hinder the Sight, so that the Bodies be cleare. and the Pores in a Right Line as in Glasse, Crystall, Diamonds, Water, &c. But a thin Scarse, or Handkerchiefe, though they be Bodies nothing so solide, hinder the Sight: Whereas (contrariwise) these Porous Bodies doe not much hinder the Hearing, but solide Bodies doe almost stop it, or at the least attenuate it. Hence also it commeth, that to the Reflexion of Visibles, small Glasses suffice; but to the Reuerberation of Audibles, are required greater Spaces, as hath likewise beene said before.

Visibles are seene further off, than Sounds are heard; Allowing neuerthelesse the Rate of their Bignesse; For otherwise a great Sound will be heard further off, than a Small Body seene.

Visibles require (generally) some Distance betweene the Obiect, and the Eye, to bee better seene; Whereas in Audibles, the nearer the Approch of the Sound is to the Sense, the better. But in this there may be a double Errour. The one, because to Seeing, there is required Light; And any thing that toucheth the Pupill of the Eye (all ouer,) excludeth the Light. For I haue heard of a Person very credible, (who himselfe was cured of a Cataract in one of his Eyes,) that while the Siluer Needle did worke vpon the Sight of his Eye, to remoue the Filme of the Cataract, he neuer saw any thing more cleare or perfect, than that white Needle: Which (no doubt,) was, because the Needle was lesser than the Pupill of the Eye; and so Cooke not the Light from it. The other Errour may be, for that the Obiect of Sight doth strike vpon the Pupill of the Eye, directly without any interception; wheras the Caue of the Eare doth hold off the Sound a little from the Organ: And so neuerthelesse there is some Distance required in both.

Visibles are s-if-lior carried to the Sense, than Audibles; As appeareth in Thunder and Lightning; Flame and Report of a Peece, — Motion of the Aire in Hewing of Wood. All which haue beene set downe heretofore, but are proper for this Title.

I conceiue also, that the Species of Audibles doe hang longer in the Aire, than those of Visibles: For although euen those of Visibles, doe hang some time, as we see in Rings turned, that shew like Spheres; In Lute-strings fillipped, A Fire-brand caried along, which leaueth a Traine of Light behinde it; and in the Twilight; And the like: Yet I conceiue that Sounds stay longer, because they are carried vp and downe with the Winde: And because of the Distance of the Time, in Ordnance a discharged, and heard twenty Miles off.

In Visibles, there are not sound Obiects so odious and in grate to the Sense, as in Audibles. For foule Sights doe rather displease, in that they exci-e the Memory of foule Things, than in the immediate Obiects. And therefore in —— — those foule Sights doe not much offend; But in Audibles, the Grating of a Saw, when it is sharpned, doth offend so much, as it Fen — the Teeth on Edge. And any of the harsh Discords in Musicke, the Eare doth straightwaies refuse.

In Visibles, after great Light, if you come suddenly into the Darke; Or contrariwise, out of the Darke into a Glaring light, the Eye is dazled for a time; and the Sight confused; not whether any such Effect be after great Sounds, or after a deepe Silence, may be better enquired. It is an old Tradiribit, th — those that dwell heare the C — n — of Nil — , are strucken deafe, But we finde no such effect, in Canno — ers, not Millers, not those that dwell vpon Bridges.

It seemeth that the Impression of Colour is so weake, as it worketh not but by a Cone of Direct Beames, or Right Lines; wherof the Basis is in the Obiect, and the Verticall Point in the Eye; So as there is a Corra-iation and Co — un —— of Beames; And those Beames so sent forth, yet are not of any force to bege-the like borrowed or second Beames, except it be by Reflexion, wherof we speake not. For the Beames passe, and giue little Ta —— — to that — te, which is Adiacent; which if they did, we should see Colours out of a Right line. But as this is in Colours, so otherwise it is in the Body of Light. For when there is a Skreene between the Candle and the Eye, yet the Light passeth to the Paper wheron One writeth; So that the Light is seene, where the Body of the Flame is not seene; And where any Colour (if it were placed where the Body of the Blame is) would not be seene. I iudge that Sound is of this Latter Nature: For when two are placed on both sides of a Wall, and the Voice is heard, I iudge it is not onely the Originall Sound, which passeth in an Arebed Line; But the Sound, which passeth aboue the Wall in a Right Line, begetteth the like Motion round about it, as the first did, though more weake.

All Concords and Discords of Musicke, are, (no doubt,) Sympathies, and Antipathies of Sounds. And so (likewise) in that Musicke, which we call Broken Musicke, or Consort Musicke; Some Consorts of Instruments are sweeter than others; (A Thing not suffciently yet obserued:) As the Irish Harpe, and Base Viall agree well: The Recorder and Stringed Musick agree well: Organs and the Voice agree well; &c. But the Virginalls and the Lute; Or the Welch-Harpe, and, Irish-Harpe; Or the Voice and Pipes alone, agree not so well; But for the Melieration of Musicke, there is yet much lest (in this Point of Exquisite Consorts) to try and ehquire.

There is a Common Obseruation, that if a Lute, or Viall, be layed vpon the Backe, with a small Straw vpon one of the Strings; And another Lute or Viall be laid by it; And in the other Lute or Viall, the Vnison to that String be strucken; it will make the String, moue; Which will appeare both to the Eye, and by the Strawes Falling off. The like will be, if the Diapason or Eight to that String be strucken, either in the same Lute, or Viall, or in others lying by; But in one of these there is any Report of Sound, that can be discerned, but onely Motion.

It was deuised, that a Viall should haue a Lay of Wire Strings below, as close to the Belly, as a Lute; And then the Strings of Guts mounted vpon a Bridge, as in Ordinary Vialls; To the end, that by this means, the vpper Strings strucken, should make the lower resound by Sympathy, and so make the Musicke the better; Which, if it be to purpose, then Sympathy worketh, as well by Report of Sound, as by Motion. But this deuice I conceiue to be of no vse; because the vpper Strings, which are stopped in great variety, cannot maintaine a Diapason or Vnison, with the Lower, which are neuer stopped, But if it should be of vse at all; it must be in Instruments which haue no Stops; as Virginalls, and Harpes; wherin triall may be made of two Rowes of Strings, distant the one from the other.

The Experiment of Sympathy may be transferred (perhaps) from Instruments of Strings, to other Instruments of Sound. As to try if there were in one Steeple, two Bells of Vnison, whether the striking of the one would moue the other, more than if it were another Accord: And so in pipes, (if they be of equall Bore, and Sound,) whether a little Straw or Feather would moue in the one Pipe, when the other is blowne at an Vnison.

It seemeth, both in Eare, and Eye, the Instrument of Sense hath a Sympathy or Similitude with that which giueth the Reflexion; (As hath beene touched befor.) For as the Sight of the Eye is like a Crystall, or Glasse, or Water; So is the Eare a sinuous Caue, with a hard Bone, to stop and reuerberate the Sound; Which is like to the Places that report Eccho's.

When a Man Yawneth, he cannot Heare so well. The Cause is, for that the Membrane of the Eare is extended; And so rather casteth off the Sound, than

draweth it to.

We Heare better when we hold our Breath, than contrary; In so much as in all Listening to attaine a Sound a farre off, Men hold their Breath. The Cause is, For that in all Expiration, the Motion is Outwards; And therefore, rather driueth away the voice, than draweth it: And besides we see, that in all Labour to doe things with any strength, we hold the Breath: And listening after any Sound, that is heard with difficulty, is a kinde of Labour.

Let it be tryed, for the Helpe of the Hearing, (and I conceiue it likely to succeed,) to make an Instrument like a Tunnell; The narrow Part whereof may be of the Bignesse of the Hole of the Eare; And the Broader End much larger, like a Bell at the Skirts; And the length halfe a foot, or more. And let the narrow End of it be set close to the Eare: And marke whether any Sound, abroad in the open Aire, will not be heard distinctly, from further distance; than without that Instrument; being (as it were) an Eare-Spectacle. And I haue heard there is in Spaine, an Instrument in vse to be set to the Eare, that helpeth somewhat those that are Thicke of Hearing.

If the Mouth be shut close, neuerthelesse there is yeelded by the Roofe of the Mouth, a Murmur, Such as is vsed by dumbe Men: But if the Nostrills be likewise stopped, on such Murmur can be made; Except it be in the Bottome of the Pallate towards the Throat. Whereby it appeareth manifestly, that a Sound in the Mouth, except such as aforesaid, if the Mouth be stopped, passeth from the Pallate, thorow the Nostrills.

The Repercussion of Sounds, (which we call Eccho,) is a great Argument of the Spirituall Essence of Sounds. For if it were Corporeall,) the Repercussion should be created in the same maner, and by like Instruments, with the Originall Sound-. But we see what a Number of Exquisite Instruments must concurre in Speaking of Words, where of there is no such Matter in the Returning of them; But onely a plaine Stop, and Repercussion.

The Exquisite Differences of Articulate Sounds, carried along in the Aire, shew that they cannot be Signalures or Impressions in the Aire, as hath beene well refuted by the Ancients. For it is true, that Seales make excellent

Impressions: And so it may be thought of Sounds in their first Generation: But then the Delation and Continuance of them without any new Sealing, shew apparently they cannot be Impressions.

All Sounds are suddenly made, and doe suddenly perish; But neither that, nor the Exquisite Differences of them, is Matter of so great Admiration: For the —— e — gs, and Warblings to Lutes, and Pipes, are as swift; And the Tongue, (which is no very fine Instrument,) doth in Speech, make no fewer Motions, than there be Letters in all the Words, which are vttered. But that Sounds should not onely be so speedily generated, but carried so farre euery way, in such a momentany time, deserueth more Admiration. As for Example; If a Man stand in the middle of a Field, and speake aloud, he shall be heard a Furlong in round; And that shall be in Articulate Sounds; And those shall be Entire in euery little Portion of the Aire; And this shall be done in the Space of lesse than a Minute.

The Sudden Generation and Perishing of Sounds, must be one of these two Waies. Either that the Aire suffereth some Force by Sound, and then restoreth it selfe; As Water doth; Which being diuided, maketh manny Circles, till it restore it selfe to the naturall Consistence: Or otherwise, that the Aire doth willingly imbibe the Sound as gratefull, but cannot maintaine it; For that the Aire hath (as it should seeme) a secret and hidden Appetite of Receiuing the Sound at the first; But then other Grosse and more Materiate Qualities of the Aire straightwaies suffocate it; Like vnto Flame, which is generated with Alacrity, but straight quenched by the Enmity of the Aire, or other Ambient Bodies.

There be these Differences (in generall) by which Sounds are diuided; 1. Musicall, Immusicall; 2. Treble, Base; 3. Flat, Sharpe; 4. Soft, Loud; 5. Exteriour, Interiour, 6. Cleane, Harsb or Purling; 7. Articulate, Inarticulate.

We haue laboured (as may appeare,) in this Inquisition of Sounds, diligently; Both because Sound is one of the most Hidden Portions of Nature, (as we said in the beginning:) And because it is a Vertue which may be called Incorporeall, and Immateriate; wherof there be in Nature but few. Besides, we were willing, (now in these our first Centuries,) to make a Patterne or President of an Exact Inquisition; And we shall doe the like hereafter in some other Subiects which

require it. For we desire that Men should learne and perceiue, how seuere a Thing the true Inquisition of Nature is; And should accustome themselues, by the light of Particulars, to enlarge their Mindes, to the Amplitude of the World; And not reduce the World to the Narrownesse of their Mindes.

Metalls giue Orlens and Fine Colours in Dissolutions; As Gold giueth an excellent Yellow; Quick-Siluer an excellent Greene; Tinne giueth an excellent Azure: Likewise in their Putrefactions, or Rusts; As Vermilion, Verdegrease, Bise, Cirrus, &c. And likewise in their vitrifications. The Cause is, for that by their Strength of Body, they are able to endure the Fire, or Strong Waters, and to be put into an Equall Posture; And againe to retaine Part of their principall Spirit; Which two Things, (Equall Posture, and Quicke Spirits) are required chiefely, to make Colours lightsome.

It conduceth vnto Long Life, and to the more Placide Motion of the Spirits, which thereby doe lesse prey and consume the Iuyce of the Body; Either that Mens Actions bee free and voluntary; That nothing bee done Inuitâ Mineruâ, but Secundum Genium: Or on the other side, that the Actions of Men bee full of Regulation, and Commands within themselues: For then the Victory and Performing of the Command, giueth a good Disposition to the Spirits; Especially if there bee a Proceeding from Degree to Degree; For then the Sense of Victory is the greater. An example of the former of these, is in a Countrey life; And of the latter, in Monkes and Philosophers, and such as doe continually enioyne themselues.

It is certaine, that in all Bodies, there is an Appetite of Vnion, and Euitation of Solution of Continuity: And of this Appetite there bee many Degrees; But the most Remarkable, and fit to bee distinguished, are three. The first in Liquours; The second in Hard Bodies: And the third in Bodies Cleaning or Tenacious. In Liquours, this Appetite is weake: We see in Liquours, the Thredding of them in Stillicides, (as hath beene said;) The Falling of them in Round Drops, (which is the forme of Vnion;) And the Staying of them, for a little time, in Bubbles and Froth. In the second Degree or Kinde, this Appetite is strong; As in Iron, in Stone, in Wood, &c. In the third, this Appetite is in a Medium betweene the

other two: For such Bodies doe partly follow the Touch of another Body; And partly sticke and continue to themselues; And therefore they roape, and draw themselues in Threds; As wee see in Pitch, Glew, Birdlime, &c. But note, that all Solide Bodies are Cleaning, more or lesse: And that they loue better the Touch of somewhat that is Tangible, than of Aire, For Water, in small quantity, cleaueth to any Thing that is Solide; And so would Metall too, if the weight drew it not off. And therefore Gold Foliate, or any Metall Foliate, cleaueth: But those Bodies which are noted to bee Clammy, and Cleauing, are such, as haue a more indifferent Appetite (at once,) to follow another Body; And to hold to Themselues. And therefore they are commonly Bodies ill mixed; And which take more pleasure in a Forraine Body, than in preseruing their owne Consistence; And which haue little predominance in Drought, or Moisture.

Time, and Heat, are Fellowes in many Effects.Heat drieth Bodies, that doe easily expire; As Parchment, Leaues, Roots, Clay, &c. And, so doth Time or Age arefie; As in the same Bodies, &c. Heat dissolueth and melteth Bodies, that keepe in their Spirits; As in diuers Liquefactions; And so doth Time, in some Bodies of a softer Consistence: As a manifest in Honey, which by Age waxeth more liquid: And the like in Sugar; And so in old Oyle, which is euer more cleare, and more hot in Medicinable vse. Heat causeth the Spirits to search some Issue out of the Body; As in the Volatility of Metalls; And so doth Time; As in the Rust of Metalls. But generally Heat doththat in small time, which Age doth in long.

Some Things which passe the Fire are softest at first, and by Time grow hard; As the Crumme of Bread. Some are harder when they come from the Fire, and afterwards giue againe, and grow soft, as the Crust of Bread, Bisket, Sweet Meats, Salt, &c. The Cause is, for that in those things which waxe Hard with Time, the Worke of the Fire is a Kinde of Melting: And in those that waxe Soft with Time, (contrariwise,) the woke of the Fire is a Kinde of Baking; And whatsoeuer the Fire baketh, Time doth in some degree dissolue.

Motions passe from one Man to another, not so much by Exciting Imagination; as by Inuitation; Especially if there be an Aptnesse or Inclination

before. Therefore Gaping, or Yawning, and Stretching doe passe from Man to Man; For that that causeth Gaping and Stretching is, when the Spirits are a little Heauy, by any Vapour, or the like. For then they striue, (as it were,) to wring out, and expell that which loadeth them. So Men drowzy, and desirous to sleepe; Or before the Fit of an Ague; doe vse to Yawne and Stretch; And doe likewise yeeld a Voice or Sound, which is an Interiection of Expulsion: So that if another be apt and prepared to doe the like, he followeth by the Sight of another. So the Laughing of another maketh to Laugh.

There be some knowne Diseases that are Infectious; And Others that are not. Those that are Infectious, are; First, such as are chiefly in the Spirits, and not so much in the Humours; And therefore passe easily from Body to Body: Such are Pestilences, Lippitudes; and such like. Secondly, such as Taint the Breath; Which wee see passeth manifestly from Man to Man; And not inuisibly, as the Affects of the Spirits doe: Such are Consumptions of the Lungs, &c. Thirdly such as come forth to the Skinne; And therefore taint the Aire, or the BodyAdiacent; Especially if they consist in an Vnctuous Substance, no apt to dissipate; Such are Scabs, and Lepronsie. Fourthly, such as are meerely in the Humours, and not in the Spirits, Breath, or Exhalations: And therefore they neuer infect, but by Touch onely; and such a Touch also, as commeth within the Epidermis; As the Venome of the French Poxe, And the Biting of a Mad Dog.

Most Powders grow, more Close and Coherent by Mixture of Water, than by Mixture of Oyle, though Oyle be the thicker Body; As Meale; &c. The Reason is the Congruity of Bodies; which if it be more, maketh a Perfecter Imbibition, and Incorporation; Which in most Powders is more betweene Them and Water, than betweene Them and Oyle: But Printers Colours ground, and Ashes, doe better incorporate with Oyle.

Much Motion and Exercise is good for some Bodies; And Sitting, and lesse Motion for Others. If the Body be Hot, and Void of Superflous Moistures, too much Motion hurteth: And it is an Errour in Physitians, to call too much vpon Exercise. Likewise Men ought to beware, that they vse not Exercise, and a Spare Diet both: But if much Exercise, then a Plentifull Diet, And if Sp-ring

Diet, then little Exercise. The Benefits that come of Exercise are, First, that it sendeth Nourishment into the Parts more forcibly. Secondly, that it helpeth to Exceme by Sweat, and so maketh the Parts assimilate the more perfectly. Thirdly, that it maketh the Substance of the Body more Solide and Compact; And so lesse apt to be Consumed and Depredated by the Spirits. The Euills that come of Exercise, are: First, that it maketh the Spirits more Hot and Predatory. Secondly, that it doth absorbe likewise, and attenuate too much the Moisture of the Body. Thirdly, that it maketh too great —— sion, (especially if it be violent,) of the Inward Parts; which delight more in Rest. But generally Exercise, if it be much, is no Friend to Prolongation of Life; Which is one Cause, why Women liue longer than Men, because they stirre lesse.

Some Food we may vse long, and much, without Glatting; As Bread, Flesh that is not fat, or rancke, &c. Some other, (though pleasant,) Glutteth sooner; As Sweet Meats, Fat Meats, &c. The Cause is, for that Appetite consisteth in the Emptinesse of Mouth of the Stomacke; Or possessing it with somewhat that is Astringent; and therfore Cold and Dry. But things that are Sweet and Fat, are more Filling: And do swimme and hang more about the Mouth of the Stomacke; And goe not downe so speedily: And againe turne sooner to Choler, which is hot, and euer abateth the Appetite. Wee see also, that another Cause of Society, is an Ouer-custome; and of Appetite is Nouelty: And therefore Meats, if the same be continually taken, induce Loathing. To giue the Reason of the Distast of Society, and of the Pleasure in Nouelty; and to distinguish not onely in Meats and Drinkes, but also in Motions, Loues, Company, Delights, Studies, what they be that Custome maketh more gratefull; And what more tedious; were a large Field. But for Meats, the Cause is Attraction, which is quicker, and more excited towards that which is new, than towards that whereof there remaineth a Rellish by former vse. And (generally) it is a Rule, that whatsoeuer is somewhat Ingrate at first, is made Gratefull by Custome; But whatsoeuer is too Pleasing at first, groweth quickly to satiate.

IV. Century.

ACCELERATION of Time, in Works of Nature, may well be esteemed Inter Magnalia Naturae. And euen in Diuine Miracles, Accelerating of the Time, is next to the Creating of the Matter. We will now therfore proceed to the Enquiry of it: And for Acceleration of Germination, we will referre it ouer, vnto to the place, where we shall handle the Subiect of Plants, generally; And will now begin with other Accelerations.

Liquours are (many of them,) at the first, thicke and troubled; As Must, Wort, Iuyces of Fruits, or Hearbs expressed, &c. And by Time they settle, and Clarifie. But to make them cleare, before the Time, is a great Worke; For it is a Spurre to Nature, and putteth her out of her pace; And besides it is of good vse, for making Drinkes, and Sances, Potable, and Seruiceable, speedily; But to know the —— — of Accelerating Clarification, we must first know the Causes of Clarification. The first Cause is, by the Separation of the Gresser Parts of the Liquour-, from the Finer. The second, by the Equall Distribution of the Spirits of the Liquour, with the 8 letters Parts; For that —— representeth Bodies Cleare and Vntroubled. The third, by the Resining the Spirit it selfe, which therby giueth to the Liquour more Splendour, and more Lustre.

First, for Separation; It is wrought by Weight; As in the ordinary Residence or Settlement of Liquours: By Heat: By Motion: By Precipitation, or Sublimation; (That is, a Calling of the seuerall Parts, either vp, or downe, which is a kinde of Attraction:) By Adhesion; As when a Body more Viscous is mingled and agitated with the Liquour: which Viscous Body (afterwards seuered) draweth with it the grosser Parts of the Liquour; And Lastly, By Percolation or Passage.

Secondly, for the Euen Distribution of the Spirits; It is wrought By Gentle Heat; And By Agitation or Motion; (For of Time we speake not, because it is that, we would anticipate & represent:) And it is wrought also, By Mixture of

some other Body, which hath a vertue to open the Liquour, and to make the Spirits the better passe thorow.

Thirdly, for the Refining of the Spirit, it is wrought likewise By Heat; By Motion; And by Mixture of some Body which hath Vertue to attenuate. So therefore (hauing shewen the Causes) for the Accelerating of Clarification, in generall, and the Enducing of it; take these Instances, and Trialls.

It is in common Practise, to draw Wine, or Beere, from the Lees, (which we call Racking;) wherby it will Clarifie much the sooner: For the Lees, though they keepe the Drinke in Heart, and make it lasting; yet withall they cast vp some Spissitude: And this Instance is to be referred to Separation.

On the other side, it were good to try, what the Adding to the Liquour more Lees than his owne will worke; For thought the Lees doe make the Liquour turbide, yet they refine the Spirits. Take therfore a Vessell of New Beere; And take another Vessell of New Beere, and Rack the one Vessell from the Lees, and powre the Lees of the Racked Vessell into the vnracked Vessell, and see the Effect: This Instance is referred to the Refining of the Spirits.

Take New Beere, and put in some Quantitie of Stale Beere into it, and see whether it will not accelerate the Clarification, by Opening the Body of the Beere, and Cutting the Grosser Parts, wherby they may fall downe into Lees. And this Instance againe is referred to Separation.

The longer Malt, or Herbs, or the like, are Infused in Liquour, the more thicke and troubled the Liquour is; But the longer they be decocted in the Liquour, the clearer it is. The Reason is plaine, because in infusion, the longer it is, the greater is the Part of the Grosse Body, that goeth into the Liquour: But in Decoction, though more goeth forth, yet it either purgeth at the Top, or fettleth at the Bottome. And therfore the most Exact Way to Clarifie is; First to Infuse, and then to take off the Liquour, and Decoct it; as they doe in Beere, which hath Malt first Infused in the Liquour, and is afterwards boiled with the Hop. This also is referred to Separation.

Take Hot Embers, and put them about a Bottle filled with New Beere, almost to the very Neck: Let the Bottle be well stopped, lest it flie out: And continue it,

renewing the Embers euery day, by the space of Ten Dayes; and then compare it with another Bottle of the same Beere set-by. Take also Lime both Quenched, and Vnquenched, and set the Bottles in them, vt Supra. This Instance is referred, both to the Euen Distribution, and also to the Refining of the Spirits by Heat.

Take Bottles, and Swing them; Or Carry them in a Wheels-Barrow, vpon Rough Ground; twice in a day: But then you may not fill the Bottles full, but leaue some Aire; For if the Liquour come close to the Stopple, it cannot play, nor flower: And when you haue shaken them well, either way, poure the Drinke into another Bottle, stopped close, after the vsuall manner; For if it stay with much Aire in it, the Drinke will pall; neither will it settle so perfectly in all the Parts. Let it stand sorce 24. houres: Then take it, and put it againe into a Bottle with Aire, vt supra: And thence into a Bottle Stopped, vt supra: And so repeat the same Operation for seuen dayes. Note that in the Emptying of one Bottle into another, you must doe it swiftly, lest the Drinke pall. It were good also, to trie it in a Bottle with a little Aire below the Neck, without Emptying. This Instance is referred to the Euen Distribution and Refining of the Spirits by Motion.

As for Percolation, Inward, and Outward, (which belongeth to Separation,) Triall would be made, of Clarifying by Adhesion, with Milks put into New Beere, and stirred with it: For it may be that the Grossar Part of the Beere will cleave to the Milke: The Doubt is, whether the Milke will feuer - ell againe; Which is soone tried. And it is vsuall in Clarifying Ippoerasse to put in Milke; Which after seuereth and carrieth with it the Grosser Parts of the Ippoerasse, as hath beene said elsewhere. Also for the better Clarification by Persolation, when they run New Beere, they vse to let it passe through a Strainer; And it is like the finer the Strainer is, the clearer it will be.

The Accelerating of Maturation Wee will now enquire of. And of Maturation it selfe. It is of three Natures. The Maturation of Fruits. The Maturation of Drinkes: And the Maturation of Impostumes, and Vlcers. This last we referre to another Place, where wee shall handle Experiments Medicinall. There be also other Maturations, as of Metalls, &c. whereof we will speake as Occasion

serueth. But we will begin with that of Drinkes, because it hath such a Affinitie with the Clarification of Liquours.

For the Maturation of Drinkes, it is wrought by the congregation of the Spirits together, whereby they digest more perfectly the Grosser Parts: And it is effected partly, by the same meanes, that Clarification is, (wherof wee spake before;) But then more, that an Extreme Clarification doth spread the Spirits so Smooth, as they become Dull, and the Drinke dead, which ought to haue a little Flouring. And therefore all your Cleare Amber Drinke is flat.

We see the Degrees of Maturation of Drinkes; In Must; In Wine, as it is drunke; And in Vinegar. Whereof Must hath not the Spirits well Congregated; Wine hath them well vnited; so as they make the Parts somewhat more Oylie: Vinegar hath them Congregated, but more Ieiune, and in smaller Quantitie; The greatest and finest Spirit and Part being exhaled: For we see Vinegar is made by setting the Vessell of Wine against the hot Sun: And therefore Vinegar will not burne; For that much of the Finer Parts is Exhaled.

The Refreshing and Quickning of Drinke Palled, or Dead, is by Enforcing the Motion of the Spirit: So wee see that Open Weather relaxeth the Spirit, and maketh it more liuely in Motion. Wee see also Bottelling of Beere, or Ale, while it is New, and full of Spirit, (so that it spirteth when the Stopple is taken forth) maketh the Drinke more quicke and windie. A Pan of Coales in the Cellar doth likewise good, and maketh the Drinke worke againe. New Drinke, put to Drinke that is Dead, prouoketh it to worke againe; Nay, which is more, (as some affirme,) A Brewing of New Beere, set by Old Beere, maketh it worke againe. It were good also to Enforce the Spirits by some Mixtures, that may excite and quicken them; As by Putting into the Bottles, Nitre, Chalke, Lime, &c. We see Creame is Matured, and made to rise more speedily, by Putting in Cold Water; which, as it seemeth, getteth downe the Whey.

It is tried, that the Burying of Bottles of Drinke well stopped, either in drie Earth, a good depth; Or in the Bottome of a Well within Water; And best of all the Hanging of them in a deepe Well somewhat aboue the Water, for some forthnights space, is an Excellent Meanes of making Drink fresh, and quicke: for

the Cold doth not cause my Exhaling of the Spirits at all; As Heat doth, though it rarifieth the rest that remaine: But Cold maketh the Spirits vigorous, and irritateth them, whereby they Incorporate the Parts of the Liquour perfectly.

As for the Maturation of Fruits; It is wrought by the Calling forth of the Spirits of the Body outward, and so Spreading them more Smoothly: And likewise by Digesting, in some degree, the Grosser Parts: And this is Effected, by Heat; Motion; Attraction; And by a Rudiment of Putrefaction: For the Inception of Putrefaction hath in it a Maturation.

There were taken Apples, and laid in Straw; In Hay; In Flower; In Chalke; In Lime; Couered ouer with Onions; Couered ouer with Crabs; Closed vp in Wax; Shut in a Box; &c. There was also an Apple hanged vp in Smoake: Of all which the Experiments sorted in this Manner.

After a Moneths Space, the Apple Enclosed in Wax, was as Greene and Fresh as at the first Putting in, and the Kernells continued White. The Cause is, for that all Exclusion of Open Aire, (which is euer Predatory) maintaineth the Body in his first Freshnesse, and Moisture: But the Inconuenience is, that it tasteth a little of the Wax: Which, I suppose, in a Pomgranate, or some such thick-coated Fruit, it would not doe.

The Apple Hanged in the Smoake, turned like an Old Mellow Apple, Wrinkled, Drle, Soft, Sweet Yellow within. The Cause is, for that such a degree of Heat, which doth neither Melt, nor Scorch, (For we see that in a greater Heat, a Roast Apple Softneth and Melteth; And Pigs feet, made of Quarters of Wardens, scorch and haue a Skin of Cole) doth Mellow, and not Adure: The Smoake also maketh the Apple (as it were) sprinkled with Soot, which helpeth to Mature. We see than in Drying of Peares, and Prunes, in the Ouen, and Remouing of them often as they begin to Sweat, there is a like Operation; But that is with a farre more Intense degree of Heat.

The Apples couered in the Lime and Ashes, were well Matured; As appeared both in their Yellownesse, and Sweetnesse. The Cause is, for that that Degree of Heat which is in Lime, and Ashes, (being a Smoothering Heat) is of all the rest most Proper; for it doth neither Liquefie, nor Atefie; And that is true Maturation,

N — that the Taste of those Apples was good; And therefore it is the Experiment fittest for Vse.

The Apples, Conered with Crabs, and Onions, were likewise well Matured. The Cause is, not any, Heat; But for that the Crab and the Onions draw forth the —— of the Apple, and spread them equally thorow out the — , which — away Hatdnesse —— — see f — one Apple — ath against another. And therefore in making of Cider, they turne the Apples first vpon a heape. So one Cluster of Grapes, that toucheth another —— it groweth ripeneth faster; —— —— —— —— —— —

The Apple —— —— and the S —— —— apparently, though —— —— — in the —— — more. The Cause is, for that the Hay and Straw haue a very low degree of Heat, but yet Close and Smoothering, and which drieth nor.

The Apple in the Close Box, was ripened also: The Cause is, for that all Alfe, kept close; hath a degree of Warmth. As we see in W —— — Plus-, &c.

Note that all these were Compared with another Apple, of the same kinds, that lay of it Selfe: And in Comparison of that, were more Sweet, and more Yellow, and so appeared to be most Ripe.

Taken Apple, or P — , or other like Fruit and Row — it vpon a Table hard: We see in Common Experience, that the doth Soften and Sweeten the Fruit presently▪ Which is Nothing but the S —— —— — of the Spirits into the Parts; For the —— D —— of the Spirits maketh the Ha — ishnesse: But this Hard Row — is betweene Concoction, and a Simple Maturation; Therefore, if you should Rowle them but gently, perhaps twice a day; And some seuen dayes▪ it is like they would mature more finely, and like vnto the Naturall Maturation.

Take an Apple, and cut out a Peece of the Top, and couer it, to see whether that Solution of Continuitie will not hasten a Maturation▪ We see that where a Waspe, or a Flie, or a Worme hath bitten, in a Grape, or any Fruit, it will sweeten hastily.

Take an Apple, &c. and pricke it with a Prinne full of Holes, not deepe, and smeare it a little with Sacke, or Cinnamon Water, or Spirit of Wine, euery day

for ten dayes, to see if the Virtuall Heat of the Wine, or Strong Waters, will not Mature it.

In these Trialls also, as was vsed in the first, set another of the same Fruits by, to Compare them: And trie them, by their Yellownesse, and by their Sweetnesse.

The World hath beene much abused by the Opinion of Making of Gold: The Worke it selfe I iudge to be possible; But the Meanes (hitherto propounded) to effect it, are, in the Practise, full of Errour and Imposture; And in the Theory, full of vnsound Imaginations. For to say, that Nature hath an Intention to make all Metals Gold; And that, if she were deliuered from Impediments, she would performe her owne Worke; And that, if the Crudities, Impurities, and Leprosities of Metals were cured, they would become Gold; And that a little Quantitie of the Medicine, in the Worke of Proiection, will turne a Sea of the Baser Metall into Gold, by Multiplying: All these are but dreames: And so are many other Grounds of Alchymy. And to helpe the Matter, the Alchymists call in likewise many Vanities, out of Astrologie; Naturall Magicke; Superstitious Interpretations of Scriptures; Auricular Traditions; Faigned Testimonies of Ancient Authors; And the like. It is true, on the other side, they haue brought to light not a few profitable Experiments, and thereby made the World some amends. But wee, when wee shall come to handle the Version and Transmutation of Bodies; And the Experiments concerning Metalls, and Mineralls; will lay open the true Wayes and Passages of Nature, which may leade to this great Effect. And wee commend the wit of the Chineses, who despaire of Making of Gold, but are Mad vpon the Making of Siluer: For certaine it is, that it is more difficult to make Gold, (which is the most Ponderous and Materiate amongst Metalls) of other Metalls, lesse Ponderous, and lesse Materiate; than (viâ versâ) to make Siluer of Lead, or Quick-Siluer; Both which are more Ponderous than Siluer; So that they need rather a further Degree of Fixation, than any Condensation. In the meanetime, by Occasion of Handling the Axiomes touching Maturation, we will direct a Triall touching the Maturing of Metalls, and therby Turning some of them into Gold; For we conceiue indeed, that a perfect good Concoction, or Disgestion, or Maturation of some Metalls,

will produce Gold. And here we call to minde, that wee knew a Dutch-man, that had wrought himselfe into the beleese of a great Person, by vndertaking that he could make Gold: Whose discourse was, that Gold might be made; But that the Alchymists Ouer-fired the Worke: For (he said) the Making of Gold did require a very temperate Heat, as being in Nature a Subterrany worke, where little Heat commeth; But yet more to the Making of Gold, than of any other Metall; And therefore, that he would doe it with a great Lampe, that should carry a Temperate and Equall Heat: And that it was the Worke of many Moneths. The Deuice of the Lampe was folly; But the Ouer-firing now vsed; And the Equall Heat to be required; And the Making it a Worke of some good Time; are no ill Discourses.

We resort therefore to our Axiomes of Maturation, in Effect touched before. The First is, that there be vsed a Temporate Heat; For they are euer Temperate Heats that Disgest, and Mature: Wherein we meane Temperate, according to the Nature of the Subiect; For that may be Temperate to Fruits, and Liquours, which will not worke at all vpon Metalls. The Second is, that the Spirit of the Metall be quickened, and the Tangible Parts opened: For without those two Operations, the Spirit of the Metall, wrought vpon, will not be able to disgest the Parts. The Third is, that the Spirits doe spread themselues Euen, and moue not Subsultorily; For that will make the Parts Close, and Pliant. And this requireth a Heat, that doth not rise and fall, but continue as Equall as may be. The Fourth is, that no Part of the Spirit be emitted, but detained: For if there be Emission of Spirit, the Body of the Metall will be Hard, and Churlish. And this will be performed, partly by the Temper of the Fire; And partly by the closenesse of the Vessell. The Fifth is, that there be Choice made of the likeliest and best Prepared Metall, for the Version: For that will facilitate the Worke. The Sixth is, that you giue Time enough for the Worke: Not to prolong Hopes (as the Alchymists doe;) but indeed to giue Nature a conuenient Space to worke in. These Principles are most certaine, and true; Wee will now deriue a direction of Triall out of them; Which may (perhaps) by further Meditation, be improued.

Let there be a Small Furnace made, of a Temperate Heat; Let the Heat be such, as may keepe the Metall perpetually Moulten, and no more; For that aboue

all importeth to the Worke. For the Materiall, take Siluer, which is the Metall that in Nature Symbolizeth most with Gold; Put in also, with the Siluer, a Tenth Part of Quick-siluer, and a Twelfth Part of Nitre, by weight; Both these to quicken and open the Body of the Metall: And so let the Worke be continued by the Space of Six Moneths, at the least. I wish also, that there be, at some times, an Iniection of some Oyled Substance; Such as they vse in the Recouering of Gold, which by Vexing with Separations hath beene made Churlish: And this is, to lay the Parts more Close and Smooth, which is the Maine Worke. For Gold (as we see) is the Closest (and therefore the Heauiest) of Metalls: And is likewise the most Flexible, and Tensible. Note, that to thinke to make Gold of Quick-Siluer, because it is the heauiest, is a Thing not to be hoped; For Quick-Siluer will not endure the Mannage of the Fire. Next to Siluer, I thinke Copper were fittest to bee the Materiall.

Gold hath these Natures: Greatnesse of Weight; Closenesse of Parts; Fixation; pliant-esse, or Softnesse; Immunity from Rust; Colour or Tincture of Yellow. Therfore the Sure Way, (though most about,) to make Gold, is to know the Causes of the Seuerall Natures before rehearsed, and the Axiomes concerning the same. For if a Man can make a Metall, that hath all these Properties, Let Men dispute, whether it be Gold, or no?

The Enducing and Accelerating of Putrefaction, is a Subiect of a very Vniuersall Enquiry: For Corruption is a Reciprocall to Generation. And they Two, are as Natures two Termes or Bundaries; And the Guides to Life and Death, Putrefaction is the Worke of the Spirits of Bodies, which euer are Vnquiet to Get forth, and Congregate with the Aire, and to onioy the Sunbeames: The Getting forth, or Spreading of the Spirits, (which is a Degree of Getting forth,) hath fine Differing Operations. If the Spirits be detained within the Body, and moue more violently, there followeth Colliquation; As in Metalls, &c. If more Mildely, there followeth Disgestion, or Maturation, As in Drinkes, and Fruits. If the Spirits be not meerely Detained, but Protrude a little, and that Motion be Confused, and Inordinate, there followeth Putrefaction; Which euer dissolueth the Consistence of the Body into much Inequality; As in Flesh, Rotten

Fruits, Shining Wood, &c. And also in the Rust of Metalls. But if that Motion be in a certaine Order, there followeth Viuification, and Figuration; As both in Liuing Creatures bred of Putrefaction, and in Liuing Creatures Perfect. But if the Spirits issue out of the Body, there followeth Deficcation, Induration, Consumption, &c. As in Bricke, Euaporation of Bodies Liquid, &c.

The Meanes to Enduce and Accelerate Putrefaction, are; First by Adding some Crude pr Watry Moisture; As in Wetting of any Flesh, Fruit, Wood, with Water, &c. For contrariwise Vnctuous and Oyly Substances preserue.

The Second is by Inuitation or Excitation; As when a Rotten Apple lyeth close to another Apple that is Sound; Or when Dung (which is a substance, already Putrified) is added to other Bodies. And this is also notably seene in Church-yards, where they bury much; Where the Earth will consume the Corps, in farre shorter time, than other Earth will.

The Third is, by Closenesse, and Stopping, which detaineth the Spirits, in Prison, more than they would; And thereby irritateth them to seeke Issue; As in Corne, and Cloaths, which waxe Musty; and therefore Open Aire (which they call Aer perstabilis) doth preserue: And this doth appeare more Euidently in Agnes, which come (most of them,) of Obstructions, and Penning the Humours, which thereupon Putrisie.

The Fourth is, by Solution of Continuity; As we see an Apple will rot sooner, if it be Cut or Pierced; And so will Wood, &c. And so the Flesh of Creatures aliue, where they haue receiued any Wound.

The Fifth is, either by the Exhaling, or by the Driuing back of the Principall Spirits, which preserue the Consistence of the Body; So that when their Gouernment is Dissolued, euery Part returneth to his Nature, or Homogeny. And this appeareth in Vrine, and Blond, when they coole, and thereby breake; It appeareth also in the Gangrene, or Mortification of Flesh, either by Opiates, or by Intense Colds. I conceiue also the same Effect is in Pestilences, for that the Malignity of the Infecting Vapour, daunceth the Principall Spirits, and maketh them fly, and leaue their Regiment; And then the Humours, Flesh, and Secondary Spirits, doe dissolue, and breake, as in an Anarchy.

The Sixth is, when a Forraine Spirit, Stronger and more Eager than the Spirit of the Body, entreth the Body; As in the Stinging of Serpents. And this is the Cause (generally) that vpon all Poysons followeth Swelling: And we see Swelling followeth also, when the Spirits of the Body it selfe, Congregate too much; As vpon Blowes, and Bruises; Or when they are Pent in too much, as in Swelling vpon Cold. And we see also, that the Spirits comming of Putrefaction of Humours in Agues, &c. Which may be counted as Forraine Spirits, though they be bred within the Body, doe Extinguish and Suffocate the Naturall Spirits, and Heat.

The Seuenth is, by such a Weake Degree of Heat, as setteth the Spirits in a little Motion, but is not able, either to disgest the Parts, or to Issue the Spirits; As is seene in Flesh kept in a Roome that is not Coole; Whereas in a Coole and Wet Larder it will keepe longer. And wee see, that Viuisication (whereof Putrefaction is the Bastard Brother,) is effected by such Soft Heats; As the Hatching of Egges; The Heat of the Wombe, &c.

The Eight is, by the Releasing of the Spirits; which before were close kept by the Solidnesse of their Couerture, and thereby their Appetite of Issuing checked; As in the Artificiall Rusts induced by strong Waters, in Iron, Lead, &c. And therefore Wetting hasteneth Rust, or Putrefaction of any thing, because it softeneth the Crust, for the Spirits to come forth.

The Ninth is, by the Enterchange of Heat and Cold, or Wet and dry; As wee see in the Moulding of Earth in Frosts, and Sunne; And in the more hasty Rotting of Wood, that is sometimes wet, sometimes dry.

The Tenth is, by Time, and the Worke Procedure of the Spirits themselues, which cannot keepe their Station; Especially if they be lost to themselues; And there be not Agitation or Locall Motion. As wee see in Corne not stirred; And Mens Bodies not exercised.

All Moulds are Inceptions of Putrefaction; As the Moulds of Pyes, and Flesh; the Moulds of Orenges, and Limons; which Moulds afterwards turne into Wormes, or more odious Putrefactions: And therfore (commonly) proue to be ill

Odour. And if the Body be Liquid, and not apt to Putrifie totally, it will cast vp a Mother in the Top; As the Mothers of Distilled Waters.

Mosse is a kinde of Mould, of the Earth, and Trees. But it may be better sorted as a Rudiment of Germination; To which we referre it.

It is an Enquiry of Excellent vse, to Enquire of the Meanes of Preuenting or Staying Putrefaction, For therein consisteth the Meanes of Conseruation of Bodies; For Bodies haue two Kindes of Dissolutions; The one by Consumption, and Deficcation; The other by Putrefaction. But as for the Putrefactions of the Bodies of Men, and Liuing Creatures, (as in Agues, Wormes, Consumptions of the Lungs, Impostumes, and Vlcers both Inwards and Outwards,) they are a great Part of Physicke, and Surgery: And therefore we will reserue the Enquiry of them to the proper Place, where we shall handle Medicinal Experiments of all Sorts. Of the rest we will now Enter into an Enquiry: wherein much light may be taken, form that which hath beene said, of the Meanes to Enduce or Accelerate Putrefaction; For the Remouing that, which caused Putrefaction, doth Preuent and Auoid Putrefaction.

The First Meanes of Prohibiting or Checking Putrefaction, is Cold: For so wee see Meat and Drinke will last longer, Vnputrified, or Vnsowred, in Winter, than in Summer: And we see that Flowers, and fruits, put in Conseruatories of Snow, keepe fresh. And this worketh by the Detention of the Spirits, and Constipation of the Tangible Parts.

The Second is Astriction: For Astriction prohibiteth Dissolution: As we see (generally) in Medicines, whereof such as are Astringents doe inhibite Putrefaction; And by the same reason of Astringency, some small Quantity of Oile of Vitrioll, will keepe Fresh Water long from Putrefying. And this Astriction is in a substance that hath a Virtuall Cold; And it worketh (partly) by the fame Meanes that Cold doth.

The Third is, the Excluding of the Aire; And againe, the Exposing to the Aire; For these Contraries, (as it commeth often to passe;) worke the same Effect, according to the Nature of the Subiect Matter. So we see, that Beere, or Wine, in Bottles close stopped, last long; That the Garners vnder Ground keepe

Come longer than those aboue Ground; and that Fruit closed in Waxe keepeth fresh: And likewise Bodies put in Honey, and Flower, keepe more fresh; And Liquours, Drinkes, and Iuices, with a little Oyle cast on the Top keepe fresh. Contratiwise, we see that Cloth and Apparell, not Aired, doe breed Moathes, and Mould; And the Diuersity is, that in Bodies that need Detenties of Spirits, the Excluston of the Aire doth good; As in Drinkes, and C —— : But in Bodies that need Emission of Spirits, to discharge some of the Superfluous Moisture, it doth hurt, for they require Atring.

The fourth is Motion, and Stirring; For Putrefaction asketh Rest; For the Subtill Motion, which Putrefaction requireth, is disturbed by any Agitation; And all Locall Motion keepeth Bodies Integrall, and their Parts together; As we see that Turning ouer of Corne in a Garner; Or Letting it runne like an Houre-glasse, from an vpper Roome into a Lower, doth keepe it Sweet; And Running Waters putrefie not; And in Mens Bodles. Exercise hindreth Putrefaction; And contrariwise Rest, and Want of Motion, or Stoppings, (whereby the Runne of Humours, or the Motion of Perspiration, is stayed,) further Putrefaction; As we part partly touched a little before.

The Fifth is, the Breathing forth of the Aduentitious Moisture in Bodies; For as Wetting doth hasten Putrefaction; So Connenient Drying. (wherby the more Radicall Moisture is onely kept in,) putteth backe Putrefaction: So we see that Herbs, and Flowers, if they be dried in the Shade; Or dried in the hot Sunne, for a small time, keepe best. For the Emission of the Loose and Aduentitious Moisture, doth betray the Radicall Moisture; And carryeth it out for Company.

The Sixth is, the Strengthning of the Spirits of Bodies; For as a Great Heat keepeth Bodies from Putrefaction; But a Tepide Heat enclineth them to Putrefaction: So a Strong Spirit likewise preserueth, and a Weake or Faint Spirit disposeth to Corruption. So we finde that Salt-water corrupteth not so soone as Fresh: And Salting of Oisters, and Powdring of Meat, keepeth them from Putrefaction, It would be tried also, whether Chalke put into Water, or Drinke doth not preserue it from Putrefying, or speedy Souring. So wee see that Strong Beere, will last longer than Small; And all Things, that are hot and Aromaticall,

doe helpe to preserue Liquours, or Powders, &c. Which they doe, as well by Strengthning the Spirits, as by Soaking out the loose Moisture;

The Seuenth is, Separation of the Cruder Parts, and thereby making the Body more Equall; for all vnperfect Mixture is apt to Putrefie; And Watry Substances are more apt to Putrefie, than Oyly. So we see Distilled Waters will last longer than Raw waters; And Things that haue passed the Fire, doe last longer, than those that haue not passed the Fire; As Dried Peares, &c.

The Eighth is, the Drawing forth continually of that part, where the Putrefaction beginneth: Which is (commonly) the Loose and watry Moisture; Not onely for the Reason before giuen, that it prouoketh the Radicall Moisture to come forth with it; But because being detained in the Body, the Putrefaction taking hold of it, insecteth the rest: As we see in the Embalming dead Bodies; And the same Reason is of Preseruing Herbs, or Fruits, or Flowers, in Branne, or Meale.

The Ninth, is the Commixiture of any Thing that is more Oily, or Sweet: For such Bodies are least apt to Putrefie, the Aire working little vpon them; And they not putrefying preserue the rest. And therefore we see Syrrups, and Ointments, will last longer, than Iuyces.

The Tenth is, the Commixture of somewhat that is Dry; For Putrefaction beginneth first from the Spirits; And then from the Moisture; And that that is dry is vnapt to puttrefie: And therefore Smoake preserueth Flesh; As wee see in Bacon, and Neats-Tongues, and Martlemas Beese, &c.

The Opinion of some of the Ancients, that Blowne Aires doe preserue Bodies, longer than other Aires, seemeth to Mee Probable; For that the Blowne Aires, being Ouer-charged and Compressed, will hardly receiue the Exhaling of any Thing, but rather repulse it. It was tried in a Blowne Bladder, whereinto Flesh was put, and likewise a Flower, and it sorted not; For Dry Bladders will not Blow: And New Bladders rather further Putrefaction: The way were therfore, blow strongly, with a Paire of Bellowes, into a Hogshead, putting into the Hogshead (before) that which you would haue preserued; And in the instant that you withdraw the Bellowes, stop the Hole close.

The Experiments of Wood that Shineth in the Darke, we haue diligently driuen, and pursued. The rather, for that of all Things, that giue Light here below, it is the most Durable. And hath least Apparent Motion, Fire and Flame are in continuall Expence; Sugar shineth onely while it is in Scraping; And Salt-water while it is in Dashing; Glowing — es haue their Shining while they liue or a little after; Onely Scales of Fishes (Putrified) seeme to be of the same Nature with Shining Wood; And it is true, that all Putrefaction hath with it an Inward Motion, as well as Fire, or Light. The Triall sorted thus. 1. The Shining is in some Peeces more Bright, in some more Di — ; but the most Bright of all doth not attaine to the Light of a Glow-w —— . 2. The Woods that haue beene tried to shine, are chiefly Sallow, and Willow; Also the A — , and Husle; It may be, it holdeth in others. 3. Both Roots, and Bodies doe shine, but the Roots better. 4. The Colour of the Shining Part, by Daylight, is in some Peeces White, in some Peeces inclining to Red; Which in the Countrey they call the White, and Red Garret. 5. The Part that Shineth, is, (for the most part) somewhat Safe, and Moist to feele to; But some was sound to be Firme and Hard; So as it might be figured into a Crosse, or into Beads, &c. But you must not looke to haue an Image, or the like, in any Thing that is Lightsome; For euen a face in Iron red Hot will not be seene, the Light confounding the small differences of Lightsome and Darksome, which shew the figure. 6. There was the Shining Part pared off, till you came to that, that did not Shine; But within two Dayes the Part Contiguous began also to Shine, being laid abroad in the Dew; So as it seemeth the Putrefaction spreadeth. 7. There was other dead Wood of like kinde, that was Laid abroad, which Shined not at the first; But after a Nights lying abroad began to Shine. 8. There was other Wood, that did First Shine; And being laid dry in the House, within fiue or six daies, Lost the Shining; And laid abroad againe, Recouered the Shining: 9. Shining woods, being laid in a Dry Roome, within a Seuen night, lose their Shining; But being laid in a Cellar, or Darke Roome, kept the Shining. 10. The Boring of Holes, in that kinde of Wood, and then laying it abroad, seemeth to conduce to make it Shine: The Cause is, for that all Solution of Continuity doth helpe on Putrefaction, as was touched before. 11. No Wood

hath beene yet tried to Shine, that was cut downe aliue, but such as was Rotted, both in Stocke, and Root, while it grew. 12. Part of the Wood that Shined, was Steeped in Oyle, and retained the Shining a Forthnight. 13. The like succeeded in some Steeped in Water, and much better. 14. How long the Shining will continue, if the Wood be laid abroad euery Night, and taken in and Sprinckled with Water in the Day, is not yet tryed. 15. Triall was made of laying it abroad in Frostie weather, which hurt it not. 16. There was a great Peece of a Root which did shine, and the Shining Part was Cut off, till no more Shined; Yet after two Nights, though it were kept in a drie Roome, it got a Shining.

The Bringing, forth of liuing Creatures may be accelerated in two Respects: The one, if the Embryon ripeneth and perfecteth sooner: The other if there be some Cause from the Mothers Body, of Expulsion or Putting it downe: whereof the Former is good, and argueth Strength; The Latter is ill, and commeth by Accident or Disease. And therefore the Ancient Obseruation is true, that the Childe borne in the Seuenth Mo — th, doth commonly well; But Borne in the Eighth Moneth, doth (for the most part) die. But the Cause assigned is Fabulous; Which is, that in the Eighth Moneth, should be the Returne of the Raigne, of the Planet Saturne: which (as they say) is a Planet Maligne; whereas in the Seuenth is the Raigne of the Moone, which is a Planet Propitious. But the true Cause is, for that where there is so great a Preuention of the Ordinary time, it is the lustinesse of the Childe; But when it is lesse, it is some Indisposition of the Mother.

To Accelerate Growth or Stature, it must proceed; Either from the Plentie of the Nourishment; Or from the Nature of the Nourishment; Or from the Quickening and Exciting of the Naturall Heat. For the first, Excesse of Nourishment is hurtfull; For it maketh the Childe Corpulent; And Growing in Breadth, rather than in Heighth. And you may take an Experiment from Plants, which, if they spread much, are seldome tall. As for the Nature of the Nourishment; First, it may not be too Drie; And therefore Children in Dayrie Countries doe wax more tall, than where they feed more vpon Bread, and Flesh. There is also a receiued Tale; That Boyling of Dasie Roots in Milke (which it is

certaine are great Driers) will make Dogs little. But so much is true, that an Ouer-drie Nourishment in Childhood putteth backe Stature. Secondly, the Nourishment must be of an Opening Nature; For that Attenuateth the Iuice, and furthereth the Motion of the Spirits, vpwards. Neither is it without cause, that Xenophon, in the Nouriture of the Persian Children, doth so much commend their Feeding vpon Cardamon; which (hee saith) made them grow better, and be of a more Actiue Habit. Cardamon is in Latine Nasturtium; And with vs Water-Cresses; Which, it is certaine, is an Herbe, that whilest it is young, is Friendly to Life. As for the Quickening of Naturall Heat, it must be done chiefly with Exercise; And therefore (no doubt) much Going to Schoole, where they sit so much, hindreth the Growth of Children; whereas Countrey People, that goe not to Schoole, are commonly of better Stature. And againe Men must beware, how they giue Children, any thing that is Cold in Operation; For euen Long Sucking doth hinder both Wit, and Stature. This hath beene tried, that a Whelpe, that hath beene fed with Nitre in Milke, hath become very little, but extreme liuely: For the Spirit of Nitre is Cold. And though it be an Excellent. Medicine, in Strength of yeares, for Prolongation of Life; yet it is, in Children and young Creatures, an Enemy to Growth: And all for the same Reason, For Heat is requisite to Growth: But after a Man is come to his Middle Age, Heat consumeth the Spirits; which the Coldnesse of the Spirit of Nitre doth helpe to condense, and correct.

There be two Great Families of Things; You may terme them by seuerall Names; Sulphureous and Mercuriall, which are the Chymists Words: (For as for their Sal, which is their Third Principle, it is a Compound of the other two;) Inflammable and Not Inflammable; Mature and Crude; Oily and Watry. For we see that in Subterranies there are, as the Fathers of their Tribes, Brimstone and Mercury: In Vegetables, and Liuing Creatures there is Water and Oyle: In the Inferiour Order of Pneumaticalls there is Aire and Flame: And in the Superiour, there is the Body of the Starre, and the Pure Sky. And these Paires, though they be vnlike in the Primitiue Differences of Matter, yet they seeme to haue many Consents: For Mercury and Sulphure are principall Materialls of Metalls; Water and Oyle, are principall Materialls of Vegetables, and Animals; And seeme to

differ but in Maturation, or Concoction: Flame (in Vulgar Opinion) is but Aire Incensed; And they both haue Quicknesse of Motion, and Facility of Cession, much alike: And the Interstellar Sky, (though the Opinion be vaine, that the Starre is the Denser Part of his Orbe,) hath notwithstanding so much Affinity with the Starre, that there is a Rotation of that, as well as of the Starre. Therefore, it is one of the greatest Magnalia Naturae, to turne Water, or Watry Iuyce, into Oile or Oily Iuyce: Greater in Nature, than to turne Siluer, or Quick-siluer, into Gold.

The Instances we haue, wherein Crude and Watry Substance turneth into Fat and Oily, are of foure kindes. First in the Mixture of Earth and Water; which mingled by the helpe of the Sunne, gather a Nitrous Fatnesse, more than either of them haue seuerally; As we see, in that they put forth Plants, which need both Iuyces.

The Second is in the Assimilation of Nourishment, made in the Bodies of Plants, and Liuing Creatures; Where of Plants turne the Iuyce of meere Water and Earth, into a great deale of Oily Matter: Liuing Creatures, though much of their Fat, and Flesh, are out of Oily Aliments, (as Meat, and Bread,) yet they Assimilate also in a Measure their Drinke of VVater, &c. But these two Wayes of Version of Water into Oyle, (namely by Mixture, and by Assimilation) are by many Passages, and Percolations, and by long Continuance of soft Heats, and by Circuits of Time.

The third is in the Inception of Putrefaction; As in Water Corrupted; And the Mothers of Waters Distilled; Both which haue a kinde of Fatnesse, or Oyle.

The Fourth is in the Dulcoration of some Metalls; As Saccharum Saturni, &c.

The Intention of Version of Water into a more Oily Substance, is by Disgestion; For Oile is almost Nothing else but Water disgested; And this Disgestion; is principally by Heats Which Heat must be either Outward, or Inward: Againe, it may be by Prouocation, or Excitation; Which is caused by the Mingling of Bodies already Oily, or Disgested; For they will somewhat Communicate their Nature with the rest. Disgestion also is strongly effected by direct Assimilation, of Bodies Crude into Bodies Disgested; As in Plants, and

Liuing Creatures, whose Nourishment is far more Crude than their Bodies: But this Disgestion is by a great Compasse, as hath beene said. As for the more full Handling of these two Principles, whereof this is but a Taste; (the Enquiry of which is one of the Profoundest Enquiries of Nature,) We leaue it to the Title of Version of Bodies; And likewise to the Title of the First Congregations of Matter; Which like a Generall Assembly of Estates, doth giue Law to all Bodies.

A Chameleon is a Creature about the Bignesse of an Ordinary Lizard: His Head vnproportionably bigge; His Eyes great: He moueth his Head without the writhing of his Necke, (which is inflexible,) as a Hogge doth: His Backe crooked; His Skin Spotted with little Tumours, lesse Eminent nearer the Belly; His Taile slender, and long: On each Foot he hath fiue Fingers; three on the Outside, and two on the Inside; His Tongue of a maruellous Length in respect of his Body, and hollow at the end; Which he will launch out to prey vpon Flses. Of Colour Greene, and of a dusky Yellow, brighter and whiter towards the Belly; Yet spotted with Blew, White, and Red. If hee be laid vpon Greene, the Greene predominateth; If vpon Yellow, the Yellow; Not so if he be laid vpon Blew, or Red, or White; Onely the Greene Spots receiue a more Orient Lustre: Laid vpon Blacke, he looketh all Blacke, though not without a Mixture of Greene. He feedeth not only vpon Aire, (though that be his principall Sustenance;) For sometimes hee taketh Flies, as was said; yet some that haue kept Chameleons a whole yeare together, could neuer perceiue that euer they fed vpon any Thing else but Aire; And might obserue their Bellies to swell after they had exhausted the Aire, and closed their Iawes; Which they open commonly against the Rayes of the Sunne. They haue a foolish Tradition in Magicke, that if a Chameleon be burnt vpon the Top of a House, it will raise a Tempest; Supposing (according to their vaine Dreames of Sympathies) because he nourisheth with Aire, his Body should haue great vertue to make Impression vpon the Aire.

It is reported by one of the Ancients, that in Part of Media, there are Eruptions of Flames out of Plaines; And that those Flames are cleare, and cast not forth such Smoake, and Ashes, and Pummice, as Mountaine Flames doe. The Reason (no doubt) is, because the Flame is not pent, as it is in Mountaines, and Earth-

quakes which cast Flame. There be also some Blinde Fires, vnder Stone, which flame not out, but Oile being powred vpon them, they flame out. The Cause whereof is, for that it seemeth, the Fire is so choaked, as not able to remoue the Stone, it is Heat, rather than Flame; Which neuerthelesse is sufficient to Enflame the Oyle.

It is reported, that in some Lakes, the Water is so Nitrous, as if Foule Cloaths be put into it, it scoureth them of it selfe: And if they stay any whit long, they moulder away. And the Scouring Vertue of Nitre is the more to be noted, because it is a Body Cold; And we see Warme Water scoureth better than Cold. But the Cause is, for that it hath a Subtill Spirit, which seuereth and diuideth any thing that is soule, and Viscous, and sticketh vpon a Body.

Take a Bladder, the greatest you can get; Fill it full of Winde, and tye it about the Necke with a Silke thred waxed; And vpon that put likewise Wax very close; So that when the Neck of the Bladder dryeth, no Aire may possibly get in, nor out. Then bury it three or foure foot vnder the Earth, in a Vault, or in a Conferuatory of Snow, the Snow being made hollow about the Bladder; And after some Forthnights distance, see whether the Bladder be shruncke: For if it be, then it is plaine, that the Coldnesse of the Earth, or Snow, hath Condensed the Aire, and brought it a Degree nearer to Water: Which is an Experiment of great Consequence.

It is a Report of some good credit, that in Deepe Caues, there are Pensile Crystall, and Degrees of Crystall that drop from aboue; And in some other, (though more rarely) that rise from below. Which though it be chiefly the Worke of Cold, yet it may be, that Water, that passeth thorow the Earth, gathereth a Nature more clammy, and fitter to Congeale, and become Solide, than Water of it selfe. Therfore Triall would be made, to lay a Heape of Earth, in great Frosts, vpon a Hollow Vessell, putting a Canuase betweene, that it falleth not in: And poure Water vpon it, in such Quantitie, as will be sure to soake thorow; And see whether it will not make an harder Ice in the bottome of the Vessell, and lesse apt to dissolue, than ordinarily. I suppose also, that if you make the Earth narrower at the bottome, than at the Top, in fashion of a Sugar Loafe Reuersed,

it will helpe the Experiment. For it will make the Ice, where it Issueth, lesse in Bulke; And euermore Smalnesse of Quantity is a Helpe to Version.

Take Damaske Roses, and pull them; Then dry them vpon the Top of an House, vpon a Lead or Tarras, in the hot Sunne, in a cleare day, betweene the Houres (onely) of twelue and two; or there abouts. Then put them into a Sweet Dry Earthen Bottle, or a Glasse, with narrow Mouthes, stuffing them close together, but without Bruising: Stop the Bottle, or Glasse, close, and these Roses will retaine, not onely their Smell Perfect, but their Colour fresh, for a yeare at least. Note, that Nothing doth so much destroy any Plant, or other Body, either by Putrefaction, or Arefaction, as the Aduentitious Moisture, which hangeth loose in the Body, if it be not drawne out. For it betrayeth and tolleth forth the Innate and Radicall Moisture, along with it, when it selfe goeth forth. And therefore in Liuing Creatures, Moderate Sweat doth preserue the Iuyce of the Body. Note that these Roses, when you take them from the Drying, haue little or no Smell; So that the Smell is a Second Smell, that issueth out of the Flower afterwards.

The Continuance of Flame, according vnto the diuersity of the Body Enflamed, and other Circumstances, is worthy the Enquiry; Chiefly, for that though Flame be (almost) of a Momentany Lasting, yet it receiueth the More, and the Lesse: we will first therefore speake (at large) of Bodies Enflamed, wholly, and Immediately, without any Wieke to helpe the Inflammations. A Spoonefull of Spirit of Wine, a little heated, was taken, and it burnt as long as came to 116. Pulses. The same Quantity of Spirit of Wine, Mixed with the Sixth Part of a Spoonefull of Nitre, burnt but to the space of 94. Pulses. Mixed with the like Quantity of Bay-salt, 83. Pulses. Mixed with the like Quantity of Gunpowder, which dissolued into a Blacke water, 110. Pulses. A Cube, or Pellet of Yellow Waxe, was taken, as much as halfe the Spirit of Wine, and set in the Middest, and it burnt onely to the space of 87. Pulses. Mixed with the Sixth Part of a spoonefull of Milke, it burnt to the space of 100. Pulses; And the Milke was crudled. Mixed with the Sixth Part of a spoonefull of Water, it burnt to the space of 86. Pulses; With an Equall Quantity of Water, onely to the space of 4. Pulses.

A small Pebble was laid in the Middest; and the Spirit of Wine burnt to the space of 94. Pulses. A Peece of Wood, of the Bignesse of an Arrow, and about a Fingers length, was set vp in the Middest, and the Spirit of Wine burnt to the space of 94. Pulses. So that the Spirit of Wine Simple, endured the longest; And the Spirit of Wine with the Bay-salt, and the Equall Quantity of Water, were the shortest.

Consider well, whether the more speedy Going forth of the flame, becaused, by the Greater Vigour of the Flame in Burning; Or by the Resistance of the Body mixed, and the Auersion thereof to take Flame: Which will appeare by the Quantitie of the Spirit of Wine, that remaineth after the Going out of the Flame. And it seemeth cleerely to be the latter; For that the Mixture of Things least apt to burne, is the Speediest in going out. And note, by the way, that Spirit of Wine burned, till it goe out of it selfe, will burne no more; And tasteth nothing so hot in the Mouth, as it did; No nor yet sowre, (as if it were a degree towards Vinegar,) which Burnt Wine doth; but flat and dead.

Note, that in the Experiment of Wax aforesaid, the Wax dissolued in the burning, and yet did not incorporate it selfe, with the Spirit of Wine, to produce one Flame; but wheresoeuer the Wax floated, the Flame forsooke it, till at last it spread all ouer, and put the Flame quite out.

The Experiments of the Mixtures of the Spirit of Wine enflamed, are Things of discouerie, and not of Vse: But now wee will speake of the Continuance of Flames, such as are vsed for Candles, Lamps, or Tapers; consisting of Inflammable Matters, and of a Wieke that prouoketh Inflamation. And this importeth not only Discouerie, but also Vse and Profit; For it is a great Sauing, in all such Lights, if they can be made as faire and bright as others, and yet last longer. Wax Pure made into a Candle, and Wax Mixed seuerally into Candle-stuffe, with the Particulars that follow; (viz Water, Aqua-vitae, Milke, Bay-salt, Oyle, Butter, Nitre, Brimstone, Saw-dust,) Euery of these bearing a Sixth Part to the Wax; And euery of these Candles mixed, being of the same Weight and Wieke with the Wax Pure, proued thus in the Burning, and Lasting. The Swiftest in Consuming was that with Saw-dust; Which first burned faire, till some part of

the Candle was consumed; and the Dust gathered about the Snaste; But then it made the Snaste bigge, and long, and to burne duskishly, and the Candle wasted in halfe the time of the Wax Pure. The next in Swiftnesse, were the Oyle, and Butter, which consumed, by a Fifth part, swifter than the Pure Wax. Then followed in Swiftnesse the Cleare Wax it selfe. Then the Bay-Salt, which lasted about an Eighth part longer than the Cleare Wax. Then followed the Aqua-vita, which lasted about a Fifth part longer than the Cleare Wax. Then followed the Milke, and Water, with little difference from the Aqua-vita, but the Water slowest. And in these foure last, the Wieke would spit forth little Sparks. For the Nitre, it would not hold lighted aboue some Twelue Pulses; But all the while it would spit out Portions of Flame, which afterwards would goe out into a vapour. For the Brimstone, it would hold lighted, much about the same time with the Nitre; But then after a little while, it would harden and cake about the Snaste; So that the Mixture of Bay-Salt with Wax, will winne an Eighth part of the time of lasting, and the Water a Fifth.

After the Seuerall Materialls were tried, Triall was likewise made of seuerall Wickes; As of Ordinary Cotton; Sowing Thred; Rush; Silke; Straw; and Wood. The Silke, Straw, and Wood, would flame a little, till they came to the Wax, and then goe out: of the Other Three, the Thred consumed faster than the Cotton, by a Sixth part of Time: The Cotton next: Then the Rush consumed flower than the Cotton, by at least a third part of time. For the Bignesse of the Flame, the Cotton, and Thred, cast a Flame much alike; and the Rush much lesse, and dimmer. Quare, whether Wood, and Wiekes both, as in Torches, consume faster, than the Wiekes Simple?

We haue spoken of the Seuerall Materialls, and the Seuerall Wiekes: But to the lasting of the Flame, it importeth also; Not only what the Materiall is, but in the same Materiall, whether it be Hard, Soft, Old, New, &c. Good Housewines, to make their Candles burne the longer, vse to lay them (one by one) in Bran, or Flower, which make them harder, and so they Consume the flower: Insomuch, as by this meanes, they will out-last other Candles, of the same Stuffe, almost Halfe in Halfe. For Bran and Flower haue a Vertue to Harden: So that both Age, and

lying in the Bran, doth helpe to the Lasting. And wee see that Wax Candles last longer than Tallow Candles, because Wax is more firme, and hard.

The Lasting of Flame also dependeth vpon the easie Drawing of the Nourishment; As we see in the Court of England, there is a Seruice which they call All-night; which is (as it were) a great Cake of Wax, with the Wieke in the Middest; whereby it commeth to passe, that the Wieke fetcheth the Nourishment further off. Wee see also that Lamps last longer, because the Vessell is farre broader, than the Bredth of a Taper, or Candle.

Take a Turretted Lampe of Tinne, made in the forme of a Squire; The Heighth of the Turret being thrice as much, as the length of the lower part, whereupon the Lampe standeth: Make only one Hole in it, at the End of the Returne furthest from the Turret. Reuerse it, and fill it full of Oile, by that Hole; And then set it vpright againe; And put a Wieke in at the Hole; And lighten it: You shall finde, that it will burne flow, and a long time. Which is caused, (as was said last before,) for that the Flame fetcheth the Nourishment a Farre off. You shall finde also, that as the Oile wasteth, and descendeth, so the Top of the Turret, by little and little, filleth with Aire; which is caused by the Rarefaction of the Oile by the Heat. It were worthy the Obseruation, to make a Hole, in the Top of the Turret, and to trie, when the Oile is almost consumed, whether the Aire made of the Oile, if you put to it a Flame of a Candle, in the letting of it forth, will Enflame. It were good also to haue the Lampe made, not of Tinne, but of Glasse, that you may see how the Vapour, or Aire gathereth, by degrees, in the Top.

A fourth Point, that importeth the lasting of the Flame, is the Closenesse of the Aire, wherein the Flame burneth. Wee see, that if Wind bloweth vpon a Candle, it wasteth apace. We see also, it lasteth longer in a Lanthorne, than at large. And there are Traditions of Lamps, and Candles, that haue burnt a very long time, in Caues, and Tombes.

A Fifth Point, that importeth the Lasting of the Flame, is the Nature of the Aire, where the Flame burneth; whether it be Hot or Cold; Moist or Drie. The Aire, if it be very Cold, irritateth the Flame, and maketh it burne more fiercely;

(As Fire scorcheth in Frostie weather;) And so furthereth the Consumption. The Aire once heated, (I conceiue) maketh the Flame burne more mildly, and so helpeth the Continuance. The Aire, if it be Drie, is indifferent: The Aire, if it be Moist, doth in a Degree quench the Flame: (As wee see Lights will goe out in the Dumps of Mines:) And howsoeuer maketh it burne more dully: And so helpeth the Continuance.

Burialls in Earth serue for Preseruation; And for Condensation; And for Induration of Bodies. And if you intend Condensation, or Induration you may burie the Bodies so, as Earth may touch them: As if you will make Artificiall Porcellane, &c. And the like you may doe for Conseruation, if the Bodies be Hard, and Solid; As Clay, Wood, &c. But if you intend Preseruation of Bodies, more Soft and Tender, then you must doe one of these two: Either you must put them in Cases, whereby they may not touch the Earth; Or else you must vault the Earth, whereby it may hang ouer them, and not touch them; For if the Earth touch them, it will doe more hurt, by the Moisture, causing them to putrifie, than good by the virtuall Cold, to conserue them; Except the Earth be very Drie, and Sandie.

An Orenge, Limon, and Apple, wrapt in a Linnen Cloth, being buried for a Forthnights Space, foure Foot deepe within the Earth, though it were in a Moist Place, and a Rainie Time, yet came forth, no wayes Mouldie, or Rotten, but were become a little harder than they were; Otherwise fresh in their Colour; But their Iuyce somewhat flatted. But with the Buriall of a Forthnight more they became Putrified.

A Bottle of Beere, buried in like manner, as before, became more liuely, better tasted, and Clearer, than it was. And a Bottle of Wine in like manner. A Bottle of Vinegar, so buried, came forth more liuely, and more Odoriferous, smelling almost like a Violet. And after the whole Moneths Buriall, all the Three came forth, as fresh and liuely, if not better, than before.

It were a profitable Experiment, to presrue Orenges, Limons, and Pomgranates, till Summer; For then their Price will be mightily increased. This may be done, if you put them in a Pot or Vessell, well couered, that the Moisture

of the Earth come not at them; Or else by putting them in a Conseruatorie of Snow. And generally, whosoeuer will make Experiments of Cold, let him be prouided of three Things; A Conseruatorie of Snow; A good large Vault, twenty foot at least vnder the Ground; And a Deepe Well;

There hath beene a Tradition, that Pearle, and Cora-, and TurchoisStone, that haue lost their Colours, may be recouered by Burying in the Earth: Which is a thing of great profit, if it would sort: But vpon Triall of Six Weekes Buriall, there followed no Effect. It were good to trie it, in a Deepe Well; Or in a Conseruatory of Snow, where the Cold may be more Constringent; And so make the Body more vnited, and thereby more Resplendent.

Mens Bodier are heauier, and lesse disposed to Motion, when S — ther — Winds blow, than when Northerne. The Cause is, for that when the Southerne Winds blow, the Humours doe (in some Degree) melt, and waxe fluide, and so flow into the Parts; As it is seene in Wood, and other Bodies, which, when the Southerne Winds blow, doe swell. Besides, the Motion and Actiuity of the Body consisteth chiefly in the Sinewes, which, when the Southerne Wind bloweth, are more relaxe.

It is commonly seene, that more are Sick in the Summer, and more Dye in the Winter; Except it be in Peslilent Diseases, which commonly raigne in Summer, or Autumne. The Reason is, because Diseases are bred (indeed) chiefly by Heat; But then they are Cured most by Sweat, and Purge; which in the Summer commeth on, or is prouoked, more Easily: As for Pestilent Diseases, the Reason why most Dye of them in Summer, is because they are bred most in the Summer; For otherwise those that are touched are in most Danger in the Winter.

The Generall Opinion is, that Yeares Hot and Moist, are most Pestilent; Vpon the Superficiall Ground, that Heat and Moisture cause Putrefaction. In England it is found not true; For, many times, there haue beene great Plagues in Dry Yeares. Whereof the Cause may be, for that Drought in the Bodies of Islanders, habituate to Moist Aires, doth Exasperate the Humours, and maketh them more apt to Putrifie, or Enflame: Besides, it tainteth the Waters (commonly,) and

maketh them lesse wholesome. And againe in Barbary, the Plagues breake vp in the Summer-moneths, when the Weather is Hot and Dry.

Many Diseases, (both Epidemicall, and others,) breake forth at Particular times. And the Cause is falsely imputed to the Constitution of the Aire, at that time, when they breake forth, or raigne; whereas it proc-edeth (indeed) from a Precedent Sequence, and Series of the Seasons of the Yeare: And therefore Hippocrates, in his Prognosticks, doth make good Obseruations, of the Diseases, that ensue vpon the Nature, of the Precedent foure Seasons of the Yeare.

Triall hath beene made, with Earthen Bottles well stopped, hanged in a Well of Twenty Fathome deepe, at the least; And some of the Bettles haue beene let downe into the Water, some others haue hanged aboue, within about a fathome of the Water; And the Liquours so tried haue beene, Beere, (not New, but Ready for drinking,) and Wine, and Milke. The Proofe hath beene, that both the Beere, and the Wine, (as well within Water, as aboue,) haue not beene palled or deaded at all; But as good, or somewhat better, than Bottles of the same Drinks, and Stalenesse, kept in a Celler. But those which did hang aboue Water, were apparently the best; And that Beere did flower a little; whereas that vnder Water did not, though it were Fresh. The Milke sowred, and began to Purrifie. Neuerthelosse it is true, that there is a Village neare Blois, where in Deepe Canes they doe thicken Milke; In such sort, that it becommeth very pleasant; Which was some Cause of this Triall of Hanging Milke in the Well: But our proofe was naught; Neither doe I know, whether that Milke in those Caues, be first boysed; It were good therefore to try it with Milke Sodden, and with Creame; For that Milke of it selfe is such a Compound Body, of Creame, Curds, and Whey, as it is eas-ly Turned, and Dissolued. It were good also to try the Beere, when it is in Wort, that it may be seene, whether the Hanging in the Well, will Accelerate the Ripening and Clarifying of it.

Diuers, we see, doe Stut. The Cause may be, (in most,) the Refrigeration of the Tongue; Whereby it is lesse apt to moue. And therfore we see, that Naturalls doe generally Stut: And we see that in those that Stut, if they drinke Wine moderately, they Stut lesse, because it heateth: And so we see, that they that

Stut, doe Stut more in the first Offer to speake, than in Continuance; Because the Tongue is, by Motion, somewhat heated. In some also, it may be, (though rarely,) the Drinesse of the Tongue; which likewise maketh it lesse apt to moue, as well as Cold; For it is an Affect that commeth to some Wise and Great Men; As it did vnto Moses, who was Ling-epr apedita; And many Stutters (we finde) are very Cholericke Men; Choler Enducing a Drinesse in the Tongue.

Smells, and other Odours, are Sweeter in the Aire, at some Distance, than neare the Nose; As hath beene partly touched heretofore. The Cause is double: First the finer Mixture, or Incorporation of the Smell: For we see that in Sounds likewise, they are Sweetest, when we cannot heare euery Part by it selfe. The other Reason is, for that all Sweet Smells haue ioyned with them, some Earthy or Crude Odours; And at some distance the Sweet, which is the more Spirituall, is Perceiued; And the Earthy reacheth not so farre.

Sweet Smells are most forcible, in Dry Substances, when they are Broken; And so likewise in Orenges, or Limons, the Nipping of their Rinde, giueth out their Smell more: And generally, when Bodies are Moued or Stirred, though not Broken, they Smell more; As a SweetBagge waued. The Cause is double: The one, for that there is a Greater Emission of the Spirit, when Way is made: And this holdeth in the Breaking, Nipping, or Crushing; It holdeth also, (in some Degree) in the Mouing: But in this last, there is a Con-urrence of the Second Cause; Which is the Impulsion of the Aire, that bringeth the Sent faster vpon vs.

The daintiest Smells of Flowers, are out of those Plants, whose Leaues smell not; As Violets, Roses, Wall-flowers, Gilly-flowers, Pinckes, Woodbines, Vine-flowers, Apple-Bloomes, Lime-Tree Bloomes, Beane-Bloomes, &c. The Cause is, for that where there is Heat and strength enough in the Plant, to make the Leaues Odorate, there the Smell of the Flower is rather Euanide and Weaker, than that of the Leaues; As it is in Rose-Mary-Flowers, Lauender-Flowers, and Sweet-Briar-Roses. But where there is lesse Heat, there the Spirit of the Plant, is disgested and refined, and feuered from the Grosser Iuyce, in the Esstorescence, and not before.

Most Odours Smell best, Broken or Crusht, as hath beene said; But Flowers Pressed or Beaten, doe leese the Freshnesse and Sweetnesse of their Odour. The Cause is, for that when they are Crushed, the Grosser and more Earthy Spirit commeth out with the Finer, and troubleth it; Whereas in stronger Odours there are no such Degrees of the Issue of the Smell.

It is a Thing of very good Vse, to Discouer the Goodnesse of Waters, The Taste, to those that Drinke Water onely, doth somewhat: But other Experiments are more sure. First, try Waters by Weight; Wherein you may finde some difference, though not much: And the Lighter you may account the Better.

Secondly, try them by Boyling vpon an Equall Fire: And that which consumeth away fastest, you may account the Best.

Thirdly, try them in Seuerall Bottles, or Open Vessels, Matches in euery Thing else, and see which of them Last Longest, without Stench, or Corruption. And that which holdeth Vnputrified longest, you may likewise account the Best.

Fourthly, try them by Making Drinkes Stronger, or Smaller, with the same Quantity of Mault; And you may conclude, that that Water, which maketh the Stronger Drinke, is the more Concocted, and Nourishing; though perhaps it be not so good for Medicinall vse. And such Water (commonly) is the Water of Large and Nanigable Riuers: And likewise in Large and Cleane Ponds of Standing Water: For vpon both them, the Sunne hath more power, than vpon Fountaines, or Small Riuers. And I concelue that Chalke-water is next them the best, for going furthest in Drinke: For that also helpeth Concoction; So it be out of a Deepe Well; For then it Cureth the Rawnesse of the Water; But Chalkie Water, towards the Top of the Earth, is too fretting; As it appeareth in Laundry of Cloaths, which weare out apace, if you vse such Waters.

Fifthly, The Houswiues doe finde a Difference in Waters, for the Bearing, or Not Bearing of Soape: And it is likely that the more Fat Water will beare Soape best; For the Hungry Water doth kill the Vnctuous Nature of the Soape.

Sixthly, you may make a Iudgement of Waters, according to the Place, whence they Spring, or Come: The Rain-Water is, by the Physitians, esteemed the Finest, and the best; But yet it is said to putrifie soonest; which is likely,

because of the Finenesse of the Spirit: And in Conseruatories of Raine-water, (such as they haue in Venice, &c.) they are and not so Choice waters; The worse, (perhaps,) because they are Couered aloft, and kept from the Sunne. Snow-water is held vnwholesome; In so much as the People, that dwell at the Foot of the SnowMountaines, or otherwise vpon the Ascent, (especially the Women,) by drinking of Snow-water, haue great Bagges hanging vnder their Throats. Well-water, except it be vpon Chalke, or a very plentifull Spring, maketh Meat Red; which is an ill Signe. Springs on the Tops of High-Hills are the best: For both they seeme to haue a Lightnesse, and Appetite of Mounting; And besides they are most pure and Vnmingled; And againe are more Percolated thorow a great Space of Earth. For Waters in Valleyes, ioyne in effect vnder Ground with all Waters of the same Leuell; Whereas Springs, on the Tops of Hills, passe thorow a great deale of Pure Earth, with lesse Mixture of other Waters.

Seuenthly, Iudgement may be made of Waters by the Soyle whereupon the Water runneth; As Pebble is the Cleanest, and best tasted; And next to that Clay-water; And Thirdly, Water vpon Chalke; Fourthly that vpon Sand; And Worst of all vpon Mudde. Neither may you trust Waters that Taste Sweet, For they are commonly found in Rising Grounds of great Cities; which must needs take in a great deale of Filth.

In Peru, and diuers Parts of the West Indies, though vnder the Line, the Heats are not so Intolerable, as they be in Barbary, and the Skirts of the Torrid Zone. The Causes are, First the Great Brizes, which the Motion of the Aire in great Circles, (such as are vnder the Girdle of the World,) produceth; Which doe refrigerate; And therefore in those Parts Noone is nothing so hot, when the Brizes are great, as about Nine or Ten of the Clocke in the Fore-Noone. Another Cause is, for that the Length of the Night, and the Dewes thereof, doe compense the Heat of the Day. A third Cause is the Stay of the Sunne; Not in Respect of Day and Night, (for that wee spake of before,) but in Respect of the Season; For vnder the Line, the Sunne crosseth the Line, and maketh two Summers, and two Winters; But in the Skirts of the Torrid Zone, it doubleth, and goeth backe againe, and so maketh one Long Summer.

The Heat of the Sunne maketh Men Blacke in some Countries, as in AEthiopia, and Ginny, &c.Fire doth it not, as wee see in GlasseMen, that are continually about the Fire. The Reason may be, because Fire doth licke vp the Spirits, and Bloud of the Body, so as they Exhale; So that it euer maketh Men looke Pale, and Sallow; But the Sunne, which is a Gentler Heat, doth but draw the Bloud to the Outward Parts; And rather Concooteth it, than Soaketh it; And therefore wee see that all AEthiapes are Fleshy, and Plumpe, and haue great Lips; All which betoken Moisture retained, and not drawne out. Wee see also, that the Negroes are bred in Countries that haue Plenty of Water, by Riuers, or otherwise: For Meroe, which was the Metropolis of AEthiopia, was vpon a great Lake: And Congo, where the Negroes are, is full of Riuers. And the Confines of the Riuer Niger, where the Negroes also are, are well watered: And the Region about Capo Verde, is likewise Moist, in so much as it is pestilent through Moisture: But the Countries of the Abyssenes, and Barbary, and Peru. where they are Tawney, and Oliuaster, and Pale, are generally more Sandy, and Dry. As for the AEthiopes, as they are Plumpe, and Fleshy; So (it may bee) they are Sanguine, and ruddy Coloured, if their blacke Skinne would suffer it to be seene.

Some Creatures doe moue a good while after their Head is off; As Birds; Some a very little time; As Men, and all beasts; Some moue, though cut in feuerall Pieces; As Snakes, Eeles, Wormes, Flies, &c. First therefore it is certaine, that the Immediate Cause of Death, is the Resolution or Extinguishment of the Spirits; And that the Destruction or Corruption of the Organs, is but the Mediate Cause. But some Organs are so peremptorily necessary, that the Extinguishment of the Spirits doth speedily follow; But yet so, as there is an Interim of a Small Time. It is reported by one of the Ancients, of credit, that a Sacrificed Beast hath lowed, after the Heart hath beene feuered; And it is a Report also of Credit, that the Head of a Pigge hath beene opened, and the Braine put into the Palme of a Mans hand, trembling, without breaking any part of it, or feuering it from the Marrow of the Back-bone; During which time the Pigge hath beene, in all appearance, starke dead, and without Motion; And after a small Time the Braine hath beene replaced, and the Skull of the

Pigge closed, and the Pigge hath a little after gone about. And certaine it is, that an Eye vpon Reuenge hath beene thrust forth, so as it hanged a pretty distance by the Visuall Nerue; And during that time the Eye hath beene without any Power of Sight; And yet after (being replaced) recouered Sight. Now the Spirits are chiefly in the Head, and Cells of the Braine which in Men, and Beasts are Large; And therefore, when the Head is off, they moue little or Nothing. But Birds haue small Heads, and therefore the Spirits are a little more dispersed in the Sinewes, whereby Motion remaineth in them a little longer; In so much as it is Extant in Story, that an Emperour of Rome, to shew the Certainty of his Hand, did Shoote a great Forked Arrow at an Estrich, as shee ranne swiftly vpon the Stage, and strooke off her Head; And yet shee continued the Race, a little way, with the Head off. As for Wormes, and Flies, and Eeles, the Spirits are diffused almost all ouer; And therefore they moue in their Seuerall Pieces.

V. Century.

WE will now enquire of Plants or Vegetables: And we shall doe it with diligence. They are the principall Part of the Third Dayes Worke. They are the first Producat, which is the Word of Animation: For the other Words are but the Words of Essence; And they are of excellent and generall Vse, for Food, Medicine, and a Number of Mechanicall Arts.

There were sowen in a Bed, Turnip-Seed, Radish-Seed, Wheat, Cucumber-Seed, and Pease. The Bed we call a Hot-Bed, and the Manner of it is this. There was taken Horse-dung, old, and well rotted; This was laid vpon a Banke, halfe a foot high, and supported round about with Planks; And vpon the Top was cast Sifted Earth, some two Fingers deepe; And then the Seed Sprinkled vpon it, hauing beene steeped all night in Water Mixed with Cow dung. The Turnip-Seed, and the Wheat came vp halfe an Inch aboue Ground, within two dayes after, without any Watring. The Rest the third day. The Experiment was made in October; And (it may be) in the Spring, the Accelerating would haue beene the speedier. This is a Noble Experiment; For without this helpe, they would haue beene foure times as long in comming vp. But there doth not occurre to me, at this present, any vse thereof, for profit; Except it should be for Sowing of Pease; which haue their Price very much increased, by the early Comming. It may be tried also with Cherries, Strawberries, and other Fruit, which are dearest, when they come early.

There was Wheat, steeped in Water mixed with Cow-Dung; Other in Water mixed with Horse-Dung; Other in Water mixed with Pigeon-Dung; Other in Vrine of Man; Other in Water mixed with Chalke powdred; Other in Water mixed with Soot; Other in Water mixed with Ashes; Other in Water mixed with Bay-Salt; Other in Claret Wine; Other in Malmsey; Other in Spirìt of Wine. The Proportion of the Mixture was, a fourth Part of the Ingredients to the Water; Saue that there was not of the Salt aboue an eighth Part. The Vrine, and Wines, and Spirit of Wine, were Simple without Mixture of Water. The Time of the

Steeping was twelue houres. The Time of the Yeare October. There was also other Wheat sowen vnsteeped, but watred twice a day with Warme water. There was also other Wheat sowen Simple to compare it with the rest. The Euent was; That those that were in the Mixture of Dung, and Vrine, and Soot, Chalke, Ashes, and Salt, came vp within fix dayes: And those that afterwards proued the Highest, Thickest, and most Lustie, were; First the Vrine; And then the Dungs, Next the Chalke; Next the Soot; Next the Ashes; Next the Salt; Next the Wheat Simple of it selfe, vnsteeped, and vnwatered; Next the Watered twice a day with warme water; Next the Claret Wine. So that these three last were slower than the ordinary Wheat of it selfe; And this Culture did rather retard, than aduance. As for those that were steeped in Malmsey, and Spirit of Wine, they came not vp at all. This is a Rich Experiment for Profit; For the most of the Steel pings are Cheape Things; And the Goodnesse of the Crop is a great Matter of Gaine; If the Goodnesse of the Crop answer the Earlinesse of the Comming vp: As it is like it will; Both being from the vigour of the Seed; Which also partly appeared in the Former Experiments, as hath beene said. This Experiment would be tried in other Graines, Seeds, and Kernells: For it may be some Steeping will agree best with some Seeds. It would be tried also with Roots steeped as before, but for longer time. It would be tried also in Seuerall Seasons of the yeare, especially the Spring.

Strawberries watered now and then, (as once in three dayes,) with Water, wherein hath beene steeped Sheepes-dung, or Pigeons-dong, will preuent and come early. And it is like, the same Effect would follow in other Berries, Herbs, Flowers, Graines, or Trees. And therefore it is an Experiment, though vulgar in Strawberries, yet not brought into vse generally: For it is vsuall to helpe the Ground with Mucke; And likewise to Recomfort it sometimes with Mucke put to the Roots; But to water it with Mucke water, which is like to be more Forcible, is not practised.

Dung, or Chalke, or Bloud, applied in Substance, (seasonably,) to the Roots of Trees, doth set them forwards. But to doe it vnto Herbs, without Mixture of Water or Earth, it may be these Helpes are too Hot.

The former Meanes of Helping Germination, are either by the Goodnesse and Strength of the Nourishment; Or by the Comforting, and Exciting the Spirits in the Plant, to draw the Nourishment better. And of this latter kinde, concerning the Comforting of the Spirits of the Plant, arealso the experiments that follow; Though they be not Applications to the Root, or Seed. The Planting of Trees warme vpon a Wall, against the South, or South-East Sunne, doth hasten their Comming on, and Ripening; And the South-East is found to be better than the SouthWest, though the SouthWest be the Hotter Coast. But the cause is chiefly, for that the Heat of the Morning succeedeth the Cold of the Night: and partly, because (many times) the South-west Sunne is too Parching. So likewise the Planting of them vpon the Backe of a Chimney, where a Fire is kept, doth hasten their Comming on, and Ripening: Nay more, the Drawing of the Boughes into the Inside of a Roome, where a Fire is continually kept, worketh the same Effect; Which hath beene tried with Grapes; In so much as they will come a Moneth earlier, than the Grapes abroad.

Besides the two Meanes of Accelerating Germination, formerly described; That is to say, the Mending of the Nourishment; and Comforting of the Spirit of the Plant; there is a Third; Which is the Making way for the Easie Comming to the Nourishment, and Drawing it. And therefore Gentle Digging and Loosening of the Earth about the Roots of Trees; And the Remening Herbs and Flowers into new Earth, once in two yeares, (which is the same thing, For the new Earth is euer looser,) doth greatly further the Prospering, and Earlinesse of Plants.

But the most admirable Acceleration by Facilitating the Nourishment, is that of Water. For a Standard of a Damaske Rose with the Root on, was set in a Chamber, where no Fire was, vpright in an Earthen Pan, full of Faire Water, without any Mixture, halfe a foot vnder the Water, the Standard being more then two foot high aboue the Water: Within the Space of ten dayes, the Standard did put forth a faire Greene lease, and some other little Buds, which stood at a stay, without any Shew of decay or withering, more then seuen Daies. But afterwards that Leafe faded, but the young Buds did sprout on; which afterward opened into faire Leaues, in the space of three Moneths; And continued so a while after, till

vpon Remouall wee left the Triall. But note that the Leaues were somewhat paler, and lighter-coloured, than the Leaues vse to be abroad. Note that the first Buds were in the End of October; And it is likely that if it had beene in the Spring time, it would haue put forth with greater strength, and (it may be) to haue growne on to beare Flowers. By this Meanes, you may haue, (as it seemeth,) Roses set in the middest of a Poole, being supported with some stay; Which is Matter of Rarenesse and Pleasure, though of small Vse. This is the more strange, for that the like Rose-Standard was put, at the same time, into Water, mixed with Horse-dung, the Horse-dung about the fourth Part to the Water, and in foure Moneths space (while it was obserued) put not forth any Leafe, though diuers Buds at the first, as the other.

A Dutch Flower, that had a Bulbous Root, was likewise put, at the same time, all vnder Water, some two or three Fingers deepe; And within seuen dayes sprouted, and continued long after, further Growing. There were also put in, a Beet-Root, a Borrage-Root, and a RaddishRoot, which had al their Leaues cut almost close to the Roots; And within six weekes had faire Leaues; And so continued, till the end of Nouember.

Note that if Roots, or Pease, or Flowers, may be Accelerated in their Comming and Ripening, there is a double Profit; The one in the high Price that those Things beare when they come early: The other in the Swiftnesse of their Returnes: For in some Grounds which are strong, you shall haue a Raddish, &c. come in a Month; That in other Grounds will not come in two; And so make double Returnes.

Wheat also was put into the Water, and came not forth at all; So as it seemeth there must be some Strength and Bulke in the Body, put into the Water, as it is in Roots; For Graines, or Seeds, the Cold of the Water will mortifie. But casually some Wheat lay vnder the Pan, which was somewhat moistned by the Suing of the Pan; which in six weekes (as aforesaid) looked mouldy to the Eye, but it was sprouted forth halfe a Fingers length.

It seemeth by these Instances of Water, that for Nourishment, the Water is almost all in all, and that the Earth doth but keepe the Plant vpright, and saue it

from Ouer-heat, and Ouer-cold; And therefore is a Comfortable Experiment for good Drinkers. It proueth also that our former Opinion; That Drinke incorporate with Flesh, or Roots, (as in Capon-Baere, &c.) will nourish more easily, than Meat and Drinke taken seuerally.

The Nousing of Plants (I conceiue) will both Accelerate Germination, and bring forth Flowers and Plants in the Colder Seasons: And as wee House Hot-Countrey Plants, as Limons, Orenges, Myrtles, to saue them; So we may House our owne Countrey Plants, to forward them, and make them come in the Cold Seasons; In such sort, that you may haue Violets, Strawberries, Pease, all Winter: So that you sow, or remoue them at fit times. This Experiment is to be referred vnto the Comforting of the Spirit of the Plant, by Warmth, as well as Housing their Boughes, &c. So then the Meanes, to Accelerate Germination, are in Particular eight, in Generall three.

To make Roses, or other Flowers come late, it is an Experiment of Pleasure. For the Ancients esteemed much of Rosa Sera. And indeed the Nouember-Rose is the sweetest, hauing beene lesse exhaled by the Sunne. The Meanes are these. First, the Cutting off their Tops, immediately after they haue done Bearing; And then they will come againe the same yeare about Nouember: But they will not come iust on the Tops, where they were cut, but out of those Shoots, which were as it were,) Water-Boughes. The Cause is, for that the Sap, which otherwise would haue fed the Top, (though after Bearing,) will, by the discharge of that, diuert vnto the Side-Sprouts; And they will come to beare, but later.

The Second is the Pulling off the Buds of the Rose, when they are Newly knotted; For then the Side-Branches will beare. The Cause is the same with the former: For Cutting off the Tops, and Pulling off the Buds, worke the same Effect, in Retention of the Sap for a time, and Diuersion of it to the Sprouts, that were not so forward.

The Third is the Cutting off some few of the Top-Roughes in the Spring-time, but suffering the lower Boughes to grow on. The Cause is, for that the Boughes doe helpe to draw vp the Sap more strongly; And we see that in Powling of Trees, many doe vse to leaue a Bough or two on the Top, to helpe to

draw vp the Sap. And it is coparated also, that if you graft vpon the Bough of a Tree, and cut off some of the old Boughes, the new Cions will perish.

The Fourth is by Laying the Roots bare about christmus, some dayes. The Cause is plaine, for that it doth —— the Sap, from going vpwards, for a time; Which Arrest is after wards released by the Couering of the Root a gaine with Earth; And then the Sap getteth vp, but later.

The Fifth is the Re —— of the Tree, some Moneth before it Buddes. The cause is, for that some time will be required after the Re — e, for the Reselting; before it can draw the Iuycs: And that time being lost, the Blossome u — needs some forth later.

The Sixth is the Grasting of Kaser in May, which commonly Gardiners doe not till Inly; And then they beare not till the Next Yeare; But if you graft them in May, they will beare the same yeare, but late.

The Seuenth is, the Girding of the Body of the Tree about with some Pack-threed; For that also, in a degree, restraineth the Sap, and maketh it come vp, more late, and more Slowly.

The Eighth in, the Planting of them — Shade, or in a Hedge; The Cause is, partly the Keeping out of the Sunne, which hasteneth the Sap to rise; And partly the Robbing of them of Nourishment, by the S-uffe in the Hedge. These Meanes may be practised vpon other, both Trees, and Flowers, M10 letters

Men haue entertained a Conceit that sheweth prettily; Namely, that if you grast a Late Comming Fruit, vpon a Stocke of a Fruittree that —— — early, the Graft will beare Fruit Early. At a Peach vpon a Cherry; And contrariwise, if an Early-Comming Fruit vpon a Stocke of a Fruit-Tree that Commeth late, the Grafe will beare Fruit late; As a Cherry vpon a Peach. But these are but Imaginations, and vntrue. The Cause is, for that the Cions ouerroleth the Stocke quite; And the Stocke is but Passue onely, and giueth Aliment, but no Motion to the Graft.

We will speake now, how to make Fruits, Flowers, and Ro-larger; in more plenty; and sweeter; than they vse to be; And how to make the Trees themselues, more Tall; more Spread; and more Hasty and Sudden; than they vse to be.

Wherein there is no doubt, but the former Experiments of Acceleration, will serue much to these Purposes. And againe, that these Experiments, which we shall now set downe, doe serue also for Acceleration; because both Effects proceed from the Encrease of vigour in the Tree, But yet to auoid Confusion; And because some of the Meanes are more proper for the one Effect, and some for the other, wee will handle them apart.

It is an assured Experience, that an Heape of flint, or Stone, laid about the Bottome of a Wilde-Tree, (as an Oake, Elme, Ash, &c.) vpon the first Planting, doth make it prosper double as much, as without it. The Cause is, for that it retaineth the Moisture, which falleth at any time vpon the Tree, and suffereth it not to be exhaled by the Sunne. Againe, it keepeth the Tree warme, from Cold Blasts and Frosts, as it were in an House. It may be also, there is somewhat in the Keeping of it steady at the first. Quare, if Laying of Straw some Height about the Body of a Tree, will not make the Tree forwards. For though the Root giueth the Sap, yet it is the Body that draweth it. But you must note, that if you lay Stones about the stalke of Lettuce, or other Plants, that are more soft, it will ouer-moisten the Roots, so as the Wormes will eat them.

A Tree, at the first Setting, should not be Shaken, vntill it hath taken Root fully: And therefore some haue, put two little Forkes about the Bottome of their Trees, to keepe them vpright; But after a yeares Rooting, then Shaking doth the Tree good, by Loosening of the Earth, and (perhaps) by Exercising (as it were) and Stirring the Sap of the Tree.

Generally, the Cutting away of Boughes and Suckers at the Root and Body, doth make Trees grow high; And contrariwise, the Powling and Cutting of the Top, maketh them grow spread, and bushy. As wee see in Pollards, &c.

It is reported, that to make hasty Growing Coppice-Woods, the way is, to take Willow, Sallow, Poplar, Alder, of some seuen yeares growth; And to set them, not vpright, but a-slope, a reasonable depth vnder the Ground; And then, instead of one Root, they will put forth many, and so carry more Shoots vpon a Stemme.

When you would haue many new Roots of Fruittrees, take a Low Tree, and bow it, and lay all his Branches a-flat vpon the Ground, and cast Earth vpon them; And euery Twigge will take Root. And this is a very profitable Experiment for Costly Trees; (for the Boughtes will make Stockes without charge;) Such as are Apricots, Peaches, Almonds, Cornelians, Mulberries, Figs, &c. The like is continually practised with Vines, Roses, Muske-Roses, &c.

From May to Iuly you may take off the Barke of any Bough, being of the Bignesse of three or foure Inches, and couer the bare Place, somewhat aboue, and below, with Loame well tempered with Horse-dung, binding it fast downe. Then cut off the Bough about Alhollontide in the bare place, and set it in the Ground; And it will grow to be a faire Tree in one Yeare. The Cause may be, for that the Baring from the Barke keepeth the Sap from descending towards Winter, and so holdeth it in the Bough; And it may be also that the Loame and Horse-Dung applied to the bare place, doe moisten it, and cherish it, and make it more apt to put forth the Root. Note, that this may be a generall Meanes for keeping vp the Sap of Trees in their Boughes; Which may serue to other Effects.

It hath beene practised in Trees, that shew faire, and beare not, to Bore a Hole thorow the Heart of the Tree, and thereupon it will beare. Which may be for that the Tree before had too much Repletion, and was oppressed with his owne Sap; For Repletion is an Enemy to Generation.

It hath beene practised in Trees, that doe not beare, to cleaue two or three of the Chiese Roots, and to put into the Cleft a small Pebble, which may keepe it open, and then it will beare. The Cause may be, for that a Root of a Tree may be (as it were,) Hide-bound, no lesse than the Body of the Tree; But it will not keepe open without somewhat put into it.

It is vsually practised, to set Trees that require much Sunne, vpon Walls against the South; As Apricots, Peaches, Plums, Vines, Figs, and the like. It hath a double Commodity; The one, the Heat of the Wall by Reflexion; The other, the Taking away of the Shade; For when a Tree groweth round, the vpper Boughes ouer-shadow the lower; But when it is spread vpon a Wall, the Sunne commeth alike, vpon the vpper, and lower Branches.

It hath also beene practised (by some) to pull off some Leanes from the Trees so spread, that the Sunne may come vpon the Bough and Fruit the better. There hath beene practised also a Curiosity, to set a Tree vpon the North-Side of a Wall, and at a little height, to draw him thorow the Wall, and spread him vpon the South-Side: Conceiuing that the Root and lower Part of the Stocke should enioy the Freshnesse of the Shade; And the Vpper Boughes, and Fruit, the Comsort of the Sunne. But it sorted not; The Cause is, for that the Root requireth some Comsort from the Sunne, though vnder Earth, as well as the Body: And the Lower Part of the Body more than the Vpper, as wee see in Compassing a Tree below with Straw.

The Lownesse of the Bough, where the Fruit commeth, maketh the Fruit greater, and to ripen better; For you shall euer see in Apricots, Peaches, or Melo-Cotones, vpon a wall, the greatest Fruits towards the Bottome. And in France the Grapes that make the Wine, grow vpon low Vines, bound to small Stakes. And the raised Vines in Arbours make but Veriuyce. It is true, that in Italy, and other Countries, where they haue hotter Sunne, they raise them vpon Elmes, and Trees; But I conceiue, that if the French Manner of Planting low, were brought in vse there, their Wines would be stronger and sweeter. But it is more chargeable in respect of the Props. It were good to try whether a Tree grafted somewhat neare the Ground, and the lower boughes onely maintained, and the higher continually proined off, would not make a larger Fruit.

To haue Fruit in Greater Plenty, the way is, to graft, not onely vpon young Stockes, but vpon diuers Boughes of an old Tree; for they will beare great Numbers of Fruit; Whereas if you graft but vpon one Stocke, the Tree can beare but few.

The Digging yearely about the Roots of Trees, which is a great means, both to the Acceleration and Melioration of Fruits, is practised in nothing but in Vines; Which if it were transferred vnto other Trees, and Shrubs, (as Roses, &c.) I conceiue would aduance them likewise.

It hath beene knowne, that a Fruit-Tree hath beene blowne vp (almost) by the Roots, and set vp againe, and the next yeare bare exceedingly. The Cause of this,

was nothing but the Looseming of the Earth, which comforteth any Tree, and is fit to be practised, more than it is, in Fruit-Trees: For Trees cannot be so fitly remoued into New Grounds, as Flowers and Herbs may.

To reuiue an Old Tree, the Digging of it about the Roots, and Applying new Mould to the Roots, is the way. We see also that DraughtOxen, put into fresh Pasture, gather new and tender Flesh; And in all Things, better Nourishment than hath beene vsed, doth helpe to renew; Especially, if it be not onely better, but changed, and differing from the former.

If an Herbe be cut off from the Roots, in the beginning of Winter, and then the Earth be troden and beaten downe hard, with the Foot and Spade, the Roots will become of very great Magnitude in Summer. The Reason is, for that the Moisture being forbidden to come vp in the Plant, stayeth longer in the Root, and so dilateth it. And Gardiners vse to tread downe any loose Ground, after they haue sowne Onions, or Turnips, &c.

If Panicum be laid below, and about the Bottome of a Root, it will cause the Root to grow to an Excessiue Bignesse. The Cause is, for that being it selfe of a Spungy Substance, it draweth the Moisture of the Earth to it, and so feedeth the Root. This is of greatest vse for Onions, Turnips, Parsnips, and Carrets.

The Shifting of Ground is a Meanes to better the Tree, and Fruit; But with this Caution; That all Things doe prosper best, when they are aduanced to the better: Your Nursery of Stockes ought to be in a more Barren Ground, than the Ground is whereunto you remoue them. So all Grasiers preferre their Cattell from meaner Pastures to better. We see also, that Hardnesse in Youth lengthneth Life, because it leaueth a Cherishing to the better, of the Body, in Age: Nay in Exercises, it is good to begin with the hardest, as Dancing in Thicke Shooes, &c.

It hath beene obserued, that Hacking of Trees in their Barke, both downe-right, and acrosse, so as you make them rather in slices, than in continued Hacks, doth great good to Trees; And especially deliuereth them from being Hide-bound, and killeth their Mosse.

Shade to some Plants conduceth to make them large, and prosperous, more than Sun; As in Strawberries, and Bayes, &c. Therefore amongst Strawberries,

sow here and there some Barrage-Seed; And you shall finde the Strawberries vnder those Leaues farro more large than their Fellowes. And Bayes you must plant to the North; Or defond them from the Sunne by a Hedge-Row; And when you sow the Berries, weed not the Borders, for the first halfe yeare; For the Weed giueth them Shade.

To increase the Crops of Ph — , there would be considered, not only the Increasing the Lust of the Earth, or of the Plant, but the Sauing also of that which is spilt. So they haue lately made a Triall, to Set Wheat; which neuerthelesse hath beene left off, because of the trouble and paines; Yet so much is true, that there is much saued by the Setting, in comparison of that which is Sewen; Both by keeping it from being picked vp by Birds; And by Auoiding the Shallow lying of it, whereby much that is sowen taketh no Root.

It is prescribed by some of the Ancients, that you take Small Trees, vpon which Figs or other Fruit grow, being yet vnripe, and couer the Trees in the Middle of Autamne with dung, vntill the Spring; And then take them vp in a warme day, and replant them in good Ground; And by that meanes, the former yeares Tree will be ripe, as by a new Birth; when other Trees of the fame kinde, doe but blossome. But this seemeth to haue no great Probabilitie.

It is reported, that if you take Nitre, and mingle it with Water, to the thicknesse of Honey, and therewith anoint the Bud, after the Vine is cut, it will sprout forth within eight dayes. The Cause is like to be, (if the Experiment be true,) the Opening of the Bud, and of the Parts Contiguous, by the Spirit of the Nitre; For Nitre is (as it were) the Life of Vegetables.

Take Seed, or Kernells of Apples, Peares, Orenges; Or a Peach, or a Plum Stone, &c. And put them into a Squill, (which is like a great Onion,) and they will come vp much earlier than in the Earth it selfe. This I conceiue no be as a Kinde of Grafting in the Root; For as the Stocke of a Graft yeeldeth better prepared Nourishment to the Graft, than the Crude Earth; So the Squill doth the like to the Seed. And I suppose the same would be done, by Putting Kernells into a Turnip, or the like; Saue that the Squill is more Vigorous, and Hot. It may be

tried also, with putting Onion-Seed into an Onion-Head, which thereby (perhaps) will bring forth a larger, and earlier Onion.

The Pricking of a Fruit in seuerall places, when it is almost at his Bignesse, and before it ripeneth, hath beene practised with successe, to ripen the Fruit more suddenly. Wee see the Example of the Biting of Waspes, or Wormes, vpon Fruit, whereby it (manifestly) ripeneth the sooner.

It is reported, that Alga Marina (Sea-weed) put vnder the Roots of Coleworts, and (perhaps) of other Plants, will further their Growth. The vertue (no doubt) hath Relation to Salt, which is a great Helpe to Fertilitie.

It hath beene practised, to cut off the Stalkes of Cucumbers, immediately after their Bearing, close by the Earth; And then to cast a prettie Quantitie of Earth vpon the Plant that remaineth; and they will beare the next yeare Fruit, long before the ordinary time. The Cause may be, for that the Sap goeth downe the sooner, and is not spent in the Stalke or Lease, which remaineth after the Fruit. Where note, that the Dying, in the winter, of the Roots of Plants, that are Annuall, seemeth to be partly caused by the Ouer-Expence of the Sap into Stalke, and Leaues; which being preuented, they will super-annate, if they stand warme.

The Pulling off many of the Blossomes from a Fruit-Tree, doth make the Fruit fairer. The Cause is manifest; For that the Sap hath the lesse to nourish. And it is a Common Experience, that if you doe not pull off some Blossomes, the first time a Tree bloometh, it will blossome it selfe to death.

It were good to trie, what would be the Effect, if all the Blossomes were pulled from a Fruit-Tree; Or the Acornes and Chesnut-buds, &c. from a Wilde Tree, for two yeares together. I suppose that the Tree will either put forth, the third yeare, bigger, and more plentifull Fruit; Or else, the same yeares, larger Leaues, because of the Sap stored vp.

It hath beene generally receiued, that a Plant Watered with Warme Water, will come vp sooner and better, than with Cold Water, or with Showers. But our Experiment of Watering Wheat with Warme Water (as hath beene said) succeeded not; which may be, because the Triall was too late in the Yeare, vix.

in the End of October. For the Cold then comming vpon the Seed, after it was made more tender by the Warme Water, might checke it.

There is no doubt, but that Grafting (for the most Part) doth meliorate the Fruit. The Cause is manifest; For that the Nourishment is better prepared in the Stocke, than in the Crude Earth: But yet note well, that there be some Trees, that are said to come vp more happily from the Kernell, than from the Graft; As the Peach, and Melocotone. The Cause I suppose to he, for that those Plants require a Nourishment of great Moisture; And though the Nourishment of the Stocke be finer, and better prepared, yet it is not so moist, and plentifull, as the Nourishment of the Earth. And indeed we see those Fruits are very Cold Fruits in their Nature.

It hath beene receiued, that a Smaller Peare, grafted vpon a Stocke that beareth a greater Peare, will become Great. But I thinke it is as true, as that of the Prime-Fruit vpon the Late Stocke; And è conuerso; which we reiected before: For the Cions will gouerne. Neuerthelesse it is probable enough, that if you can get a Cions to grow vpon a Stocke of another kinde, that is much moister than his owne Stocke, it may make the Fruit Greater, because it will yeeld more plentifull nourishment; Though it is like it will make the Fruit Baser. But generally, the Grafting is vpon a dryer Stock; As the Apple vpon a Crab; The Peare vpon a Thorne; &c. Yet it is reported, that in the Low-Conntries they will graft an Apple-Cions vpon the Stocke of a Colewort, and it will beare a great flaggy Apple: The Kernell of which, if it be set, will be a Colewort, and not an Apple. It were good to try, whether an Apple-Cions will prosper, if it be grafted vpon a Sallow, or vpon a Poplar, or vpon an Alder, or vpon an Elme, or vpon an Horse-Plumme, which are the moistest of Trees. I haue heard that it hath beene tryed vpon an Elme, and succeeded.

It is manifest by Experience, that Flowers Remoued wax greater, because the Nourishment is more easily come by, in the loose Earth. It may be, that Oft Regrafting of the same Cions, may likewise make Fruit greater; As if you take a Cions, and graft it vpon a Stocke the first yeare; And then cut it off, and graft it

vpon another Stocke the second yeare; and so for a third; Or fourth yeare; And then let it rest, it will yeeld afterward, when it beareth, the greater Fruit.

Of Grafting there are many Experiments worth the Noting, but those we reserue to a proper Place.

It maketh Figs better, if a Fig-Tree, when it beginneth to put forth Leaues, haue his Top cut off. The Cause is plaine, for that the Sap hath the lesse to seed, and the lesse way to mount: But it may be, the Figge will come somewhat later, as was formerly touched. The same may be tried likewise in other Trees.

It is reported, that Mulberries will be fairer, and the Trees more fruitfull, if you bore the Truncke of the Tree thorow, in seuerall places, and thrust into the Places bored, Wedges of some Hot Trees, as Turpentine, Mastick-Tree, Guaiacum, Inniper, &c. The Cause may be, for that Aduentiue Heat doth cheare vp the Natiue Iuyce of the Tree.

It is reported, that Trees will grow greater, and beare better Fruit, if you put Salt, or Lees of Wine, or Bloud to the Root. The Cause may be the Encreasing the Lust or Spirit of the Root; These Things being more forcible, than ordinary Composts.

It is reported by one of the Ancients, that Artichoakes will be lesse prickly, and more tender; if the Seeds haue their Tops dulled, or grated off vpon a Stone.

Herbes will be tenderer, and fairer; if you take them out of Beds, when they are newly come vp, and remoue them into Pots, with better Earth. The Remoue from Bed to Bed was spoken of before; But that was in seuerall yeares; This is vpon the sudden. The Cause is the same with other Remoues, formerly mentioned.

Coleworts are reported by one of the Ancients, to prosper exceedingly, and to be better tasted, if they be sometimes watred with Salt-Water; And much more with Water mixed with Nitre; The Spirit of which is lesse Adurent than Salt.

It is reported, that Cucumbers will proue more Tender, and Dainty, if their Seeds be Steeped (a little) in Milke; The Cause may be, for that the Seed being mollified with the Milke, will be too weake to draw the grosser Iuyce of the Earth, but onely the finer. The same Experiment may be made in Artichoakes,

and other Seeds, when you would take away, either their Flashinesse, or Bitternesse. They speake also, that the like Effect followeth, of Steeping in Water mixed with Honey; But that seemeth to me not so probable, because Honey hath too quicke a Spirit.

It is reported that Cucumbers will be lesse Watry, and more Melonlike, it in the Pit where you set them, you fill it (halfe way vp) with Chaffe, or small Stickes, and then powre Earth vpon them; For Cucumbers, as it seemeth, doe extremely affect Moisture; And ouer-drinke themselues; Which this Chaffe, or Chips, forbiddeth. Nay it is further reported, that if when a Cucumber is growne, you fet a Pot of water about fiue or six inches distance from it, it will, in 24, houres, shoot so much out, as to touch the Pot; Which if it be true, it is an Experiment of an higher Nature than belongeth to this Title: For it discouereth Perception in Plants, to moue towards that which should helpe and comfort them, though it be at a distance. The ancient Tradition of the Vine is far more strange: It is, that if you set a Stake, or Prop, some distance from it, it will grow that way; Which is farre stranger (as is said) than the other; For that Water may worke by a Sympathy of Attraction: But this of the Stake seemeth to be a Reasonable Discourse.

It hath beene touched before, that Terebration of Trees doth make them prosper better. But it is found also, that it maketh the Fruit sweeter, and better. The Cause is, for that notwithstanding the Terebration, they may receiue Aliment sufficient; And yet no more than they can well turne, and disgest; And withall doe sweat out the coursest and vnprofitablest Iuyce; Euen as it is in Lining Creatures, which by Moderate Feeding, and Exercise, and Sweat, attaine the soundest Habite of Body.

As Terebration doth Meliorate Fruit, so, vpon the like reason, doth Letting of Plants Blond; As Pricking Vines, or other Trees, after they be of some Growth; And thereby letting forth Gumme, or Teares; Though this be not to continue, as it is in Terebration, but at some Seasons. And it is reported, that by this Artifice, Bitter Almonds haue beene turned into Sweet.

The Ancients for the Dulcorating of Fruit, doe commend SwinesDung aboue all other Dung; Which may be, because of the Moisture of that Beast, whereby the Excrement hath lesse Acrimony; For wee see Swines and Pigges Flesh is the Moistest of Fleshes.

It is obserued by some, that all Herbs wax sweeter, both in Smell and Taste, if after they be growne vp some reasonable time, they be cut, and so you take the latter Sprout. The Cause may be, for that the longer the Iuyce stayeth in the Root, and Stalke, the better it concocteth. For one of the Chiefe Causes, why Graines, Seeds, and Fruits, are more Nourishing than Leanes, is the Length of time, in which they grow to Maturation. It were not amisse to keepe backe the Sap of Herbs, or the like, by some fit meanes, till the end of Summer; whereby (it may be) they will be more Nourishing.

As Grafting doth generally aduance and Meliorate Fruits, aboue that which they would be, if they were set of Kernells, or Stones, in regard the Nourishment is better concocted; So (no doubt) euen in Grafting, for the same cause, the Choise of the Stocke doth much; Alwayes prouided, that it be somewhat inferiour to the Cions: For otherwise it dulleth it. They commend much the Grafting of Peares, or Apples, vpon a Quince.

Besides the Meanes of Melioration of Fruits, before mentioned, it is set downe as tryed, that a Mixture of Bran, and SwinesDung; Or Chaffe and SwinesDung; (especially laid vp together for a Moneth to rot,) is a very great Nourisher, and Comforter to a Fruit-Tree.

It is deliuered, that Onions wax greater, if they be taken out of the Earth, and laid a drying twenty dayes, and then set againe; And yet more, if the outermost Pill be taken off all ouer.

It is deliuered by some, that if one take the Bough of a Low Fruittree, newly budded, and draw it gently, without hurting it, into an Earthen Pot perforate at the bottome to let in the Plant, and then Couer the Pot with Earth, it will yeeld a very large Fruit, within the Ground. Which Experiment is Nothing but Potting of Plants, without Remouing, and Leauing the Fruit in the Earth. The like, (they say,) will be effected, by an Empty Pot without Earth in it, put ouer a Fruit,

being propped vp with a Stake, as it hangeth vpon the Tree; And the better, if some few Pertusions be made in the Pot. Wherein, besides the Defending of the Fruit, from Extremity of Sunne or Weather, some giue a reason, that the Fruit, Louing and Coueting the open Aire and Sunne, is inuited by those Pertusions, to spread and approch, as neare the open Aire, as it can; And so enlargeth in Magnitude.

All Trees, in High and Sandy Grounds, are to be set deepe; And in Watry Grounds, more shallow. And in all Trees, when they be remoued (especially Fruit-Trees) care ought to be taken, that the Sides of the Trees be coasted, (North and South, &c.) as they stood before. The same is said also of Stone out of the Quarry, to make it more durable; Though that seemeth to haue lesse reason; Because the Stone lyeth not so neare the Sunne, as the Tree groweth.

Timber Trees in a Coppice Wood, doe grow better, than in an Open Field; Both because, they offer not to spread so much, but shoot vp still in Height; And chiefly because they are defended from too much Sun and Wind, which doe checke the Growth of all Fruit; And so (no doubt) Fruit-Trees, or Vines, set vpon a Wall, against the Sunne, betweene Elbowes or Buttresses of Stone, ripen more, than vpon a Plaine Wall.

It is said, that if Potado Roots, be set in a Pot filled with Earth, and then the Pot with Earth be set likewise within the Ground, some two or three Inches, the Roots will grow greater, than Ordinary. The Cause may be, for that Hauing Earth enough within the Pot to nourish them; And then being stopped by the Bottom of the Pot from putting Strings downward, they must needs grow greater in Breadth, and Thicknesse. And it may be, that all Seeds or Roots, Potted, and so set into the Earth, will prosper the better.

The Cutting off the Leaues of Radish, or other Roots, in the beginning of Winter, before they wither; And Couering againe the Root, something high with Earth; Will preserue the Root all Winter, and make it bigger, in the Spring following, as hath beene partly touched before. So that there is a double Vse of this Cutting off the Leaues: For in Plants, where the Root is the Esculent, as Radish, and Parsnips, it will make the Root the greater: And so it will doe to the

Heads of Onions. And where the Fruit is the Esculent, by Strengthning the Root, it will make the Fruit also the greater.

It is an Experiment of great pleasure, to make the Leaues of Shady Trees, larger than ordinary. It hath beene tryed (for certaine) that a Cions of a Weech-Elme, grafted vpon the Stocke of an Ordinary Elme, will put forth Leaues, almost as broad as the Brimme of ones Hat. And it is very likely, that as in Fruit-Trees, the Graft maketh a greater Fruit; So in Trees that beare no Fruit, it will make the greater Leaues. It would be tryed therefore in Trees of that kinde chiefly; As Birch, Asp, Willow; And especially the Shining Willow, which they call Swallow-Taile, because of the pleasure of the Leafe.

The Barrennesse of Trees, by Accident, (besides the Weaknesse of the Soile, Seed, or Root; And the Iniury of the Weather) commeth either of their Ouer-growing with Mosse, Or their being Hide-bound; Or their Planting too deepe; Or by Issuing of the Sap too much into the Leaues. For all these there are Remedies mentioned before.

Wee see that in Liuing Creatures, that haue Male and Female, there is Copulation of seuerall Kindes; And so Compound Creatures; As the Mule, that is generated betwixt the Horse and the Asse; And some other Compounds, which we call Monsters, though more rare: And it is held, that that Prouerbe, Africa semper aliquid Monstri parit; commeth, for that the Fountaines of Waters there, being rare, diuers Sorts of Beasts come from seuerall Parts to drinke; And so being refreshed, fall to couple, and many times with seuerall Kinds. The Compounding or Mixture of Kinds in Plants is not found out; Which neuerthelesse, if it be possible, is more at command, than that of liuing Creatures; For that their Lust requireth a voluntary Motion: wherefore it were One of the most Noble Experiments touching Plants, to finde it out: For so you may haue great Varietie of New Fruits, and Flowers yet vnknowne. Grafting doth it not: That mendeth the Fruit, or doubleth the Flowers, &c. But it hath not the Power to make a New Kinde. For the Cions euer ouer-ruleth the Stocke.

It hath beene set downe by one of the Ancients, that if you take two Twigs of seuerall Fruit Trees, and flat them on the Sides, and then binde them close

together, and set them in the ground, they will come vp in one Stocke; But yet they will put forth their seuerall Fruits, without any Commixture in the Fruit. Wherein note (by the way) that Vnitie of Continuance, is easier to procure, than Vnitie of Species. It is reported also, that Vines of Red and White Grapes, being set in the Ground, and the vpper Parts being flatted, and bound close together, will put forth Grapes of the seuerall Colours, vpon the same Branch; And Grape-Stones of seuerall Colours within the same Grape: But the more, after a yeare or two; The Vnitie (as it seemeth) growing more Perfect. And this will likewise helpe, if from the first Vniting, they be often Watred; For all Moisture helpeth to Vnion. And it is prescribed also, to binde the Bud, as soone as it commeth forth, as well as the Stocke; At the least for a time.

They report, that diuers Seeds, put into a Clout, and laid in Earth well dunged, will put vp Plants Contiguous; Which (afterwards) being bound in, their Shoots will Incorporate. The like is said of Kernels, put into a Bottle, with a Narrow Mouth, filled with Earth.

It is reported, that young Trees of seuerall kindes, set contiguous, without any binding, and very often Watred, in a Fruitfull Ground, with the very Luxurie of the Trees will incorporate, and grow together. Which seemeth to me the likeliest Meanes, that hath beene propounded; For that the Binding doth hinder the Naturall Swelling of the Tree; which, while it is in Motion, doth better vnite.

There are many Ancient and Receiued Traditions and Obseruations, touching the Sympathy and Antipathy of Plants: For that some will thriue best growing neere others; which they impute to Sympathy: And some worse; which they impute to Antipathy. But these are Idle and Ignorant Conceits; And forsake the true Indication of the Causes; As the most Part of Experiments, that concerne Sympathies and Antipathies doe. For as to Plants, neither is there any such Secret Friendship, or Hatred, as they imagine; And if we should be content to call it Sympathy, and Antipathy, it is vtterly mistaken; For their Sympathy is an Antipathy, and their Antipathy is a Sympathy: For it is thus; Wheresoeuer one Plant draweth such a particular Iuyce out of the Earth; as it qualifieth the Earth; So as that Iuyce which remaineth is fit for the other Plant, there the

Neighbourhood doth good; Because the Nourishments are contrary, or seuerall: But where two Plants draw (much) the same Iuyce, there the Neighbourhood hurteth; For the one deceiueth the other.

First therfore, all Plants that doe draw much Nourishment from the Earth, and so soake the Earth, and exhaust it; hurt all Things that grow by them; As Great Trees, (especially Ashes,) and such Trees, as spread their Roots, neere the Top of the Ground. So the Colewort is not an Enemy (though that were anciently receiued) to the Vine only; But it is an Enemy to any other Plant; Because it draweth strongly the fattest Iuyce of the Earth. And if it be true, that the Vine, when it creepeth neere the Colewort, will turneaway; This may be, because there it findeth worse Nourishment; For though the Root be where it was, yet (I doubt) the Plant will bend as it nourisheth.

Where Plants are of seuerall Natures, and draw seuerall Iuyces out of the Earth, there (as hath beene said) the One set by the other helpeth: As it is set downe by diuers of the Ancients, that Rew doth prosper much, and becommeth stronger, if it be set by a Figge-Tree: which (we conceiue) is caused, Not by Reason of Friendship, but by Extraction of a Contrary Iuyce: The one Drawing Iuyce fit to result Sweet, the other bitter. So they haue set downe likewise, that a Rose set by Garlicke is sweeter: Which likewise may be, because the more Fetide Iuyce of the Earth goeth into the Garlicke; And the more Odorate into the Rose.

This wee see manifestly, that there be certaine Corne-Flowers, which come seldome or neuer in other places, vnlesse they be set; But onely amongst Corne: As the Blew-Bottle, a kinde of Yellow Mary Gold, Wilde Poppy, and Fumitorie. Neither can this be, by Reason of the Culture of the Ground, by Plowing, or Furrowing; As some Herbs, and Flowers, will grow but in Ditches new Cast; for if the Ground lie sallow, and vnsowne, they will not come: So as it should seeme to be the Corne, that qualifieth the Earth, and prepareth it for their Growth.

This Obseruation, if it holdeth, (as it is very probable,) is of great vse, for the Meliorating of Taste in Fruits, and Esculent Herbs; And of the Sent of Flowers. For I doe not doubt, but if the Figge-Tree doe make the Rew more strong, and

bitter, (as the Ancients haue noted,) good store of Rew planted about the Figge-Tree, will make the Figge more sweet. Now the Tastes that doe most offend in Fruits, and Herbs, and Roots, are Bitter; Harrish; Sowre; And Watrish, or Flashy. It were good therefore to make the Trials following.

Take Wormewood, or Rew, and set it neere Lettuce, or Goleflory, or Arti-hoake; And see whether the Lettuce, or the Coleflory, &c. become not the sweeter.

Take a Seruice-Tree, or a Cornelian-Tree, or an Elder-Tree, which wee know haue Fruits of harsh and binding Iuyce, and set them neere a Vine, or Figge-Tree, and see whether the Grapes, or Figs, will be the sweeter.

Take Cucumbers, or Pumpions, and set them (here and there) amongst Muske-Melons, and see whether the Melons will not be more Winy, and better tasted. Set Cucumbers (likewise) amongst Radish, and see whether the Radish will not be made the more Biting.

Take Sorrell, and set it amongst Rosps, and see whether the Rasps will not be the sweeter.

Take Common Briar, and set it amongst Violets, or Wall-Flowers, and see whether it will not make the Violets, or Wall-Flowers sweeter, and lesse Earthy in their Smell. So set Lettuce, or Cucumbers, amongst Rosemary, or Bayes, and see whether the Rosemary, on Bayes, will not be the more Odorate, or Aromaticall.

Contrariwise, you must take heed, how you set Herbs together, that draw much the like Iuyce. And therefore I thinke Rosemary will leese in Sweetnesse, if it be set with Lauender, or Bayes, or the like. But yet, if you will correct the strength of an Herbe, you shall doe well to set other like Herbs by him, to take him downe; As if you should set Tansey by Angelica, it may be, the Angelica would be the weaker, and fitter for Mixture in Perfume. And if you should set Rew by Common Wormewood, it may be, the Wormewood would turne to be like Roman Worniewood.

This Axiome is of large extent; And therefore would be seuered, and refined by Triall. Neither must you expect to haue a Grasse Difference by this kinde of

Culture, but only Further Perfection.

Triall would be also made in Herbs Poisonous, and Purgatine, whose ill Qualitie (perhaps) may be discharged, or attempted, by Setting stronger Poisons; or Purgatines, by them.

It is reported, that the Shrub called Our Ladies Seale; (which is a Kinde of Briony,) and Coleworts, set neere together, one or both will die. The Cause is, for that they be both great Depredatours of the Earth, and one of them starueth the other. The like is said of a Reed, and a Brake; Both which are succulent; And therefore the One deceiueth the Other. And the like of Hemlocke and Rew; Both which draw strong luyces.

Some of the Ancients, and likewise diures of the Moderne Writers, that haue laboured in Natural Magicke, haue noted a Sympathy, between the Sunne, Moone, and some Principall Starres; And certaine Herbs, and Plants. And so they haue denominated some Herbs Solar, and some Lunar; And such like Toyes put into great Words. It is manifest, that there are some Flowers, that haue Respect to the Sunne, in two Kindes; The one by Opening and Shutting; And the other by Bowing and Inclining the Head. For Mary-golds, Tulippa's, Pimper-ell, and indeed most Flowers, doe open or spread their Leaues abroad, when the Sunne shineth serene and faire: And againe, (in some part,) close them, or gather them inward, either towards Night, or when the Skie is ouercast. Of this there needeth no such Solemne Reason to be assigned; As to say, that they reioyce at the presence of the Sunne; And mourne at the Absence thereof. For it is Nothing else, but a little Loading of the Leaues, and Swelling them at the Bottome, with the Moisture of the Aire; whereas the drie Aire doth extend them: And they make it a Peece of the wonder, that Garden Clauer will hide the Stalke, when the Sunne sheweth bright; Which is Nothing, but a full Expansion of the leaues. For the Bowing and Inclining the Head; it is found in the great Flower of the Sunne; in Mary-golds; Wart wort; Mallow Flowers; and others. The Cause is somewhat more Obscure than the former; But I take it to be no other, but that the Part against which the Sunne beateth, waxeth more faint and flaccide in the Stalke; And thereby lesse able to support the Flower.

What a little Moisture will doe in Vegetables, euen though they be dead, and seuered from the Earth, appeareth well in the Experiment of Inglers. They take the Beard of an Oate; which (if you marke it well,) is wreathed at the Bottome, and one smooth entire Straw at the Top. They take only the Part that is Wreathed, and cut off the other, leauing the Beard halfe the Breadth of a finger in length. Then they make a little Crosse of a Quill, long-wayes of that Part of the Quill, which hath the Pith; And Crosse-wayes of that peece of the Quill without Pith; The whole Crosse being the Breadth of a Finger high. Then they pricke the Bottome where the Pith is, and thereinto they put the Oaten-beard, leauing halfe of it sticking forth of the Quill: Then they take a little white Box of wood, to deceiue Men, as if somewhat in the Box did worke the Feat: In which, with a Pinne, they make a little Hole, enough to take the Beard, but not to let the Crosse sinke downe, but to sticke. Then likewise by way of Imposture, they make a Question; As, Who is the Fairest Woman in the Company? Or, Who hath a Gloue, or Card? And canse Another to name diners Persons: And vpon euery Naming, they sticke the Crosse in the Box, hauing first put it towards their Mouth, as if they charmed it; And the Crasse stirreth not; But when they come to the Person that they would take; As they hold the Orasse to their Mouth, they touch the Beard with the Tip of their Tongue, and wet it; And so sticke the Crosse in the Box; And then you shall see it turne finely and softly, three or foure Turnes; Which is caused by the vntwining of the Beard by the Moisture. You may see it more euidently, if you sticke the Crosse betweene your fingers, in Stead of the Box; And therfore you may see, that this Motion, which is effected by so little Wet, is stronger than the Closing or Bending of the Head of a Marigold.

It is reported by some, that the Herb called Rosa-Solis, (wherof they make Strong Waters,) will at the Noone-day, when the Sunne shineth hot and bright, haue a great Dew vpon it. And therefore, that the right Name is Ros Solis: which they impute to a Delight and Sympathy, that it hath with the Sunne. Men fauour Wonders. It were good first to be sure, that the Dew that is found vpon it, be not the Dew of the Morning Preserued, when the Dew of other Herbs is breathed

away; for it hath a smooth and thicke Leafe, that doth not discharge the Dew so soone, as other Herbs that are more Spungy and Porous. And it may be Purslane, or some other Herb, doth the like, and is not marked. But if it be so, that it hath more Dew at Noone, than in the Morning, then sure it seemeth to be an Exudation of the Herb is solfe. As Plums sweat when they are set into the Ouen: for you will not (I hope) thinke, that it is like Gedeons Fleeel of Wood, that the Dew should fail vpon that, and no where else.

It is certaine, that the Honey-dews are found more vpon Oahe-le — es, than vpon A — of Beech, or the like: But whether any Cause be, from the Leafe it selfe, to concoct-the Dew, Or whether it be onely, that the Leafe is Close and Smooth; (And therefore drinketh not in the Dew, but preserueth it;) may be doubted. It would be well inquired, whether Ma — the Drug, doth fall but vpon certaine Herbs or L — onely. Flowers that haue deepe Sockets, doe gather in the Bottome, a kinde of Honey; As Honey-Suckles; (both the Woodbine, and the Trisoile;) Dillier; and the like. And in them certainly the Flower beareth part with the Dew.

The Experience is, that the Froth, which they call Woodsears, (being like a kinde of Spittle,) is found but vpon certaine Herbs, and those Hot Ones; As Lauender-cotton, Sage, Hissope, &c. Of the Cause of this enquire further; For it seemeth a Secret. There falleth also Mildew vpon Corne, and smutteth it; But it may be, that the same salleth also vpon other Herbs, and is not obserued.

It were good, Triall were made, whether the great Consent betweene Plants and Water, which is a principall Nourishment of them; will make an Attraction or Distance, and not at Touch onely. Therfore take a Vessell, and in the middle of it make a false Bottome of course Can — affe: Fill it with E — aboue the Canuaffey and let not the Bar-h be wa-ed; Then sow some good Seeds in that Earth, But — the Canuaffe, some halfe a foot in the Bottome of the Vessell, lay a great Sp — ge, th — owly wet in water; And let it lye so some ten Dayes. And see whether the Seeds will sprout, and the Earth become more Moist, and the Spunge more dry. The Experiment formerly mentioned of the Cucumber, creeping to the Pot of Water, is far stranger than this.

The Altering of the Sent, Colour, or Taste, of Fruit, by Infusing, Mixing, or Letting into the Barke, or Rost, of the Tree, Herb, or Flower, any Coloured, Aromaticall, or Medicinall; Substance; are but Fancies. The Cause is, for that those Things haue passed their Period, and nourish not. And all Alteration of Vegetables, in those Qualitles, must be by somewhat, that is apt to goe into the Nourishment of the Plant. But this is true; that where Kine feed vpon Wilde Garlicke, their Milke tasteth plainly of the Garlicke: And the Flesh of Muttons is better tasted where the Sheepe feed vpon Wilde Thyme, and other wholesome Herbs. Galen also speaketh of the Curing of the Scirrus of the Liuer, by Milke of a Cow, that feedeth but vpon certaine Herbs; And Honey in Spaine smelleth (apparently) of the Rosemary, or Orenge, from whence the Bee gathereth it: And there is an old Tradition of a Mayden that was fed with Napellus; (which is counted the Strongest Poyson of all Vegetables;) which with vse did not hurt the Maid, but poisoned some that had Carnall Company with her. So it is obserued by some, that there is a vertuous Bexoar, and another without vertue; which appeare to the shew alike; But the Vertuous is taken from the Beast, that feedeth vpon the Mountaines, where there are Theriacall Herbs; And that without Vertue; from those that feed in the Valleyes, where no such Herbs are. Thus far I am of Opinion; That as Steeped Wines and Beeres, are very Medicinall; and likewise Bread tempred with diuers Powders; So of Meat also, (as Flesh, Fish, Milke, and Egges,) that they may be made of great vse for Medicine, and Diet, if the Beasts, Fowle, or Fish, be fed with a speciall kinde of food, fit for the Disease. It were a dangerous Thing also for secret Empoysonthents. But whether it may be applyed vnto Plants, and Herbs. I doubt more; Because the Nourishment of them is a more common Iuyce; which is hardly capable of any speciall Quality, vntill the Plant doe assimilate it.

But lest our Incredulity may preiudice any profitable Operations in this kind, (especially since Many of the Ancients haue set them down,) We thinke good briefly to propound the foure Meanes, which they haue deuised of Making Plants Medicinable. The First is by Slitting of the Root, and Infusing into it the Medicine; As Hellebore, Opium, Scammony, Triacle, &c. And then binding it vp

againe. This seemeth to me the least probable; Because the Root draweth immediately from the Earth; And so the Nourishment is the more Common, and lesse Qualified: And besides, it is a long time in Going vp, ere it come to the Fruit. The Second Way is, to Perforate the Body of the Tree, and there to Infuse the Medicine: Which is somewhat better: For if any Vertue be receiued from the Medicine, it hath the lesse way, and the lesse time, to goe vp. The Third is, the Steeping of the Seed or Kernell in some Liquour, wherein the Medicine is Infused: Which I haue little Opinion of, because the Seed, (I doubt,) will not draw the Parts of the Matter, which haue the Propriety: But it will be farre the more likely, if you mingle the Medicine with Dung; For that the Seed naturally drawing the Moisture of the Dung, may call in withall some of the Propriety. The fourth is, the Watring of the Plant oft, with an Infusion of the Medicine. This, in one respect, may haue more force than the rest; Because the Medication is oft renewed; Whereas the rest are applyed but at one time: And therefore the Vertue may the sooner vanish. But still I doubt, that the Root is somewhat too stubborne to receiue those fine Impressions; And besides, (as I said before,) they haue a great Hill to goe vp. I iudge therefore the likeliest way to be the Perforation of the Body of the Tree, in senerall Places, one aboue the other; And the Filling of the Holes with Dung mingled with the Medicine. And the Watring of those Lumpes of Dung, with Squirts of an Infusion of the Medicine in Dunged water, once in three or foure Daies.

VI. Century.

OVR Experiments we take care to be, (as we haue often said,) either Experimenta Fructifera, or Lucifera; Either of Vse, or of Discouery: For we hate Impostures; And despise Curiosities. Yet because we must apply out Selues somewhat to Others, wee will set downe some Curiofities touching Plants.

It is a Curiosity, to haue seuerall Fruits vpon one Tree; And the more, when some of them come Early, and some come Late; So that you, may haue, vpon the same Tree, Ripe Fruits all Sommer. This is easily done, by Grafting of Seurall Cians, vpon seuerall Boughes of a Stock, in a good Ground, plentifully sed. So you may haue all Kindes of Cherries, and all kindes of Plums, and Peaches, and Apricots, vpon one Tree; But I conceiue the Diuer sity of Fruits must be such, as will grast vpon the same Stocke. And therefore, I doubt, whether you can haue Apples, or Peares, or Orenges, vpon the same Stocke, vpon which you graft Plummes.

It is a Curiosity to haue Fruits of Diuers Shopes, and Figures. This is easily performed by Moulding them, when the Fruit is young, with Moulds of Earth, or Wood. So you may haue Cucumbers &c. as Long as a Cane; Or as Round as a Spheare; Or formed like a Crosse. You may haue also Apples, in the sorme of Peares, or Limons. You may haue also Fruit in more Accurate Figures; As we said of Men, Beasts, or Birds, according as you make the Moulds. Wherein you must vnderstand, that you make the Mould big enough, to containe the whole Fruit, when it is growne to the greatest: For else you will choake the Spreading of the Fruit; Which otherwise would spread it selfe, and fill the Concaue, and so be turned into the Shape desired; As it is in Mouldworkes of Liquid Things. Some doubt may be conceiued, that the Keeping of the Sunne from the Fruit, may hurt it: But there is ordinary experience of Fruit that groweth Couered. Quare also, whether some small Holes, may not be made in the Wood, to let in the Sunne. And note, that it were best to make the Moulds partible, glued, or cemented together, that you may open them, when you take out the Fruit.

It is a Curiosity, to haue Inscriptions, or Engrauings, in Fruit, or Trees. This is easily performed, by Writing with a Needle, or Bodkin, or Knife, or the like, when the Fruit, or Trees are young; For as they grow, so the Letters will grow more large, and Graphicall.

— Teneris{que} meos incidere Amores
Arboribus, crescent illa, crescetis Amores.

You may haue Trees apparrelled with Flowers, or Herbs, by Boring Holes in the Bodies of them, and Putting into them Earth Holpen with Mucke, and Setting Seeds, or Slips, of Wielets, Stramberries, Wilde-Thyme Camamill, and such like in the Earth. Wherein they doe but grow, in the Tree, as they doe in Pots; Though (perhaps) with some Feeding from the Trees. It would be tried also with Shoots of Vines and Roots of RedRoses; For it may be, they being of a more Ligueout Nature, will incorporate with the Tree it selfe.

It is an ordinary Curiosity, to Forme Trees and Sbrubs, (as Rosemary, Inniper, and the like,) into Sundry Shapes; which is done by Moulding them within, and Cutting them without. But they are but lame Things, being too small to keepe Figure: Great Castles made of Trees vpon Frames of Timber, with Turrets, and Arches, were anciently matters of Magnificence.

Amongst Cariofities, I shall place Colouration, though it be somewhat better: For Beauty in Flowers is their Preheminence. It is obserued by some, that Gilly-flowers, Sweet-Williams, Yielets, that are Coloured, if they be neglected, and neither Watred, not New Monlded, nor Transplanted, will turne White. And it is probable, that the White with much culture, may turne Coloured. For this is certaine, that the White Colour commeth of Scarcity of Nourishment; Except in Flowers that are onely White, and admit no other Colours.

It is good therefore, to see what Natures doe accompany what Colours; For by that you shall haue Light, how to induce Colours, by Producing those Natures. Whites are more Inodorate, (for the most part) than Flowers of the same kinde Coloured; As is found in Single White Violets, White-Roses, White GillyFlowers, White Stock-Grlly-Flowers, &c. Wee finde also, that Blossomes of Trees, that are White, are commonly Inodorate; As Cherries, Pearas; Pl ——

s; Whereas those of Apples, Crabs, Almonds, and Peaches, are Blushy, and Smell Sweet. The Cause is, for that the Substance that maketh the Flower, is of the thinnest and sinest of the Plant; Which also maketh Flowers to be of so dainty Colours. And if it bee too Sparing, and Thinne, it attaineth no Strength of Odour; Except it be in such Plants, as are very Succulent; Whereby they need rather to be scanted in their Nourishment, than replenished, to haue them sweet. As we fee in White Satyrian, which is of a Dainty Smell; And in Beane-Flowers, &c. And againe, if the Plant be of Nature, to put forth White Flowers onely, and those not thinne, or dry, they are commonly of rancke and fulsome Smell; As May-Flowers, and White Lillies.

Contrariwise, in Berries, the White is commonly more Delicaee, and Sweet in Taste, than the Coloured; As wee see in White Grapes; In White Raspes; In White Strawberries; In White Carra-, &c. The Cause is, for that the Coloured are more iuyced, and courfer iuyced; And therefore not so well and equally Concocted; But the White are better proportioned, to the Disgestion of the Plant.

But in Fruits, the White commonly is meaner; As in Peare-Plums, Da-asi-s, &c. And the Choicest Plammes are Blacke, The Malberry, (which though they call it a Berry, is a Fruit,) is better the Blacke, than the White. The Haruest White-Pl-mme, is a base Pl-mme; And the Verdoccie and White Date-Plamme, are no very good Plummes. The Cause is, for that they are all Ouer-watry: Whereas an higher Concoction is required for Sweetnesse, or Pleasure of Taste; And therefore all your dainty Plummes, are a little dry, and come from the Stone; As the Muscle-Plumme, the Damasin-Plumme, the Peach, the Apricet, &c. Yet some Fruits, which grow not to be Blacke, are of the Nature of Berries, sweetest such as are Paler; As the Cae-r-Cherry, which inclineth more to White, is sweeter than the Red; But the Egriot is more sowre.

Take GillyFlower Seed, of one kinde of GillyFlower: (As of the Cloue-Gilly-Flower, which is the most Common;) And sow it; And there will come vp GillyFlowers, some of one Colour, and some of another, casually, as the Seed meeteth with Nourishment in the Earth; So that the Gardiners finde, that they may haue two or three Roots amongst an hundred, that are rare, and of great

Price: As Purple, Carnation of Seuerall Stripes; The Canse is, (no doubt,) that in Earth, though it be contiguous, and in one Bed, there are very feuerall luyees; And as the Seed doth casually meet with them, so it commethforth. And it is noted especially, that those which doe come vp Purple, doe alwayes come vp Single; The Iuyee, as it seemeth, not being able to suffice a Succulent Colour, and a Double Leafe. This Experiment of seuerall Colours, comming vp from one Seed, would be tried also in Larkes-Foot, Moukes-Head, Rappy, and Hollyoke.

Few Fruits are coloured Red within; The Queene-Apple is; And another Apple, called the Rose Apple; Mulberries likewise; and Grapes, though most toward the Skinne. There is a Peach also, that hath a Circle of Red towards the Stone: And the Egriot-Cherry is somewhat Red within; But no Peare, nor Warden, not Plumme, nor Apricet, although they haue (many times) Red sides, are Coloured Red within. The Canse may be enquired.

The Generall Colour of Plants is Greene; which is a Colour that no Flower is of. There is a Greenish Prime-Rose, but it is Pale, and scatce a Greene; The Leaues of some Trees turne a little Murry, or Reddish; And they be commonly Young Leaues that doe so; As it is in Oakes, and Vines, and Hasle. Leaves tot into a Yellow; And some Hollies haue part of their Leaues Yellow, that are, (to all seeming,) as Fresh and Shining, as the Greene. I suppose also, that Yellow is a lesse Succulent Colour, than Greene; And a degree nearer White. For it hath beene noted, that those Yellow Leaues of Holly stand euor towards the North, or North-East. Some Roots are Yellow, as Carress; And some Plants Bloud-Red, Stalke and Leafe, and all; as Amaranthus. Some Herbs incline to Purple, and Red; As a Kinde of Sage doth, and a Kinde of Mint, and Rosa Solis, &c. And Some haue White Leaues, as another Kinde of Sape, and another kinde of Mins; But Azure, and a Paire Purple, are neuer found in Leaues. This Sheweth, that Flowers are made of a Refined luyce, of the Earth; And so are Fruits: But Leaues of a more Courfe, and Common.

It is a Curiosity also to make Flowers Double; Which is effected by Often Remouing them into New Earth; As on the contrary Part, Double Flowers, by neglecting, and not Remouing, proue Single And the Way to doe it speedily, is

to sow or set Seeds, or Slips of Flowers; And as soone as they come vp, to remoue them into New Ground, that is good. Enquire also, whether Inoculating of Flowers, (as Stock-GillyFlowers, Roses, MuskeRoses. &c.) doth not make them Double. There is a Cherry-Tree, that hath Double Blossomes; But that Tree beareth no Fruit; And, it may be, that the same Meanes, which applied to the Tree, doth extremely accelerate the Sap to rise, and breake sorth. Would make the Tree spend it selfe in Flowers, and those to become Double; Which were a great pleasure to see; Especially in AppleTrees, Peach-Trees, and Almond-Trees, that haue Blossomes Blush-Coloured.

The Making of Fruits, without Core or Stone, is likewise a Curiosity; And somewhat better: Because whatsoeuer maketh them so, is like to make them more Tender and Delicate. If a Cions or Shooe, fit to be set in the Ground, haue the Pith finely taken forth, (and not altogether, but some of it left, the better to saue the life,) it will beare a Fruit with little, or no Core, or Stone. And the like is said to be, of diuiding a Quicke-Tree downe to the Ground, and Taking out the Pith, and then binding it vp againe.

It is reported also, that a Citron grafted vpon a Quince haue small or no Seeds; And it is very probable, that grafted vpon a Stocke, that a Sweeter Fruit may hath make the Fruit sweeter, and more void of the harsh ◊◊◊ or Seeds.

It is reported, that not only the —— —— of the —— but the Steepping of the Iuyce of the Pith, from Rising in the if you should boare a Tree cleane thorow, and put a wedge in.It is true, there is some Affinitie betweene the Pith, and the Kernell,because they are both of a harsh Substance, and both placed in the Middest.

It is reported, that Trees watred perpetually with Warme Water, will make a Fruit, with little or no Core, or — . And the Rule is generall, that whatsoeuer will make a Water-Tree a Garden-Tree, will make a Garden-Tree to haue lesse Core, or Stone.

The Rule is certaine, that Plants for want of Culture, —— to be be baser in the same Kinde; And sometimes so —— , as to change into another Kinde. 1. The St — ding —— not being Remoued, — keth them degenerase. 2. Drangle,

vnlesse the Earth of it selfe be moist, doth the like. 3. So doth Remouing into worse Earth, or Gorbearing to C — p-st the Earth; As wee see that Water-Mini turneth into Field-Mini; And the Colewort into Rape by Neglect, &c.

Whatsouer Fruit vseth to bee set vpon a Ro — , or a Slipif it bee will degenerate. Grapes sowne; Figs, Almonds, Pomgranate Kernells sowne; make the Fruits degenerate, and become Wilde. And againe, Most of those Fruits that vse to be grafted, if they be set of Kernells, or Stones, degenerate. It is true, that —— , (as hath beene touched before,) doe better vpon S — S — , than vpon Grafting: And the Rule of Exception should seeme to be this; That whatsoeuer P —— requireth much Moisture, prospereth better vpon the Stone, or Kernell, than vpon the Graft. For the Stocke, though it glueth a finer Nourishment, yet it giueth a scanter, than the Earth at large.

Seeds, if they be very Old, and yet haue strength enough to bring forth a Plant, make the Plant degenerate. And therefore skilfull Gardiners make triall of the Seeds, before they buy them, whether they be good or no, by Putting them into Water gently Boyled; And if they be good, they will sprout within Halfe an Houre.

It is strange which is reported, that Basill too such exposed to the Sunne, doth turne into Wilde Thyme: Although those two Herbs seeme to haue small Affinitie; but Basill is almost the only Hot Herbe, that hath Fat and Succulent Leaues; Which Oylinesse, if it be drawne forth by the Sunne, it is like it will make a very great Change.

There is an old Tradition, that Boughs of Oake, put into the Earth, will put forth Wilde Vines: Which if it be true, (no doubt,) it is not the Oake that turneth into a Vine, but the Oake-Bough Putrifying, qualifieth the Earth, to put forth a Vine of it selfe.

It is not impossible, and I haue heard it verified, that vpon Cutting downe of an Old Timber-Tree, the Stub hath put out sometimes a Tree of another Kinde; As that Beech hath put forth Birch; Which, if it be true, the Cause may be, for that the old Stub is too scant of Iuyce, to put forth the former Tree; And

therefore putteth forth a Tree of a smaller kindey that needeth lesse Nourishment.

There is an Opinion in the Countrey, that if the same Ground be oft sowen, with the Graine that grew vpon it, it will, in the end, grow to be of a ba-er kinde.

It is certaine, that in very Sterile Yeares, Carne sowne will grow to an Other Kinde.

Grandia sapè quibus mandauimus Hordes Sulcis.

Infoelix Lolium, & steriles dominantur Auena.

And generally it is a Rule, that Plants, that are brought forth by Culture, as Corne, will sooner change into other Species, than those that come of themselues: For that Culture giueth but an Aduentitious Nature, which is more easily put off.

This worke of the Transmutation of Plants, one into another, is inter Magnalia Naturae: For the Transmutation of Species is, in the vulgar philosophie, pronounced Impossible: And certainly, it is a thing of difficultie, and requireth deepe Seatch into Nature: But feeing there appeare some manifest Instances of it, the Opinion of Impossibilitie is to be reiected; And the Meanes thereof to be found out. Wee see, that in Liuing Creatures, that come of Putrefaction, there is much Transmutation, of one into another; As Catterpillers turne into Flies, &c. And it should seeme probable, that what soeuer Creature, hauing life, is generated without Seed, that Creature will change out of one Species into another. For it is the Seed, and the Nature of it, which locketh and boundeth in the Creature, that it doth not expatiate. So as wee may well conclude, that seeing the Earth, of it selfe, doth put forth Plants, without Seed, therefore Plants may well haue a Transmigration of Species. Wherefore Wanting Instances, which doe occurre, wee shall giue Directions of the most likely Trialls: And generally, wee would not haue those, that read this our Worke of Sylua Syluarum, account it strange, or thinke that it is an Ouer-Haste, that wee haue set downe Particulars vntried; For contrariwise, in our owne Estimation, we account such Particulars, more worthy, than those that are already tried and knowne. For these Later must

be taken as you finde them; But the Other doe leuell Point blanke at the Inuenting of Causes, and Axiomes.

Flast therefore you must make account, that if you will haue one Plant change into another, you must haue the Nourishment ouer-rule the Seed; And therefore you are to practise it by Nourishments as contrary, as may be, to the Nature of the Harbs; So neuerthelesse as the Herbe may grow; And likewise with Seeds that are of the Weakest Sort, and haue least Vigour. You shall doe well therefore, to take Marsh-Herbs, and Plant them vpon Tops of Hills, and Champaignes; And such plants as require much Moisture, vpon Sandy and very drie Grounds. As for Example, Marsh-Maltowes, and Sedge, vpon Hills; Cucumber and Let-nce. Seeds, and Coloworis, vpon a Sandy Plas: So contrariwise plant Bushes, Heath, Ling, and Brakes, vpon a Wet or Mu-sh Ground. This I conceiue also, that all E-c-lent and Garden-Herbs, set vpon the Tops of Hills, will proue more Modicinall, though leffe E — lent, than they were before. And it may be likewise, some Wilde-Herbs you may make Sallel-Herbs. This is the first Rule for Trans — ction of Plants.

The second Rule shall be to burie some few Seeds, of the Herbe you would change, amongst other Seeds; And then you shall see, whether the luyee of those other Seeds, doe — so qualifie the Earth, as it will alter the Seed, whereupon you worke. As for Example; Put Parfly — amongst Onion-S — t Or Lettuce Seed amongst Parthy-Seed; Or Ba — Seed amongst Thyme-Seed; And see the Change of Taste on otherwise. But you shall doe well, to put the Seed you would change, into a little linnen Cloth, that it mingle not with the forraine Seed.

The third Rule shall be, the Making of some Medley or Mixture of Earth, with some other plants Braised, or Shanes, either in Leafe or Root; As for Example, make Earth with a Mixture of Calmert-Leaues, stamped, and set in it Artis — kes, or Pars-ips; So take Earth made with Mai — , or Origa — m, or Wilde Th — , bruised, or stamped, and set in it Fennell-Seed, &c. In which Operation, the Processe of Nature still will be, (as I conceiue,) not that the Harbe you worke vpon, should draw the Iuyce of the Fo — ne Herbes (For that Opinion

was haue formerly reiected;) But that there will be a New Confection of Mould, which perhaps will alter the Seed, and yet not to the kinde of the former Herbe.

The fo — Rule shall be, to — what Herbs, some — doe put forth of themselues; And to take — Earth, and to Pat it, or to —— — it; And in that to set the Seed you would change: as for example, sake from vnder Walls, or the like, where Nettles put forth in abundance, the Earth which you shall there finde, without any String, or Root of the Nettles; And Pot that Earth, and set in it Stock-gilly, flowers, or Wall Flowers, &c. Or sow in the Seeds of them; And see what the Euent will be: Or take Earth, that you haue prepared to put forth Mushromes, of it selfe, (whereof you shall finde some Instances following;) And sow in it Purslane Seed, or Lettuce-Seed; For in these Experiments, it is likely enough, that the Earth being accustomed to send forth one Kinde of Nourishment, will alter the new Seed.

The fifth Rule shall be, to make the Herbe grow Contrary to his Nature; As to make Ground-Herbes rise in Heighth: As for example; Carry Camomill, or Wilde-Thyme, or the Greene Strawberry, vpon Sticks, as you doe Heps vpon Poles; And see what the Euent will be.

The sixth Rule shall be, to make Plants grow out of the Sunne, or Open Aire; For that is a great Mutation in Nature; And may induce a Change in the Seed: As barrell vp Earth, and sow some Seed in it, and put it in the Bottome of a Pond; Or put it in some great hollow Tree; Trie also the Sowing of Seeds, in the Bottomes of Caues; And Pots with Seeds sowne, hanged vp in Wells, some distance from the Water, and see what the Euent will be.

It is certaine, that Timber-Trees in Coppice-Words, grow more vpright, and more free from Vnder-Boughs, than those that stand in the Field; The Cause whereof is, for that Plants haue a Naturall Motion, to get to the Sunne; And besides, they are not glutted with too much Nourishment; For that the Coppice shareth with them; And Repletion euer hindreth Stature; Lastly, they are kept warme; And that euer in Plants helpeth Mounting.

Trees, that are, of themselues, full of Heat, (which Heat appeareth by their Inflammable Gumms,) as Firrs, and Pines, mount of themselues in Heighth

without Side-Boughs, till they come towards the Top. The Cause is, partly Heat; And partly Tenuitie of Iuyce; Both which send the Sap vpwards. As for Iuniper, it is but a Shrub, and groweth not bigge enough in Body, to maintaine a tall Tree.

It is reported, that a Good Strong Canuas, spread ouer a Tree grasted low, soone after it putteth forth, will dwarfe it, and make it spread. The Cause is plaine; For that all Things that grow, will grow as they finde Roome.

Trees are generally set of Roots, or Kernells; But if you set them of Slips, (as of some Trees you may, by name the Mulberry), some of the Slips will take; And those that take, (as is reported,) will be DwarfeTrees. The Cause is, for that a Slip draweth Nourishment more weakly, than either a Root, or Kernell.

All Plants, that put forth their Sap hastily, haue their Bodies not proportionable to their Length; And therefore they are Winders, and Creepers; As Iuy, Briony, Hops, Woodbine: Whereas Dwarsing requireth a slow Putting forth, and lesse Vigour of Mounting.

The Scripture saith, that Salomon wrote a Naturall History, from the Cedar of Libanus, to the Mosse growing vpon the Wall: For so the belt Translations haue it. And it is true that Mosse is but the Rudiment of a Plant. And (as it were) the Mould of Earth, or Barke.

Mosse groweth chiefly vpon Ridges of Houses, tiled or thatched, And vpon the Crests of Walls. And that Mosse is of a lightsome, and pleasant Greene. The Growing vpon Slopes is caused, for that Mosse, as on the one side it commeth of Moisture and Water, so on the other side the Water must but Slide, and not Stand or Poole. And the Growing vpon Tiles, or Walls, &c. is caused, for that those dried Earths, hauing not Moisture sufficient to put forth a Plant, doe practise Gormination by Putting forth Mosse; Though when by Age, or otherwise, they grow to relent and resolue, they sometimes put forth Plants; As Wall-Flowers. And almost all Mosse hath here and there little Stalkes, besides the low Thrumme.

Mosse groweth vpon Alleyes, especially such as lye Cold, and vpon the North; As in diuers Tarrasses: And againe, if they be much trodden; Or if they

were, at the first, grauelled; For wheresoeuer Plants are kept downe, the Earth putteth forth Mosse.

Old Ground, that hath beene long vnbroken vp, gathereth Mosse: And therfore Husbandmen vse to cure theit Pasture Grounds, when they grow to Mosse, by Tilling them for a yeare, or two: Which also dependeth vpon the same Cause; For that, the more Sparing and Staruing Iuyce of the Earth, in sufficient for Plants, doth breed Mosse.

Old Trees are more Mossy, (farre) than Young; For that the Sap is not so francke as to rise all to the Boughes, but tireth by the way, and putteth out Mosse.

Fountaines haue Mosse growing vpon the Ground about them;

Muscosi Fontes; —

The Cause is, for that the Fountaines draine the Water from the Ground Adiacent, and leaue but sufficient Moisture to breed Mosse: And besides, the Coldnesse of the Water conduceth to the same.

The Mosse of Trees, is a kinde of Haire; For it is the Iuyce of the Tree, that is Excerned, and doth not Affimilate. And vpon great Trees the Mosse gathereth a Figure, like a Leafe.

The Moister Sort of Trees yeeld little Mosse; As we see in Aspes, Poplars, Willowes, Beeches, &c. Which is partly caused, for the Reason that hath beene giuen, of the francke Putting vp of the Sap into the Boughes; And partly, for that the Barkes of those Trees, are more Close and Smooth, than those of Oakes, and Ashes; Whereby the Mosse can the hardlier issue out.

In Clay-Grounds, all Fruit-Trees grow full of Mosse, both vpon Body and Boughes; Which is caused, partly by the Coldnesse of the Ground, whereby the Plants nourish lesse; And partly by the Toughnesse of the Earth, whereby the Sap is shut in, and cannot get vp, to spread so franckly, as it should doe.

Wee haue said heretofore, that if Trees be Hide-bound, they wax lesse Fruitfull, and gather Mosse: And that they are holpen by Hacking, &c. And therefore by the Reason of Contraries, if Trees be bound in with Cords, or some Outward Bands, they will put forth more Mosse: Which (I thinke) happeneth to

Trees that stand Bleake, and vpon the Cold Winds. It would also be tried, whether, if you couer a Tree, somewhat thicke vpon the top, after his Powling, it will not gather more Mosse. I thinke also, the Watring of Trees with Cold Fountaine-Water, will make them grow full of Mosse.

There is a Mosse the Perfumers haue, which commeth out of AppleTrees, that hath an Excellent Sent. Quare particularly for the Manner of the Growth, and the Nature of it. And for this Experiments, sake, being a Thing of Price, I haue set downe the last Experiments, how to multiply, and call on Mosses.

Next vnto Mosse, I will speake of Mushromes; Which are likewise an Vnperfect Plant. These Mushromes haue two strange Properties; The One, that they yeeld so Delicious a Meat; The other, that they come vp so bastily; As in a Night; And yet they are Vnsowne. And therefore, such as are Vpstarts in State, they call, in reproch, Mushromes. It must needs bee therefore, that they be made of much Moisture; And that Moisture Fat, Grosse, and yet somewhat Concocted. And (indeed) we finde, that Mushromes cause the Accident, which we call Incubus, or the Mare, in the Stomacke. And therefore the Surfet of them may Suffocate, and Empoyson. And this sheweth, that they are Windy; And that Windinesse is Grosse, and Swelling; Not Sharpe, or Griping. And vpon the same reason Mushromes are a venereous Meat.

It is reported, that the Barke of White, or Red Poplar, (which are of the Moistest of Trees,) cut small, and cast into Furrowes well dunged, will cause the Ground to put forth Mushromes, at all Seasons of the Yeare, fit to be eaten. Some adde to the Mixture Leanen of Bread, resolued in Water.

It is reported, that if a Hilly-Field, where the Stubble is standing, bee set on Fire, in a Showry Season, it will put forth great Store of Mushromes.

It is reported, that HartsHorne, Shauen, or in Small Peeces, mixed with Dung, and watred, putteth vp Mushromes. And we know HartsHorne is of a Fat and Clammy Substance: And it may be Oxe-Horne would doe the like.

It hath beene reported, though it be searce credible, that Iuy hath growne out of a Stags-Horne; Which they suppose, did rather come from a Confrication of the Horne vpon the Iuy than from the Horne it selfe. There is not knowne any

Substance, but Earth, and the Procedures of Earth, (as Tile, Stone, &c.) that yeeldeth any Mosse, or Herby Substance. There may be Trial made of some Seeds, as that of Fennel-Seed, Mustard Seed, and Rape-Seed, put into some little Holes, made in the Hornes of Stags, or Oxen, to see if they will grow.

There is also another Vnperfect Plant, that (in shew) is like a great Mushrome: And it is sometimes as broad as ones Hat; Which they call a Toads-Stoole: But it is not Esculent; And it groweth (commonly) by a dead Stub of a Tree; And likewise about the Roots of Rotten Trees: And therefore seemeth to take his Iuyce from Wood Putrified. Which sheweth, by the way, that Wood-Putrified yeeldeth a franke Moisture.

There is a Cake, that groweth vpon the Side of a Dead Tree, that hath gotten no Name, but it is large, and of a Chesnut Colour, and hard, and pithy; Whereby it should seeme, that euen Dead Trees forget not their Putting forth; No more than the Careasses of Mens Bodies, that put forth Haire, and Nailes, for a Time.

There is a Cod, or Bag, that groweth commonly in the Fields; That at the first is hard like a Tennis-Ball, and white; And after groweth of a Mushrome Colour, and full of light Dust vpon the Breaking: And is thought to be dangerous for the Eyes, if the Powder get into them; And to bee good for Kibes. Belike it hath a Corrosiue, and Fretting Nature.

There is an Herb called Iewes-Eare, that groweth vpon the Roots, and Lower Parts of the Bodies of Trees; Especially of Elders, and sometimes Ashes. It hath a strange Property; For in Warme-water, it swelleth, and openeth extremely. It is not greene, but of a dusky browne Colour. And it is vsed for Squinancies, and Inflammations in the Throat; Whereby it seemeth to haue a Mollifying, and Lenifying Vertue.

There is a Kinde of Spongy Excrescence, which groweth chiefly vpon the Roots of the Laser-Tree; And sometimes vpon Cedar, and other Trees. It is very White, and Light, and Friable: Which we call Agarick. It is famous in Physicke for the Purging of Tough flegme. And it is also an excellent Opener for the Liuer: But Offensiue to the Stomack; And in Taste it is, at the first, Sweet, and after Bitter.

We finde no Super-Plant, that is a Formed Plant, but Misseltoe. They haue an idle Tradition, that there is a Bird, called a Missel-Bird, that feedeth vpon a Seed, which many times shee cannot disgest, and so expelleth it whole with her Excrement: which falling vpon a Bough of a Tree, that hath some Rift, putteth forth the Misseltoe. But this is a Fable: For it is not probable, that Birds should feed vpon that they cannot disgest. But allow that, yet it cannot be for other Reasons: For First, it is found but vpon certaine Trees; And those Trees beare no such Fruit, as may allure that Bird to sit, and feed vpon them. It may be, that Bird feedeth vpon the Misseltoe-Berries, and so is often found there; Which may haue giuen occasion to the Tale. But that which maketh an End of the Question, is, that Misseltoe hath beene found to put forth vnder the Boughes, and not (onely) aboue the Boughes: So it cannot be any Thing that falleth vpon the Bough. Misseltoe groweth chiefly vpon CrabTrees, AppleTrees; sometimes vpon Hasses; And rarely vpon Oakes; The Misseltoe whereof is counted very Medicinall. It is cuer greene, Winter and Summer; And beareth a White Glistering Berry: And it is a Plant, vtterly differing from the Plant, vpon which it groweth. Two things therfore may be certainly set downe: First, that Super-fatation must be by Abundance of Sap, in the Bough that putteth it forth: Secondly, that that Sap must be such, as the Tree doth excerne, and cannot affimilate; For else it would goe into a Bough; And besides, it seemeth to be more Fat and Vnctuous, than the Ordinary Sap of the Tree; Both by the Berry, which is Clammy; And by that it continueth greene, Winter and Summer, which the Tree doth not.

This Experiment of Misseltoe may giue Light to other Practises. Therefore Triall would be made, by Ripping of the Bough of a CrabTree, in the Barke; And Watring of the Wound euery Day, with Warme Water Dunged, to see if it would bring forth Misseltoe, or any such like Thing. But it were yet more likely to try it, with some other Watring, or Anointing, that were not so Naturall to the Tree, as Water is; As Oyle, or Barme of Drinke, &c. So they be such Things as kill not the Bough.

It were good to try, what Plants would put forth, if they be forbidden to put forth their Naturall Boughes: Poll therefore a Tree, and couer it, some thicknesse, with Clay on the Top; And see what it will put forth. I suppose it will put forth Roots; For so will a Cions, being turned downe into Clay: Therefore, in this Experiment also, the Tree would be closed with somewhat, that is not so Naturall to the Plant, as Clay is. Try it with Leather, or Cloth, or Painting, so it be not hurtfull to the Tree. And it is certaine, that a Brake hath beene knowne to grow out of a Pollard.

A Man may count the Prickles of Trees to be a kinde of Excrescence; For they will neuer be Boughes, nor beare Leaues. The Plants that haue Prickles, are Thornes, blacke and white; Brier; Rose; Limon-Trees; CrabTrees; Goose-Berry; Berbery; These haue it in the Bough, The Plants that haue Prickles in the Leafe, are; Holly; Iuniper; Whin-bush; Thistle; Nettles also haue a small Venemous Prickle; So hath Borrage a small prickle, but harmelesse. The Cause must be Hasty Putting forth; Want of Moisture; And the Closenesse of the Barke; For the Haste of the Spirit to put forth, and the Want of Nourishment to put forth a Bough, and the Closenesse of the Barke, cause Prickles in Boughes; And therefore they are euer like a Pyramis, for that the Moisture spendeth after a little Putting forth. And for Prickles in Leaues, they come also of Putting forth more Iuyce into the Leafe, than can spread in the Leafe smooth; And therefore the Leaues otherwise are Rough, as Borrage and Nettles are. As for the Leaues of Holly, they are Smooth, but neuer Plaine, but as it were with Folds, for the same Cause.

There be also Plants, that though they haue no Prickles, yet they haue a Kinde of Downy or Veluet Rine, vpon their Leaues; As Rose Campion, Stock-Gilly-Flowers, Colts-Foot; which Downe or Nap commeth of a Subtill Spirit, in a Soft or Fat Substance. For it is certaine, that both Stock-Gilly-Flowers, and Rose-Campions, stamped, haue beene applied, with successe,) to the Wrests of those that haue had Tertian, or Quartan Agues; And the Vapour of Colts-Foot hath a Sanatiue vertue, towards the Lungs; And the Leafe also is Healing in Surgery.

Another Kinde of Excrescence is an Exudation of Plants, ioyned with Putrefaction; As we see in Oake-Apples, which are found chiefly vpon the Leaues of Oakes; And the like vpon Willowes: And Countrey People haue a kinde of Prediction, that if the Oake-Apple, broken, be full of Wormes, it is a Signe of a Pestilent Yeare; Which is a likely Thing, because they grow of Corruption.

There is also vpon Sweet, or other Brier, a fine Tuse, or Brush of Mosse, of diuers Colours; Which if you cut, you shall euer finde full of little white Wormes.

It is certaine, that Earth taken out of the Foundations of Vaults and Houses, and Bottomes of Wells, and then put into Pots, will put forth Sundry Kindes of Herbs: But some Time is required, for the Germination; For if it be taken, but from a Fathome deepe, it will put forth the First Yeare; If much deeper, not till after a Yeare, or Two.

The Nature of the Plants growing out of Earth so taken vp, doth follow the Nature of the Mould it selfe; As if the Mould be Soft, and Fine, it putteth forth Soft Herbs; As Grasse, Plantine, and the like; if the Earth be Harder and Courser, it putteth forth Herbs more Rough, as Thistles, Firres, &c.

It is Common Experience, that where Alleyes are close Grauelled, the Earth putteth forth, the first yeare, Knot-grasse, and after Spire-grasse. The Cause is, for that the Hard Grauell, or Pebble at the first Laying, will not suffer the Grasse to come forth vpright, but turneth it to finde his way where it can; But after that the Earth is somewhat loosened at the Top, the Ordinary Grasse commeth vp.

It is reported, that Earth, being taken out of Shady and Watry Woods, some depth, and Potted, will put forth Herbs of a Fat and Iuycy Substance; As Penny-wort, Purslane, Hausleeke, Penny-royall, &c.

The Water also doth send forth Plants, that haue no Roots fixed in the Bottome; But they are lesse Perfect Plants, being almost but Leaues, and those Small ones; Such is that we call Duck-Weed; Which hath a Leafe no bigger than a Thyme-Leafe, but of a fresher Greene, and putteth forth a little String into the

Water, farre from the Bottome. As for the Water-Lilly, it hath a Root in the Ground, And so haue a Number of other Herbs that grow in Ponds.

It is reported by some of the Ancients, and some Moderne Teftimony likewife, that there be some Plants, that grow vpon the Top of the Sea; Being supposed to grow of some Concretion of Slime from the Water, where the Sunne beateth hot, and where the Sea stirreth little. As for Alga Marina, (Sea-weed,) and Eryngium (Sea-Thistle,) both haue Roots; but the Sea-weed vnder the Water, the Sea-Thistle but vpon the Shore.

The Ancients haue noted, that there are some Herbs, that grow out of Snow, laid vp close together, and Putrified; And that they are all Bitter; And they name one specially, Flomus, which wee call MothMullein It is certaine, that Wormes are found in Snow commonly, like Earth-Wormes; And therefore it is not vnlike, that it may likewise put forth Plants.

The Ancients haue affirmed, that there are some Herbs, that grow out of Stone; Which may be, for that it is certain, that Toads haue been found in the Middle of a Free-Stone. We see also, that Flints, lying aboue Ground, gather Mosse; And Wall-Flowers, and some other Flowers, grow vpon Walls; But whether vpon the Maine Bricke, or Stone, or whether out of the Lime, or Chinckes, is not well obserued; For Elders and Ashes haue beene seene to grow out of Steeples: But they manifestly grow out of Clefts; In so much as when they grow big, they will disioyne the Stone. And besides it is doubtfull, whether the Mortar it selfe putteth it forth, or whether some Seeds be not let fall by Birds. There be likewife Rock-Herbs; But I suppose those are, where there is some Mould, or Earth. It hath likewife beene found, that great Trees growing vpon Quarries, haue put downe their Root into the Stone.

In some Mines in Germany, as is reported, there grow in the Bottome Vegetables; And the Worke-Folkes vse to say, they haue Magicall Vertue; And will not suffer Men to gather them.

The Sea-Sands seldome beare Plants. Whereof the Cause is yeelded, by some of the Ancients, for that the Sunne exhaleth the Moisture; before it can incorporate with the Earth, and yeeld a Nourishment for the Plant. And it is

affirmed also, that Sand hath (alwayes) his Root in Clay; And that there be no Veines of Sand, any great depth within the Earth.

It is certaine, that some Plants put forth for a time, of their owne Store, without any Nourishment from Earth, Water, Stone, &c. Of which Vide the Experiment 29.

It is reported, that Earth, that was brought out of the Indies, and other Remote Countries, for Ballast of Ships, cast vpon some Grounds in Italy, did put forth Fortaine Herbs, to vs in Europe not knowne; And, that which is more, that of their Roots, Barkes, and Seeds, con-used together, and mingled with other Earth, and well Watred with Warme Water, there came forth Herbs, much like the Other.

Plants brought out of Hot Countries, will endeuour to put forth, at the same Time, that they vsually do in their owne Climate; And therfore to preserue them, there is no more required, than to keepe them from the Iniury of Putting backe by Cold. It is reported also, that Graine out of the Hotter Countries translated into the Colder, will be more forward, than the Ordinary Graine of the Cold Countrey. It is likely, that this will proue better in Graines, than in Trees; For that Graines are but Annuall; And so the Vertue, of the Seed is not worne out; Whereas in a Tree, it is embased by the Ground, to which it is Remoued.

Many Plants, which grow in the Hotter Countries; being set in the Colder, will neucrthelesse, euen in those Cold Countries, being sowne of Seeds, ate in the Spring, come vp and abide most Part of the Summer; As we finde it in Orenge, and Limon-Seeds, &c. The Seeds whereof, Sowen in the End of Aprill, will bring forth Excellent Sallets, mingled with other Herbs. And I doubt not, but the Seeds of Cloue-Trees, and Pepper-Seeds, &c. if they could come hither Greene enough to be sowen, would doe the like.

There be some Flowers, Blossomes, Graines, and Fruits, which come more Early; And Others which come more Late in the Yeare. The Flowers that come early, with vs, are; Prime-Roses, Violets, Anemonies, Water-Daffadillies, Crocus Vernus, and some early Tulippa's. And they are all Cold Plants; Which therefore, (as it should seeme,) haue a quicker Perception, of the Heat of the

Sunne Increasing, than the Hot Herbs haue; As a Cold Hand will sooner finde a little Warmth, than a Hot. And those that come next after, are Wall-Flowers, Cowflips, Hyacinths, Rosemary-Flowers, &c. And after them, Pincks, Roses, Flowerdelnces, &c. And the latest are GillyFlowers, Holly-oakes, Larkes-Foot, &c. The Earliest Blossomes are, the Blossomes of Peaches, Almonds, Cornelians, Mezerions, &c. And they are of such Trees, as haue much Moisture, either Watrie, or Oylie. And therefore Grocus Vernus also, being an Herbe, that hath, an Oylie luyce, putteth forth early. For those also finde the Sunne sooner than the Drier Trees. The Graines are, first Rye and Wheat; Then Oats and Barley; Then Pease and Beanes. For though Greene Pease and Beanes be eaten sooner, yet the Drie Ones, that are vsed for Horse-Meat, are ripe last; And it seemeth that the Fatter Graine commeth first. The Earliest Fruits are, Strawberries, Cherries, Gooseberries, Corrans; And after them Early Apples, Early Peares, Apricots, Rasps; And after them Damasins, and most Kinde of Plums, Peaches, &c. And the latest are Apples, Wardens, Grapes, Nuts, Quinces, Almonds, Sloes, Brier-Berries, Heps, Medlars, Seruices, Cornelians, &c.

It is to be noted, that (commonly) Trees that ripen latest, blossome soonest: As Peaches, Cornelians, Sloes, Almonds, &c. And it seemeth to be a Worke of Prouidence, that they blossome so soone; For otherwise, they could not haue the Sunne long enough to ripen.

There be Fruits, (but rarely,) that come twice a Teare; as some Peares, Strawberries, &c. And it seemeth they are such, as abound with Nourishment; Whereby after one Period, before the Sunne waxeth too weake, they can endure another. The Violet also, amongst Flowers, commeth twice a Yeare; Especially the Double White; And that also is a Plant full of Moisture. Roses come twice, but it is not without Ca-ting, as hath beene formerly said.

In Muscbuia, though the Corne come not vp, till late Spring, yet their Haruest is as Early as Ours. The Cause is, for that the Strength of the Ground is kept in with the Snow; And wee see with vs, that if it be a long Winter, it is commonly a more Plentifull Teare: And after those kinde of Winters likewise, the Flowers, and Corne, which are Earlier, and Later, doe come commonly at once, and at the

same time; Which troubleth the Husbandman many times; For you sh-ll haue Red Roses, and Damaske Roses, come together; And likewise the Harnest of Wheat and Barley. But this happeneth euer, for that the Earlier staieth for the Later; And not that the Later commeth sooner.

There be diuers Fruit-Trees, in the Hot Countries, which haue Blossomes, and Young Fruit, and Ripe Fruit, almost all the Yeare, succeeding one another. And it is said, the Orenge hath the like with vs, for a great Part of Summer; And so also hath the Figge. And no doubt, the Naturall Motion of Plants, is to haue so; But that either they want luyce to spend; Or they meet with the Cold of the Winter: And therefore this Circle of Ripening cannot be, but in Succulent Plants, and Hot Countries.

Some Herbs are but Annuall, and die, Root and all, once a Yeare; As Borrage, Lettuce, Cucumbers, Muske-Melons, Bafill, Tobacco, Mustard-Seed, and all kindes of Corne; Some continue many Yeares; As Hyssope, Germander, Lanander, Fennell, &c. The Cause of the Dying is double; The first is the Tendernesse and Weaknesse of the Seed, which maketh the Period in a small time; As it is in Borrage, Lettnce, Cucumbers, Corne, &c. And therefore none of these are Hot. The other Cause is, for that some Herbs can worse endure Cold; As Basill, Tobacco, Mustard-Seed. And these haue (all) much Heat.

The Lasting of Plants is most in those that are Largest of Body; As Oakes, Elme, Ches-Nut, the Loat-Tree, &c. And this holdeth in Trees; But in Herbs it is often contrary; For borage, Colewort, Pompions, which are Herbs of the Largest Size, are of small Durance; Whereas Hyssope, Winter-Sauoury, Germander, Thyme, Sage, will last long. The Cause is, for that Trees last according to the Strength, and Quantitie of their Sap and Iuyce; Being well munited by their Barke against the Iniuries of the Aire: But Herbs draw a Weake luyce; And haue a Soft Stalke; And therefore those amongst them which last longest, are Herbs of Strong Smell, and with a Sticky Stalke.

Trees that beare Mast, and Nuts, are commonly more lasting, than those that beare Fruits; Especially the Moister Fruits: As Oakes, Beeches, Chesnuts, Wall-nuts, Almonds, Pine-Trees, &c. last longer than Apples, Peares, Plums, &c. The

Cause is the Fatnesse and Oylinesse of the Sap; Which euer wasteth lesse, than the more Watry.

Trees, that bring forth their Leaues late in the Yeare, and cast them likewise late, are more lasting, than those that sprout their Leaues Early, or shed them betimes. The Cause is, for that the late Comming forth sheweth a Moisture more fixed; And the other more loose, and more easily resolued, And the same Cause is, that Wilde-Trees last longer than Garden-Trees; And in the same kinde, those whose Fruit is Acide, more than those whose Fruit is sweet.

Nothing procureth the Lasting of Trees, Bushes, and Herbs, so much, as often Cutting: For euery Cutting causeth a Renouation of the Iuyee of the Plant; That it neither goeth so farre, nor riseth so faintly, as when the Plant is not Cut: Insomuch as Annuall Plants, if you cut them seasonably, and will spare the vse of them, and suffer them to come vp still young, will last more Yeares than one; As hath beene partly touched; Such as is Lettuce, Purslane, Cucumber, and the like. And for Great Trees, we see almost all Ouer-growne-Trees, in Church-yards, or neare Ancient Buildings, and the like, are Pollards, or Dottards, and not Trees at their full Height.

Some Experiment would be made, how by Art to make Plants more Lasting, than their ordinary Period; As to make a Stalke of Wheat, &c. last a whole yeare. You must euer presuppose, that you handle it so, as the Winter killeth it not; For we speake onely of Prolonging the Naturall Period. I conceiue, that the Rule will hold; That whatsoeuer maketh the Herbe come later, than at his time, will make it last longer time: It were good to try it, in a Stalke of Wheat, &c. set in the Shade, and encompassed with a Case of Wood, not touching the Straw, to keepe out Open Aire.

As for the Preseruation of Fruits, and Plants, as well vpon the Tree, or Stalke, as gathered, we shall handle it vnder the Title of Conseruation of Bodies.

The Particular Figures of Plants we leaue to their Descriptions; But some few Things, in generall, we will obserue. Trees and Herbs, in the Growing forth of their Boughes, and Branches, are not Figured, and keep no Order. The Cause is, for that the Sap, being restrained in the Rinde, and Barke, breaketh not forth at

all; (As in the Bodies of Trees, and Stalkes of Herbs.) till they begin to branch; And then, when they make an Eruption, they breake forth casually, where they finde best way, in the Barke, or Rinde. It is true, that some Trees are more scattered in their Boughes; As Sallow-Trees, Warden-Trees, Quince-Trees, Medlar-Trees, Limon-Trees, &c. Some are more in the forme of a Pyramis, and come almost to todd; As the Peare-Tree, (which the Critickes will haue to borrow his name of — , Fire,) Orenge-Trees, Firre-Trees, Service-Trees, LimeTrees, &c. And some are more spred and broad; As Beeches, Hornebeame, &c. The rest are more indifferent. The Cause of Scattering the Boughes, is the Hasty breaking forth of the Sap; And therefore those Trees rise not in a Body of any Height, but branch neare the Ground. The Cause of the Pyramis, is the Keeping in of the Sap, long before it branch; And the spending of it when it beginneth to branch, by equall degrees. The Spreading is caused by the Carrying vp of the Sap, plentifully, without Expence; And then putting it forth speedily, and at once.

There be diuers Herbs, but no Trees, that may be said to haue some kinde of Order, in the Putting forth of their Leaues: For they haue Ioynts, or Knuckles, as it were Stops in their Germination; As haue GillyFlowers, Pinckes, Fennell, Corne, Reeds, and Canes. The Cause whereof is, for that the Sap asoendeth vnequally, and doth (as it were) tire and stop by the way. And it seemeth, they haue some Closenesse, and Hardnesse in their Stalke, which bindreth the Sap from going vp, vntill it hath gathered into a Knot, and so is more vrged to put forth. And therefore, they are most of them hollow, when the Stalke is dry. As Fennell-Stalke, Stubble, and Canes.

Flowers haue (all) exquisite Figures; And the Flower-Numbers are (chiefly) Fiue, and Foure; As in Prime-Roses, Brier-Roses, Single MuskeRoses, Single Pinkes, and GillyFlowers, &c. which haue fiue Leaues: Lillies, Flowerde-luces, Borage, Buglosse, &c. which haue foure Leaues. But some put forth Leaues not Numbered; But they are euer small Ones; As Mary-Golds, Trisoile, &c. We see also, that the Sockets, and Supporters of Flowers, are Figured; As in the Fiue Brethren of the Rose; Sockets of GillyFlowers, &c. Leaues also are all Figured,

Some Round, Some Long; None Square; And many iagged on the Sides; Which Leaues of Flowers seldome are. For I account the Iagging of Pinkes, and GillyFlowers, to be like the Inequality of Oake-leaues, or Vine-leaues, or the like; But they seldome or neuer haue any small Purles.

Of Plants, some few put forth their Blossomes before their Leaues; As Almonds, Peaches, Cornelians, Black-Thorne, &c. But most put forth some Leaues before their Blossomes; As Apples, Peares, Plums, Cherries, White-Thorne, &c. The Cause is, for that those, that put forth their Blossomes first, haue either an Acute and Sharpe Spirit; (And therfore commonly they all put forth earely in the Spring, and ripen very late; As most of the Particulars before mentioned;) Or else an Oyly Iuyce, which is apter to put out Flowers, than Leaues.

Of Plants, some are Greene all Winter; Others cast their Leaues. There are Greene a-l Winter; Holly, Iny, Box, Firre, Eugh, Cypresse, Iuniper, Bayes, RoseMary, &c. The Cause of the Holding Greene, is the Close and Compact Substance of their Leaues, and the Pedicles of them. And the Cause of that againe, is either the Tough and Viscous Iuyce of the Plant; Or the Strength and Heat thereof. Of the first Sort is Holly; Which is of so Viscous a Iuyce, as they make Bird-lime of the Barke of it. The Stalke of Iuy is Tough, and not Fragile, as we see in other small Twigs dry. Firre yeeldeth Pitch. Box is a fast and heauy Wood, as we see it in Bowles. Eugh is a Strong and Tough Wood, as we see it in Bowes. Of the second Sort is Iuniper, which is a Wood Odorate, and maketh a hot Fire. Bayes is likewise a Hot and Aromatical Wood; And so is RoseMary for a Shrub. As for the Leaues, their Density appeareth, in that, either they are Smooth and Shining, as in Bayes, Holly, Iuy, Box, &c. Or in that they are Hard and Spiry, as in the rest. And Triall would be made of Grasting of RoseMary, and Bayes, and Box, vpon a Holly-Stocke; Because they are Planes that come all Winter. It were good to try it also with Grafts of other Trees, either Fruit-Trees, or Wilde-Trees; To see whether they will not yeeld their Fruit, or beare their Leaues, later, and longer in the Winter; because the Sap of the Holly putteth

forth most in the Winter. It may be also a Mexerion-Tree, grafted vpon a Holly, will proue both an Earlier, and a Greater Tree.

There be some Plants, that beare no Flower, and yet beare Fruit: There be some, that beare Flowers, and no Fruit: There be some that beare neither Flowers, nor Fruit. Most of the great Timber-Trees, (as Oakes, Beeches, &c.) beare not apparent Flowers: Some few (likewise) of the Fruit-Trees; As Mulberry, Wall-unt, &c. And some Shrubs, (as Iuniper, Holly, &c.) beare no Flowers. Diuers Herbs also beare Seeds, (which is as the Fruit,) and yet beare no Flowers; As Parslane, &c. Those that beare Flowers and no Fruit, are few; At the Double Cherry, the Sallow, &c. But for the Cherry, it is doubtfull, whether it be not by Art, or Culture; For if it be by Art, then Triall would be made, whether Apples, and other Fruits Blossomes, may not be doubled. There are some Few, that beare neither Fruit, nor Flower; As the Elme, the Poplers, Box, Brakes, &c.

There be some Plants, that shoot still vpwards, and can Support themselues; As the greatest Part of Trees and Plants: There be some Other, that Creepe along the Ground; Or Winde about other Trees, or Props, and cannot support themselues; As Vines, Iuy, Briar, Briony, Woodbines, Hop's, Climatis, Camomill, &c. The Cause is, (as hath beene partly touched,) for that all Plants, (naturally) moue vpwards; But if the Sap put vp too fast, it maketh a slender Stalks, which will not support the weight: And therefore these latter Sort are all Swift and Hasty Commers.

The first and most Ordinary Holpe is Stercoration. The Sheeps-Dung is one of the best; And next, the Dung of Kine: And thirdly, that of Horses: Which is held to be somewhat too hot, vnlesse it be mingled. That of Pigeons for a Garden, or a small Quantity of Ground, excelleth. The Ordering of Dung is; If the Ground be Arable, to spread it immediately before the Plonghing and Sowing; And so to Plough it in: For if you spread it long before, the Sunne will draw out much of the Fatnesse of the Dung: If the Ground be Grazing Ground, to spread it somewhat late, towards Winter; That the Sunne may haue the lesse Power to dry it vp. As for speciall Composts for Gardens, (as a Hot Bed, &c.) we haue handled them before.

The Second Kind of Compost, is, the Spreading of diuers Kinds of Earths; As Marle, Chalke, Sea-Sand, Earth vpon Earth, Pond-Earth; And the Mixtures of them. Marle is thought to be the best; As hauing most Fatnesse; And not Heating the Ground too much. The next is Sea-Sand; Which (no doubt) obtaineth a speciall Vertue, by the Salt: For Salt is the first Rudiment of life. Chalke ouer heateth the Ground a little. And therfore is best vpon Gold Clay-Grounds, or Moist Grounds: But I heard a great Husband say, that it was a common Errour, to thinke that Chalke helpeth Arable Grounds, but helpeth not Grazing Grounds; Wheras (indeed) it helpeth, Grasse, as well as Corne: But that which breedeth the Errour is, because after the Chalking of the Ground, they weare it out with many Crops, without Rest; And then (indeed) afterwards it will beare little Grasse, because the Gound is tired out. It were good to try the laying of Chalke vpon Arable Grounds, a little while before Ploughing; And to Plough it in, as they doe the Dung; But then it must be Friable first, by Raine, or Lying: As for Earth, it Copasseth it Selfe; For I knew a Great Garden, that had a Field (in a manner) powred vpon it; And it did beare Fruit excellently the first yeare of the Planting: For the Surface of the Earth is cuer the Fruitfullest. And Earth so prepared hath a double Surface. But it is true, as I co¯-eiue, that such Earth, as hath Salt-Petre bred in it, if you can procure it without too much charge, doth excell. The way to hasten the Breeding of Salt-Petre, is to forbid the Sunne, and the Growth of Vegetables, And therefore, if you make a large Houell, thatched, ouer some Quantity of Ground; Nay if you doe but Plancke the Ground ouer, it will breed Salt-petre. As for Pond-Earth, or Riuer-Earth, it is a very good Compost; Especially if the Pond haue beene long vncleansed, and so the Water be not too Hungry: And I iudge it will be yet better, if there be some Mixture of Chalke.

The Third Helpe of Ground, is, by some other Substances, that haue a Vertue to make Ground Fertile; though they be not meerely Earth: wherin Ashes excell; In so much as the Countries about AEtna, and Vesuuius, haue a kinde of Amends made them, for the Mischiefe the Eruptions (many times) doe, by the exceeding Fruit fulnesse of the Soyle, caused by the Ashes, scattered about. Soot

also, though thinne spred, in a Field, or Garden, is tried to be a very good Compost. For Salt, it is too Costly: But it is tryed, that mingled with SeedCorne, and sowen together, it doth good: And I am of Opinion, that Chalke in Powder, mingled with SeedCorne, would doe good; Perhaps as much as Chalking the Ground all ouer. As for the Steeping of the Seeds, in seuerall Mixtures with Water, to giue them Vigour; Or Watring Grounds with Compost-Water; We haue spoken of them before.

The Fourth Helpe of Ground, is, the Suffering of Vegetables to dye into the Ground; And so to Fatten it; As the Stubble of Corne, Especially PeaseBrakes cast vpon the Ground, in the Beginning of Winter, will make it very Fruitfull. It were good (also) to try, whether Leaues of Trees swept together, with some Chalke and Dung mixed, to giue them more Heart, would not make a good Compost: For there is nothing lost, so much as Leaues of Trees; And as they lye scattered, and without Mixture, they rather make the Ground soure, than otherwise.

The Fifth Helpe of Ground, is Heat and Warmth. It hath beene anci —— practised to burne Heath, and Ling, and Sedge, with the vantage of Wind, vpon the Ground: Wee see, that Warmth of Walls and Enclo — es, mendeth Ground: We see also that Lying open to the South, men — th Ground: We see againe, that the Foldings of Sheepe helpe Ground.ll by their Warmth, as by their Compost: And it may be doubted, — ther the Couering of the Ground with Brakes, in the Beginning of the Winter, (where of we spake in the last Experiment,) helpeth it not, by reaso-of the Warmth. Nay some very good Husbands doe suspect, that the Gathering vp of Flints, in Flinty Ground, and Laying them on Heapes, (which is much vsed,) is no good Husbandry; For that they would keep the Ground Warme.

The Sixth Helpe of Ground is, by Watering, and Irrigation; which is in two Munners: The one by Letting in, and Shutti gout Waters, at seasonable Tunes: For Water, at some Seasons, and with reasonable dry, deth good; But at some other Seasons, and with too long Stay, doth — . And this serueth onely for Meadowes, which are along some Rtuer. The other way is, to bring Water, from

some Hanging Grounds, where there are Springs, into the Lower Grounds, carrying it in some — Furrowes; And from those Furrowes, drawing it trauerse to spread the Water. And this maketh an excellent Improuement, both for Corne, and Grasse. It is the richer, if those Hanging Grounds be fruitfull, because it washeth off some of the Fatnesse of the Earth: But howsoeuer it profiteth much. Generally, where there are great Ouerflowes, in Fens, or the like, the drowning of them in the Winter, maketh the Summer following more fruitfull: The Cause may be, for that it keepeth the Ground warme, and nourisheth it: But the Fen-Men hold, that the Sewers must be kept so, as the Water may not stay too long in the Spring, til the Weeds and Sedge be growne vp; For then the Ground will be like a Wood, which keepeth out the Sunne; And so continueth the Wet; Whereby it will peuer graze (to purpose) that yeare. Thus much for Irrigation. But for Anoydances, and Draynings of water, where there is too much, and the Helps of Ground in that kinde, wee shall speake of them in another Place.

VII. Century.

THe Differences betweene Animate and Inanimate Bodies, we shall handle fully vnder the Title of Life, and Liuing Spirits, and Powers. We shall therefore make but a briefe Mention of them in this Place. The Maine Differences are two. All Bodies haue Spirits, and Pneumaticall Parts within them: But the Maine Differences betweene Animate and Inanimate, are two: The first is, that the Spirits of Things Animate, are all Continued with themselues, and are Branched in Veines, and secret Canales, as Bloud is: And in Liuing Creatures, the Spirits haue not only Branches, but certaine Cells or Seats, where the Principall Spirits doe reside, and whereunto the rest doe resort: But the Spirits in Things Inanimate are shut in, and cut off by the Tangible Parts; And are not peruious one to another; As Aire is in Snow. The Second Maine Difference is, that the Spirits of Animate Bodies, are all in some degree, (more or lesse,) kindled and inflamed; And haue a fine Commixture of Flame, and an Aeriall Substance. But Inanimate Bodies haue their Spirits no whit Inflamed, or Kindled. And this Difference consisteth not in the Heat or Coolenesse of Spirits; For Cloues and other Spices, Naphtha and Petroleum, haue exceeding Hot Spirits, (hotter a great deale than Oyle, Wax, or Tallow, &c.) but not Inflamed. And when any of those Weake and Temperate Bodies come to be Inflamed, then they gather a much greater Heat, than others haue Vn-inflamed; besides their Light, and Motion, &c.

The Differences, which are Secondary, and proceed from these two Radicall Differences, are; First, Plants are all Figurate and Determinate, which Inanimate Bodies are not; For looke how farre the Spirit is able to Spread and Continue it selfe; So farre goeth the Shape, or Figure; And then is determined. Secondly, Plants doe nourish; Inanimate Bodies doe not: They haue an Accretion, but no Alimentation. Thirdly, Plants haue a Period of Life; which Inanimate Bodies haue not. Fourthly, they haue a Succession, and Propagation of their Kinde; which is not in Bodies Inanimate.

The Differences betweene Plants, and Metalls or Fossiles, besides those foure before mentioned, (For Metalls I hold Inanimate,) are these: First, Metalls are more Durable than Plants: Secondly, they are more Solid and Hard: Thirdly, they are wholly Subterrany; Whereas Plants are part aboue Earth, and part vnder Earth.

There be very few Creatures, that participate of the Nature of Plants, and Metalls both; Corall is one of the Nearest of both Kindes: Another is Vitrioll, for that is aptest to sprout with Moisture.

Another speciall Affinitie is betweene Plants and Mould or Putrefaction: For all Putrefaction (if it dissolue not in Arefaction) will in the end issue into Plants, or Liuing Creatures bred of Putrefaction. I account Mosse, and Mushromes, and Agaricke, and other of those kindes, to be but Moulds of the Ground, Walls, and Trees, and the like. As for Flesh, and Fish, and Plants themselues, and a Number of other things, after a Mouldinesse, or Rottensesse, or Corrupting, they will fall to breed Wormes. These Putrefactions, which haue Affinitie with Plants, haue this Difference from them; That they haue no Succession or Propagation, though they Nourish, and haue a Period of Life, and haue likewise some Figure.

I left once, by chance, a Citron cut, in a close Roome, for three Summer-Moneths, that I was absent; And at my Returne, there were grown forth, out of the Pith cut, Tufts of Haires, an Inch long, with little blacke Heads, as if they would haue beene some Herbe.

The Affinities and Differences betweene Plants and Liuing Creatures, are these that follow. They haue both of them Spirits Continued, and Branched, and also Inflamed: But first in Liuing Creatures, the Spirits haue a Cell or Seat, which Plants haue not; As was also formerly said: And secondly, the Spirits of Liuing Creatures hold more of Flame, than the Spirits of Plants doe. And these two are the Radicall Differences. For the Secondary Differences, they are as follow. First, Plants are all Fixed to the Earth; Whereas all Liuing Creatures are seuered, and of themselues. Secondly, Liuing Creatures haue Locall Motion; Plants haue not. Thirdly, Liuing Creatures nourish from their Vpper Parts, by the Mouth chiefly; Plants nourish from below, namely from the Roots. Fourthly,

Plants haue their Seed and Seminall Parts vppermost; Liuing Creatures haue them lower-most: And therefore it was said, not elegantly alone, but Philosophically; Homoest Planta inuerse; Man is like a Plant turned vpwards; For the Root in Plants, is as the Head in Liuing Creatures. Fifthly, Liuing Creatures haue a more exact Figure than Plants. Sixthly, Liuing Creatures haue more Diuersity of Organs within their Bodies, and (as it were) Inward Figures, than Plants haue. Seuenthly, Liuing Creatures haue Sense, which Plants haue not. Eighthly, Liuing Creatures haue Voluntary Motion, which Plants haue not.

For the Difference of Sexes in Plants, they are oftentimes by name distinguished; As Male-Piony, Female-Piony; Male-Rose-mary, FemaleRose mary; Hee-Holly, Shee-Holly; &c. but Generation by Copulation (certainly) extendeth not to Plants. The nearest Approach of it, is between the Hee-Palme, and the Shee-Palme; which, (as they report,) if they grow neare, incline the One to the other: In so much as, (that which is more strange,) they doubt not to report, that to keepe the Trees vpright from Bending, they tye Ropes, or Lines, from the one to the other, that the Contact might be enjoyed by the Contact of a Middle Body. But this may be Faigned, or at least Amplified. Neuerthelesse, I am apt enough to thinke, that this same Binarium of a Stronger and a Weaker, like vnto Masculine and Feminine, doth hold in all Liuing Bodies. It is confounded sometimes; As in some Creatures of Putrefaction, wherein no Markes of Distinction appeare: And it is doubled sometimes; As in Hermaphrodites: But generally there is a Degree of Strength in most Species.

The Participles or Consiners betweene Plants and Liuing Creatures, are such chiefly, as are Fixed, and haue no Locall Motion of Remoue, though they haue a Motion in their Parts; Such as are Oysters., Cockles, and such like. There is a Fabulous Narration, that in the Northerne Countries, there should be an Herbe that groweth in the likenesse of a Lambe, and feedeth vpon the Grasse, in such sort, as it will bare the Grasse round about. But I suppose, that the Figure maketh the Fable; For so we see, there be Bee-Flowers, &c. And as for the Grasse, it seemeth the Plant, hauing a great Stalke and Top, doth prey vpon the Grasse, a good way about, by drawing the Iuyce of the Earth from it.

The Indian Fig boweth his Roots downe so low, in one yeare, as of it selfe it taketh Root againe: And so multiplieth from Root to Root; Making of one Tree a kinde of Wood. The Cause is the Plenty of the Sap, and the Softnesse of the Stalke, which maketh the Bough, being ouerloaden, and not stiffely vpheld, weigh downe. It hath Leaues, as broad as a little Target, but the Fruit no bigger than Beanes. The Cause is, for that the Continuall Shade increaseth the Leaues, and abateth the Fruit; which neuerthelesse is of a pleasant Taste. And that (no doubt) is caused, by the Supplenesse and Gentlenesse of the Iuyce of that Plant, being that which maketh the Boughes also so Flexible.

It is reported by one of the Ancients, that there is a certaine Indian Tree, hauing few, but very great, Leaues, three Cubits long, and two broad; And that the Fruit, being of good Taste, groweth out of the Barke. It may be, there be Plants, that poure out the Sap so fast, as they haue no leisure, either to diuide into many Leaues, or to put forth Stalks to the Fruit. With vs Trees (generally) haue finall Leaues, in comparison. The Fig hath the greatest; And next it the Vine, Mulberry, and Sycamore; And the Least are those of the Willow, Birch, and Thorne. But there be found Herbs with farre greater Leaues than any Tree; As the Burre, Gourd, Cucumber, and Cole-wort. The Cause is, (like to that of the Indian Fig,) the hasty and plentifull Putting forth of the Sap.

There be three Things in vse for Sweetnesse; Sugar, Honey, Manna. For Sugar, to the Ancients it was scarce knowne, and little vsed. It is found in Canes: Quare, whether to the first Knuckle, or further vp? And whether the very Barke of the Cane it selfe do yeeld Sugar, or no? For Honey, the Bee maketh it, or gathereth it; But I haue heard from one, that was industrious in Husbandry, that the labour of the Bee is about the Wax; And that he hath knowne in the beginning of May, Honey-Combs empty of Honey; And within a forthnight, when the Sweet Dewes fall, filled like a Cellar. It is reported also by some of the Ancients, that there is a Tree called Occhus, in the Valleyes of Hyrcanis, that distilleth Honey in the Mornings. It is not vnlike, that the Sap and Teares of some Trees, may be sweet. It may be also, that some sweet Iuyces, fit for many vses, may be concocted out of Fruits, to the Thicknesse of Honey, or perhaps of

Sugar; The likeliest are Raisins of the Sunne, Figs, and Corrans: The Meanes may be enquired.

The Ancients report of a Tree, by the Persian Sea, vpon the ShoreSands, which is nourished with the Salt-Water; And when the Tide ebbeth, you shall see the Roots, as it were, bare without Barke, (being as it seemeth corroded by the Salt,) & grasping the Sands like a Crab; Which neuerthelesse beareth a Fruit. It were good to try some Hard Trees, as a Seruice-Tree, or Firre-Tree, by setting them within the Sands.

There be of Plants, which they vse for Garments, these that follow. Hempe; Flax; Cotton; Nettles, (whereof they make Nettle-Cloth;) Sericum, which is a Growing Silke; They make also Cables of the Barke of Lime-Trees. It is the Stalke that maketh the Filaceous Matter, commonly; And sometimes the Downe that groweth aboue.

They haue, in some Countries, a Plant of a Rosy Colour, which shutteth in the Night, Openeth in the Morning, and Openeth wide at Noone; which the Inhabitants of those Countries say is a Plant that Sleepeth. There be Sleepers enow then; For almost all Flowers doe the like.

Some Plants there are, but rare, that haue a Mossy or Downy Root; And likewise that haue a Number of Threds, like Beards; As Mandrakes; wherof Witches and Impostours make an vgly Image, giuing it the Forme of a Face at the Top of the Root, and leaue those Strings to make a broad Beard downe to the Foot. Also there is a Kinde of Nard, in Creet, (being a Kinde of Phu) that hath a Root hairy, like a Rough-Footed-Doues foot, So as you may see, there are of Roots, Bulbous Roots, Fibrous Roots, and Hirsute Roots. And, I take it, in the Bulbous, the Sap hasteneth most to the Aire, and Sunne: In the Fibrous, the Sap dollghreth more in the Earth, and therefore putteth downward: And the Hirsute is a Middle betweene both; That besides the Putting forth vpwards, and downwards, putteth forth in Round.

There are some Teares of Trees, which are kembed from the Beards of Goats: For when the Goats bite and crop them, especially in the Mornings, the

Dew being on, the Teare commeth forth, and hangeth vpon their Beards: Of this Sort is some kinde of Ladanum.

The Irrigation of the Plaine-Tree by Wine, is reported by the Ancients, to make it Fruitfull. It would be tried likewise with Roots; For vpon Seeds it worketh no great Effects.

The way to carry Farraine Roots, a long Way, is to vessell them close in Earthan Vessells. But if the Vessells be not very Great, you must make some Holes in the Bottome, to giue some Refreshment to the Roots; Which otherwise (as it seemeth) will decay, and suffocate.

The ancient Cinnamon, was, of all other Plants, while it grew, the Dryest; And those Things, which are knowne to comfort other Plants, did make that more Sterill: For in Showers it prospered worst: It grew also amongst Bushes of other kindes, where commonly Plants doe not thriue: Neither did it loue the Sunne: There might be one Cause of all those Effects; Namely, the sparing Nourishment, which that Plant required. Quare how farre Cassia, which is now the Substitute of Cinnamon, doth participate of these Things.

It is reported by one of the Ancients that Cassia when it is gathered, is put into the Skins of Beasts, newly fleyed; And that the Skins Corrupting, and Breeding Wormes, the Wormes doe deuoure the Pith and Marrow of it, and so make it Hollow; But meddle not with the Barke, because to them it is bitter.

There were, in Ancient Time, Vines, of farre greater Bodies, than we know any; For there haue beene Cups made of them, and an Image of Iupiter. But it is like they were Wilde-Vines; For the Vines, that they vse for Wine, are so often Cut, and so much Digged and Dressed, that their Sap spendeth into the Grapes, and so the Stalke cannot increase much in Bulke. The Wood of Vines is very durable, without Rotting. And that which is strange, though no Tree hath the Twigges, while they are greene, so brittle, yet the Wood dryed is extreme Tough; And was vsed by the Captaines of Armies, amongst the Romans, for their Cudgells.

It is reported, that in some Places, Vines are suffered to grow like Herbs, spreading vpon the Ground; And that the Grapes of those Vines are very great. It

were good to make tryall, whether Plants that vse to be borne vp by Props, will not put forth greater Leaues, and greater Fruits, if they be laid along the Ground; As Hops, l-y, Wood bine, &c.

Quinces, or Apples, &c. if you will keepe them long, drowne them in Honey; But because Honey (perhaps) will giue them a Taste Ouerlushious, it were good to make Triall in Powder of Sugar; Or in Syrrup of Wine onely Boyled to Height. Both these would likewise be tried in Orenges, Limons, and Pomgranats; For the Powder of Sugar, and Syrrup of Wine, will serue for more times than once.

The Conseruation of Fruit would be also tried in Vessells, filled with fine Sand, or with Powder of Chalke; Or in Meale and Flower; Or in Dust of Oake-wood; Or in Mill.

Such Fruits, as you appoint for Long Keeping, you must gather before they be full Ripe; And in a Faire and Dry Day, towards Noone; And when the Wind bloweth not South; And when the Moone is vnder the Earth; And in Decrease.

Take Grapes, and hang them in an Empty Vessell, well Stopped; And set the Vessell, not in a Cellar, but in some dry Place; And it is said, they will last long. But it is reported by some, they will keepe better, in a Vessell halfe full of Wine, so that the Grapes touch not the Wine.

It is reported, that the Preseruing of the Stalke, helpeth to preserue the Grape; Especially if the Stalke be put into the Pith of Elder, the Elder not touching the Fruit.

It is reported by some of the Ancients, that Fruit put in Bottles, and the Bottles let downe into Wells vnder Water, will keepe long.

Of Herbs and Plants, some are good to eat Raw; As Lettuce, Endiue, Purslane, Tarragon, Cresses, Cucumbers, Muske-Melons, Radish, &c. Others onely after they are Boyled, or haue Passed the Fire; As Parsley, Clary, Sage, Parsnips, Turnips, Asparagus, Artichoakes, (though they also being young are eaten Raw:) But a Number of Herbs are not Esculent at all; As Worme-wood, Grasse, Greeke-Corne, Centory, Hyssope, Lauender, Balme, &c. The Causes are, for that the Herbs, that are not Esculent, do want the two Tastes, in which

Nourishment resteth; Which are, Fat, and Sweet; And haue (contrariwise) Bitter and Ouer-strong Tastes, or a Iuyce so Crude, as cannot be ripened to the degree of Nourishment. Herbes and Plants, that are Esculent Raw, haue Fatnesse, or Sweetnesse, (as all Esculent Fruits;) Such are Onions, Lettuce, &c. But then it must be such a Fatnesse, (for as for Sweet Things, they are in effect alwayes Esculent,) as is not Ouer-grosse, and Loading of the Stomach; For Parsnips and Leeks haue Fatnesse; But it is too Grosse and Heauy without Boyling. It must be also in a Substance somewhat Tender; For we see Wheat, Barley, Artichoakes, are no good Nourishment, till they haue Passed the Fire; But the Fire doth ripen, and maketh them soft and tender, and so they become Esculent. As for Radish, and Tarragon, and the like, they are for Condiments, and not for Nourishment. And euen some of those Herbes, which are not Esculent, are notwithstanding Poculent; As Hop's, Broome, &c. Quare what Herbs are good for Drinke, besides the two aforenamed; For that it may (perhaps) ease the Charge of Brewing, if they make Beere to require lesse Malt, or make it last longer.

Parts fit for the Nourishment of Man, in Plants, are, Seeds, Roots, and Fruits; But chiefly Seeds, and Roots. For Leaues, they giue no Nourishment, at all, or very little: No more doe Flowers, or Blossomes, or Stalkes. The Reason is, for that Roots, and Seeds, and Fruits, (in as much as all Plants consist of an Oyly and Watry Substance commixed,) haue more of the Oyly Substance; And Leaues, Flowers, &c. of the Watry. And secondly, they are more Concocted; For the Root, which continueth euer in the Earth, is still Concocted by the Earth. And Fruits, and Graines, (we see) are halfe a yeare, or more, in Concocting; Whereas Leaues are out, and Perfect in a Moneth.

Plants (for the most part) are more strong, both in Taste, and Smell, in the Seed, than in the Leafe, and Root. The Cause is, for that in Plants, that are not of a Fierce and Eager Spirit, the Vertue is increased by Concoction, and Maturation, which is euer most in the Seed; But in Plants, that are of a Fierce and Eager Spirit, they are stronger whilest the Spirit is enclosed in the Root; And the Spirits doe but weaken, and dissipate, when they come to the Aire, and Sunne; As we see it in Onions, Garlicke, Dragon, &c. Nay there be Plants, that

haue their Roots very Hot, and Aromaticall; And their Seeds rather Insipide; As Ginger. The Cause is (as was touched before,) for that the Heat of those Plants is very Dissipable; which vnder the Earth is contained and held in; But when it commeth to the Aire, it exhaleth.

The Iuyces of Fruits are either Watry, or Oyly. I reckon amongst the Watry, all the Fruits out of which Drinke is expressed; As the Grape, the Apple, the Peare, the Cherry, the Pomgranate, &c. And there are some others, which, though they be not in vse for Drinke, yet they appeare to be of the same Nature; As Plummes, Serukes, Mulberries, Rasps, Orenges, Limons, &c. And for those Iuyces, that are so fleshy, as they cannot make Drinke by Expression, yet (perhaps) they may make Drinke by Mixture of Water;

Pocula{que} admistis imitantur vitea Sorbis.

And it may be Heps and Brier-Berries would doe the like. Those that haue Oyly Iuyce, are; Oliues, Almonds, Nuts of all sorts, Pine-Apples, &c. And their Iuyces are all Inflammable. And you must obserue also, that some of the Watry Iuyces, after they haue gathered Spirit, will Burne and Enflame; As Wine. There is a Third Kinde of Fruit, that is sweet, without either Sharpnesse, or Oylinesse: Such as is the Fig, and the Date.

It hath beene noted, that most Trees, and specially those that beare Mast, are fruitfull but once in two yeares. The Cause (no doubt) is, the Expence of Sap; For many Orchard-Trees, well Cultured, will beare diuers yeares together.

There is no Tree, which besides the Naturall Fruit, doth beare so many Bastard-Fruits, as the Oake doth: For besides the Acorne, it beareth Galls, Oake-Apples, and certaine Oake-Nuts, which are Inflammable; And certaine Oake-Berries, sticking close to the Body of the Tree, without Stalke. It beareth also Misseltoe, though rarely. The Cause of all these may be, the Closenesse and Solidenesse of the Wood, and Pith of the Oake; Which maketh seuerall Iuyces finde seuerall Eruptions. And therefore, if you will deuise to make any Super-Plants, you must euer giue the Sap Plentifull Rising, and Hard Issue.

There are two Excrescences, which grow vpon Trees; Both of them in the Nature of Mushromes: The one the Romans called Boletus; Which groweth vpon

the Roots of Oakes; And was one of the Dainties of their Table; The other is Medicinall, that is called Agaricke, (whereof we haue spoken before,) which groweth vpon the Tops of Oakes; Though it be affirmed by some, that it groweth also at the Roots. I doe conceiue, that many Exerescences of Trees grow chiefly, where the Tree is dead, or faded; For that the Naturall Sap of the Tree, corrupteth into some Preternaturall Substance.

The greater Part of Trees beare Most, and Best, on the Lower Boughs; As Oakes, Figs, Wall-Nuts, Peares, &c. But some beare Best on the TopBoughes; As Crabs, &c. Those that beare best below, are such, as Shade doth more good to, than Hurt. For generally all Fruits beare best lowest; Because the Sap tireth not, hauing but a short Way: And therefore in Fruits spred vpon Walls, the Lowest are the Greatest, as was formerly said; So it is the Shade that hindereth the Lower Boughes; Except it be in such Trees, as delight in Shade; Or at least beare it well. And therfore, they are either Strong Trees, as the Oake; Or else they haue large Leaues, as the Wallnut and Fig; Or else they grow in Pyra-is, as the Peare. But if they require very much Sunne, they beare best on the Top; As it is in Crabs, Apples, Plummes, &c.

There be Trees, that beare best, when they begin to be Old; As Almonds, Peares, Vines, and all Trees that giue Mast. The Cause is, for that all Trees that beare Mast, haue an Oyly Fruit; And Young Trees haue a more Watry Iuyce, and lesse Concocted; And of the same kinde also is the Almond. The Peare likewise, though it be not Oyly, yet it requireth much Sap, and well Concocted; For we see it is a Heauy Fruit, and Solide; Much more than Apples, Plummes, &c. As for the Vine, it is noted, that it beareth more Grapes when it is Young; But Grapes that make better Wine, when it is Old; For that the Iuyce is better Concocted: And wee see that Wine is Insflammable; So as it hath a kinde of Oylinesse. But the most Part of Trees, amongst wich are Apples, Plummes, &c. beare best when they are Young.

There be Plants, that haue a Milke in them, when they are Cut; As Figs, Old Lettuce, Sowe-Thistles, Spurge, &c. The Cause may be an Inception of Putrefaction: For those Milkes haue all an Acrimony; though one would thinke

they should be Lenitiue. For if you write vpon Paper, with the Milke of the Fig, the Letters will not be seene, vntill you hold the Paper before the Fire, and then they wax Browne; Which sheweth that it is a Sharpe or Fretting Iuyce: Lettuce is thought Poysonous, when it is so Old, as to haue Milke; Spurge is a kinde of Poyson in it Selfe; And as for Sowe-Thistles, though Coneyes eat them, yet Sheepe and Cattell will not touch them; And besides the Milke of them, rubbed vpon Warts, in short time, weareth them away: Which sheweth the Milke of them to be Corrosine. We see also, that Wheat, and other Corne sowen, if you take them forth of the Ground, before they sprout, are full of Milke; And the Beginning of Germination is euer a Kinde of Putrefaction of the Seed. Euphorbium also hath a Milke, though not very white, which is of a great Acrimony. And Saladine hath a yellow Milke, which hath likewise much Acrimony; For it cleanseth the Eyes. It is good also for Cataracts.

Mushromes are reported to grow, as well vpon the Bodies of Trees, as vpon their Roots, or vpon the Earth: And especially vpon the Oake. The Cause is, for that Strong Trees, are towards such Excresc — ces, in the Nature of Earth; And therfore put forth Mosse, Mushromes, and the like.

There is hardly found a Plant, that yeeldeth a Red Iuyce, in the Blade, or Eare; Except it be the Tree that beareth Sanguis Draconis: Which groweth (chiefly) in the Island Soquotra: The Herb Amaranthus, (indeed,) is Red all ouer; And Brasill is Red in the Wood: And so is Red Sunders. That Tree of the Sanguis Draconis, groweth in the forme of a Sugar-loafe. It is like, that the Sap of that Plant, concocteth in the Body of the Tree. For woe see that Grapes, and Pomegranats, are Red in the Iuyce, but are Greene in the Teare: And this maketh the Tree of Sanguis Draconis, lesser towards the Top; Because the Iuyce hasteneth not vp; And besides it is very Astringent; And therefore of Slow Motion.

It is reported, that Sweet Mosse, besides that vpon the Apple-Trees, groweth likewise (sometimes) vpon Poplars; And yet (generally) the Poplar is a Smooth Tree of Barke, and hath little Mosse. The Mosse of the Larix Tree burneth also

Sweet, and sparkleth in the Burning, Quaere of the Mosses of Oderate Trees; As Cedar, Cypres, Lignum Aloës, &c.

The Death that is most without Paine, hath been noted to be, vpon the Taking of the Petium of Hemloche; which in Humanity was the Forme of Execution of Capitall Offenders in Athens. The Poyson of the Aspe, that Cleopatra vsed, hath some affinity with it. The Cause is, for that the Torments of Death are chiefly raised by the Strife of the Spirits; And these Vapours quench the Spirits by Degrees; Like to the Death of an extreme Old Man. I conceiue it is lesse Painfull than Opium:, because Opium hath Parts of Heat mixed.

There be Fruits, that are Sweet before they be Ripe; As Mirabolanes; So Reuuell-Seeds are Sweet before they ripen, and after grow Spicy. And some neuer Ripen to be Sweet; As Tamarinds, Berberries, Crabs, Sloes, &c. The Cause is, for that the former Kinde haue — eh and subtill Heat, which causeth Earely Sweetnesse; The latter haue a Cold and Acide Iuyce, which no Heat of the Sunne can sweeten. But as for the Mirabelane, it hath Parts of Contrary Natures; For it is Sweet, and yet Astringont.

There bee few Herbes that haue a Salt Taste; And contrariwise all Bloud of Liuing Creatures hath a Saltnesse: The Cause may be, for that Salt, though it be the Audiment of Life, yet in Plants the Originall Taste remaineth not; For you shall haue them Bitter, Sowre, Sweet, Biting, but seldome Salt: But in Liuing Creatures, all those High Tastes may happen to be (sometimes) in the Humours, but are seldome in the Flesh, or Substance; Because it is of a more Oyly Nature; which is not very Susceptible of those Tastes; And the Saltnesse it selfe of Bloud, is but a light, and secret Saltnesse: And euen among Plants, some doe participate of Saltnesse, as Alga Marina, Sampire, Scorny-Grasse, &c. And they report, there is, in some of the Indian-Seas, a Swimming Plant, which they call Salgazus, spreading ouer the Sea, in such sort, as one would thinke it were a Meadow. It is certaine, that out of the Ashes of all Plants, they extract a Salt, which they vse in Medicines.

It is reported by one of the Ancients, that there is an Herb growing in the Water, called Lincostis, which is full of Prickles: This Herbe putteth forth

another small Herbe out of the Leafe; which is imputed to some Moisture, that is gathered betweene the Prickles, which Putrified by the Sunne, Germinateth. But I remember also I haue seene, for a great Rarity, one Rose grow out of another, like Honey-Suckles, that they call Top and Top-gallants.

Barley, (as appeareth in the Malting,) being steeped in Water three dayes, and afterwards the Water drained from it, and the Barley turned vpon a dry floare, will sprout, halfe an Inch long at least: And if it be let alone, and not turned, much more; vntill the Heart be out. Wheat will doe the same. Try it also with Pease, and Beanes. This Experiment is not like that of the Orpin, and Semper-Vine; For there it is of the old Store, for no Water is added; But here it is nourished from the Water. The Experiment would be further driuen: For it appeareth already, by that which hath beene said, that Earth is not necessary to the first Sprouting of Plants; And we see that Rose-Buds set in Water, will Blow: Therefore try whether the Sprouts of such Graines may not be raised to a further Degree; As to an Herbe, or Flower, with Water onely; Or some small Commixture, of Earth: For if they will, it should seeme by the Experiments before, both of the Malt, and of the Roses, that they will come far faster on in Water, than in Earth: For the Nourishment is easilier drawne out of Water, than out of Earth. It may giue some light also, that Drinke infused with Flesh, as that with the Capon, &c. will nourish faster and easilier, than Meat and Drinke together. Try the same Experiment with Roots, as well as with Graines: as for Example, take a Turnip, and steepe it a while, and then dry it, and see whether it will sprout.

Malt in the Dren-bing will swell; And in such a manner, as after the Putting forth in Sprouts, and the drying vpon the Keele, there will be gained at least a Bushell in eight, and yet the Sprouts are rubbed off; And there will be a Bushell of Dust besides the Malt: Which I suppose to be, not onely by the loose, and open Laying of the Parts, but by some Addition of Substance, drawne from the Water, in which it was steeped.

Malt gathereth a Sweetnesse to the Taste, which appeareth yet more in the Wort. The Dulcoration of Things is worthy to be tried to the full; For that

Dulcoration importeth a degree to Nourishment: And the Making of Things Inalimentall, to become Alimentall, may be an Experiment of great Profit, for Making new Victuall.

Most Seeds in the Growing, leaue their Huske or Rinde about the Root; But the Onion will carry it vp, that it will be like a Cap vpon the Top of the Young Onion. The Cause may be, for that the Skin or Huske is not easie to breake; As we see by the Pilling of Onions, what a Holding Substance the Skin is.

Plants, that haue Curled Leaues, doe all abound with Moisture; Which commeth so fast on, as they cannot spread themselues Plaine, but must needs gather together. The Weakest Kinde of Curling is Roughnesse; As in Clary, and Burre. The Second is Curling on the Sides; As in Lettuce, and Young Cabbage: And the Third is Folding into an Head; As in Cabbage full growne, and Cabbage-Lettuce.

It is reported, that Firre, and Pine, especially if they be Old and Putrified, though they shine not, as some Rotten Woods doe, yet in the sudden Breaking they will sparkle like Hard Sugar.

The Roots of Trees doe, (some of them,) put downwards deepe into the Ground; As the Oake, Pine, Firre, &c. Some spread more towards the Surface of the Earth; As the Ash, Cypresse-Tree, Oline, &c. The Cause of this latter may be, for that such Trees as loue the Sunne, doe not willingly descend farre into the Earth; And therefore they are (commonly) Trees, that shoot vp much; For in their Body, their desire of Approach to the Sunne, maketh them spread the lesse. And the same Reason, vnder Ground, to auoid Recesse from the Sunne, maketh them spread the more. And wee see it commeth to passe in some Trees, which haue beene planted too deepe in the Ground, that forloue of Approach to the Sunne, they forsake their first Root, and put out another more towards the Top of the Earth. And wee see also, that the Oliue is full of Oylie Iuyce; And Ash maketh the best Fire; And Cypresse is an Hot Tree. As for the Oake; which is of the former sort, it loueth the Earth, And therefore groweth slowly. And for the Pine, and Firre likewise, they haue so much Heat in themselues, as they need lesse the Heat of the Sunne. There be Herbs also, that haue the same difference;

As the Herbe they call Morsus Diaboli; Which putteth the Root downe so low, as you cannot pull it vp without Breaking; Which gaue Occasion to the N-me, and — ; For that it was said, it was so wholesome a Root, that the Deuill, when it was gathered, bit — for Enny. And some of the Ancients doe report, that there was a Goodly Firre; (which they desired to remoue whole,) that had a Root vnder Ground eight Cubits deepe; And so the Root came vp broken.

It hath beene obserued, tha-a Branch of a Tree, being Vnberked some space at the Botome, and so set into the Ground, hath growen; Euen of such Trees, as if the Branch were set with the Barke on, they would not grow; yet co — driwise we see, that a Tree-ared round in the Body, aboue Ground, will die. The Cause may be, for that the Vnbarke Part draweth the Nourishment best, but the Barke continueth it only.

Grapes will continue Fresh, and Moist, all Winter long, if you hang them, Cluster by Cluster, in the Roofe of a Warme Roome; Especially, it when you gather the Cluster, you take off with the Cluster some of the Stocke.

The Reed or Cane is a Watry Plant, and groweth not but in the Water; It hath these Properties; That it is Hollow; That it is Knuckled both Stalke, and Root; That being Drie, it is more Hard and Fragile, than other Wood; That it putteth forth no Boughs. though many Stalkes come out of one Root. It differeth much in Greatnesse; The smallest being fit for Thatching of Houses; And Stopping the Chinkes of Ships; Better than Glew, or Pitch. The Second Bignesse, is vsed for Angle-Rods, and Staues; And in China for beating of Offenders vpon the Thighs. The differing Kindes of them are; The Common Reed; The Cassia Fistula; And the Sugar-Reed. Of all Blants, it boweth the easiest, and riseth againe. It seemeth, that amongst Plants, which are nourished with Mixture of Earth and Water, it draweth most Nourishment from Water; which maketh it the Smoothest of all others in Barke; And the Hollowest in Body.

The Sap of Trees, when they are let Bloud, is of differing Natures. Some more Watry and Cleare; As that of Vines; of Beeches; of Peares. Some Thicke; As Apples. Some Gummis; As Cherries. Some Frathie, As Elmes. Some Milkie; As — In Mulberries, the Sap seemeth to be (almost) towards the Barke only; For

if you cut the Tree, a little into the Barke, with a Stone, it will come forth; If you pierce it deeper with a Toole, it will be drie. The Trees, which haue the Moistest Iuyces in their Fruit. haue commonly the Moistest Sap in their Body; For the Vines and Peares are very Moist; Apples somes hat more Spongie: The Milke of the Figge hath the Qualitie of the R — nea-, to gather Cheese; And so haue certaine Sonre Herbs wherewith they make Cheese in Lent.

The Timber and Wood are, in some Trees, more Cleane, in some more Kn — tie: And it is a good Triall. to trie it by Speaking at one End, and Laying the -are at the Other: For if it he Kn — tie, the Voice will not passe well. Some haue the Veines more varied, and chamlotted; As Oake, whereof Wainscat it made; Maple, whereof Trenchers are made. Some more smooth, as Firre, and Walnnt: Some doe more easily breed Wormes and Spiders; Some more hardly, as it is said of Irish Trees: Besides, there be a Number of Differences that concerne their Vse; As Oake, Cedar, and Chesu-t, are the best Builders: Some are best for Ploughs Timber; As Ash; Some for Peeres, that are sometimes wet, and sometimes drie; As Elme: Some for Planchers; As Deale: Some for Tables, Cupboard, and Desks; As Wannts: Some for Ship Timber; As Oakes that grow in Moist Grounds; For that maketh the Timber Tough, and not apt to rift with Q-d-an — Where in English and Irish Timber are thought — excell; Some for Mosts of Ships; As Firre, and Pine, because of their Length, Straightnesse, and Lightnesse: Some for Pale; As Oake: Some for Fuell; As Ash: And so of the rest.

The Comming of Trees and Plants in certaine Regions, and net in others, is sometimes Casuall: For many haue beene translated, and haue prospered well; As Damaske-Roses, that haue not beene knowne in England aboue an hundred yeares, and now are so common. But the liking of Plants in certaine Soiles, more than in others, is meerly Naturall; As the Firre and Pine loue the Mountaines; The Poplar; Willow, Sallow, and Alder, loue Riuers, and Moist Places: The Ash loueth Coppices; But is best in Standards alone: luniper loueth Chalke; And so doe most FruitTrees: Sampire groweth but upon Rocks: Reeds and Ofiers grow where they are washed with Water: The Vine loueth Sides of Hills, turning vpon the South-East Sun, &c.

The Putting forth of certaine Herbs discouereth of what Nature the Ground where they put forth, is: As Wilde Thyme sheweth good Feeding Ground for Cattell, Betony and Strawberries shew Grounds fit for Wood: Ca — mill sheweth Mellow Grounds fit for Wheat. Mustard Seede, growing after the Plough, sheweth a good Strong Ground also for Wheat: Burnet sheweth good Meadow: And the like.

There are found, in diuers Countries, some other Plants, that grow out of Trees and Plants, besides Misseltes: As in Syria, there is an Herbe called Cassytas that groweth out of tall Trees, and windeth it selfe about the same Tree where it groweth; And sometimes about Thornes. There is a kinde of Polypode, that groweth out of Trees, though it windeth not. So likewise an Herbe called Fannes, vpon the Wilde Oline. And an Herbe called Hippopha —— vpon the Fullers Thorne; Which, they say, is good for the Falling Sicknesse.

It hath beene ob-rerue-, by -ome or the Ancients, that howsoeuer Cold and Easterly Winds, are thought to be great Enemies to Fruit; yet neuerthelesse South Winds are also found to doe Hure; Especially in the Blossoming time; And the more, if Showers follow. It seemeth, they call forth the Moisture too fast. The West Winds are the best. It hath beene obserued also that Greene and Open Winters doe hurt Trees; Insomuch as if two or three such Winters come together, Almond-Trees, and some other Trees, will dye. The Cause is the same with the former, because the Lust of the Earth ouerspendeth it selfe; Howsoeuer some other of the Ancients haue commended Warme Winters.

Snowes, lying long, cause a Fruitfull Yeare: For first, they keepe in the Strength of the Earth; Secondly, they water the Earth, better than Raine; For in Snow, the Earth doth (as it were) sucke the Water, as out of the Teate. Thirdly, the Moisture of Snow is the finest Moisture; For it is the Froth of the Cloudy Waters.

Showers, if they come a little before the Ripening of Fruits, doe good to all Shoculent and Moist Fruits; As Vines, Oliues, Pomegranates; Yet it is rather for Plenty, than for Goodnesse; For the best Wines are in the Driest Vintages: Small Showers are likewise good for Corne, so as Parching Heats come not vpon them.

Generally, Night-Showers are better than Day-Showers; For that the Sunne followeth not so fast vpon them. And we see, euen in Watring by the Hand, it is best, in Summer time, to water in the Euening.

The Differences of Earths, and the Triall of them, are worthy to be diligently inquired. The Earth, that with Showers doth easiliest Soften, is commended; And yet some Earth of that kinde will be very Dry, and Hard before the Showers. The Earth that casteth vp from the Plough, a Great Clod, is not so good, as that, which casteth vp a Smaller Clod. The Earth, that putteth forth Mosse easily, and may bee called Mouldy, is not good. The Earth, that smelleth well vpon the Digging, or Ploughing, is commended; As containing the Iuyce of Vegetables almost already prepared. It is thought by some, that the Ends of low Raine-Bowes, fall more vpon one kinde of Earth than vpon another: As it may well be; For that that Earth is most Roscide: And therfore it is commended for a Signe of good Earth. The Poorenesse of the Herbs, (it is plaine,) shew the Poorenesse of the Earth; And especially if they be in Colour more darke: But if the Herbs shew Withered, or Blasted at the Top, it sheweth the Earth to be very Cold: And so doth the Mossinesse of Trees. The Earth, whereof the Grasse is soone Parched with the Sun, and Toasted, is commonly Forced Earth, and Barren in his owne Nature. The Tender, Chessoine, and Mellow Earth, is the best; Being meere Mould, betweene the two Extreames of Clay, and Sand; Especially if it be not Loamy, and Binding. The Earth, that after Raine, will scarce be Ploughed, is commonly Fruitfull; For it is Cleaning, and full of Iuyce.

It is strange, which is obserued by some of the Ancients, that Dust helpeth the Fruitfulnesse of Trees; And of Vines, by name: Insomuch as they catt Dust vpon them of purpose. It should seeme, that that Powdring, when a Shower commeth, maketh a kinde of Soyling to the Tree, being Earth and Water, finely laid on. And they note, that Countries, where the Fields and Wayes are Dusty, beare the best Vines.

It is commended by the Ancients, for an Excellent Helpe to Trees, to lay the Stalks and Leaues of Lupines about the Roots; Or to Plough them into the Ground, where you will sowe Corne. The Burning also of the Cuttings of Vines,

and Casting them vpon land, doth much Good. And it was generally receiued of old, that the Dunging of Grounds, when the West Wind bloweth, and in the Decrease of the Moone, doth greatly helpe; The Earth (as it seemeth) being then more thirsty, and open, to receiue the Dung.

The Grafting of Vines vpon Vines, (as I take it,) is not now in vse: The Ancients had it, and that three wayes: The First was Insition, which is the Ordinary Manner of Grafting: The Second was Terebration, through the Middle of the Stocke, and Putting in the Cions there: And the Third was Paring of two Vines, that grow together, to the Marrow, and Binding them close.

The Diseases and ill Accidents of Corne, are worthy to be enquired; And would be more worthy to be enquired, if it were in Mens Power to helpe them; Whereas many of them are not to be remedied. The Mildew is one of the Greatest; which (out of question) commeth by Closenesse of Aire; And therefore in Hills, or large Champaigne Grounds, it seldome commeth; Such as is with vs York's Worad. This cannot be remedied, otherwise than that in Countries of Small Enclosure, the Grounds be turned into larger Fields: Which I haue knowne to doe good in some Farmes. Another Disease is the Putting forth of Wilde Oats, whereinto Corne oftentimes, (especially Barley,) doth degenerate. It happeneth chiefly from the Weaknesse of the Graine that is sowen; For if it be either too Old, or Mouldy, it will bring forth Wilde Oats. Another Disease is the Saciety of the Ground; For if you sow one Ground still with the same Corne, (I meane not the same Corne that grew vpon the same Ground,) but the same Kinde of Graine; (As Wheat, Barley, &c.) it will prosper but poorely: Therefore besides the Resting of the Ground, you must vary the Seed. Another ill Accident is, from the Winds, which hurt at two times; At the Flowring, by Shaking off the Flowers; And at the full Ripening, by Shaking out the Corne. Another ill Accident is, Drouth, at the Spindling of the Corne; Which with vs is rate; But in Hotter Countries, common: Insomuch as the Word, Calamitas, was first deriued from Calamus, when the Corne could not get out of the Stalke. Another ill Accident is, Ouer-wet at Sowing-Time; which with vs breedeth much Dearth; Insomuch as the Corne neuer commeth vp; And (many times) they are forced to resow

Sommer-Corne, where they sowed Winter-Corne. Another ill Accident is Bitter Frosts, continued, without Snow; Especially in the Beginning of the Winter, after the Seed is new Sowen. Another Disease is Wormes; which sometimes breed in the Root, and happen vpon Hot Sunnes, and Showers, immediately after the Sowing; And another Worme breedeth in the Eare it Selfe; Especially when Hot Sunnes breake often out of Clouds. Another Disease is Weeds; And they are such, as either Choake, and Ouershadow the Corne, and beare it downe; Or starue the Corne, and deceiue it of Nourishment. Another Disease is, Ouer-Rancknesse of the Corne; Which they vse to remedy, by Mowing it after it is come vp; Or putting Sheepe into it. Another ill Accident is Laying of Corne with great Raines, neare, or in Harnest. Another ill Accident is, if the Seed happen to haue touched Oyle, or any Thing, that is Fat; For those Substances haue an Antipathy with Nourishment of Water.

The Remedies of the Diseases of Corne haue beene obserued as followeth. The Steeping of the Graine, before Sowing, a little time in Wine, is thought a Presernatiue: The Mingling of Seed-Corne with Ashes, is thought to be good: The Sowing at the Wane of the Moone, is thought to make the Corne sound: It hath not beene practised, but it is thought to be of vse, to make some Miscellane in Corne; As if you sow a few Beanes with Wheat, your Wheat will be the better. It hath beene obserued, that the Sowing of Corne with Honsleeke, doth good. Though Graine, that toucheth Oyle, or Fat, receiueth hurt, yet the Steeping of it, in the Dregs of Oyle, when it beginneth to Putrifie, (which they call Amurca,) is thought to assure it against Wormes. It is reported also, that it Corne be Mowed, it will make the Graine Longer, but Emptier, and hauing More of the Huske.

It hath beene noted, that Seed of a yeare old, is the Best; And of two or three yeares is Worse, And that which is more Old, is quite Barren; Though (no doubt) some Seeds and Graines last better than others. The Corne, which in the Vanning lieth lowest, is the best; And the Corne, which broken or bitten retaineth a little Yellownesse, is better than that which is very White.

It hath beene obserued, that of all Roots of Herbs, the Root of Sorrell goeth the furthest into the Earth; Insomuch as it hath bin knowne to go three Cubits

deepe; And that it is the Root that continueth fit (longest) to be set againe, of any Root that groweth. It is a Cold and Acide Herbe, that (as it seemeth) loueth the Earth, and is not much drawne by the Sunne.

It hath beene obserued, that some Herbs like best, being watred with Salt-Water; As Radish, Beet, Rew, Pennyroyall; This Triall would be extended to some other Herbs; Especially such as are Strong; As Tarragon, Mustard-Seed, Rocket, and the like.

It is strange that is generally receiued, how some Poysonous Beasts affect Odorate and Wholesome Herbs; As that the Snake loueth Fennell; That the Toad will be much vnder Sage; That Frogs will be in Cinque foile. It may be, it is rather the Shade, or other Couerture, that they take liking in, than the Vertue of the Herbe.

It were a Matter of great Profit, (saue that I doubt it is too Coniecturall to venture vpon,) if one could discerne, what Corne, Herbs, or Fruits, are like to be in Plenty, or Scarcity, by some Signes and Prognosticks. in the Beginning of the Yeare: For as for those, that are like to be in Plenty, they may be bargained for, vpon the Ground; As the Old Relation was of Thales; who to shew how easie it was for a Philosopher to be rich, when he fore-saw a great Plenty of Oliues, made a Monopoly of them. And for Scarcity, Men may make Profit in keeping better the Old Store. Long Continuance of Snow is beleeued to make a Fruitfull Yeare of Corne: An Earely Winter, or a very Late Winter, a Barren Yeare of Corne: An Open and Serene Winter, an ill Yeare of Fruit: These we haue partly touched before: But other Prognostickes of like Nature are diligently to be enquired.

There seeme to be, in some Plants, Singularities, wherein they differ from all Other; The Oliue hath the Oyly Part, only on the Outside; Wheras all other Fruits haue it in the Nut, or Kernell. The Firre hath (in effect) no Stone, Nut, nor Kernest; Except you will count the little Graines Kernells. The Pom granate and Pine Apple haue onely, amongst Fruits, Graines distinct in seuerall Cells. No Herbs haue Curled Leaues, but Cabbage, and Cabbage-Lettuce. None haue double Leaues, one belonging to the Stalke, another to the Fruit or Seed, but the

Artichoke: No Flower hath that kinde of Spread that the Woodbine hath. This may be a large Field of Contemplation; For it sheweth that in the Frame of Nature, there is, in the Producing of some Species, a Composition of Matter, which happeneth oft, and may be much diuersified: In others, such as happeneth rarely, and admitteth little Variety: For so it is likewise in Beasts: Dogs haue a Resemblance with Wolnes, and Foxes; Horses with Asses, Kine with Bustes; Hares with Coneyes; &c. And so in Birds: Kites and Kastrells haue a Resemblance with Hawkes; Common-Doues with Ring-Dea-s, and Tortles; Black-Birds with Thrushes, and Manisses; Crowes with Bauens, Dawes, and Choughas, &c. But Elephants, and Swine amongst Beasts; And the Bird of Paradise, and the Peacocke amongst Birds; And some few others; haue sea — any other Species, that haue Affinity with them.

We leaue the Description of Plants, and their Vertues, to Herballs, and other like Bookes of Naturall History: Wherein Mens Diligence hath b —— great, euen to Curiosity: For our Experiments are onely such as doe euer ascend a Degree, to the Deriuing of Causes, and Extracting of Axiomes, which, wee are not ignorant, but that some, both of the Ancient, and Modeme Writers, haue also labôured, But their Causes, and Axiomes, are so full of Imagination, and so infected with the old Receiued Theories, as they are meere Inquinations of Experience, and Concoct it not.

It hath beene obserued by some of the Ancients, that Skins, (especially of — ams, newly pulled off, and applied to the Wounds of Stripts, doe keepe them from Swelling, and Exulcerating; And likewise Heade them, and Close them vp; And that the Whites of Eggs do the same. The Cause is a Temperate Conglutination; For both Bodies are Glommy, and Viscous, and doe bridle the Des-uxe of Humours to the Hu — , without Penning them in too much.

You may turne (almost) all Flesh into a ——— ——— , if you take Flesh, and cut it into Peeces, and put the Peeces into a Glasse couered with Parchment; And so let the Glasse stand six or seuen Houres — Boyling Water. It may be an Experiment of Profit, for Making of Fat, or Grease, for many vses; But then it

must be of such Flesh as is not Edible; As Horses, Dogs, Beares, Foxes, Bodgers, &c.

It is reported by one of the Ancients, that New Wine, put into Vessells well stopped, and the Vessells let downe into the Sea, will accelerate very much, the Making of them Ripe, and Potable. The same would be tried in Wort.

Beasts are more Hairy than Men; And Sauage Man more than Ciuill; And the Plumage of Birds exceedeth the Pilosity of Beasts. The Cause of the Smoothnesse in Men, is not any Abundance of Heat, and Moisture, though that indeed causeth Pilosity; But there is requisite to Pilosity, not so much Heat and Moisture, as Excrementitious Heat and Moisture: (For whatsoeuer assimilateth, goeth not into the Haire:) And Excrementitious Moisture aboundeth most in Beasts, and Men that are more Sauage. Much the same Reason is there of the Plumage of Birds; For Birds assimilate lesse, and excerne more than Beasts: For their Excrements are euer liquid, and their Flesh (generally) more dry: Besides, they haue not Instruments for Vrine; And so all the Excrementitious Moisture goeth into the Feathers: And therefore it is no Maruell, though Birds bee commonly better Meat than Beasts, because their Flesh doth assimilate more finely, and secerneth more subtilly. Againe, the Head of Man hath Haire vpon the first Birth, which no other Part of the Body hath. The Cause may be Want of Perspiration: For Much of the Matter of Haire, in the other Parts of the Body, goeth forth by Insensible Perspiration; And besides, the Skull being of a more solide Substance, nourisheth and assimilateth lesse, and excerneth more: And so likewise doth the Chinne; We see also that Haire commeth not vpon the Palmes of the Hands, nor Soales of the Feet; Which are Parts more Perspirable. And Children likewise are not Hairy, for that their Skins are more Perspirable.

Birds are of Swifter Motion than Beasts: For the Flight of many Birds is Swifter, than the Race of any Beasts. The Cause is, for that the Spirits in Birds, are in greater Proportion, in comparison of the Bulke of their Body, than in Beasts: For as for the Reason that some giue, that they are partly Carried, whereas Beasts goe, that is Nothing; For by that Reason Swimming should be

swifter, than Running: And that Kinde of Carriage also, is not without Labour of the Wing.

The Sea is Clearer, when the North wind bloweth, than when the South-wind. The Cause is, for that Salt-Water hath a little Oylinesse in the Surface thereof; As appeareth in very Hot Daies: And againe, for that the Southerne Wind relaxeth the Water somewhat; As no Water Boyling is so Cleare as Cold Water.

Fire burneth Wood, making it first Luminous; Then Blacke and Brittle: And lastly, Broken and Incinerate: Sealding Water doth none of these. The Cause is, for that by Fire, the Spirit of the Body is first Refined, and then Emitted; Whereof the Refining, be Attenuation causeth the Light; And the Emission, first the Fragilitie, and after the Dissolution into Ashes: Neither doth any other Body enter: But in Water the Spirit of the Body is not Refined so much; And besides Part of the Water entreth; Which doth increase the Spirit, and in a degree extinguish it: Therefore wee see that Hot Water will quench Fire. And againe wee see, that in Bodies, wherein the Water doth not much enter, but only the Heat passeth, Hot Water worketh the Effects of Fire: As in Egges Boyled, and Roasted, (into which the Water entreth not at all,) there is scarce difference to be discerned; But in Fruit, and Flesh, whereinto the Water entreth, in some part, there is much more difference.

The Bottome of a Vessell of Boyling Water, (as hath beene obserued,) is not very much Heated; So as Men may put their Hand vnder the Vessell, and remoue it. The Cause is, for that the Moisture of Water, as it quencheth Coales, where it entreth; So it doth allay Heat, where it toucheth: And therefore note well, that Moisture, although it doth not passe thorow Bodies, without Communication of some Substance, (As Heat and Cold doe;) yet it worketh manifest Effects; not by Entrance of the Body, but by Qualifying of the Heat, and Cold; As wee see in this Instance: And wee see likewise, that the Water of Things distilled in Water, (which they call the Bath,) differeth not much from the Water of Things Distilled by Fire: Wee see also, that Pewter-Dishes, with Water in them, will not Melt easily; But without it, they will: Nay wee see more, that Butter, or Oyle, which in themselues are Inflammable, yet by Vertue of their Moisture, will doe the like.

It hath beene noted by the Ancients, that it is dangerous to Picke ones Eare, whilest he Yawneth. The Cause is, for that in Yawning, the Inner Parchment of the Eare is extended, by the Drawing in of the Spirit, and Breath; For in Yawning, and Sighing both, the Spirit is first strongly Drawne in, and then strongly Expelled.

It hath beene obserued by the Ancients, that Sneezing doth cease the Hiccough. The Cause is, for that the Motion of the Hiccough, is a Lifting vp of the Stomacke: which Sneezing doth somewhat depresse, and diuert the Motion another way. For first wee see, that the Hiccough commeth of Fulnesse of Meat, (especially in Children, which causeth an Extension of the Stomacke: Wee see also, it is caused by Acide Meats, or Drinkes, which is by the Pricking of the Stomacke: And this Motion is ceased, either by Diuersion; Or by Detention of the Spirits: Diuersion, as in Sneezing; Detention, as wee see Holding of the Breath, doth helpe somewhat to cease the Hiccough: And putting a Man into an Earnest Studie doth the like; As is commonly vsed: And Vinegar put to the Nostbrills, or Gargarized, doth it also; For that it is Astringent, and inhibiteth the Motion of the Spirits.

Looking against the Sunne, doth induce Sneezing. The Cause; is not the Heating of the Nosthrills; For then the Holding vp of the Nosthrills against the Sunne, though one Winke, would doe it, But the Drawing downe of the Moisture of the Braine: For it will make the Eyes, run with Water; And the Drawing of Moisture to the Eyes, doth draw it to the Nosthrills, by Motion of Consent; And so followeth Sneezing; As contrariwise, the Tickling of the Nosthrills within, doth draw the Moisture to the Nosthrills, and to the Eyes by Consent; For they also will Water. But yet, it hath beene obserued, that if one be about to Sneeze, the Rubbing of the Eyes, till they run with Water, will preuent it. Where of the Cause is, for that the Humour, which was descending to the Nosthrills, is diuerted to the Eyes.

The Teeth are more, by Cold Drinke, or the like, affected, than the other Parts. The Cause is double: The One, for that the Resistance of Bone to Cold, is greater than of Flesh; for that Flesh shrinketh, but the Bone resisteth, whereby

the Cold becommeth more eager: The Other is, for that the Teeth are Parts without Bloud; Whereas Bloud helpeth to qualifie the Cold: And therefore wee see, that the Sinnewes are much affected with Cold; For that they are Parts without Bloud: So the Bones in Sharpe Colds wax Brittle; And therefore, it hath beene seene, that all Contusions of Bones, in Hard Weather, are more difficult to Cure.

It hath been noted, that the Tongue receiueth, more easily, Tokens of Diseases, than the other Parts; As of Heats within, which appeare most in the Blacknesse of the Tongue. Againe, Pied Cattell are spotted in their Tongues, &c. The Cause is, (no doubt,) the Tendernesse of the Part; which thereby receiueth more easily all Alterations, than any other Parts of the Flesh.

When the Mouth is out of Taste, it maketh Things taste, sometimes Salt; Chiefly Bitter; And sometimes Loathsome; But neuer Sweet. The Cause is, the Corrupting of the Moisture about the Tongue; Which many times turneth Bitter, and Salt, and Loathsome; But Sweet neuer; For the rest are Degrees of Corruption.

It was obserued in the Great Plague of the last Yeare, that there were seene, in diuers Ditches, and low Grounds, about London, many Toads, that had Tailes, two or three Inches long, at the least; Whereas Toads (vsually) haue no Tailes at all. Which argueth a great Disposition to Putrefaction in the Soile, and Aire. It is reported likewise, that Roots, (such as Carrets, and Parsuips,) are more Sweet, and Lushious, in Infectious Yeares, than in other Yeares.

Wife Physitians should with all diligence inquire, what Simples Nature yeeldeth, that haue extreme Subtile Parts, without any Mordication, or Acrimony: For they Vndermine that which is Hard; They open that which is Stopped, and Shut; And they expell that which is Offensive, gently, without too much Perturbation. Of this Kinde are Elder-Flowers, which therefore are Proper for the Stone: Of this kinde is the DwarfePine; which is Proper for the laundies: Of this kinde is Harts-Horne; which is Proper for Agues, and Infections: Of this kinde is Piony; which is Proper for Stoppings in the Head: Of this kinde is Fumitory; which is Proper for the Spl — e: And a Number of Others. Generally,

diuers Creatures bred of Putrefaction, though they be somewhat loathsome to take, are of this kinde; As Earth-wormes, Timber-Sowes, Snailes, &c. And I conceiue, that the Trechischs of Vipers, (which are so much magnified,) and the Flesh of Snakes some wayes condited, and corrected, (which of late are growne into some Credite,) are of the same Nature. So the Parts of Beasts Putrified; (as Castereum, and Muske, which haue extreme Subtill Parts,) are to be placed amongst them. We see also that Patrefactions of Plants, (as Agarichs, and lewes —— . are of greatest Vertue. The Cause is, for that Putrefection is the Subtillest of all Motions, in the Parts of Bodies: And since we cannot take downe the Lines of Liuing Creatures, (which some of the — say (If they could be taken downe,) would make vs Immortall;) the Next is for Subtilty of Operation, to take Bodies Putresied; Such as may be safely taken.

It hath beene obserued by the Ancients, that Much vse of Venus doth Dimme the Sight; And yet Eunuchs, which are vnable to generate, are (neuerthelesse) also Dimme Sighted. The Cause of Dimnesse of Sight, in the Former, is the Expence of Spirts; In the Latter, the Ouer-moisture of the Braine: For the Ouer-moisture of the Braine doth thicken the Spirits Visuall. and obstructeth their Passages; As we see by the Decay, in the Sight, in Age; Where also the Diminution of the Spirits concurreth as another Cause: we see also that Blindnesse commeth by Rheumes, and — . Now in — . there are all the Notes of Moisture; As the Swelling of their Thighes, the Loosenesse of their Belly, the Smoothnesse of their Skinne, &c.

The Pleasure in the Act of Venus is the greatest of the Pleasures of the Senses: The Matching of it with Itch is vnproper; though that also be Pleasing to the touch. But the Conses are Profound. First, all the Organe of the Senses qualifie the Nations of the Spirits; And make so many Seuerall Species of Motions, and Pleasures or Displeasures thereupon, as there be Dinersitics of Organs. The Instruments of Sight, Hearing, Taste, and Smell, are of seuerall frame; And so are the Parts for Generation. Therefore Sealiger doth well, to make the Pleasure of Generation a Sixth Sense; And if there were any other differing Organs, and Qualified Perfraction for the spirits to passe; there would

be more than the Fiue Senses; Neither doe we well know, whether some Beasts, and Birds, haue not Senses that we know not: And the very some of Dogs is almost a sense it selfe. Secondly, the Pleasures of the Touch, are greater and deeper, than those of the other Senses; As we see in Warming vpon Cold; Or Refrigeration vpon Heat: For as the Paines of the Touch, are greater than the Offences of other Sense; So likewise are the Pleasures. It is true, that the Affecting of the Spirits immediately, and (as it were) without an Organ, is of the greatest Pleasure; Which is but in two things: Sweet Smells; And Wine, and the like Sweet Vapours. For Smells, wee see their great and sudden Effect in fetching Men againe, when they swoune: For Drinke, it is certaine, that the Pleasure of Drunkennesse, is next the Pleasure of Venus: And Great Ioyes (likewise) make the Spirits moue, and touch themselues: And the pleasure of Venus is somewhat of the same Kinde.

It hath beene alwayes obserued, that Men are more inclined to Venus in the Winter, and Women in the Summer. The Cause is, for that the Spirits, in a Body more Hot and dry, (as the Spirits of Men are,) by the Summer are more exhaled, and dissipated; And in the Winter more condensed, and kept entire: But in Bodies that are Cold and Moist, (as Womens are,) the Summer doth Cherish the Spirits, and calleth them forth; the Winter doth dull them. Furthermore, the Abstinence or Intermission of the Vse of Venus, in Moist and Well Habituate Bodies, breedeth a Number of Diseases; And especially dangerous Impostumations. The Reason is euident; For that it is a Principall Euacuation, especially of the Spirits: For of the Spirits, there is scarce any Euacuation, but in Venus, and Exercise. And therefore the Omission of either of them, breedeth all Diseases of Repletion.

The Nature of Viuification is very worthy the Enquiry: And as the Nature of Things, is commonly better perceiued, in Small, than in Great, and in vnperfect, than in perfect, and in Parts, than in whole: So the Nature of Viuification is best enquired in Creatures bred of Putrefaction. The Contemplation whereof hath many Excellent Fruits. First, in Disclosing the Originall of of Viuification. Secondly, in Disclosing the Originall of Figuration. Thirdly, in Disclosing many

Things in the Nature of Perfect Creatures, which in them lye more hidden. And Fourthly, in Traducing, by way of Operation, some Obseruations in the Insecta, to worke Effects vpon Perfect Creatures. Note that the word Insecta, agreeth not with the Matter, but we euer vse it for Breuities sake, intending by it Creatures bred of Putrefaction.

The Insecta are found to breed out of seuerall Matters: Some breed of Mud, or Dung; As the Earth-wormes, Eeles, Snakes, &c. For they are both Putrefactions: For Water in Mud doth Puttifie, as not able to Preserue it selfe: And for Dung, all Excrements are the Refuse and Putrefactions of Nourishment. Some breed in Wood, both Growing, and Cut down. Quare in what Woods most, and at what Seasons? We see that the Worms with many Feet, which round themselues into Balls, are bred chiefly vnder Logs of Timber, but not in the Timber; And they are said to be found also, (many times,) in Gardens, where no Logs are. But it seemeth their Generation requireth a Couerture, both from Sunne, and Raine, or Dew; As the Timber is; And therfore they are not Venemous, but (contrariwise) are held by the Physitians to clarifie the Bloud. It is obserued also that Cimices are found in the Holes of Bed-Sides. Some breed in the Haire of Liuing Creatures; As Lice, and Tikes; which are bred by the Sweat close kept, and somewhat are fied by the Haire. The Excrements of Liuing Creatures, do not only breed Insecta, when they are Excerned, but also while they are in the Body; As in Wormes, whereto Children are most subiect, and are chiefly in the Guts. And it hath beene lately obserued by Physitians, that in many Pestilent Diseases, there are Wormes found in the vpper Parts of the Body, where Excrements are not, but onely Humours Putrified. Fleas breed Principally of Straw or Mass, where there hath beene a little Moisture; Or the Chamber and Bed-straw kept close, and not Aired. It is receiued that they are killed by Strewing Worme-wood in the Rooms. And it is truly obserued, that Bitter Things are apt, rather to kill, than engender Putrefaction; And they be Things, that are Fat, or Sweet, that are aptest to Putrifie. There is a Worme, that breedeth in Meale, of the shape of a large white Magget, which is giuen as a great Dainty to Nightingales. The Moath breedeth vpon Cloth, and other Lanifices; Especially if

they be laid vp dankish, and wet. It delighteth to be about the Flame of a Candle. There is a Worme called a Wenill, brad vnder Ground, and that feedeth vpon Roots; As Parsnips, Carrets, &c. Some breed in Waters, especially shaded, but they must be Standing-waters; As the Water-Spider, that hath six Legs. The Fly called the Oad-fly, breedeth of somewhat that Swimmeth vpon the Top of the Water, and is most about Ponds. There is a Worme that breedeth of the Dregs of Wine Decayed; which afterwards, (as is obserued by some of the Ancients,) turneth into a Gnat. It hath bin obserued by the Ancients, that there is a Worme that breedeth in old Snow, and is of Colour Reddish, and dull of Motion, and dieth soone after it commeth out of Snow. Which should shew, that Snow hath in it a secret Warmth; For else it could hardly Viuisie. And the Reason of the Dying of the Worme, may be the sudden Exhaling of that little Spirit, as soone as it commeth out of the Cold, which had shut it in. For as Butterflies quicken with Heat, which were benummed with Cold; So Spirits may exhale with Heat, which were Preserued in Cold. It is affirmed both by Ancient and Moderne Obseruation, that in Furnaces of Copper, and Brasse, where Chalcites, (which is Vitrioll,) is often cast in, to mend the working, there riseth suddenly a Fly, which sometimes moueth, as if it tooke hold on the walls of the Furnace; Sometimes is seene mouing in the Fire below; And dieth presently, as soone as it is out of the Furnace. Which is a Noble Instance, and worthy to be weighed; for it sheweth that as well Violent Heat of Fire, as the Gentle Heat of Liuing Creatures, will Viuifie, if it haue Matter Proportionable. Now the great Axiome of Viuification is, that there must be Heat to dilate the Spirit of the Body; An Actiue Spirit to be dilated; Matter Viscous or Tenacious, to hold in the Spirit; And that Matter to be put forth, and Figured. Now a Spirit dilated by so ardent a Fire, as that of the Furnace, as soone as euer it cooleth neuer so little, congealeth presently. And (no doubt) this Action is furthered by the Chalcites, which hath a Spirit, that will Put forth and germinate, as we see in Chymicall Trialls. Briefly, most Things Putrified bring forth Insecta of seuerall Names; But wee will not take vpon vs now, to Enumerate them all.

The Insecta haue beene noted by the Ancients, to feed little: But this hath not beene diligently obserued; For Grashoppers eat vp the Greene of whole Countries; And Silke-wormes deuoure Leaues swiftly; And Ants make gret Prouision. It is true, that Creatures, that Sleepe and rest much, Eat little; As Dormise, and Bats, &c. They are all without Bloud: Which may be, for that the Iuyce of their Bodies, is almost all one; Not Bloud, and Flesh, and Skin, and Bone, as in Perfect Creatures; The Integrall Parts haue Extreme Variety, but the Similar Parts little. It is true, that they haue, (some of them,) a Disphragme, and an Intestine; And they haue all Skins; Which in most of the Insecta are cast often. They are not (generally) of long Life: Yet Bees haue beene knowne to liue seuen yeares: And Snakes are thought, the rather for the Casting of their Spoils, to liue till they be Old: And Eeles, which many times breed of Putrefaction, will liue and grow very long: And those that Enterchange from Wormes to Flyes in the Summer, and from Flyes to Wormes in the Winter, haue beene kept in Boxes oure kyears at the least. Yet there are certain Flyes, that are called Ephemera, that liue but a day. The Cause is, the Exility of the Spirit; Or perhaps the Absence of the Sunne; For that if they were brought in, or kept close, they might liue longer. Many of the Insecta, (as Butterflies, and other Flies,) reuiue easily, when they seeme dead, being brought to the Sunne, or Fire, The Cause whereof is, the Diffusion of the Vitall Spirit, and the Easie Dilating of it by a little Heat. They stirre a good while, after their Heads are off, or that they be cut in Pecces; Which is caused also, for that their Vitall Spirits are more diffused thorow-out all their Parts, and lesse confined to Organs, than in Perfect Creatures.

The Insecta haue Voluntary Motion, and therefore Imagination; And whereas some of the Ancients haue said, that their Motion is Indeterminate, and their Imagination Indefinite, it is negligently obserued; For Arts goe right forwards to their Hills; And Bees doe (admirably) know the way, from a Flowry Heath, two or three Miles off, to their Hiues. It may be, Gnats, and Flyes, haue their Imagination more mutable, and giddy, as Small Birds likewise haue. It is said by some of the Ancients, that they haue onely the Sense of Feeling; which is manifestly vntrue: For if they goe forthright to a Place, they must needs haue

Sight: Besides they delight more in one Flower, or Herbe, than in another, and therefore haue Taste: And Bees are called with Sound vpon Brasse, and therefore they haue Hearing: Which sheweth likewise that though their Spirit be diffused, yet there is a Seat of their Senses in their Head.

Other Obseruations concerning the Insecta, together with the Enumeration of them, wee referre to that place, where wee meane to handle the Title of Animal's in generall.

A Man Leapeth better with Weights, in his Hands, than without. The Cause is, for that the Weight, (if it be proportionable,) strengthneth the Sinneues, by Contracting them. For otherwise, where no Contraction is needfull, Weight hindereth. As wee see in Horse-Races, Men are curious to fore-see, that there be not the least Weight, vpon the one Horse, more than vpon the other. In Leaping with Weights, the Armes are first cast backwards, and then forwards, with so much the greater Force: For the Hands goe backward before they take their Raise. Quaere, if the contrary Motion of the Spirits, immediately before the Motion wee intend, doth not cause the Spirits, as it were, to breake forth with more Force: As Breath also drawne, and kept in, commeth forth more forcibly: And in Casting of any Thing, the Armes, to make a greater Swing, are first cast backward.

Of Musicall Tones, and Vnequall Sounds, wee haue spoken before; But touching the Pleasure, and Displeasure of the Senses, not so fully.Harsh Sounds, as of a Sawe, when it is sharpened; Grinding of one Stone against another; Squeaking, or Skriching Noise; make a Shiuering or Horrour in the Body, and set the Teeth on edge. The Cause is, for that the Obiects of the Eare, doe affect the Spirits (immediately) most with Pleasure and Offence. We see, there is no Colour that affecteth the Eye much with Displeasure: There be Sights, that are Horrible, because they excite the Memory of Things that are Odious, or Fearefull; But the same Things Painted doe little affect. As for Smells, Tastes, and Touches, they be Things that doe affect, by a Participation, or Impulsion of the Body, of the Obiect. So it is Sound alone, that doth immediately, and incorporeally, affect most: This is most manifest in Musicke; and Concords and

Discords in Musicke: For all Sounds, whether they be sharpe, or Flat, if they be Sweet, haue a Roundnesse and Equality; And if they be Harsh, are Vnequall: For a Discord it selfe is but a Harshnesse of Diners Sounds Meeting. It is true, that Inequality, not Stayed vpon, but Passing, is rather an Encrease of Sweetnesse: As in the Purling of a Wreathed String; And in the Rancity of a Trumpet; And in the Nightinghale-Pipe of a Regall; And in a Discord straight falling vpon a Concord: But if you stay vpon it, it is Offensiue; And therefore, there bee these three Degrees of Pleasing, and Displeasing in Sounds; Sweet Sounds; Discords and Harsh Sounds, which we call by diuers Names, as Skriching, or Grating, such as wee now speake of. As for the Setting of the Teeth on Edge, we see plainly, what an Intercourse there is, betweene the Teeth, and the Organ of the Hearing, by the Taking of the End of a Bow, betweene the Teeth, and Striking vpon the String.

VIII. Century.

THere be Mineralls, and Fossiles, in great Varietie; But of Veines of Earth Medicinall, but few; The Chiefe are, Terra Lemnia, Terra Sigillata communis, and Bolus Arminus: Whereof Terra Lemnia is the Chiefe. The Vertues of them are, for Curing of Wounds, Stanching of Bloud, Stopping of Flaxes and Rheumes, and Arresting the Spreading of Poison, Infection, and Putrefaction: And they haue, of all other Simples, the Perfectest and Purest Qualitie of Drying, with little or no Mixture of any other Qualitie. Yet it is true, that the Bole-Arminicke is the most Cold of them; And that Terra Lemnia is the most Hot; For which Cause, the Island Lemnos, where it is digged, was in the Old Fabulous Ages consecrated to Vulcan.

About the Bottome of the Straights are gathered great Quantities of Sponges, which are gathered from the sides of Rocks, being as it were a large, but tough, Mosse. It is the more to be noted, because that there be but few Substances, Plant-like, that grow deepe within the Sea; For they are gathered sometimes fifteene Fathome deepe; And when they are laid on Shoare, they seeme to be of great Bulke; But crushed together, will be transported in a very small Roome.

It seemeth, that Fish, that are vsed to the Salt-Water, doe neuerthelesse delight more in Fresh. Wee see, that Salmons, and Smelts, loue to get into Riuers, though it be against the Streame. At the Hauen of Constantinople, you shall haue great Quantities of Fish that come from the Euxine-Sea; that when they come into the Fresh Water, doe inebriate and turne vp their Bellies; So as you may take them with your Hand. I doubt, there hath not beene sufficient Experiment made of Putting Sea-Fish into Fresh Water, Ponds, and Pooles. It is a Thing of great Vse, and Pleasure: For so you may haue them new at some good distance from the Sea: And besides, it may be, the Fish will eat the pleasanter, and may fall to breed: And it is said that Colchester Oysters, which are put into Pits, where the Sea goeth and commeth, (but yet so, that there is a Fresh Water

Comming also to them, when the Sea voideth,) become by that meanes Fatter, and more Growne.

The Turkish-Bow giueth a very Forcible Shoot; Insomuch as it hath beene knowne, that the Arrow hath pierced a Stecle Target, or a Peece of Brasse of two Inches thicke: But that which is more strange, the Arrow, if it be Headed with Wood, hath beene knowne to pierce thorow a Peece of Wood, of eight Inches thicke. And it is certaine, that wee had in vse at one time, for Sea-Fight, short Arrowes, which they called Sprights, without any other Heads, saue Wood sharpned; which were discharged out of Muskets, and would pierce thorow the Sides of Ships, where a Bullet would not pierce. But this dependeth vpon one of the greatest Secrets in all Nature; Which is, that Similitude of Substance will cause Attraction, where the Body is wholly freed from the Motion of Grauitie: For if that were taken away, Lead would draw Lead, and Gold would draw Gold, and Iron would draw Iron, without the helpe of the Load-Stone. But this same Motion of Weight or Grauitie, (which is a meere Motion of the Matter, and hath no Affinitie with the Forme, or Kinde,) doth kill the other Motion, except it selfe be killed by a violent Motion; As in these Instances of Arrowes; For then the Motion of Attraction by Similitude of Substance, beginneth to shew it selfe. But wee shall handle this Point of Nature fully in due Place.

They haue in Turkey, and the East, certaine Confections, which they call Seruetts, which are like to Candied Conserues; And are made of Sugar and Limons, or Sugar and Citrons, or Sugar and Violets, and some other Flowers; And some Mixture of Amber for the more delicate Persons; And those they dissolue in Water, and thereof make their Drinke because they are forbidden Wine by their Law. But I doe much maruell that no Englishman, or Dutehman, or German, doth set vp Brewing in Constantinople; Considering they haue such Quantitie of Barley. For as so the generall Sort of Men, Frugalitie may be the Cause of Drinking Water; For that it is no small Sauing, to pay nothing for ones Drinke: But the better Sort mought well be at the Cost. And yet I wonder the lesse at it, because I see France, Italie, or Spaine, haue not taken into vse, Beere, or Ale; Which (perhaps) if they did, would better both their Healths, and their

Complexions. It is likely it would be Matter of great Gaine to any, that should begin it in Turkey.

In Bathing in Hot Water, Sweat (neuerthelesse) commeth not in the Parts vnder the Water. The Cause is; First, for that Sweat is a Kinde of Colliquation. And that Kinde of Colliquation is not made, either by an Ouer-Drie Heat, or an Ouer-Moist Heat. For Ouer-Moisture doth somewhat extinguish the Heat; As wee see that euen Hot Water quencheth Fire: And Ouer-Drie Heat shutteth the Pores: And therefore Men will sooner Sweat couered before the Sunne, or Fire, than if they stood Naked; And Earthen Bottles, filled with Hot Water, doe prouoke, in Bed, a Sweat more daintily, than Bricke-bats Hot. Secondly, Hot Water doth cause Euaporation from the Skin; So as it spendeth the Matter, in those Parts vnder the Water, before it issueth in Sweat. Againe, Sweat commeth more plentifully, if the Heat be increased by Degrees, than if it be greatest at first, or equall. The Cause is, for that the Pores are better opened by a Gentle Heat, than by a more Violent; And by their opening the Sweat issueth more abundantly. And therefore Physitians may doe well, when they prouoke Sweat in Bed, by Bottles, with a Decoction of Sudorisicke Herbs in Hot Water, to make two Degrees of Heat in the Bottles; And to lay in the Bed, the lesse Heated first, and after halfe an Houre the more Heated.

Sweat is Salt in Taste; The Cause is, for that, that Part of the Nourishment, which is Fresh and Sweet, turneth into Bloud, and Flesh; And the Sweat is only that Part which is Separate, and Excerned. Bloud also Raw hath some Saltnesse, more than Flesh; because the Assimilation into Flesh, is not without a little and subtile Excretion from the Bloud.

Sweat commeth forth more out of the Vpper Parts of the Body, than the Lower; The Reason is, because those Parts are more replenished with Spirits; And the Spirits are they that put forth Sweat: Besides, they are lesse Fleshy, and Sweat issueth (chiefly) out of the Parts that are lesse Fleshy, and more Dry; As the Forehead, and Breast.

Men Sweat more in Sleepe, than Waking; And yet Sleepe doth rather stay other Fluxions, than cause them; As Rheumes, Loosenesse of the Body, &c. The

Cause is, for that in Sleepe, the Heat and Spirits doe naturally moue inwards, and there rest. But when they are collected once within, the Heat becommeth more Violent, and Irritate; And thereby expelleth Sweat.

Cold Sweats are (many times) Mortall, and neere Death; And alwayes ill, and Suspected; As in Great Feares, Hypochondricall Passions, &c. The Cause is, for that Cold Sweats come by a Relaxation or Forsaking of the Spirits, wherby the Moisture of the Body, which Heat did keepe firme in the Parts, seuereth, and issueth out.

In those Diseases, which cannot be discharged by Sweat, Sweat is ill, and rather to be stayed; As in Diseases of the Lungs, and Fluxes of the Belly; But in those Diseases, which are expelled by Sweat, it easeth and lightneth; As in Agues, Pestilences, &c. The Cause is, for that Sweat in the Latter Sort is partly Criticall, and sendeth forth the Matter that offendeth; But in the Former, it either proceedeth from the Labour of the Spirits, which sheweth them Oppressed; Or from Motion of Consent, when Nature not able to expell the Disease, where it is seated, moueth to an Expulsion indifferent ouer all the Body.

The Nature of the Glo-wormexs is hitherto not well obserued. Thus much we see; That they breed chiefly in the Hottest Moneths of Summer; And that they breed not in Champaigne, but in Bushes, and Hedges. Wherby it may be conceiued, that the Spirit of them is very fine, and not to be refined, but by Summer Heats: And againe, that by reason of the Finenesse, it doth easily exhale. In Italy, and the Hotter Countries, there is a Fly they call Lucciole, that shineth as the Glo-worme doth; And it may be is the Flying Glo-worme. But that Fly is chiefly vpon Fens, and Marrishes. But yet the two former Obseruations hold; For they are not seene, but in the Heat of Summer; And Sedge, or other Greene of the Fens, giue as good Shade, as Bushes. It may be the Glo-wormes of the Cold Countries ripen not so farre as to be Winged.

The Passions of the Minde, worke vpon the Body the Impressions following.Feare causeth Palenesse; Trembling; The Standing of the Haire vpright; Starting; and Skritching. The Palenesse is caused, for that the Bloud runneth inward, to succour the Heart. The Trembling is caused, for that through

the Flight of the Spirits inward, the Outward Parts are destituted, and not sustained. Standing Vpright of the Haire is caused, for that by the Shutting of the Pores of the Skin, the Haire that lyeth asloape, must needs Rise, Starting is both an Apprehension of the Thing feared, (And, in that kinde, it is a Motion of Shrincking;) And likewise an Inquisition, in the beginning, what the Matter should be; (And in that kinde it is a Motion of Erection;) And therefore, when a Man would listen suddenly to any Thing, he Starteth; For the Starting is an Erection of the Spirits to attend. Skritching is an Appetite of Expelling that which suddenly striketh the Spirits: For it must be noted, that many Motions, though they be vnprofitable to expell that which hurteth, yet they are Offers of Nature, and cause Motions by Consent; As in Groaning, or Crying vpon Paine.

Griefe and Paine cause Sighing; Sobbing; Groaning; Screaming; and Roaring; Teares; Distorting of the Face; Grinding of the Teeth; Sweating. Sighing is caused by the Drawing in of a greater Quantity of Breath to refresh the Heart that laboureth: like a great Draught when one is thirsty. Sobbing is the same Thing stronger. Groaning, and Screaming, and Roaring, are caused by an Appetite of Expulsion, as hath beene said: For when the Spirits cannot expell the Thing that hurteth, in their Strife to do it, by Motion of Consent, they expell the Voice. And this is, when the Spirits yeeld, and giue ouer to resist; For if one doe constantly resist Paine, he will not groane. Teares are caused by a Contraction of the Spirits of the Braine; Which Contraction by consequence astringeth the Moisture of the Braine, and thereby sendeth Teares into the Eyes. And this Contraction, or Compression causeth also Wringing of the Hands; For Wringing is a Gesture of Expression of Moisture. The Distorting of the Face is caused by a Contention, first to beare and resist, and then to expell; Which maketh the Parts knit first, and afterwards open. Grinding of the Teeth is caused (likewise) by a Gathering and Serring of the Spirits together to resist; Which maketh the Teeth also to set hard one against another. Sweating is also a Compound Motion by the Labour of the Spirits, first to resist, and then to expell.

Ioy causeth a Chearefulnesse, and Vigour in the Eyes; Singing; Leaping; Dancing; And sometimes Teares. All these are the Effects of the Dilatation, and

Comming forth of the Spirits into the Outward Parts; Which maketh them more Linely, and Stirring. We know it hath beene seene, that Excessiue Sudden Ioy, hath caused Present Death, while the Spirits did spread so much, as they could not retire againe. As for Teares, they are the Effects of Compression of the Moisture of the Braine. vpon Dilatation of the Spirits. For Compression of the Spirits worketh an Expression of the Moisture of the Braine, by Consent, as hath beene said in Griefe. But then in Ioy, it worketh it diuersly; *viz.* by Prepulsion of the Moisture, when the Spirits dilate, and occupy more Roome.

Anger causeth Palenesse in some, and the Going and Comming of the Colour in Others: Also Trembling in some, Swelling; Foaming at the Month; Stamping; Bending of the Fist. Palenesse, and Going, and Comming of the Colour, are caused by the Burning of the Spirits about the Heart; Which to refresh themselues call in more Spirits from the Outward Parts. And if the Palenesse be alone, without Sending forth the Colour againe, it is commonly ioyned with some Feare; But in many there is no Palenesse at all, but contrariwise Rednesse about the Cheekes, and Gills; Which is by the Sending forsh of the Spirits in an Appetite to Reuenge. Trembling in Anger is likewise by a Calling in of the Spirits; And is commonly, when Anger is ioyned with Feare. Swelling is caused, both by a Dilatation of the Spirits by Ouer-Heating, and by a Liquefaction or Boyling of the Humours thereupon. Foaming at the Mouth is from the same Cause, being an Ebullition. Stamping. and Bending of the Fist, are caused by an Imagination of the Act of Reuenge.

Light Displeasure or Dislike, causeth Shaking of the Head; Frowning, and Knitting of the B — es. These Effects arise from the same Causes that Trembling, and Horrour doe; Namely, from the Retiring of the Spirits. but in a lesse degree. For the Shaking of the Head is but a Slow and Definite Trembling; And is a Gesture of Slight Refusall: And we see also, that a Dislike causeth (often) that Gesture of the Hand, which wee vse, when we refuse a Thing, or warne it away. The Frowning, and Knitting of the Browes, is a Gathering, or Serring of the Spirits, to resist in some Measure. And we see also, this Knitting

of the Browes will follow vpon earnest Studying, or Cogitation of any Thing, though it bee without Dislike.

Shame causeth Blushing; And Casting downe of the Eyes. Blushing is the Resort of Bloud to the Face; Which in the Passion of Shame is the Part that laboureth most. And although the Blushing will be seene in the whole Breast, if it be Naked, yet that is but in Passage to the Face. As for the Casting downe of the Eyes, it proceedeth of the Reuerence a Man beareth to other Men; Whereby, when he is ashamed, he cannot endure to looke firmely vpon Others: And we see that Blushing, and the Casting downe of the Eyes both, are more when we come before Many; Ore Pompeij quid mollius? Nunquàm non coram pluribus erubuit: And likewise when we come before Great, or Reuerend Persons.

Pity causeth sometimes Teares; And a Flexion or Cast of the Eye aside. Teares come from the same Cause that they doe in Griefe: for Pity is but Griefe in Anothers Behalfe. The Cast of the Eye is a Gesture of Auersion, or Loathnesse to behold the Obiect of Pity.

Wonder causeth Astonishment, or an Immoueable Posture of the Body; Casting vp of the Eyes to Heauen; And Lifting vp of the Hands. For Astonishment, it is caused by the Fixing of the Minde vpon one Obiect of Cogitation, whereby it doth not spatiate and transcurre, as it vseth: For in Wonder the Spirits fly not, as in Feare; But onely settle, and are made lesse apt to moue. As for the Casting vp of the Eyes, and Lifting vp of the Hands, it is a Kinde of Appeale to the Deity; Which is the Authour, by Power, and Prouidence, of Strange Wonders.

Laughing causeth a Dilatation of the Mouth, and Lips; A Continued Expulsion of the Breath, with the loud Noise, which maketh the Interiection of Laughing; Shaking of the Breast, and Sides; Running of the Eyes with Water, if it be Violent, and Continued. Wherein first it is to be vnderstood, that Laughing is scarce (properly) a Passion, but hath his Source from the Intellect; For in Laughing there euer precedeth a Conceit of somewhat Ridiculous, And therefore it is Proper to Man. Secondly, that the Cause of Laughing is but a Light Touch of the Spirits, and not so deepe an Impression as in other Passions. And therefore,

(that which hath no Affinity with the Passions of the Minde) it is moued, and that in great vehemency, onely by Tickling some Parts of the Body: And we see that Men euen in a Grieued State of Minde, yet cannot sometimes forbeare Laughing. Thirdly, it is euer ioyned with some Degree of Delight: And therefore Exhilaration hath some Affinity with Ioy, though it be a much Lighter Motion: Res seneraest verum Gandium. Fourthly, that the Obiect of it is Deformity, Absurdity, Shrew'd Turnes, and the like. Now to speake of the Causes of the Effects before mentioned, whereunto these Generall Notes giue some Light, For the Dilatation of the Mouth and Lips, Continued Expulsion of the Breath and Voice, and Shaking of the Breast and Sides, they proceed (all) from the Dilatation of the Spirits; Especially being Sudden. So likewise, the Running of the Eyes with Water, (as hath beene formerly touched, where we spake of the Teares of Ioy and Griefe,) is an Effect of Dilatation of the Spirits. And for Suddennesse, it is a great Part of the Matter: For we see, that any Shrew'd Turne that lighteth vpon Another; Or any Deformity, &c. moueth Laughter in the Instant; Which after a little time it doth not. So we cannot Laugh at any Thing after it is Stale, but whilest it is New: And euen in Tickling, if you Tickle the Sides, and giue warning; Or giue a Hard or Continued Touch, it doth not moue Laughter so much.

Lust causeth a Flagrancy in the Eyes; and Priapisme. The Cause of both these is, for that in Lust, the Sight, and the Touch, are the Things desired: And therefore the Spirits resort to those part-, whch are most affected. And note well in generall, (For that great Vse may be made of the Obseruation,) that (euermore) the Spirits, in all Passions, resort most to the Parts, that labour most, or are most affected. As in the last, which hath been mentioned, they resort to the Eyes, and Venereous Parts: In Feare, and Anger, to the Heart: In Shame to the Face: And in Light Dislikes to the Head.

It hath beene obserued by the Ancients and is yet beleeued, that the Sperme of Drunken Men is Vnfruitfull. The Cause is, for that it is Ouer-moistened, and wanteth Spissitude. And we haue a merry Saying, that they that goe Drunke to Bed, get Daughters.

Drunken Men are taken with a plaine Defect, or Destitution in Voluntary Motion. They — ele: They tremble: They cannot stand, nor speake strongly. The —— is, for that the Spirits of the Wine, oppresse the Spirits Animall, and — pate Part of the Place, where they are; And so make them Weake to moue. And therefore Drunken Men are apt to fall asleepe: And Opiates, and Stupefactines, (as Poppy, Henbane, Hemlocke, &c.) induce a kinde of Drunkennesse, by the Grossenesse of their Vapour; As Wine doth by the Quantity of the Vapour. Besides, they rob the Spirits Animall of their Matter, whereby they are nourished: For the Spirits of the Wine prey vpon it, as well as they: And so they make the Spirits lesse Supple, and Apt to moue.

Drunken Men imagine euery Thing turneth round; They imagine also that Things Come vpon them; They See not well Things a farre off; Those Things that they See neare hand, they See out of their Place; And (sometimes) they see Things double. The Cause of the Imagination that Things turne Round, is, for that the Spirits themselues turne, being compressed by the Vapour of the Wine: (For any Liquid Body vpon Compression, turneth, as we see in Water:) And it is all one to the Sight, whether the Visuall Spirits moue, or the Obiect moueth, or the Medium moueth. And we see that long Turning Round breedeth the same Imagination. The Cause of the Imagination that Things come vpon them, is, for that the Spirits Visuall themselues draw backe; which maketh the Obiect seeme to come on; And besides, when they see Things turne Round, and Moue, Feare maketh them thinke they come vpon them. The Cause that they cannot see Things a farre off, is the Weaknesse of the Spirits; for in euery Megrim, or Vertige, there is an Obtenebration ioyned with a Semblance of Turning round; Which we see also in the lighter Sort of Swonnings. The Cause of Seeing things out of their Place, is the Refraction: of the Spirits Visuall; For the Vapour is as an Vnequall Medium; And it is, as the Sight of Things, out of place, in Water. The Cause of Seeing Things double, is, the Swift and Vnquiet Motion of the Spirits, (being Oppressed,) to and fro; For, (as was said before,) the Motion of the Spirits Visuall, and the Motion of the Obiect, make the same Appearances;

And for the Swift Motion of the Obiect, we see, that if you fillip a Lute-String, it sheweth double, or Treble.

Men are sooner Drunke with Small Draughts, than with Great. And againe, Wine Sugred inebriateth lesse, than Wine Pure. The Cause of the Former is, for that the Wine descendeth not so fast to the Bottome of the Stomach; But maketh longer Stay in the Vpper Part of the Stomach, and sendeth Vapours faster to the Head; And therefore inebriateth sooner. And, for the same Reason, Sops in Wine, (Quantity for Quantity,) inebriate more, than Wine of it selfe. The Cause of the Latter is, for that the Sugar doth inspissate the Spirits of the Wine, and maketh them not so easie to resolue into Vapour. Nay further, it is thought, to be some Remedy against Inebriating, if Wine Sugred be taken after Wine Pure. And the same Effect is wrought either by Oyle, or Milke, taken vpon much Drinking.

The Vse of Wine, in Dry, and Consumed Bodies, is hurtfull; In Moist, and Full Bodies, it is good. The Cause is, for that the Spirits of the Wine doe prey vpon the Dew, or Radicall Moisture, (as they terme it,) of the Body, and so deceiue the Animall Spirits. But where there is Moisture Enough, or Superfluous, there Wine helpeth to disgest, and desiccate the Moisture.

The Catterpiller is one of the most Generall of Wormes, and breedeth of Dew, and Leaues: For we see infinite Number of Catterpillers, which breed vpon Trees, and Hedges; By which the Leaues of the Trees, or Hedges, are in great Part consumed; As well by their Breeding out of the Leafe, as by their Feeding vpon the Leafe. They breed in the Spring chiefly, because then there is both Dew, and Leafe. And they breed commonly when the East Winds haue much blowne: The Cause whereof is, the Drinesse of that Wind: For to all Viuification vpon Putrefaction, it is requisite the Matter be not too Moist: And therefore we see, they haue Copwebs about them, which is a signe of a Slimy Drinesse: As we see vpon the Ground, whereupon, by Dew, and Sunne, Copwebs breed all ouer. We see also the Greene Catterpiller breedeth in the Inward Parts of Roses, especially not blowne, where the Dew sticketh: But especially Catterpillers, both the greatest, and the most, breed vpon Cabbages, which haue a Fat Leafe, and apt to Putrifie. The Catterpiller towards the End of Summer waxeth Volatile, and

turneth to a Butterfly, or perhaps some other Fly. There is a Catterpiller, that hath a Furre, or Downe vpon him, and seemeth to haue Affinity with the Silke-worme

The Flyes Cantharides are bred of a Worme, or Catterpiller, but peculiar to certaine Fruit-Trees; As are the Fig-tree, the Pine-tree, and the Wilde Briar; All which beare Sweet Fruit; And Fruit that hath a kinde of secret Biting, or Sharpnesse: For the Fig hath a Milke in it, that is Sweet, and Corrosiue: The Pine-Apple hath a Kernell that is Strong and Absterside: The Fruit of the Briar is said to make Children, or those that Eat them, Scabbed. And therefore, no maruell though Cantharides haue such a Corrosiue, and Cauterizing Quality; For there is not any other of the Insecta, but is bred of a Duller Matter. The Body of the Cantharides is bright coloured; And it may be, that the delicate-coloured Dragon-Flies, may haue likewise some Corrosiue Quality.

Lassitude is remedied by Bathing, or Annointing with Oyle, and Warme water. The Cause is, for that all Lassitude is a kinde of Contusion, and Compression of the Parts; And Bathing, and Annointing giue a Relaxation, or Emollition: And the Mixture of Oyle, and Water, is better than either of them alone; Because Water Entreth better into the Pores, and Oyle after Entry softneth better. It is found also, that the Taking of Tobacco doth helpe and discharge Lassitude. The Reason whereof is, partly, because by Chearing or Comforting of the Spirits it openeth the Parts Compressed, or Contused: And chiefly, because it refresheth the Spirits by the Opiate Vertue thereof; And so dischargeth Wearinesse; as Sleepe likewise doth.

In Going vp a Hill, the Knees will be most Weary; In Going downe a Hill, the Thighes. The Cause is, for that, in the Lift of the Feet, when a Man Goeth vp the Hill, the Weight of the Body beareth most vpon the Knees; And in Going downe the Hill, vpon the Thighes.

The Casting of the Skin, is by the Ancients compared, to the Breaking of the Secundine, or Call; but not rightly: For that were to make euery Casting of the Skin a New Birth: And besides, the Secundine is but a generall Couer, not shaped according to the Parts; But the Skin is shaped according to the Parts. The

Creatures, that cast their Skin, are; The Snake, the Viper, the Grashopper, the Lizard, the Silke worme, &c. Those that cast their Shell, are; The Lobster, the Crab, the Crafish, the Hodmandod or Dedman, the Tortoise, &c. The Old Skins are found, but the Old Shells neuer: So as it is like, they scale off, and crumble away by degrees. And they are knowne, by the Extreme Tendernesse and Softnesse of the New Shell; And somewhat by the Freshnesse of the Colour of it. The Cause of the Casting of Skin, and Shell, should seeme to be the great Quantity of Matter in those Creatures, that is fit to make Skin, or Shell; And againe, the Loosenesse of the Skin, or Shell, that sticketh not close to the Flesh. For it is certaine, that it is the New Skin, or Shell, that putteth off the Old: So we see, that in Deere, it is the Young Horne, that putteth off the Old; And in Birds, the Young Feathers put off the Old: And so Birds, that haue much Matter for their Beake, cast their Beakes; the New Beake Putting off the Old.

Lying, not Erect, but Hollow, which is in the Making of the Bed; Or with the Legges gathered vp, which is in the Posture of the Body, is the more Wholesome. The Reason is, the better Comforting of the Stomach, which is by that lesse Pensile: And we see, that in Weake Stomachs, the Laying vp of the Legs high, and the Knees almost to the Mouth, helpeth, and comforteth. We see also that Gally-Slanes, notwithstanding their Misery otherwise, are commonly Fat and Fleshy; And the Reason is, because the Stomach is supported somewhat in Sitting; And is Pensile in Standing, or Going. And therefore, for Prolongation of Life, it is good to choose those Exercises, where the Limbes moue more than the Stomach, and Belly; As in Rowing, and in Sawing being Set.

Megrims and Giddinesse are rather when we Rise, after long Sitting, than while we Sit. The Cause is, for that the Vapours, which were gathered by Sitting, by the Sudden Motion, fly more vp into the Head.

Leaning long vpon any Part maketh it Numme, and, as wee call it, Asleepe. The Cause is, for that the Compression of the Part suffereth not the Spirits to haue free Accesse; And therefore, when wee come out of it, wee feele a Stinging or —— ing; Which is the Re-entrance of the Spirits.

It hath beene noted, that those Yeares are Pestilentiall, and Vnwholesome, when there are great Numbers of Frogs, Flies, Locusts, &c. The Cause is plaine; For that those Creatures being engendred of Putrefaction, when they abound, shew a generall Disposition of the Yeare, and Constitution of the Aire, to Diseases of Putrefaction. And the same Prognesticke, (as hath beene said before,) holdeth, if you finde Wormes in OakeApples. For the Constitution of the Aire, appeareth more subtilly, in any of these Things, than to the Sense of Man.

It is an Obseruation amongst Country-People, that Yeares of Store of Hawes and Heps, doe commonly portend Cold Winters; And they ascribe it to Gods Prouidence, that, (as the Scripture saith) reacheth euen to the Falling of a Sparrow; And much more is like to reach to the Preseruation of Birds in such Seasons. The Naturall Cause also may be the Want of Heat, and Abundance of Moisture, in the Summer precedent; Which putteth forth those Fruits, and must needs leaue great Quantity of Cold Vapours, not dissipate; Which causeth the Cold of the Winter following.

They haue in Turkey, a Drinke called Coffa, made of a Berry of the same Name, as Blacke as Soot, and of a Strong Sent, but not Aromaticall; Which they take, beaten into Powder, in Water, as Hot as they can drinke it: And they take it, and sit at it, in their Coffa-Houses, which are like our Tauernes. This Drinke comforteth the Braine, and Heart, and helpeth Disgestion. Certainly this Berry Coffa; The Root, and Leafe Betel; The Leafe Tobacco; And the Teare of Poppy, (Opium,) of which the Turks are great Takers, (supposing it expelleth all Feare;) doe all Condense the Spirits, and make them Strong, and Aleger. But it seemeth they are taken after seuerall manners; For Coffa and Opium are taken downe; Tobacco but in Smoake; And Betel is but champed in the Mouth, with a little Lime. It is like there are more of them, if they were well found out, and well corrected. Quare of Henbane-Seed; Of Mandrake; Of Saffron, Root, and Flower; Of Folium Indum; Of Amber-grice; Of the Assyrian Amomum, if it may be had; And of the Scarlet Powder, which they call Kermez; And (generally) of all such

Things, as doe inebriate, and prouoke Sleepe. Note that Tobacco is not taken in Root, or Seed, which are more forcible euer than Leaues.

The Turkes haue a Blacke Powder, made of a Minerall called Alcohole; Which with a fine long Pencill they lay vnder their Eye-lids; Which doth colour them Blacke; Whereby the White of the Eye is set off more white. With the same Powder they colour also the Haires of their Eye-lids, and of their Eye-browes, which they draw into Embowed Arches. You shall finde that Xenophon maketh Mention, that the Medes vsed to paint their Eyes. The Turkes vse with the same Tincture, to colour the Haire of their Heads and Beards Blacke: And diuers with vs, that are growne Gray, and yet would appeare Young, finde meanes to make their Haire blacke, by Combing it, (as they say,) with a Leaden Combe, or the like. As for the Chineses, who are of an ill Complexion, (being Oliuaster,) they paint their Cheekes Scarlet; Especially their King, and Grandes. Generally, Barbarous People, that goe Naked, doe not onely paint Themselues, but they pownce and raze their Skinne, that the Painting may not be taken forth; And make it into Works. So doe the West Indians; And so did the Ancient Picts, and Brittons; So that it seemeth, Men would haue the Colours of Birds Feathers, if they could tell how; Or at least, they will haue Gay Skins, instead of Gay Cloathes.

It is strange, that the Vse of Bathing, as a Part of Diet, is left. With the Romans, and Grecians, it was as vsuall, as Eating, or Sleeping: And so is it amongst the Turkes at this day: Whereas with vs it remaineth but as a Part of Physicke. I am of Opinion, that the Vse of it, as it was with the Romans, was hurtfull to Health; For that it made the Body Soft, and easie to Waste. For the Turkes it is more proper, because that their Drinking Water, and Feeding vpon Rize, and other Food of small Nourishment, maketh their Bodies so Solide, and Hard, as you need not feare that Bathing should make them Froathie. Besides, the Turkes are great Sitters, and seldome walke; Whereby they Sweat lesse, and need Bathing more. But yet certaine it is, that Bathing, and especially Annointing, may be so vsed, as it may be a great Helpe to Health, and

Prolongation of Life. But hereof we shall speake in due Place, when we come to handle Experiments Medicinall.

The Turkes haue a Pretty Art of Chamoletting of Paper, which is not with vs in vse. They take diuers Oyled Colours, and put them seuerally (in drops) vpon Water; And stirre the Water lightly; And then wet their Paper, (being of some Thicknesse,) with it; And the Paper will be Waued, and Veined, like Chamolet, or Marble.

It is somewhat strange, that the Bloud of all Birds, and Beasts, and Fishes, should be of a Red Colour, and only the Bloud of the Cuttle should be as Blacke as Inke. A Man would thinke, that the Cause should be the High Concoction of that Bloud; For wee see in ordinary Puddings, that the Boyling turneth the Bloud to be Blacke; And the Cuttle is accounted a delicate Meat, and is much in Request.

It is reported of Credit, that if you take Earth, from Land adioyning to the Riuer of Nile; And preserue it in that manner, that it neither come to be Wet, nor Wasted; And Weigh it daily, it will not alter Weight vntill the seuenteenth of Iune, which is the Day when the Riuer beginneth to rise; And then it will grow more and more Ponderous, till the Riuer commeth to his Heighth Which if it be true, it cannot be caused, but by the Aire, which then beginneth to Condense; And so turneth within that Small Mould into a degree of Moisture; Which produceth Weight. So it hath beene obserued, that Tobacco, Cut, and Weighed, and then Dried by the Fire, loseth Weight; And after being laid in the open Aire, recouereth Weight againe. And it should seeme, that as soone as euer the Riuer beginneth to increase, the whole Body of the Aire thereabouts suffereth a Change: For (that which is more strange,) it is credibly affirmed, that vpon that very Day, when the Riuer first riseth, great Plagues, in Caire, vse suddenly to breake vp.

Those that are very Cold, and especially in their Feet, cannot get to Sleepe. The Cause may be, for that in Sleepe is required a Free Respiration, which Cold doth shut in, and hinder: For wee see, that in great Colds, one can scarce draw his Breath. Another Cause may be, for that Cold calleth the Spirits to succour;

And therefore they cannot so well close; and goe together in the Head; Which is euer requisite to Sleepe. And for the same Cause, Paine, and Noise hinder Sleepe; And Darknesse (contrariwise) furthereth Sleepe.

Some Noises (whereof wee spake in the 112. Experiment) helpe Sleepe; As the Blowing of the Wind, the Trickling of Water, Humming of Bees, Soft Singing, Reading, &c. The Cause is, for that they moue in the Spirits a gentle Attention; And whatsoeuer moueth Attention, without too much Labour, stilleth the Naturall and discursiue Motion of the Spirits.

Sleepe nourisheth, or at least preserueth Bodies, a long time, without other Nourishment. Beasts that sleepe in Winter, (as it is noted of Wilde Beares,) during their Sleep wax very Fat, though they Eat nothing. Bats haue beene found in Ouens, and other Hollow Close Places, Matted one vpon another; And therefore it is likely that they Sleepe in the Winter time, and eat Nothing. Quare, whether Bees doe not Sleepe all Winter, and spare their Honey? Butterflies, and other Flies, doe not onely Sleepe, but lye as Dead all Winter; And yet with a little Heat of Sunne, or Fire, reuine againe. A Dormonse, both Winter and Summer, will Sleepe some dayes' together, and eat Nothing.

To restore Teeth in Age, were Magnale Naturae. It may be thought of. But howsoeuer the Nature of the Teeth deserueth to be enquired of, as well as the other Parts of Liuing Creatures Bodies.

There be Fiue Parts in the Bodies of Liuing-Creatures, that are of Hard Substance; The Skull; The Teeth; The Bones; The Hornes; and the Nailes. The greatest Quantity of Hard Substance Continued, is towards the Head. For there is the Skull of one Entire Bone; There are the Teeth; There are the Maxillary Bones; There is the Hard Bone, that is the Instrument of Hearing; And thence issue the Hornes: So that the Building of Liuing Creatures Bodies, is like the Building of a Timber-House, where the Walls, and other Parts haue Columnes, and Beames; But the Roofe is, in the better Sort of Houses, all Tile, or Lead, or Stone. As for Birds, they haue Three other Hard Substances proper to them; The Bill, which is of like Matter with the Teeth; For no Birds haue Teeth: The Shell of the Egge: And their Quills: For as for their Spurre, it is but a Naile. But no

Liuing-Creatures, that haue Shells very hard; (As Oysters, Cockles, Mussles, Scallops, Crabs, Lobsters, Crafish, Shrimps, and especially the Tortoise,) haue Bones within them, but onely little Gristles.

Bones, after full Growth, continue at a Stay: And so doth the Skull: Hornes, in some Creatures, are cast, and renued: Teeth stand at a Stay except their Wearing: As for Nailes, they grow continually: And Bills and Beakes will ouer-grow, and sometimes be cast; as in Eagles, and Parrots.

Most of the Hard Substances fly to the Extremes of the Body, As Skull, Hornes, Teeth, Nailes, and Beakes: Onely the Bones are more Inward, and clad with Flesh. As for the Entrailes, they are all without Bones; Saue that a Bone is (sometimes) found in the Heart of a Stag; And it may be in some other Creature.

The Skull hath Braines, as a kinde of Marrow, within it. The Back-Bone hath one Kinde of Marrow, which hath an Affinity with the Braine; And other Bones of the Body haue another. The Iaw-Bones haue no Marrow Seuered, but a little Pulpe of Marrow diffused. Teeth likewise are thought to haue a kind of Marrow diffused, which causeth the Sense, and Paine: But it is rather Sinnew; For Marrow hath no Sense; No more than Bloud. Horne is alike throughout; And so is the Naile.

None other of the Hard Substances haue Sense, but the Teeth: And the Teeth haue Sense, not onely of Paine, but of Cold.

But we will leaue the Enquiries of other Hard Substances, vnto their seuerall Places; And now enquire onely of the Teeth.

The Teeth are, in Men, of three Kindes: Sharpe, as the Fore-Teeth; Broad, as the Back-Teeth, which we call the Molar-Teeth, or Grinders; And Pointed-Teeth, or Canine, which are betweene both. But there haue beene some Men, that haue had their Teeth vndiuided, as of one whole Bone, with some little Marke in the Place of the Diuision; As Pyrrhus had. Some Creatures haue Ouer-long, or Out-growing Teeth, which wee call Fangs, or Tuskes; As Boares, Pikes, Salmons, and Dogs though lesse. Some Liuing Creatures haue Teeth against Teeth; As Men, and Horses; And some haue Teeth, especially their Master-Teeth, indented one within Another, like Sawes; As Lions; And so againe haue Dogs. Some

Fishes haue diuers Rowes of Teeth in the Roofes of their Mouthes; As Pikes, Salmons, Trouts, &c. And many more in Salt-Waters. Snakes, and other Serpents, haue Venomous Teeth; which are sometimes mistaken for their Sting.

No Beast that hath Hornes, hath Vpper Teeth; And no Beast, that hath Teeth aboue, wanteth them below: But yet if they be of the same kinde, it followeth not, that if the Hard Matter goeth not into Vpper Teeth, it will goe into Hornes; Not yet — conuerse; For Doe's, that haue no Hornes, haue no Vpper Teeth.

Horses haue, at three yeares old, a Tooth put forth, which they call the Colts Tooth; And at foure yeares old there commeth the Mark-Tooth, which hath a Hole, as big as you may lay a Pease within it; And that weareth shorter and shorter, euery yeare; Till that at eight yeares old, the Tooth is smooth, and the Hole gone; And then they say; That the Marke is out of the Horses Mouth.

The Teeth of Men breed first, when the Childe is about a yeare and halfe old: And then they cast them, and new come about seuen yeares old. But diuers haue Backward-Teeth come forth at Twenty, yea some at Thirty, and Forty. Quare of the manner of the Comming of them forth. They tell a Tale of the old Countesse of Desmond, who liued till she was seuen-score yeares old, that she did Dentire, twice, or thrice; Casting her old Teeth, and others Comming in their Place.

Teeth are much hurt by Sweet-Meats; And by Painting with Mercury; And by Things Ouer-hot; And by Things Ouer-cold; And by Rheumes. And the Paine of the Teeth, is one of the sharpest of Paines.

Concerning Teeth, those Things are to be Considered. 1. The Preseruing of them. 2. The Keeping of them White. 3. The Drawing of them with Least Paine. 4. The Staying and Easing of the Tooth-ach. 5. The Binding in of Artificiall Teeth, where haue beene strucken out. 6. And last of all, that Great One, of Restoring Teeth in Age. The Instances that giue any likelihood of Restoring Teeth in Age, are; The Late Comming of Teeth in some; And the Renewing of the Beakes in Birds, which are Commateriall with Teeth. Quare therefore more particularly how that commeth. And againe, the Renewing of Hornes. But yet that hath not beene knowne to haue beene prouoked by Art; Therfore let Triall be made, whether Hornes may be procured to grow in Beasts that are not

Horned, and how? And whether they may be procured to come Larger than vsuall; As to make an Oxe, or a Deere, haue a Greater Head of Hornes? And whether the Head of a Deere, that by Age is more Spitted, may be brought againe to be more Branched; For those Trialls, and the like, will shew, whether by Art such Hard Matter can be called, and prouoked. It may be tryed also, whether Birds may not haue some thing done to them, when they are Young, wherby they may be made to haue Greater, or Longer Bills; Or Greater and Longer Tallons? And whether Children may not haue some Wash, or Something to make their Teeth Better, and Stronger? Corall is in vse as an Helpe to the Teeth of Children.

Some Liuing Creatures generate but at certaine Seasons of the Yeare; As Deere, Sheepe, Wilde Conneyes, &c. And most Sorts of Birds, and Fishes: Others at any time of the Yeare, as Men; And all Domesticke Creatures; As Horses, Hogges, Dogges, Cats, &c. The Cause of Generation at all Seasons seemeth to be Fulnesse: For Generation is from Redundance. This Fulnesse ariseth from two Causes; Either from the Nature of the Creature, if it be Hot, and Moist, and Sanguine; Or from Plenty of Food. For the first, Men, Horses, Dogges, &c. which breed at all Seasons, are full of Heat, and Moisture; Dones are the fullest of Heat and Moisture amongst Birds, and therefore breed often; The Tame Doue almost continually. But Deere are a Melancholy Dry Creature, as appeareth by their Fearefulnesse, and the Hardnesse of their Flesh. Sheepe are a Cold Creature, as appeareth by their Mildnesse, and for that they seldome Drinke. Most sort of Birds are of a dry Substance in comparison of Beasts, Fishes are cold. For the second Cause, Fulnesse of Food; Men, Kine, Swine, Dogs, &c. seed full; And we see that those Creatures, which being Wilde, generate seldome, being Tame, generate often; Which is from Warmth, and Fulnesse of Food. We finde, that the Time of Going to Rut of Deore is in September; For that they need the whole Summers Feed and Grasse, to make them fit for Generation. And if Raine come Earely about the Middle of September, they goe to Rut somewhat the sooner; If Drought, somewhat the later. So Sheepe, in respect of their small Neat. generate about the same time, or

somewhat before. But for the most part, Creatures that generate at certaine Seasons, generate in the Spring; As Birds, and Fishes; For that the End of the Winter, and the Heat, and Comfort of the Spring prepareth them. There is also another Reason, why some Creatures generate at certaine Seasons: And that is the Relation of their Time of Bearing, to the time of Generation: For no Creature goeth to generate, whilest the Female is full; Nor whilest shee is busie in Sitting or Rearing her Young. And therefore it is found by Experience, that if you take the Egges, or Young Ones, out of the Neasts of Birds, they will fall to generate againe, three or foure times, one after another.

Of Liuing Creatures, some are Longer time in the Wombe, and some Shorter. Women goe commonly nine Moneths; The Cow and the Ewe about six Moneths; Doe's goe about nine Moneths; Mares eleuen Moneths; Bitches nine Weekes; Elephants are said to goe two Yeares; For the Receiued Tradition of ten Yeares is Fabulous. For Birds there is double Enquiry; The Distance betweene the Treading or Coupling, and the Laying of the Egge; And againe betweene the Egge Layed, and the Disclosing or Hetching. And amongst Birds, there is lesse Diuersity of Time, than amongst other Creatures; yet some there is: For the Hen sitteth but three Weekes; The Turky-Hen, Goose, and Ducke, a Moneth: Quare of others. The Cause of the great Difference of Times, amongst Liuing Creatures, is, Either from the Nature of the Kinde; Or from the Constitution of the Wombe. For the former, those that are longer in Comming to their Maturity or Growth, are longer in the Wombe; As is chiefly seene in Men; And so Elephants which are long in the Wombe, are long time in Comming to their full Growth. But in most other Kindes, the Constitution of the Wombe, (that is, the Hardnesse or Drinesse thereof,) is concurrent with the former Cause. For the — lt hath about foure yeares of Growth; And so the Fawne; And so the Calfe. But Whelps, which come to their Growth (commonly) within three Quarters of a yeare, are but nine Weekes in the Wombe. As for Birds, as there is lesse Diuersity, amongst them, in the time of their Bringing forth; So there is lesse Diuersity in the time of their Growth; Most of them comming to their Growth within a Twelue-Moneth.

Some Creatures bring forth many Young Ones at a Burthen; As Bitches, Hares, Conneyes, &c. Some (ordinatily) but One; As Women, Lionesses, &c. This may be caused, either by the Quantity of Sperme required to the Producing One of that Kinde; which if lesse be required, may admit greater Number; If more, fewer: Or by the Partitions and Cells of the Wombe, which may feuer the Sperme.

There is no doubt, but Light by Refraction will shew greater, as well as Things Coloured. For like as a Shilling, in the Bottomes of the Water. will shew greater; So will a Candle in a Lanthorne, in the Bottome of the Water. I haue heard of a Practise, that Glo-wormes in Glasses were put in the Water, to make the Fish come. But I am not yet informed, whether when a Diuer Diueth, hauing his Eyes open, and swimmeth vpon his Backe; whether (I say) he seeth Things in the Aire greater, or lesse. For it is manifest, that when the Eye standeth in the Finer Medium, and the Obiect is in the Grosser, things shew greater; But contrariwise, when the Eye is placed in the Grosser Medium, and the Obiect in the Finer, how it worketh I know not.

It would be well boulted out, whether great Refractions may not be made vpon Reflexions, as well as vpon Direct Beames. For Example, We see that take an Empty Basen, put an Angell of Gold, or what you will, into it; Then goe so farre from the Basen, till you cannot see the Angell, because it is not in a Right Line; Then fill the Basen with Water, and you shall see it out of his Place, because of the Reflexion. To proceed therefore, put a Looking-Glasse into a Basen of Water; I suppose you shall not see the Image in a Right Line, or at equall Angles, but aside. I know not, whether this Experiment may not be extended so, as you might see the Image, and not the Glasse; Which for Beauty, and Strangenesse, were a fine Proofe: For then you should see the Image like a Spirit in the Aire. As for Example, If there be a Cesterne or Poole of Water. you shall place ouer against it a Picture of the Deuill, or what you will, so as you doe not see the Water. Then put a Looking-Glasse in the Water: Now if you can see the Deuills Picture aside, not seeing the Water, it will looke like a Deuill indeed. They haue an old Tale in Oxford, that Friar Bacon walked betweene two

Steeples: Which was thought to be done by Glasses, when he walked vpon the Ground.

A Weighty Body put into Motion, is more easily impelled, than at first when it Resteth. The Cause is, Partly because Motion doth discusse the Torpour of Solide Bodies, Which beside their Motion of Grauity, haue in them a Naturall Appetite, not to moue at all; And partly, because a Body that resteth, doth get, by the Resistance of the Body vpon which it resteth, a stronger Compression of Parts, than it hath of it Selfe: And therefore needeth more Force to be put in Motion. For if a Weighty Body be Pensile, and hang but by a Thred, the Percussion will make an Impulsion very neare as easily, as if it were already in Motion.

A Body Ouer-great, or Ouer-small, will not be throwne so farre, as a Body of a Middle Sixe: So that (it seemeth) there must be a Commensuration, or Proportion, betweene the Body Moued, and the Force, to make it moue well. The Cause is, because to the Impulsion, there is requisite the Force of the Body that Moueth, and the Resistance of the Body that is Moued: And if the Body be too great, it yeeldeth too little; And if it be too small, it resisteth too little.

It is Common Experience, that no Weight will presse or cut so strong, being laid vpon a Body, as Falling, or strucken from aboue. It may be the Aire hath some part in furthering the Percussion: But the chiefe Cause I take to be, for that the Parts of the Body Moued, haue by Impulsion, or by the Motion of Grauity continued, a Compression in them, as well downwards, as they haue when they are throwne, or Shot thorow the Aire, forwards. I conceiue also, that the quicke Loose of that Motion, preuenteth the Resistance of the Body below; And Priority of the Force, (alwaies,) is of great Efficacy; As appeareth in infinite Instances.

Tickling is most in the Soles of the Feet, and vnder the Arme-Holes, and on the Sides. The Cause is, the Thinnesse of the Skin in those Parts; Ioyned with the Rarenesse of being touched there. For all Tickling is a light Motion of the Spirits, which the Thinnesse of the Skin, and Suddennesse, and Rarenesse of Touch, doe further: For we see, a Feather, or a Rush, drawne along the Lip. or Cheeke, doth tickle; Whereas a Thing more Obtuse, or a Touch more Hard, doth

not. And for Suddennesse; We see no Man can tickle himselfe: Wee see also, that the Palme of the Hand, though it hath as Thinne a Skin as the other Parts Mentioned, yet is not Ticklish, because it is accustomed to be Touched. Tickling also causeth Laughter. The Cause may be, the Emission of the Spirits, and so of the Breath, by a Flight from Titillation; For vpon Tickling, we see there is euer a Starting, or Shrinking away of the Part, to auoid it; And we see also, that if you Tickle the Nosthrills, with a Feather, or Straw, it procureth Sneezing; Which is a Sudden Emission of the Spirits, that doe likewise expell the Moisture. And Tickling is euer Painfull, and not well endured.

It is strange, that the Riuer of Nilus, Ouer-flowing, as it doth, the Country of AEgypt, there should be neuerthelesse little or no Raine in that Country. The Cause must be, Either in the Nature of the Water; Or in the Nature of the Aire; Or of Both. In the Water, it may be ascribed, either vnto the Long — of the Water: For Swift Running Waters vapour, not so much as Standing Waters; Or else to the Concoction of the Water; For Waters well Concocted vapour not so much, as Waters Raw; No more than Waters vpon the Fire doe vapour so much, after some time of Boyling, as at the first. And it is true, that the Water of Nilus is sweeter than other Waters in Taste; And it is excellent Good for the Stone, and Hypochondriacall Melancholy; Which sheweth it is Lenefying: And it runneth thorow a Countrey of a Hot Climate, and flat, without Shade, either of Woods, or Hills; Whereby the Sunne must needs haue great Power to Concoct it. As for the Aire, (from whence I conceiue this Want of Showers commeth chiefly;) The Cause must be, for that the Aire is, of it selfe, Thin and Thirsty; And as soone as euer it getteth any Moisture from the Water, it imbibeth, and dissipateth it, in the whole body of the Aire; And suffereth it not to remaine in Vapour; Whereby it might breed Raine.

It hath beene touched in the Title of Percolations, (Namely such as are Inwards,) that the Whites of Eggs, and Milke, doe clarifie; And it is certaine, that in AEgypt, they prepare and clarifie the Water of Nile, by putting it into great Iarres of Stone, and Stirring it about with a few Stamped Almonds; Wherewith they also besmeare the Mouth of the Vessell; And so draw it off, after it hath

rested some time. It were good, to trie this Clarifying with Almonds, in New Beere, or Must, to hasten, and perfect the Clarifying.

There be scarce to be found any Vegetables, that haue Branches, and no Leaues; except you allow Corall for one. But there is also in the Desarts of S. Macario in AEgypt, a Plant which is Long, Leauelesse, Browne of Colour, and Branched like Corall, faue that it closeth at the Top. This being set in Water within House, spreadeth and displayeth strangely; And the People thereabouts haue a Superstitious Beleefe, that in the Labour of Women, it helpeth to the Easie Deliuerance.

The Crystalline Venice Glasse, is reported to be a Mixture, in equall Portions, of Stones, brought from Pauia, by the Riuer Ticinum; And the Ashes of a Weed called by the Arabs Kall, which is gathered in a Desart betweene Alexandria and Rosetta; And is by the AEgyptians vsed first for Fuell; And then they crush the Ashes into Lumps, like a Stone; And so sell them to the Venetians for their Glasse-workes.

It is strange, and well to be noted, how long Carkasses haue continued Vncorrupt, and in their former Dimensions; As appeareth in the Mummies of AEgypt; Hauing lafted, as is conceiued, (some of them,) three thousand yeeres. It is true, they finde Meanes to draw forth the Braines, and to take forth the Entrailes, which are the Parts apteft to corrupt. But that is nothing to the Wonder: For wee see, what a Soft and Corruptible Substance the Flesh, of all the other Parts of the Body, is. But it should seeme, that according to our Obseruation, and Axiorne, in our hundredth Experiment, Putrefaction, which we conceiue to be so Naturall a Period of Bodies, is but an Accident; And that Matter maketh not that Haste to Corruption, that is conceiued. And therefore Bodies, in Shining-Amber; In Quicke-Siluer; In Balmes, (whereof wee now speake;) In Wax; In Honey; In Gummes; And (it may be) in Conseruatories of Snow; &c. are preserued very long. It need not goe for Repetition, if we resume againe that which wee said in the aforesaid Experiment, concerning Annihilation; Namely, that if you prouide against three Causes of Putrefaction, Bodies will not corrupt: The First is, that the Aire be excluded; For that

vndermineth the Body, and conspireth with the Spirit of the Body to dissolue it. The Second is, that the Body Adiacent and Ambiens be not Commateriall, but meerely Heterogeneall towards the Body that is to be presured: For if Nothing can be receiued by the One, Nothing can issue from the Other, Such are Quick-Siluer, & White-Amber, to Herbs, and Flies, and such Bodies. The Third is, that the Body to be preserued, be not of that Grasse, that it may corrupt within it selfe, although no Part of it issue into the Body Adiacent: And therefore it must be rather Thinne, and Small, than of Bulke. There is a Fourth Remedie also, which is; That if the Body to be preserued be of Bulke, as a Corps is, then the Body that Incloseth it, must haue a Vertue to draw forth, and drie the Moisture of the Inward Body; For else the Putrefaction will play within, though Nothing issue forth. I remember Liuy doth relate, that there were found, at a time, two Coffins of Lead, in a Tombe; Whereof the one contained the Body of King Numa; It being some foure hundred yeares after his Death: And the other, his Bookes of Sacred Rites and Ceremonies, and the Discipline of the Pontises; And that in the Coffin that had the Body, there was Nothing (at all) to be seene, but a little light Cinders about the Sides; But in the Coffin that had the Bookes, they were found as fresh, as if they had beene but newly Written; being written in Parchment, and couered ouer with Watch-Candles of Wax, three or foure fold. By this it seemeth, that the Romans. in Numa's time, were not so good Embalmers, as the AEgyptians were; Which was the Cause that the Body was vtterly consumed. But I finde in Plutarch, and Others, that when Augustus Caesar visited the Sepulchre of Alexander, the Great, in Alexandria, he found the Body to keepe his Dimension; But withall, that, notwithstanding all the Embalming, (which no doubt was of the best,) the Body was so Tender, as Caesar touching but the Nose of it, defaced it. Which maketh mee finde it very strange, that the Egyptian Mummies should be reported to be as Hard as Stone-Pitch: For I finde no difference but one; Which indeed may be very Materiall; Namely, that the Ancient AEgyptian Mummies, were shrowded in a Number of Folds of Linnen, besmeared with Gums, in manner of Seare-Cloth; Which it doth not appeare was practised vpon the Body of Alexander.

Neare the Castle of Catie, and by the Wells of Assan, in the Land of Idumea, a great Part of the Way, you would thinke the Sea were neare hand, though it be a good distance off: And it is Nothing, but the Shining of the Nitre, vpon the Sea-Sands; Such Abundance of Nitre the Shores there doe put forth.

The Dead-Sea, which vomiteth vp Bitumen, is of that Crassitude, as Liuing Bodies bound Hand and Foot, cast into it, haue beene borne vp and not sunke. Which sheweth, that all Sinking into Water, is but an Ouer-Weight of the Body, put into the Water, in respect of the Water: So that you may make Water so strong, and heauy, of Quicke-Siluer, (perhaps,) or the like, as may beare vp Iron: Of which I see no Vse, but Imposture. Wee see also, that all Metalls, except Gold, for the same reason swimme vpon Quicke-Siluer.

It is reported, that at the Feet of a Hill, neare the More mortuum, there is a Blacke Stone, (whereof Pilgrims make Fires,) which burneth like a Coale, and diminisheth not; But only waxeth Brighter, and Whiter. That it should doe so, is not strange; For wee see Iron Red Hot burneth, and consumeth not: But the Strangenesse is, that it should continue any time so: For Iron, as soone as it is out of the Fire, deadeth straight waies. Certainly, it were a Thing of great Vse, and Profit, if you could finde out Fuell, that would burne Hot, and yet last long, Neither am I altogether Incredulous, but there may be such Candles, as they say are made of Salamanders Wooll; Being a Kinde of Minerall, which whiteneth also in the Burning, and consumeth not. The Question is this; Flame must be made of somewhat; And commonly it is made of some Tangible Body, which hath Weight: But it is not impossible, perhaps, that it should be made of Spirit, or Vapour, in a Body; (which Spirit on Vapour hath no Weight;) such as is the Matter of Ignis —— s. But then you will say, that that Vapour also can last but a short time: To that it may be answered, That by the helpe of Oile, and Wax, and other Candle-Stuffe, the Flame may continue, and the Wieke not burne.

Sea-Coale last longer than Char-Coale; And Char-Coale of Roots, being coaled into great Peeces, last longer than Ordinary Char-Coale, Turfe, and Peat, and Cow-Sheards, are cheape Fuels, and last long.Small-Coale, or Briar-Coale, powred vpon Char-Coale, make them last longer. Sedge is a cheape Fuell to

Brew, or Bake with; the rather because it is good for Nothing else. Triall would be made of some Mixture of Sea-Coale with Earth, or Chalko; For if that Mixture be, as the Sea-Coale-Men vse it, priuily, to make the Bulke of the Coale greater, it is Deceit; But if it be vsed purposely, and be made knowne, it is Sauing.

It is, at this Day, in vse, in G —— to couch Pat-Sheards or Vessels of Earth, in their Walls, to gather the Wind from the Top; and to passe it downe in Spouts into Roomes. It is a Deuice for Freshnesse, in great Heats: And it is said, there are some Roomes in Italie, and Spaine, for Freshnesse, and Gathering the Winds, and Aire, in the Heats of Summer. But they be but Pennings of the Winds, and Enlarging them againe, and Making them Reuerberate, and goe round in Circles, rather than this Deuice of Spouts in the Wall.

There would be vsed much diligence, in the Choice of some Bodies, and Places, (as it were,) for the Testing of Aire; to discouer the Wholesomenesse or Vnwholesomenesse, as well of Seasons, as of the Seats of Dwellings. It is certaine, that there be some Heuses, wherein Confitures, and Pies, will gather Mould, more than in Others. And I am perswaded, that a Peece of Raw Flesh, or Fish, will sooner corrupt in some Aires, than in Others. They be noble Experiments, that can make this Discouerie; For they serue for a Naturall Diuination of Seasons; Better than the Astronomer can by their Figures: And againe, they teach Men where to chuse their Dwelling, for their better Health.

There is a Kinde of Stone, about Bethles-, which they grinde to Powder, and put into Water, whereof Cattell drinke; Which maketh them giue more Milke. Surely, there would be some better Trialls made of Mixtures of Water in Ponds for Cattell, to make them more Milch; Or to Fatten them; Or to Keepe them from Murraine, It may be, Chalke, and Nitre, are of the best.

It is reported, that in the Valley, neare the Mountaine Carmel, in Iudea, there is a Sand, which, of all other, hath most Affinitie with Glasse; Insomuch as other Mineralls, laid in it, turne to a Glassie Substance, without the Fire; And againe Glasse put into it, turneth into the Mother-Sand. The Thing is very strange, if it be true: And it is likeliest to be Caused by some Naturall Fornace, or Heat in the

Earth: And yet they doe not speake of any Eruption of Flames. It were good to trie in Glasse-Workes, whether the Crude Materialls of Glasse, mingled with Glasse, already made, and Re-moulten, doe not facilitate the Making of Glasse with lesse Heat.

In the Sea, vpon the South-West of Sicilie, much Corall is found. It is a Sub-Marine Plan. It hath no Leanes: It brancheth only when it is vnder Water; It is Soft, and Greene of Colour; But being brought into the Aire, it becommeth Hard, and Shining Red, as wee see. It is said also, to haue a White Berry; But wee finde it not brought ouer with the Corall. Belike it is cast away as nothing worth: Inquire better of it, for the Difcouerie of the Nature of the Plant.

The Manns of Calabria is the best, and in most Plenty. They gather it from the Leafe of the Mulberry Tree; But not of such Mulberry Trees, as grow in the Valley's. And Manns falleth vpon the Leaues by Night, as other Deawes doe. It should seeme, that before those Deawes come vpon Trees in the Valley's, they dissipate, and cannot hold out. It should seeme also, the Mulberry-Leafe, it selfe, hath some Coagulating Vertue, which inspissateth the Deaw, for that it is not found vpon other Trees: And wee see by the Silke-Worme, which feedeth vpon that Leafe, what's Dainty Smooth Iuyce it hath; And the Leaues also, (especially of the Blacke Mulberry,) are somewhat Bristly, which may helpe to preserue the Deaw. Certainly, it were not amisse, to obscrue a little better, the Deawes that fall vpon Trees, or Herbs, Growing on Mountaines; For, it may be, many Deawes fall, that spend before they come to the Valleys. And I suppose, that he that would gather the best May-Deaw for Medicine, should gather it from the Hills.

It is said, they haue a manner, to prepare their Greeke-Wines, to keepe them from Fuming, and Inebriating, by adding some Sulphur, or Allome: Whereof the one is Vnctnous, and the other is Astringent. And certaine it is, that those two Natures doe best represse Fumes. This Experiment would be transferred, vnto other Wine, and Strong Beere, by Putting in some like Substances, while they worke; Which may make them both to Fume lesse, and to Inflame lesse.

It is conceiued by some, (not improbably,) that the reason, why Wilde-Fires, (Whereof the principall Ingredient is Bitumen,) doe not quench with Water, is, for that the first Concretion of Bitumen is a Mixture, of a Fiery, and Watry Substance: So is not Sulphur. This appeareth, for that in the Place neare Puteoli, which they call the Court of Valcan, you shall heare, vnder the Earth, a Horrible Thundring of Fire, and Water, conflicting together: And there breake forth also Spouts of Boyling Water. Now that Place yeeldeth great Quantities of Bitumen; Whereas AEtna, and Vesuuius, and the like, which consist vpon Sulphur, shoot forth Smoake, and Ashes, and Pumice, but no Water. It is reported also, that Bitumen Mingled with Lime, and Put vnder Water, will make, as it were, an Artificiall Rocke; The Substance becommeth so Hard.

There is a Cement, compounded of Floure, Whites of Egges, and Stone powdred, that becommeth Hard as Marble; wherewith Piscina mirabilis, neare Cuma, is said to haue the Walls Plastered. And it is certaine, and tried, that the Powder of Load-Stone, and Flint, by the Addition of Whites of Egges, and Gumm-Dragon, made into Paste, will in a few dayes harden to the Hardnesse of a Stone.

It hath beene noted by the Ancients, that in Full or Impure Bodies, Vlcers or Hurts in the Leggs, are Hard to Cure; And in the Head more Easie. The Cause is, for that Vlcers or Hurts in the Leggs require Deficcation, which by the Defluxion of Humours to the Lower Parts is hindred; Whereas Hurts and Vlcers in the Head require it not; But contrariwise Drinesse maketh them more apt to Consolidate. And in Moderne Obseruation, the like difference hath beene found, betweene French-Men, and English-Men; Where of the ones Constitution is more Dry, and the others more Moist. And therefore a Hurt of the Head is harder to cure in a French-Man, and of the Legge in an English-Man.

It hath beene noted by the Ancients, that Southerne Winds, blowing much, without Raine, doe cause a Feuourous Disposition of the Yeare; But with Raine, not. The Cause is, for that Southerne Winds doe, of themselues, qualifie the Aire, to be apt to cause Feuers; But when Showers are ioyned, they doe Refrigerate in Part, and Checke the Sultry Heat of the Southerne Wind.

Therefore this holdeth not in the Sea-Coasts, because the Vapour of the Sea, without Showers, doth refresh.

It hath beene noted by the Ancients, that Wounds which are made with Brasse, heale more easily, than Wounds made with Iron. The Cause is, for that Brasse hath, in it selfe, a Sanatiue Vertue; And so in the very Instant helpeth somewhat: But Iron is Corrosiue, and not Sanatiue. And therefore it were good, that the Instruments which are vsed by Chirurgians about Wounds, were rather of Brasse, than Iron.

In the Cold Countries, when Mens Noses, and Eares are Mortified, and (as it were) Gangrened with Cold, if they come to a Fire, they rot off presently. The Cause is, for that the few Spirits, that remaine in those Parts, are suddenly drawne forth, and so Putrefaction is made Compleat. But Snow Put vpon them, helpeth; For that it preserueth those Spirits that remaine, till they can reuiue; And besides, Snow hath in it a Secret Warmth: As the Monke proued out of the Text; Qui dat Niuem sicut Lanam, Gelu sicut Cineres spargit. Whereby he did inferre, that Snow did warme like Wooll, and Frost did fret like Ashes. Warme Water also doth good, Because by little and little it openeth the Pores, without any sudden Working vpon the Spirits. This Experiment may be transferred vnto the Cure of Gangrenes, either Comming of themselues, or induced by too much Applying of Opiates: Wherein you must beware of Dry Heat, and resort to Things that are Refrigerant, with an Inward Warmth, and Vertue of Cherishing.

Weigh Iron, and Aqua Fortis, seuerally; Then dissolue the Iron in the Aqua Fortis: And weigh the Dissolution; And you shall finde it to beare as good Weight, as the Bodies did seuerally: Notwithstanding a good deale of Wast, by a thicke Vapour, that issueth during the Working: Which sheweth, that the Opening of a Body, doth increase the Weight. This was tried once, or twice, but I know not, whether there were any Errour, in the Triall.

Take of Aqua-Fortis two Ounces, of Quick-siluer two Drachmes; (For that Charge the Aqua-Fortis will beare;) The Dissolution will not beare a Flint, as big as a Nutmeg: Yet (no doubt) the Increasing of the Weight of Water, will increase his Power of Bearing: As we see Broine, when it is Salt enough, will beare an

Egge. And I remember well a Physitian, that vsed to giue some Minerall Baths for the Gout. &c. And the Body when it was put into the Bath, could not get downe so easily, as in Ordinary Water. But it seemeth, the Weight of the Quick-siluer, more than the Weight of a Stone; doth not compense the Weight of a Stone, more than the Weight of the Aqua-Fortis.

Let there be a Body of Vnequall Weight; (As of Wood and Lead, or Bone and Lead;) If you throw it from you with the Light-End forward it will turne, and the Weightier End will recouer to be Forwards; Vnlesse the Body be Ouer-long. The Cause is, for that the more Dense Body, hath a more Violent Pressure of the Parts, from the first Impulsion; Which is the Cause, (though heretofore not found out, as hath been often said,) of all Violent Motions: And when the Hinder Part moueth swifter, (for that it lesse endureth Pressure of Parts,) than the Forward Part can make way for it, it must needs be, that the Body turne ouer: For (turned) it can more easily draw forward the Lighter Part. Ga — laeus noteth it well; That if an Open Trough, wherein Water is, be driuen faster than the Water can follow, the Water gathereth vpon an heape, towards the Hinder End, where the Motion began; Which he supposeth, (holding confidently the Motion of the Earth,) to be the Cause of the Ebbing and Flowing of the Ocean; Because the Earth ouer-runneth the Water. Which Theory, though it be false, yet the first Experiment is true. As for the Inequality of the Pressure of Parts, it appeareth manifestly in this; That if you take a Body of Stone, or Iron, and another of Wood, of the same Magnitude, and Shape, and throw them with equall Force, you cannot possibly throw the Wood, so farre, as the Stone, or Iron.

It is certaine, (as it hath beene formerly, in part, touched,) that Water may be the Medium of Sounds. If you dash a Stone against a Stone in the Bottome of the Water, it maketh a Sound. So a long Pole strucke vpon Grauell, in the Bottome of the Water, maketh a Sound. Nay, if you should thinke that the Sound commeth vp by the Pole, and not by the Water, you shall finde that an Anchor, let downe by a Roape, maketh a Sound; And yet the Roape is no Solide Body, whereby the Sound can ascend.

All Obiects of the Senses, which are very Offensiue, doe cause the Spirits to retire; And vpon their Flight, the Parts are (in some degree) destitute; And so there is induced in them a Trepidation and Horrour. For Sounds, we see that the Grating of a Saw, or any very Harsh Noise, will set the Teeth on edge, and make all the Body Shiuer. For Tastes, we see that in the Taking of a Potion, or Pills, the Head, and the Necke shake. For Odious Smells, the like Effect followeth, which is lesse perceiued, because there is a Remedy at hand, by Stopping of the Nose: But in Horses, that can vse no such Help, we see the Smell of a Carrion, especially of a Dead Horse, maketh them fly away, and take on, almost as if they were Mad. For Feeling, if you come out of the Sunne, suddenly, into a Shade, there followeth a Chilnesse or Shiuering in all the Body. And euen in Sight, which hath (in effect) no Odious Obiect, Comming into Sudden Darknesse, induceth an Offer to Shiuer.

There is, in the City of Ticinum, in Italy, a Church, that hath Windownes onely from aboue: It is in Length an Hundred Feet, in Breadth Twenty Feet, and in Height neare Fifty; Hauing a Doore in the Middest. It reporteth the Voice, twelue or thirteene times, if you stand by the Close End-Wall, ouer against the Doore. The Eccho fadeth, and dyeth by little and little, as the Eccho at Pont-charenton doth. And the Voice soundeth, as if it came from aboue the Doore. And if you stand at the Lower End, or on either Side of the Doore, the Eccho holdeth; But if you stand in the Doore, or in the Middest iust ouer against the Doore, not. Note that all Eccho's sound better against Old Walls, than New; Because they are more Dry, and Hollow.

Those Effects, which are wrought by the Percussion of the Sense, and by Things in Fact, are produced likewise, in some degree, by the Imagination. Therefore if a Man see another eat Soure or Acide Things, which set the Teeth on edge, this Obiect tainteth the Imagination. So that hee that seeth the Thing done by another, hath his owne Teeth also set on edge. So if a Man see another turne swiftly, and long; Or if he looke vpon Wheeles that turne, Himselfe waxeth Turne-sicke. So if a Man be vpon an High Place, without Railes, or good Hold, except he be vsed to it, he is Ready to Fall: For Imagining a Fall, it putteth his

Spirits into the very Action of a Fall. So Many vpon the Seeing of others Bleed, or Strangled, or Tortured, Themselues are ready to faint, as if they Bled, or were in Strife.

Take a Stocke-Gilly-Flower, and tye it gently vpon a Sticke, and put them both into a Stoope Glasse, full of Quick-siluer, so that the Flower be couered: Then lay a little Weight vpon the Top of the Glasse, that may keepe the Sticke downe; And looke vpon them after foure or fiue daies; And you shall finde the Flower Fresh, and the Stalke Harder, and lesse Flexible, than it was. If you compare it with another Flower, gathered at the same time, it will be the more manifest. This sheweth, that Bodies doe preserue excellently in Quick-siluer; And not preserue only, but, by the Coldnesse of the Quick-siluer, Indurate; For the Freshnesse of the Flower may be meerely Conseruation; (which is the more to be obserued because the Quick-Siluer presseth the Flower;) But the Stiffenesse of the Stalke, cannot be without Induration, from the Cold (as it seemeth,) of the Quick-siluer.

It is reported by some of the Ancients, that in Cyprus, there is a Kinde of Iron, that being cut into Little Peeces, and put into the Ground, if it be well Watred, will increase into Greater Peeces. This is certaine, and knowne of Old; That Lead will multiply, and Increase; As hath beene seene in Old Statua's of Stone, which haue beene put in Cellars; The Feet of them being bound with Leaden Bands; Where (after a time,) there appeared, that the Lead did swell; Insomuch as it hanged vpon the Stone like Warts.

I call Drowning of Metalls, when that the Baser Metall, is so incorporate with the more Rich, as it can by no Meanes be separated againe: which is a kinde of Version, though False: As if Siluer should be inseparably incorporated with Gold; Or Copper, and Lead, with Siluer. The Ancient Electrum had in it a Fifth of Siluer to the Gold; And made a Compound Metall, as fit for most vses, as Gold; And more Resplendent, and more Qualified in some other Properties; But then that was easily Separated. This to doe priuily, or to make the Compound passe for the Rich Metall Simple, is an Adulteration, or Counterfeiting: But if it be done Auowedly, and without Disguizing, it may be a great Sauing of the

Richer Metall. I remember to haue heard of a Man, skilfull in Metalls, that a Fifteenth Part of Siluer, incorporate with Gold, will not be Recouered by any Water of Separation; Except you put a Greater Quantity of Siluer, to draw to it the Lesse; which (he said) is the last Refuge in Separations. But that is a tedious way, which no Man (almost) will thinke on. This would be better enquired; And the Quantity of the Fifteenth turned to a Twentieth; And likewise with some little Additionall, that may further the Intrinsique Incorporation. Note that Siluer in Gold will be detected by Weight, compared with the Dimension; But Lead in Silver, (Lead being the Weightier Metall,) will not be detected; If you take so much the more Siluer, as will counteruaile the Ouer-Weight of the Lead.

Gold is the onely Substance, which hath nothing in it Volatile, and yet melteth without much difficulty. The Melting sheweth that it is not Ieiune, or Scarce in Spirit. So that the Fixing of it, is not Want of Spirit to fly out, but the Equall Spreading of the Tangible Parts, and the Close Coaceruation of them: Whereby they haue the lesse Appetite, and no Meanes (at all) to issue forth. It were good therefore to try, whether Glasse Re-moulten doe leese any Weight? For the Parts in Glasse are euenly Spred; But they are not so Close as in Gold; As we see by the Easie Admission of Light, Heat, and Cold; And by the Smalnesse of the Weight. There be other Bodies, Fixed, which haue little, or no Spirit: So as there is nothing to fly out; As wee see in the Stuffe, whereof Coppells are made; Which they put into Furnaces; Vpon which Fire worketh not: So that there are three Causes of Fixation; The Euen Spreading both of the Spirits, and Tangible Parts; The Closenesse of the Tangible Parts; And the Ieiunenesse or Extreme Comminution of Spirits: Of which Three, the Two First may be ioyned with a Nature Liquefiable; The Last not.

It is Profound Contemplation in Nature, to consider of the Emptinesse, (as we may call it,) or Insatisfaction of seuerall Bodies; And of their Appetite to take in Others.Aire taketh in Lights, and Sounds, and Smells, and Vapours; And it is most manifest, that it doth it, with a kinde of Thirst, as not satisfied with his owne former Consistence; For else it would neuer receiue them in so suddenly, and easily. Water, and all Liquours, doe hastily receiue Dry and more

Terrestriall Bodies, Proportionable: And Dry Bodies, on the other side, drinke in Waters, and Liquours: So that, (as it was well said, by one of the Ancients, of Earthy and Watry Substances,) One is a Glue to another. Parchment, Skins, Cloth, &c. drinke in Liquours, though themselues be Entire Bodies, and not Comminuted, as Sand, and Ashes; Nor apparently Porous: Metalls themselues doe receiue in readily Strong-Waters; And Strong-Waters likewise doe readily pierce into Metalls, and Stones: And that Strong-Water will touch vpon Gold, that will not touch vpon Siluer; And è conuerso. And Gold, which seemeth by the Weight, to be the Closest, and most Solide Body, doth greedily drinke in Quick-Siluer. And it seemeth, that this Reception of other Bodies, is not Violent: For it is (many times) Reciprocall, and as it were with Consent. Of the Cause of this, and to what Axiome it may be referred, consider attentiuely; For as for the Pretty Assertion, that Matter is like a Common Strumpet, that desireth all Formes, it is but a Wandring Notion. Onely Flame doth not content it selfe to take in any other Body; But either, to ouercome and turne another Body into it Selfe, as by Victory; Or it Selfe to dye, and goe out,

IX. Century.

IT is certaine, that all Bodies whatsoeuer, though they haue no Sense, yet they haue Perception: For when one Body is applied to another, there is a Kinde of Election, to embrace that which is Agreeable, and to exclude or expell that which is Ingrate: And whether the Body be Alterant, or Altered, euermore a Perception precedeth Operation: For else all Bodies would be alike One to Another. And sometimes this Perception, in some Kinde of Bodies, is farre more Subtill than the Sense; So that the Sense is but a dull Thing in Comparison of it: Wee see a Weather-Glasse, will finde the least difference of the Weather, in Heat, or Cold, when Men finde it not. And this Perception also, is sometimes at Distance, as well as vpon the Touch; As when the Load-Stone draweth Iron; or Flame fireth Naphtha of Babylon, a great distance off. It is therefore a Subiect of a very Noble Enquiry, to enquire of the more Subtill Perceptions; For it is another Key to open Nature, as well as the Sense; And sometimes Better. And besides, it is a Principall Meanes of Naturall Diuination; For that which in these Perceptions appeareth early, in the great Effects commeth long after. It is true also, that it serueth to discouer that which is Hid, as well as to foretell that which is to Come; As it is in many Subtill Trialls; As to trie whether Seeds be old, or new, the Sense cannot informe: But if you boile them in Water, the New Seeds will sprout sooner: And so of Water, the Taste will not discouer the best Water; But the Speedy Consuming of it, and many other Meanes, which we haue heretofore set downe, will discouer it. So in all Physiognomy, the Lineaments of the Body will discouer those Naturall Inclinations of the Minde, which Dissimulation will conceale, or Discipline will suppresse. Wee shall therefore now handle only, those two Perceptions, which pertaine to Naturall Diuination, and Discouery: Leauing the Handling of Perception in other Things, to be disposed Elsewhere. Now it is true, that Diuination is attained by other Meanes; As if you know the Causes; If you know the Concomitants; you may iudge of the Effect to follow: And the like may be said of Discouery; But wee tie our Selues

here, to that Diuination and Discouery chiefly, which is Caused by an Early, or Subtill Perception.

The Aptnesse or Propension of Aire, or Water, to Corrupt or Putrifie, (no doubt,) is to be found before it breake forth into manifest Effects of Diseases, Blastings, or the like. Wee will therefore set downe some Prognosticks of Pestilentiall and Vnwholsome Yeares.

The Wind blowing much from the South, without Raine; And Wormes in the Oake-Apple; haue beene spoken of before. Also the Plenty of Frogs, Grashappers, Flies, and the like Creatures bred of Putrefaction, doth portend Pestilentiall Yeares.

Great, and Early Heats in the Spring, (and namely in May,) without Winds, portend the same; And generally so doe Yeares with little Wind, or Thunder.

Great Droughts in Summer, lasting till towards the End of August, and some Gentle Showres vpon them; And then some Drie Weather againe; Doe portend a Pestilent Summer, the Yeare following: For about the End of August, all the Sweetnesse of the Earth, which goeth into Plants, and Trees, is exhaled; (And much more if the August be dry;) So that nothing then can breathe forth of the Earth, but a grosse Vapour, which is apt to Corrupt the Aire: And that Vapour, by the first Showres, if they be Gentle, is released, and commeth forth abundantly. Therefore they that come abroad soone after those Showres, are commonly taken with Sicknesse: And in Affricke, no Body will stirre out of doores, after the first Showres. But if the Showres come vehemently, then they rather wash and fill the Earth, than giue it leaue to breathe forth presently. But if Drie Weather come againe, then it fixeth and continueth the Corruption of the Aire, vpon the first Showres begun; And maketh it of ill Influence, euen to the Next Summer; Except a very Frostie Winter discharge it; Which seldome succeedeth such Droughts.

The Lesser Infections, of the Small Pockes, Purple Feuers, Agues, in the Summer Precedent, and houering all Winter, doe portend a great Pestilence in the Summer following; For Putrefaction doth not rise to his height at once.

It were good to lay a Peece of Raw Flesh, or Fish, in the Open Aire; And if it Putrefie quickly, it is a Signe of a Disposition in the Aire to Putrefaction. And because you cannot be informed, whether the Putrefaction be quicke or late, except you compare this Experiment with the like Experiment in another Yeare, it were not amisse, in the same Yeare, and at the same Time, to lay one Peece of Flesh, or Fish, in the Open Aire, and another of the same Kinde and Bignesse, within Doores: For I iudge, that if a generall Disposition be in the Aire to Putrefie, the Flesh, or Fish, will sooner Putrefie abroad, where the Aire hath more power, than in the House, where it hath lesse, being many wayes corrected. And this Experiment would be made about the End of March: For that Season is likest to discouer, what the Winter hath done; And what the Summer following will doe vpon the Aire. And because the Aire (no doubt) receiueth great Tincture, and Infusion from the Earth; It were good to trie that Exposing of Flesh, or Fish, both vpon a Stake of Wood, some heighth aboue the Earth, and vpon the Flat of the Earth.

Take May-Dew, and see whether it putrifie quickly, or no? For that likewise may disclose the Qualitie of the Aire, and Vapour of the Earth, more or lesse Corrupted.

A Drie March, and a Drie May, portend a Wholesome Summer, if there be a Showring Aprill betweene: But otherwise, it is a Signe of a Pestilentiall Yeare.

As the Discouerie of the Disposition of the Aire, is good for the Prognosticks of Wholesome, and Vnwholesome Yeares; So it is of much more vse, for the Choice of Places to dwell in: At the least, for Lodges, and Retiring Places for Health; (For Mansion Houses respect Prouisions, as well as Health; Wherein the Experiments aboue mentioned may serue.

But for the Choice of Places, or Seats, it is good to make Triall, not only of Aptnesse of Aire to corrupt, but also of the Moisture and Drinesse of the Aire; and the Temper of it, in Heat, or Cold; For that may concerne Health diuersly. Wee see that there be some Houses, wherein Sweet Meats will relent, and Baked Meats will mould, more than in others; And Wainscoats will also sweat more; so that they will almost run with Water: All which, (no doubt,) are caused chiefly

by the Moistnesse of the Aire, in those Seats. But because it is better to know it, before a Man buildeth his House, than to finde it after, take the Experiments following.

Lay Wooll, or a Sponge, or Bread, in the Place you would trie, comparing it with some other Places; And see whether it doth not moisten, and make the Wooll, or Sponge, &c. more Ponderous, than the other? And if it doe, you may iudge of that Place, as Situate in a Grosse, and Moist Aire.

Because it is certaine, that in some Places, either by the Nature of the Earth, or by the Situation of Woods, and Hills, the Aire is more Vnequall, than in Others; and Inequalitie of Aire is euer an Enemy to Health; It were good to take two Weather-Glasses, Matches in all things, and to set them, for the same Houres of One day, in seuerall Places, where no Shade is, nor Enclosures: And to marke, when you set them, how farre the Water commeth; And to compare them, when you come againe, how the Water standeth then: And if you finde them Vnequall, you may be sure that the Place where the Water is lowest, is in the Warmer Aire, and the other in the Colder. And the greater the Inequalitie be, of the Ascent, or Descent of the Water, the greater is the Inequalitie of the Temper of the Aire.

The Predictions likewise of Cold and Long Winters, and Hot and Drie Summers, are good to be knowne; As well for the Discouerie of the Causes, as for diuers Prouisions. That of Plenty of Hawes, and Heps, and Briar-Berries, hath beene spoken of before. If Wainscast, or Stone, that haue vsed to Sweat, be more drie, in the Beginning of Winter; Or the Drops of the Eaues of Houses come more slowly downe, than they vse; it portendeth a Hard and Frostie Winter. The Cause is, for that it sheweth an Inclination of the Aire, to Drie Weather; which in Winter is euer ioyned with Frost.

Generally, a Moist and Coole Summer, portendeth a Hard Winter. The Cause is, for that the Vapours of the Earth, are not dissipated in the Summer, by the Sunne; And so they rebound vpon the Winter.

A Hot and Drie Summer, and Autumne, and especially if the Heat and Drought extend farre into September, portendeth an Open Beginning of Winter;

And Colds to succeed, toward the latter Part of the Winter, and the Beginning of the Spring: For till then, the former Heat and Drought beare the Sway; And the Vapours are not sufficiently Multiplied.

An Open and Warme Winter portendeth a Hot and Drie Summer: For the Vapours disperse into the Winter Showres; Whereas Cold and Frost keepeth them in, and transporteth them into the late Spring, and Summer following.

Birds that vse to change Countries, at certaine Seasons, if they come Earlier, doe shew the Temperature of Weather, according to that Country whence they came: As the Winter-Birds, (namely Woodcocks, Feldefares, &c.) if they come earlier, and out of the Northerne Countries, with vs shew Cold Winters. And if it be in the same Country, then they shew a Temperature of Season, like vnto that Season in which they come: As swallowes, Bats, Cuckooes, &c. that come towards Summer, if they come early, shew a Hot Summer to follow.

The Prognosticks, more Immediate, of Weather to follow soone after, are more Certaine than those of Seasons. The Resounding of the Sea vpon the Shoare; And the Murmur of Winds in the Woods, without apparent Wind; shew Wind to follow: For such Winds, breathing chiefly out of the Earth, are not at the first perceiued, except they be pent, by Water, or Wood. And therefore a Murmur out of Caues likewise portendeth as much.

The Vpper Regions of the Aire, perceiue the Collection of the Matter of Tempest, and Winds, before the Aire here below: And therefore the Obscuring of the Smaller Starres is is a Signe of Tempests following. And of this kinde you shall finde a Number of Instances in our Inquisition De Ventis.

Great Mountaines haue a Perception of the Disposition of the Aire to Tempests, sooner than the Valley's or Plaines below: And therefore they say in Wales, when certaine Hills haue their Night-Cups on, they meane Mischiefe. The Cause is, for that Tempests, which are for the most part bred aboue, in the Middle Region, (as they call it,) are soonest perceiued to collect in the Places next it.

The Aire, and Fire, haue Subtill Perceptions of Wind Rising, before Men finde it. Wee see the Trembling of a Candle will discouer a Wind that otherwise

wee doe not feele; And the Flexuous Burning of Flames doth shew the Aire beginneth to be vnquiet; And so doe Coales of Fire by Casting off the Ashes more than they vse. The Cause, is, for that no Wind, at the first, till it hath strooke and driven the Aire, is Apparent to the Sense: But Flame is easier to moue, than Aire: And for the Ashes, it is no maruell, though Wind vnperceiued shake them off; For wee vsually trie, which way the Wind bloweth, by casting vp Grasse, or Chaffe, or such light Things, into the Aire.

When Wind expireth from vnder the Sea; As it causeth some Resounding of the Water, (whereof wee spake before,) so it causeth some Light Motions of Bubbles, and White Circles of Froth. The Cause is, for that the Wind cannot be perceiued by the Sense, vntill there be an Eruption of a great Quantitie, from vnder the Water; And so it getteth into a Body: Whereas in the first Putting vp it commeth in little Portions.

We spake of the Ashes, that Coales cast off; And of Grasse, and Chaffe carried by the Wind; So any Light Thing that moueth, when we finde no Wind, sheweth a Wind at hand: As when Feathers, or Downe of Thistles, fly to and fro in the Aire.

For Prognosticks of Weather from Liuing Creatures, it is to be noted; That Creatures that Liue in the Open Aire, (Sub Diô,) must needs haue a Quicker Impression from the Aire, than Men that liue most within Doores; And especially Birds, who liue in the Aire, freest, and clearest; And are aptest by their Voice to tell Tales, what they finde; And likewise by the Motion of their Flight to expresse the same.

Water-Fowles, (as Sea-Gulls, More-Hens, &c.) when they flocke and fly together, from the Sea towards the Shores; And contrariwise, LandBirds, (as Crowes, Swallowes, &c.) when they fly from the Land to the Waters, and beat the Waters with their Wings; doe fore-shew Raine, and Wind. The Cause is, Pleasure, that both Kindes take in the Moistnesse, and Density of the Aire: And so desire to be in Motion, and vpon the Wing, whither soeuer they would otherwise goe: For it is no Maruell, that Water-Fowle doe ioy most in that Aire, which is likest Water; And LandBirds also, (many of them,) delight in Bathing,

and Moist Aire. For the same Reason also, many Birds doe proine their Feathers; And Geese doe gaggle; And Crowes seeme to call vpon Raine: All which is but the Comfort they seeme to receiue in the Relenting of the Aire.

The Heron, when she foareth high, (so as sometimes she is seene to passe ouer a Cloud,) sheweth Winds: But Kites flying aloft, shew Faire and Dry Weather. The Cause may be, for that they both mount most into the Aire, of that Temper, wherein they delight: And the Heron, being a Water-Fowle, taketh pleasure in the Aire, that is Condensed: And besides, being but Heauy of Wing, needeth the Helpe of the Grosser Aire. But the Kite affecteth not so much the Grossenesse of the Aire, as the Cold and Freshnesse thereof; For being a Bird of Prey, and therefore Hot, she delighteth in the Fresh Aire; And (many times) flyeth against the Wind; As Trouts, and Salmons swimme against the Streame. And yet it is true also, that all Birds finde an Ease in the depth of the Aire; As Swimmers doe in a Deepe Water. And therefore when they are aloft, they can vphold themselues with their Wings Spred, scarce mouing them.

Fishes, when they play towards the Top of the Water, doe commonly foretell Raine. The Cause is, for that a Fish hating the Dry, will not approach the Aire, till it groweth Moist; And when it is Dry, will fly it, and Swimme Lower.

Beasts doe take Comfort, (generally,) in a Moist Aire; And it maketh them eat their Meat better: And therefore Sheepe will get vp betimes in the Morning, to feed, against Raine: And Cattell, and Deere, and Conneyes, will feed hard before Raine: And a Heifer, will put vp his Nose, and snuffe in the Aire, against Raine.

The Trifoile, against Raine, swelleth in the Stalke; and so standeth more vpright; For by Wet, Stalkes doe erect, and Leaues bow downe. I here is a Small Red Flower in the Stubble-Fields, which Country People call the Wincopipe; Which if it open in the Morning, you may be sure of a faire Day to follow.

Euen in Men, Aches, and Hurts, and Cornes, doe engrieue, either towards Raine, or towards Frost: For the One maketh the Humours more to Abound; And the Other maketh them Sharper. So we see both Extremes bring the Gout.

Wormes, Vermine, &c. doe fore-shew (likewise) Raine: For Earthwormes will come forth, and Moules will cast vp more, and Fleas bite more, against Raine.

Solide Bodies likewise fore-shew Raine. As Stones, and Wainscot, when they sweat: And Boxes, and Peggs of Wood, when they Draw, and Wind hard; Though the Former be but from an Outward Cause; For that the Stone, or Wainscot, turneth and beateth backe the Aire against it selfe; But the latter is an Inward Swelling of the Body of the Wood it selfe.

Apetite is moued chiefly by Things that are Cold, and Dry: The Cause, is for that Cold is a Kinde of Indigence of Nature, and calleth vpon Supply; And so is Drinesse: And therefore all Soure Things, (as Vinegar, Iuyce of Limons, Oyle of Vitrioll, &c.) prouoke Appetite. And the Disease, which they call Appetitus Caninus, consisteth in the Matter of an Acide and Glassy Flegme, in the Mouth of the Stomach. Appetite is also moued by Soure Things; For that Soure Things, induce a Contraction in the Nerues, placed in the Mouth of the Stomach; Which is a great Cause of Appetite. As for the Cause, why Onions, and Salt, and Pepper, in Baked Meats, moue Appetite, it is by Vellication of those Nerues; For Motion whetteth. As for Worme-Wood, Oliues, Capers, and others of that kinde, which participate of Bitternesse, they moue Appetite by Abstersion. So as there be foure Principall Causes of Appetite; The Refrigeration of the Stomach, ioyned with some Drinesse; Contraction; Vellication; And Abstersion: Besides Hunger, which is an Emptinesse: And yet Ouer Fasting doth (many times) cause the Appetite to cease; For that Want of Meat maketh the Stomach draw Humours; And such Humours as are Light, and Cholericke, which quench Appetite most.

It hath beene obserued by the Ancients, that where a Raine-Bow seemeth no hang ouer, or to touch, there breatheth forth a Sweet Smell. The Cause is, for that this happeneth but in certaine Matters, which haue in themselues some Sweetnesse; Which the Gentle Dew of the Raine-Bow doth draw forth. And the like doe Safe Showers; For they also make the Ground Sweet: But none are so delicate as the Dew of the Rain-bow, where it falleth. It may be also, that the Water it selfe bath some Sweetnesse: For the Raine-Bow consisteth of a Glo —

eration of Small Drops, which cannot possibly fall, but from the Aire, that is very Low: And therefore may hold the very Sweetnesse of the Herbs, and Flowers, as a Distilled Water: For Raine, and other Dew, that fall from high, cannot preserue the Smell, being dissipated in the drawing vp: Neither doe we know, whether some Water it selfe, may not haue some degree of Sweetnesse. It is true, that wee finde it sensibly in no Poole, Riuer, nor Fountaine; But good Earth, newly turned vp, hath a Freshnesse, and good Sent; Which water, if it be not too Equall, (For Equall Obiects neuer moue the Sense.) may also haue. Certaine it is, that Bay-Salt, which is but a kinde of Water Congealed, will sometimes smell like Violets.

To Sweet Smells Heat is requisite, to Concoct the Matter; And some Moisture to Spread the Breath of them. For Heat, we see that Woods, and Spices, are more Odorate in the Hot Countries, than in the Cold: For Moisture, we see that Things too much Dried, lose their Sweetnesse: And Flowers growing, smell better in a Morning, or Euening, than at Noone. Some Sweet Smells are destroyed by Approach to the Fire; As Violets, Wall-Flowers, Gilly-Flowers, Pinckes; And generally all Flowers that haue Coole and Delicate Spirits. Some continue both on the Fire, and from the Fire, As Rose-Water, &c. Some doe scarce come forth, or at least not so pleasantly, as by meanes of the Fire; as Iuniper, Sweet Gums, &c. And all Smells, that are Enclosed in a Fast Body: But (generally) those Smells are the most Gratefull, where the Degree of Heat is Small; Or where the Strength of the Smell is allayed; For these Things doe rather wooe the Sense, than Satiate it. And therefore the Smell of Violets, and Roses, exceedeth in Sweetnesse that of Spices, and Gummes; And the Strongest Sort of Smells, are best in a weft, a farre off.

It is certaine, that no Smell issueth, but with Emission of some Corporeall Substance; Not as it is in Light, and Colours, and in Sounds. For wee see plainly, that Smell doth spread nothing that distance, that the other doe. It is true, that some Woods of Orenges, and Heathes of RoseMary, will Smell a great way into the Sea, perhaps twenty Miles; But what is that, since a Peale of Ordnance will do as much, which moueth in a small compasse? Whereas those Woods, and

Heathes, are of Vast Spaces: Besides we see that Smells doe adhere to Hard Bodies; As in Persuming of Gloues, &c. which sheweth them Corporeall; And doe Last a great while, which Sounds, and Light doe not.

The Excrements of most Creatures Smell ill; Chiefly to the same Creature that voideth them: For we see, besides that of Man, that Pigeons, and Horses thriue best, if their Houses, and Stables be kept Sweet; And so of Cage-Birds: And the Cat burieth that which shee voideth: And it holdeth chiefly in those Beasts, which feed vpon Flesh.Dogs (almost) onely of Beasts, delight in Fetide Odours; Which sheweth there is somewhat in their Sense of Smell, differing from the Smells of other Beasts. But the Cause, why Excrements smell ill, is manifest; For that the Body it selfe reiecteth them; Much more the Spirits: And we see, that those Excrements, that are of the First Digestion; Smell the worst; As the Excrements from the Belly: Those that are from the Second Digestion, lesse ill; As Vrine; And those that are from the Third, yet lesse; For Sweat is not so bad, as the other two; Especially of some Persons, that are full of Heat. Likewise most Putrefactions are of an Odious Smell: For they smell either Fetide, or Mouldy. The Cause may be, for that Putrefaction doth bring forth such a Consistence, as is most Contrary to the Consistence of the Body, whilst it is Sound: For it is a meere dissolution of that Forme. Besides, there is another Reason which is Profound: And it is, that the Obiects that please any of the Senses, haue (all) some Equality, and (as it were) Order, in their Composition: But where those are wanting, the Obiect is euer Ingrate. So Mixture of many Disagreeing Colours is euer vnpleasant to the Eye: Mixture of Discordant Sounds is vnpleasant to the Eare: Mixture, or Hotch-Potch of many Tastes, is vnpleasant to the Taste: Harshnesse and Ruggednesse of Bodies, is vnpleasant to the Touch: Now it is certaine, that all Putrefaction, being a Dissolution of the first Forme, is a meere Confusion, and Vnformed Mixture of the Part. Neuerthelesse, it is strange, and seemeth to Crosse the former Obseruation, that some Putrefactions and Excrements doe yeeld Excellent Odours; As Ciuet, and Muske; And as some thinke Amber-Greece: For diuers take it, (though vnprobably,) to come from the Sperme of Fish: And the Mosse, wee spake of

from Apple-Trees, is little better than an Excretion. The Reason may be, for that there passeth in the Excrements, and remaineth in the Putrefactions, some good Spirits; especially where they proceed from Creatures, that are very Hot. But it may be also ioyned with a further Cause, which is more Subtill; And it is, that the Senses loue not to be Ouerpleased; But to haue a C —— — of somewhat is in it selfe Ingrate. Certainly, we see how Discords in Musicke, falling vpon Concords, make the Sweetest Straines: And we see againe, what Strange Tastes delight the Taste; As Red-Herrings, Caueary, Parmizan, &c. And it may be, the same holdeth in Smells. For those kinde of Smells, that we haue mentioned, are all Strong, and doe Pull and Vellicate the Sense. And wee finde also, that Places where Men Vrine, commonly haue some smell of Violets: And Vrine, if one hath eaten Nutmegge, hath so too.

The Sloathfull, Generall, and Indefinite Contemplations, and Notions, of the Elements, and their Coniugations; Of the Influences of Heauen; Of Heat, Cold, Moisture, Drought; Qualities, Active, Passive; And the like; haue swallowed vp the true Passages, and Processes, and Affects, and Consistences of Matter, and Naturall Bodies. Therefore they are to be set aside, being but Notionall, and ill Limited; And Definite Axiomes are to be drawne out of Measured Instances: And so Assent to be made to the more Generall Axiomes, by Scale. And of these Kindes of Processes of Natures, and Characters of Matter, we will now set downe some Instances.

All Putrefactions come chiefly from the Inward Spirits of the Body; And partly also from the Ambient Body, be it Aire, Liquour, or whatsoeuer else. And this last, by two Meanes: Either by Ingresse of the Substance of the Ambient Body, into the Body Putrified; Or by Excitation and Sollicitation of the Body Putrified, and the Parts thereof, by the Body Ambient. As for the Receiued Opinion, that Putrefaction is caused, either by Cold, or Peregrine and Preternaturall Heat, it is but Nugation: For Cold in Things Inanimate, is the greatest Enemy that is, to Putrefaction; though it extinguisheth Viuification, which euer consisteth in Spirits Attenuate. which the Cold doth congeale, and coagulate. And as for the Peregrins Heat, it is thus farre true; That if the

Proportion of the Aduentiue Heat, be greatly Predominant, to the Naturall Heat, and Spirits of the Body, it tendeth to Dissolution, or Notable Alteration. But this is wrought by Emission, or Suppression, or Suffocation, of the Natiue Spirits; And also by the Disordination, and Discomposture of the Tangible Parts; And other Passages of Nature; And not by a Conflict of Heats.

In Versions, or Maine Alterations of Bodies, there is a Medium between the Body, as it is at first, and the Body Resulting; which Medium is Corpus imperfectè Mistum, and is Transitory, and not durable; As Mists, Smoaks, Vapours, Chylus in the Stomach, Liuing Creatures in the first Vinification: And the Middle Action, which produceth such Imperfect Bodies, is fitly called, (by some of the Ancients,) Inquination, or Inconcoction, which is a Kinde of Putrefaction; For the Parts are in Confusion, till they settle, one way, or other.

The word Concoction, or Digestion, is chiefly taken into vse from Liuing Creatures, and their Organs; And from thence extended to Liquours, and Fruits, &c. Therefore they speake of Meat Concocted; Vrine and Excrements Concocted; And the Foure Disgestions, (In the Stomach; In the Liuer; In the Arteries and Nerues; And in the Seuerall Parts of the Body;) are likewise called Concoctions: And they are all made to be the Workes of Heat: All which Notions are but ignorant Catches of a few Things, which are most Obuious to Mens Obseruations. The Constantest Notion of Concoction is, that it should signifie the Degrees of Alteration, of one Body into another, from Crudity to Perfect Concoction; Which is the Vltimity of that Action, or Processe: And while the Body to be Conuerted and Altered, is too strong for the Efficient, that should Conuert, or Alter it, (whereby it resisteth and holdeth fast in some degree the first Forme, or Consistence;) it is (all that while,) Crude, and Inconcoct; And the Processe is to be called Crudity and Inconcoction. It is true, that Concoction is, in great part, the Worke of Heat; But not the Worke of Heat alone: For all Things, that further the Conuersion, or Alteration, (as Rest, Mixture of a Body already Concocted, &c.) are also Meanes to Concoction. And there are of Concoction two Periods; The one Assimilation, or Absolute Conuersion and Subaction; The other Maturation: whereof the Former is most conspicuous in the

Bodies of Liuing Creatures; In which there is an Absolute Conuersion, and Assimilation of the Nourishment into the Body: And likewise in the Bodies of Plants: And againe in Metalls, where there is a full Transmutation. The other, (which is Maturation,) is seene in Liquours, and Fruits; wherein there is not desired, nor pretended, an vtter Conuersion, but onely an Alteration to that Forme, which is most sought, for Mans vse; As in Clarifying of Drinkes; Ripening of Fruits, &c. But note, that there be two Kindes of Absolute Conuersions; The one is, when a Body is conuerted into another Body, which was before; As when Nourishment is turned into Flesh; That is it which wee call Assimilation. The other is, when the Conuersion is into a Body meerely New, and which was not before; As if Siluer should be turned to Gold; or Iron to Copper: And this Conuersion is better called, for distinctions sake, Transmutation.

There are also diuers other Great Alterations of Matter, and Bodies, besides those that tend to Concoction, and Maturation; For whatsoeuer doth so alter a Body, as it returneth not againe to that it was, may be called Alteratio Maior: As when Meat is Boyled, or Roasted, or Fried, &c. Or when Bread and Meat are Baked; Or when Cheese is made of Curds, or Butter of Creame, or Goales of wood, or Brickes of Earth; And a Number of others. But to apply Notions Philosophicall to Plebcian Termes; Or to say, where the Notions cannot fitly be reconciled, that there wanteth a Terme, or Nomenclature for it; (as the Ancients vsed;) They be but Shifts of Ignorance; For Knowledge will be euer a Wandring and Indigested Thing, if it be but a Commixture of a few Notions, that are at hand and occurre, and not excited from sufficient Number of Instances, and those well collated.

The Consistences of Bodies are very diuers: Dense, Rare; Tangible, Pneumaticall, Volatile, Fixed; Determinate, Not Determinate, Hard, Soft; Cleauing, Not Cleauing; Congealeable, Not Congealeable; Liquefiable, Not Liquefiable; Fragile, Tough; Flexible Inflexible; Tractile, or to be drawen forth in length, Intractile; Porous, Solide; Equall, and Smooth, Vnequall, Venous, and Fibrous, and with Graines, Entire; And diuers Others; All which to referre to

Heat, and Cold; and Moisture, and Drought, is a Compendious and Inutile Speculation. But of these see principally our Abecedarium Nature; And otherwise Sparfim in this in our Sylua Syluarum: Neuerthelesse in some good part, We shall handle diuers of them now presently.

Liquefiable, and Not Liquefiable, proceed from these Causes: Liquefaction is euer caused by the Detention of the Spirits, which play within the Body, and Open it. Therefore such Bodies, as are more Turgide of Spirit; Or that haue their Spirits more Sraitly Imprisoned; Or againe that hold them Better Pleased and Content; are Liquefiable: For these three Dispositions of Bodies, doe arrest the Emission of the Spirits. An Example of the first two Properties is in Metalls; And of the Last in Grease, Pitch, Sulphure, Butter, Wax, &c. The Disposition not to Liquefie proceedeth from the Easie Emission of the Spirits; whereby the Grosser Parts contract; And therefore, Bodies Ieiune of Spirits; Or which part with their Spirits more Willingly; are not Liquefiable; As Wood, Clay, Freestone, &c. But yet, euen many of those Bodies, that will not Melt, or will hardly Melt, will notwithstanding Soften; As Iron in the Forge; And a Sticke bathed in Hot Ashes, which thereby becommeth more Flexible. Moreouer, there are some Bodies, which doe Liquefie, or dissolue by Fire; As Metalls, Wax, &c. And other Bodies, which dissolue in Water; As Salt, Sugar, &c. The Cause of the former proceedeth from the Dilatation of the Spirits by Heat: The Cause of the Latter proceedeth from the Opening of the Tangible Parts, which desire to receiue the Liquour. Againe, there are some Bodies, that dissolue with both; As Gumme, &c. And those be such Bodies, as on the One Side haue good store of Spirit; And on the other Side, haue the Tangible Parts Indigent of Moisture; For the former helpeth to the Dilating of the Spirits by the Fire; And the Latter stimulateth the Parts to Receiue the Liquour.

Of Bodies, some are Fragile; And some are Tough, and Not Fragile; And in the Breaking, some Fragile Bodies breake but where the Force is; Some shatter and fly in many Peeces. Of Fragility the Cause is an Impotency to be Extended: And therefore Stone is more Fragile than Metall; And so Fictile Earth is more Fragile than Crude Earth; And Dry Wood than Greene. And the Cause of this

Vnaptnesse to Extension, is the Small Quantity of Spirits; (For it is the Spirit that furthereth the Extension or Dilatation of Bodies;) And it is euer Concomitant with Porosity, and with Drinesse in the Tangible Parts: Contrariwise, Tough Bodies haue more Spirit, and sewer Pores, and Moister Tangible Parts: Therefore wee see that Parchment, or Leather will stretch, Paper will not; Woollen Cloth will tenter, Linnen scarcely.

All Solide Bodies consist of Parts of two seuerall Natures; Pneumaticall, and Tangible; And it is well to be noted, that the Pneumaticall Substance is in some Bodies, the Nature Spirit of the Body; And in some other, plaine Aire that is gotten in; As in Bodies desiccate, by Heat, or Age: For in them, when the Natiue Spirit goeth forth, and the Moisture with it, the Aire with time getteth into the Pores. And those Bodies are euer the more Fragile; For the Natiue Spirit is more Yeelding, and Extensiue, (especially to follow the Parts,) than Aire. The Natiue Spirits also admit great Diuersitie; As Hot, Cold, Active, Dull, &c. Whence proceed most of the Vertues, and Qualities (as wee call them) of Bodies: But the Aire intermixt, is without Vertues, and maketh Things Infioide, and without any Extimulation.

The Concretion of Bodies is (commonly) solued by the Contrary; As Ice, which is congealed by Gold, is dissolued by Heat; Salt and Sugar, which are Excocted by Heat, are Dissolued by Cold, and Moisture. The Cause is, for that these Operations, are rather Returnes to their former Nature, than Alterations: So that the Contrary cureth. As for Oyle, it doth neither easily congeale with Cold, nor thicken with Heat. The Cause of both Effects, though they be produced by Contrary Efficients, seemeth to be the Same; And that is, because the Spirit of the Oyle, by either Meanes, exhaleth little; For the Cold keepeth it in; and the Heat, (except it be Vehement,) doth not call it forth. As for Cold, though it take hold of the Tangible Parts, yet as to the Spirits, it doth rather make them Swell, than Congeale them: As when Ice is congealed in a Cup, the Ice will Swell in stead of Contracting; And sometimes Rift.

Of Bodies, some (wee see) are Hard, and some Soft: The Hardnesse is caused (chiefly) by the Ieiunenesse of the Spirits; And their Imparitie with the Tangible

Parts: Both which, if they be in a greater degree, maketh them, not only Hard, but Fragile, and lesse Enduring of Pressure; As Steele, Stone, Glasse, Drie Wood, &c.Softnesse commeth (contrariwise) by the Greater Quantitie of Spirits; (which euer helpeth to Induce Yeelding and Cession;) And by the more Equall Spreading of the Tangible Parts, which thereby are more Sliding, and Following; As in Gold, Lead, Wax, &c. But note, that Soft Bodies, (as wee vse the word,) are of two Kinds; The one, that easily glueth place to another Body, but altereth not Bulke, by Rising in other Places: And therefore wee see that Wax, if you put any Thing into it, doth not rise in Bulke, but only giueth Place: For you may not thinke, that in Printing of Wax, the Wax riseth vp at all; But only the depressed Part giueth place, and the other remaineth as it was. The other, that altereth Bulke in the Cession; As Water, or other Liquours, if you put a Stone, or any Thing into them, they giue place (indeed) easily, but then they rise all ouer: Which is a False Cession; For it is in Place, and not in Body.

All Bodies Ductile, and Tensile, (as Metals that will be drawne into Wires; Wooll and Towe that will be drawne into Yarne, or Thred;) haue in them the Appetite of Not Discontinuing, Strong; Which maketh them follow the Force, that pulleth them out; And yet so, as not to Discontinue or forsake their owne Body.Viscous Bodies, (likewise,) as Pitch, Wax, Bird-Lime, Cheese toasted, will draw forth, and roape. But the difference betweene Bodies Fibrous, and Bodies Viscous, is Plaine; For all Wooll, and Towe, and Cotton, and Silke, (especially raw Silke,) haue, besides their Desire of Continuance, in regard of the Tenuitie of their Thred, a Greedinesse of Moisture; And by Moisture to ioyne and incorporate with other Thred; Especially if there be a little Wreathing; As appeareth by the Twisting of Thred; And the Practise of Twirling about of Spindles. And wee see also, that Gold and Siluer Thred cannot be made without Twisting.

The Differences of Impressible; and Not Impressible Figurable; and Not Figurable; Mouldable and Not Mouldable; Scissile and Not Scissile; And many other Passions of Matter, are Plebcian Notions, applied vnto the Instruments and Vses which Men ordinarily practise; But they are all but the Effects of some of

these Causes following; Which we will Enumerate without Applying them, because that would be too long. The First is the Cession, or Not Cession of Bodies, into a Smaller Space or Roome, keeping the Outward Bulke, and not flying vp. The Second is the Stronger or Weaker Appetite, in Bodies, to Continuitie, and to flie Discontinuitie. The Third is the Disposition of Bodies, to Contract, or Not Contract; And againe, to Extend, or Not Extend. The Fourth is the Small Quantitie, or Great Quantitie, of the Pneumaticall in Bodies. The Fifth is the Nature of the Pneumalicall, whether is — Natiue Spirit of the Body, or Common Aire. The Sixth is, the Nature of the Natiue Spirits in the Body, whether they be Actiue and Eager, or Dull and Gentle. The Seuenth is the Emission or Detention of the Spirits in Bodies. The Eighth is the Dilatation, or Contraction of the Spirits in Bodies, while they are detained. The Ninth is the Collocation of the Spirits in Bodies; whether the Collocation be Equall, or Vnequall; And againe, whether the Spirits be Coaceruate, or Diffused. The Tenth is the Densitie, or Raritie of the Tangible Parts. The Eleuenth is the Equalitie or Inequalitie of the Tangible Parts. The Twelfth is the Disgestion, or Cruditie of the Tangible Parts. The Thirteenth is the Nature of the Matter, whether Sulphureous or Mercuriall, Watrie or Oylie, Drie and Terrestriall, or Moìst and Liquid; which Natures of Sulphureous and Mercuriall, seeme to be Natures Radicall, and Principiall. The Fourteenth is the Placing of the Tangible Parts, in Length, or Transuerse; (As it is in the Warpe, and the Woofe, of Textiles;) More Inward, or More Outward; &c. The Fifteenth is the Porofitie, or Imporositie betwixt the Tangible Parts; And the Greatnesse, or Smalnesse of the Pores. The Sixteenth is the Collocation and Pesture of the Pores. There may be more Causes; but these doe occurre for the Present.

Take Lead, and melt it, and in the Middest of it, when it beginneth to Congeale, make a little Dint, or Hole, and put Quicke-Siluer wrapped in a Peece of Linnen into that Hole, and the Quicke-Siluer will fix, and run no more, and endure the Hammer. This is a Noble Instance of Induration, by Consent of one Body with another, and Motion of Excitation to Imitate; For to ascribe it only to the Vapour of Lead, is lesse Probable. Quare whether the Fixing may be in such

a degree, as it will be Figured like other Metals? For if so, you may make Works of it for some purposes, so they come not neere the Fire.

Sugar hath put downe the vse of Honey; Insomuch as wee haue lost those Obseruations, and Preparations of Honey, which the Ancients had, when it was more in Price. First, it seemeth that there was, in old time, Tree-Honey, as well as Bee-Honey; Which was the Teare or Bloud issuing from the Tree: Insomuch as one of the Ancients relateth, that in Trebisond, there was Honey issuing from the Box-Trees, which made Men Mad. Againe, in Ancient time, there was a Kinde of Honey, which either of the owne Nature, or by Art, would grow as Hard as Sugar; And was not so Lushious as Ours. They had also a Wine of Honey, which they made thus. They crushed the Honey into a great Quantitie of Water, and then strained the Liquour; After they boyled it in a Copper to the halfe: Then they powred it into Earthen Vessels, for a small time; And after tunned it into Vessels of Wood, and kept it for many years. They haue also, at this day, in Russia, and those Northerne Countries, Mead Simple, which (well made, and seasoned) is a good wholesome Drinke, and very Cleare. They vse also in Wales, a Compound Drinke of Mead, with Herbs, and Spices. But meane-while it were good, in recompence of that wee haue lost in Honey, there were brought in vse a Sugar Mead- (for so wee may call it,) though without any Mixture at all of Honey; And to brew it, and keepe it stale, as they vse Mead; For certainly, though it would not be so Abster siue, and Opening, and Solutiue a Drinke as Mead; yet it will be more gratefull to the Stomach, and more Lenitiue, and fit to be vsed in Sharpe Diseases. For wee see, that the vse of Sugar in Beere, and Ale, hath good Effects in such Cases.

It is reported by the Ancients, that there was a Kinde of Steele, in some places, which would polish almost as white and bright as Siluer. And that there was in India a Kinde of Brasse, which (being polished) could scarce be discerned from Gold. This was in the Naturall Vre; But I am doubtfull, whether Men haue sufficiently refined Metals, which we count Base; As whether Iron, Brasse, and Tinne, be refined to the Heighth? But when they come to such a Finenesse, as serueth the ordinary vse, they trie no further.

There haue beene found certaine Cements vnder Earth, that are very Soft; And yet, taken forth into the Sunne, harden as Hard as Marble: There are also ordinary Quarries in Sommerset-Shire, which in the Quarry cut soft to any Bignesse, and in the Building proue firme, and hard.

Liuing Creatures (generally) doe change their Haire with Age, turning to be Gray, and White: As is seene in Men, though some Earlier, some Later; In Horses, that are Dappled, and turne White; In Old Squirrels, that turne Grisly; And many Others. So doe some Birds; As Cygnets; from Gray turne White; Hawkes, from Browne turne more White: And some Birds there be, that vpon their Moulting, doe turne Colour; As Robin-Redbrests, after their Moulting, grow to be Red againe, by degrees; So doe Gold-Finches vpon the Head. The Cause is, for that Moisture doth (chiefly) colour Haire, and Feathers; And Drinesse turneth them Gray and White; Now Haire in Age waxeth Drier: So doe Feathers. As for Feathers, after Moulting, they are Young Feathers, and so all one as the Feathers of Young Birds. So the Beard is younger than the Haire of the Head, and doth (for the most part,) wax Hoare later. Out of this Ground, a Man may deuise the Meanes of Altering the Colour of Birds, and the Retardation of Heare-Haires. But of this see the fifth Experiment.

The Difference betweene Male and Female, in some Creatures, is not to be discerned, otherwise than in the Parts of Generation: As in Horses and Mares, Dogs and Bitches, Doues He and She, and others. But some differ in Magnitude, and that diuersly; For in most the Male is the greater; As in Man, Pheasants, Peacocks, Turkey's; and the like: And in some few, as in Hawkes, the Female. Some differ in the Haire, and Feathers, both in the Quantitie, Crispation, and Colours of them; As HeLions are Mi-sute, and haue great Maines; The She's are smooth like Cats. Bulls are more Crispe vpon the Fore-head than Cowes; The Peacocke, and Pheasant-Cocke, and Gold-Finch-Cocke, haue glorious and fine Colours; The Henn's haue not. Generally, the Hees in Birds haue the fairest Feathers. Some differ in diuers Features; As Bucks haue Hornes, Doe's none; Rammes haue more wreathed Hornes than Ewes; Cocks haue great Combes and Spurres, Henns little or none; Boares haue great Fangs, Sowes much lesse; The

TurkyCocke hath great and Swelling Gills, the Hen hath lesse; Men haue generally Deeper and Stronger Voices than Women. Some differ in Facultie; As the Cocks amongst Singing Birds, are the best Singers. The Chiefe Cause of all these, (no doubt,) is, for that the Males haue more Strength of Heat than the Females; Which appeareth manifestly in this, that all young Creatures Males, are like Females; And so are Eunuchs, and Gelt Creatures of all kinds, liker Females. Now Heat causeth Greatnesse of Growth, generally, where there is Moisture enough to worke vpon: But if there be found in any Creature, (which is seene rarely,) an Ouer-great Heat in proportion to the Moisture, in them the Female is the greater; As in Hawkes, and Sparrowes. And if the Heat be ballanced with the Moisture, then there is no Difference to be seene betweene Male and Female: As in the Instances of Horses, and Dogs. Wee see also, that the Hornes of Oxen, and Cowes, for the most part, are Larger than the Bulls; which is caused by abundance of Moisture, which in the Hornes of the Bull faileth-Againe, Heat causeth Pilosuy, and Crispation; And so likewise Beards in Men. It also expelleth finer Moisture which Want of Heat cannot Expell: And that is the Cause of the Beauty and Variety of Feathers: Againe, Heat doth put forth many Excreseences, and much Solide Matter, which Want of Heat cannot do: And this is the Cause of Hornes, and of the Greatnesse of them; And of the Greatnesse of the Combes and Spurres of Cocks, Gills of TurkyCocks, and Fangs of Boares. Heat also dilateth the Pipes, and Organs, which causeth the Deepnesse of the Voice. Againe, Heat refineth the Spirits, and that causeth the Cock-Singing Bird, to Excell the Hen.

There be Fishes greater than any Beasts; As the Whale is farre greater than the Elephant. And Beasts are (generally) greater than Birds. For Fishes, the Cause may be, that because they Liue not in the Aire, they haue not their Moisture drawne and Soaked by the Aire, and Sun-Beames. Also they rest alwaies, in a manner, and are supported by the Water, whereas Motion and Labour doe consuine. As for the Greatnesse of Beasts, more than of Birds, it is caused, for that Beasts stay Longer time in the Wombe, than Birds, and there Nourish, and Grow; Whereas in Birds, after the Egge Lay'd, there is no further

Growth, or Nourishment from the Female: For the Sitting doth Vinifie, and not Nourish.

We haue partly touched before the Meanes of Producing Fruits, without Coares, or Stones. And this we adde further, that the Cause must be Abundance of Moisture; For that the Coare, and Stone are made of a Dry Sap-. And we see that it is possible, to make a Tree put forth onely in Blossome, without Fruit; As in Cherries with Double Flowers; Much more into Fruit without Stone, or Coares. It is reported, that a Cions of an Apple, grafted vpon a Colo — Stalke, sendeth forth a great Apple without a Coare. It is not vnlikely, that if the Inward Pith of a Tree, were taken out, so that the Iuyce came onely by the Barke, it would worke the Effect. For it hath beene obserued, that in Pollards, if the Water get in on the Top, and they become Hollow, they put forth the more. We adde also, that it is deliuered for certaine by some, that if the Cions be grafted, the Small End downwards, it will make Fruit haue little or no Coares, and Stones.

Tobacco is a thing of great Price, if it be in request; For an — of it will be worth, (as is affirmed,) two Hundred Pounds, by the yeare, towards Charge. The Charge of making the Ground and otherwise, is great, but nothing to the Profit. But the English Tobacco, hath small credit, as being too Dull, and Eartby, Nay the —— Tobacco; though that be in a Hotter Climate, can get no credit, for the same — that a Triall to make Tobacco more Aromaticall, and better Concocted here in England, were a Thing of great profit. Some haue gone about to doe it by Drenching the English Tobacco, in a Decoction or Infusion of Indian Tobacco: But those are but Sophistications, and Toyes; For Nothing that is once Perfect, and hath run his Race, can receiue much Amendment. You must euer resort to the Beginnings of Things for Melioration. The Way of Maturation of Tobacco must, as in other Plants, be, from the Heat, Either of the Earth, or of the Sunne: We see some Leading of this in Musk-Melons; which are sowen vpon a Hot Bed, Dunged below, vpon a Bancke turned vpon the South Sunne, to giue Heat by Reflexion; Laid vpon Tiles, which increaseth the Heat, And Couered with Straw to keepe them from Cold. They remoue them also, which addeth some Life: And by these Helpes they become as good in England, as in Italy, or

Prouence. These, and the like Meanes, may be tried in Tobacco. Enquire also of the Steeping of the Roots, in some such Liquour, as may giue them Vigour to put forth Strong.

Heat of the Sunne, for the Maturation of Fruits; Yea and the Heat of Viuification of Liuing Creatures; are both represented and supplied, by the Heat of Fire; And likewise, the Heats of the Sunne, and Life, are represented one by the other.Trees, set vpon the Backes of Chimneyes, doe ripen Fruit sooner. Vines, that haue beene drawne in at the Window of a Kitchen, haue sent forth Grapes ripe a Month (at least) before others. Stoues, at the Backe of Walls, bring forth Orenges here with vs. Egges, as is reported by some, haue beene hatched in the warmth of an Ouen. It is reported by the Ancients, that the Estrich Layeth her Egs vnder Sand, where the Heat of the Sunne disclosed them.

Barley in the Boyling swelleth not much; Wheat swelleth more; Rize extremely; In so much as a Quarter of a Pint (vnboyled) will arise to a Pint boyled. The Cause (no doubt) is, for that the more Close and Compact the Body is, the more it will dilate: Now Barley is the most Hollow; Wheat more Solide than that; and Rize most Solide of all. It may be also that some Bodies haue a Kinde of Lentour, and more Depertible Nature than others; As we see it Euident in Colouration; For a Small Quantity of Saffron, will Tinct more, than a very great Quantity of Bresill, or Wine.

Fruit groweth Sweet by Rowling, or Pressing them gently with the Hand; As Rowling-Peares, Damasins, &c. By Rottennesse; As Medlars, Seruickes, Sloe's, Heps, &c. By Time; As Apples, Wardens, Pomgranats, &c. By certaine Speciall Maturations; As by Laying them in Hay, Straw, &c. And by Fire; As in Roasting, Stewing, Baking, &c. The Cause of the Sweetnesse by Rowling, and Pressing, is Emollition, which they properly enduce; As in Beating of Stock-Fish, Flesh, &c. By Rottennesse is, for that the Spirits of the Fruit, by Putrefaction, gather Heat, and thereby disgest the Harder Part: For in all Putrefactions, there is a Degree of Heat. By Time and Keeping is, because the Spirits of the Body, doe euer feed vpon the Tangible Parts, and attenuate them. By Seuerall Maturations is, by some Degree of Heat. And by Fire is, because it

is the Proper Worke of Heat to Refine, and to Incorporate; And all Sourenesse consisteth in some Grossenesse of the Body: And all Incorporation doth make the Mixture of the Body, more Equall, in all the Parts; Which euer induceth a Milder Taste.

Of Fleshes, some are Edible; Some, except it be in Famine, not. For those that are not Edible, the Cause is, for that they haue (commonly) too much Bitternesse of Taste; And therefore those Creatures, which are Fierce and Cholerick, are not Edible; As Lions, Wolnes, Squirrells, Dogs, Foxes, Horses, &c. As for Kine, Sheepe, Goats, Deere, Swine, Conneyes, Hares, &c. We see they are Milde, and Fearefull. Yet it is true, that Horses, which are Beasts of Courage, haue beene, and are eaten by some Nations; As the Scythians were called Hippophagi; And the Chineses eat Horse-flesh at this day; And some Gluttons haue vsed to haue Colts-flesh baked. In Birds, such as are Carniuor a, and Birds of Prey, are commonly no Good Meat; But the Reason is, rather the Cholerick Nature of those Birds, than their Feeding vpon Flesh; For Puits, Gulls, Shouelers, Duckes, doe feed vpon Flesh, and yet are Good Meat: And wee see, that those Birds, which are of Prey, or feed vpon Flesh, are good Meat, when they are very Young; As Hawkes, Rookes out of the Neast, Owles, &c. Mans Flesh is not Eaten. The Reasons are Three: First, because Men in Humanity doe abhorre it: Secondly, because no Liuing Creature, that Dyeth of it selfe, is good to Eat: And therefore the Ca — (themselues) eat no Mans-flesh, of those that Dye of Themselues, but of such as are Slaine. The Third is, because there must be (generally) some Disparity, between the Nourishment, and the Body Nourished; And they must not be Ouer-neere, or like: Yet we see, that in great Weaknesses, and Consumptions, Man haue beene sustained with Womans Milke: And Ficinus fondly (as I conceiue) aduiseth, for the Prolongation of Life, that a Veine be opened in the Arme of some wholesome Young Man; And the Bloud to be sucked. It is said, that Witches doe greedily eat Mens flesh; which if it be true, besides a Diuellish Appetite in them, it is likely to proceed, for that Mans flesh may send vp High and Pleasing Vapours, which may stirre the Imagination; And Witches Felicity is chiefly in Imagination, as hath beene said.

There is an Ancient Receiued Tradition of the Salamander, that it liueth in the Fire, and hath force also to extinguish the Fire. It must haue two Things, if it be true, to this Operation: The One a very Close Skin, whereby Flame, which in the Midst is not so hot, cannot enter: For we see that if the Palme of the Hand be annointed thicke with White of Egge, and then Aquanita be poured vpon it, and Enflamed, yet one may endure the Flame a pretty while. The other is some Extreme Cold and Quenching vertue, in the Body of that Creature, which choaketh the Fire. We see that Milke quencheth Wilde-Fire, better than Water, because it entreth better.

Time doth change Fruit, (as Apples, Peares, Pomgranats, &c.) from more Soure, to more Sweet: But contrariwise Liquours, (euen those that are of the Iuyce of Fruit,) from more Sweet to more Soure; As Wort, Must, New Veriuyce, &c. The Cause is, the Congregation of the Spirits together: For in both Kindes, the Spirit is attenuated by Time; But in the first Kinde, it is more Diffused, and more Mastered by the Grosser Parts, which the Spirits doe but disgest: But in Drinkes the Spirits doe raigne, and finding lesse Opposition of the Parts, become themselues more Strong; Which causeth also more Strength in the Liquour; Such, as if the Spirits be of the Hotter Sort, the Liquour becommeth apt to Burne; But in Time, it causeth likewise, when the Higher Spirits are Euapourated, more Sourenesse.

It hath beene obserued by the Ancients, that Plates of Metall, and especially of Brasse, applied presently to a Blow, will keepe it downe from Swelling. The Cause is Repercussion, without Humectation, or Entrance of any Body: for the Plate hath onely a Virtuall Cold, which doth not search into the Hurt; Whereas all Plasters, and Ointments doe enter. Surely, the Cause, that Blowes and Bruises enduce Swellings, is, for that the Spirits resorting to Succour the Part that Laboureth, draw also the Humours with them: For we see, that it is not the Repulse, and the Returne of the Humour in the Part Strucken, that causeth it; For that Gouts, and Tooth-Aches cause Swelling, where there is no Percussion at all.

The Nature of the Orris Root, is almost Singular; For there be few Odoriferous Roots; And in those that are, in any degree, Sweet, it is but the same

Sweetnesse with the Wood, or Leafe: But the Orris is not Sweet in the Leafe; Neither is the Flower any thing so Sweet as the Root. The Root seemeth to haue a Tender dainty Heat; Which when it commeth aboue Ground, to the Sunne, and the Aire, vanisheth: For it is a great Mollifier; And hath a Smell like a Violet.

It hath been obserued by the Ancients, that a great Vessell full, drawne into Bottles; And then the Liquour put againe into the Vessell; will not fill the Vessell againe, so full as it was, but that it may take in more Liquour: And that this holdeth more in Wine, than in Water. The Cause may be Triuiall; Namely, by the Expence of the Liquour, in regard some may sticke to the Sides of the Bottles: But there may be a Cause more Subtill; Which is, that the Liquour in the Vessell, is not so much Compressed, as in the Bottle; Because in the Vessell, the Liquour meeteth with Liquour chiefly; But in the Bottles a Small Quantity of Liquour, meeteth with the Sides of the Bottles, which Compresse it so, that it doth not Open againe.

Water, being contiguous with Aire, Cooleth it, but Moisteneth it not, except it Vapour. The Cause is, for that Heat, and Cold haue a Virtuall Transition, without Communication of Substance; but Moisture not: And to all Madefaction there is required an Imbibition: But where the Bodies are of such seuerall Leuity, and Grauity, as they Mingle not, there can follow no Imbibition. And therefore, Oyle likewise lyeth at the Top of the Water, without Commixture: And a Drop of Water, running swiftly ouer a Straw, or Smooth Body, wetteth not.

Starre-light Nights, yea and bright Moone-shine Nights, are Colder than Cloudy Nights. The Cause is, the Drinesse and Finenesse of the Aire, which thereby becommeth more Piercing, and Sharpe? And therefore Great Continents are colder than Islands: And as for the Moone, though it selfe inclineth the Aire to Moisture, yet when it shineth bright, it argueth the Aire is dry. Also Close Aire is warmer than Open Aire; which (it may be) is, for that the true Cause of Cold, is an Expiration from the Globe of the Earth, which in open Places is stronger; And againe, Aire it selfe, if it be not altered by that Expiration, is not without some Secret Degree of Heat: As it is not likewise without some Secret Degree of Light: For otherwise Cats, and Owles, could not see in the Night; But

that Aire hath a little Light. Proportionable to the Visuall Spirits of those Creatures.

The Eyes doe moue —— — way; For when one Eye moueth to the Nosthrill, the other moueth from the Nosthrill. The Cause is Motion of Consent, which in the Spirits, and Parts Spirituall, is Strong. But yet Vse will induce the Contrary: For some can Squint, when they will: And the Common Tradition is, that if Children be set vpon a Table, with a Candle behinde them, both Eyes will moue Outwards; As affecting to see the Light, and so induce Squinting.

We see more exquisitely with One Eye Shut, than with Both Open. The Cause is, for that the Spirits Visuall vnite themselues more, and so become Stronger. For you may see, by looking in a Glasse, that when you shut one Eye, the Pupill of the other Eye, that is Open, Dilateth.

The Eyes, if the Sight meet not in one Angle, See Things Double. The Cause is, for that Seeing two Things, and Seeing one Thing twice, worketh the same Effect: And therefore a little Pellet, held betweene two Fingers, laid a-crosse, seemeth Double.

Poreblinde Men, see best in the Dimmer Lights; And likewise haue their Sight Stronger neare hand, than those that are not Poreblinde; And can Reade and Write smaller Letters. The Cause is, for that the Spirits Visuall, in those that are Poreblinde, are Thinner, and Rarer, than in others; And therefore the Greater Light disperseth them. For the same Cause they need Contracting; But being Contracted, are more strong, than the Visuall Spirits of Ordinary Eyes are; As when we see thorow a Leuell, the Sight is the Stronger: And so is it, when you gather the Eyelids somewhat close: And it is commonly seene in those that are Poreblinde, that they doe much gather the Eyelids together. But Old Men, when they would see to Reade, put the Paper somewhat a farre off. The Cause is, for that Old Mens Spirits Visuall, contrary to those of Poreblinde Men, vnite not, but when the Obiect is at some good distance, from their Eyes.

Men see better, when their Eyes are ouer-against the Sunne, or a Candle, if they put their Hand a little before their Eye. The Reason is, for that the Glaring of the Sunne, or the Candle, doth weaken the Eye; wheras the Light Circumfused

is enough for the Perception. For we see, that an Ouerlight maketh the Eyes Dazell; Insomuch as Perpetuall Looking against the Sunne, would Cause Blindnesse. Againe, if Men come out of a Great Light, into a Darke Roome; And contrariwise, if they come out of a Darke Roome, into a Light Roome, they seeme to haue a Mist before their Eyes, and see worse, than they shall doe, after they haue stayed a little while, either in the Light, or in the Darke. The Cause is, for that the Spirits Visuall, are vpon a Sudden Change, disturbed, and put out of Order; And till they be recollected, doe not performe their Function well. For when they are much Dilated by Light, they cannot Contract suddenly; And when they are much Contracted by Darknesse, they cannot Dilate suddenly. And Excesse of both these, (that is, of the Dilatation, and Contraction of the Spirits Visuall,) if it belong, Destroyeth the Eye. For as long Looking against the Sunne, or Fire, hurteth the Eye by Dilatation; So Curious Painting in Small Volumes, and Reading of Small Letters, doe hurt the Eye by Contraction.

It hath beene obserued, that in Anger, the Eyes wax Red; And in Blushing, not the Eyes, but the Eares, and the Parts behinde them. The Cause is, for that in Anger, the Spirits ascend and wax Eager; Which is most easily seene in the Eyes, because they are Translucide; Though withall it maketh both the Cheekes, and the Gills Red; But in Blushing, it is true, the Spirits ascend likewise to Succour, both the Eyes, and the Face, which are the Parts that labour: But then they are repulsed by the Eyes, for that the Eyes, in Shame doe put backe the Spirits, that ascend to them, as vnwilling to looke abroad: For no Men, in that Passion, doth looke strongly, but Deiectedly; And that Repulsion from the Eyes, Diuerteth the Spirits and Heat more to the Eares, and the Parts by them.

The Obiects of the Sight, may cause a great Pleasure and Delight in the Spirits, but no Paine, or great Offence; Except it be by Memory, as hath beene said. The Glimpses and Beames of Diamonds that strike the Eye; Indian Feathers, that haue glorious Colours; The Comming into a Faire Garden; The Comming into a Faire Roome richly furnished; A Beautifull Person; And the like; doe delight and exhilarate the Spirits much. The Reason, why it holdeth not in the Offence, is, for that the Sight is the most Spirituall of the Senses; whereby

it hath no Obiect Grosse enough to offend it. But the Cause (chiefly) is, for that there be no Actiue Obiects to offend the Eye. For Harmonicall Sounds, and Discordant Sounds, are both Actiue, and Positiue: So are Sweet Smels, and Stinks: So are Bitter, and Sweet, in Tastes: So are Ouer-Hot, and Ouer-Cold, in Touch: But Blacknesse, and Darknesse, are indeed but Priuatiues; And therefore haue little or no Actiuitie. Somewhat they doe Contristate, but very little.

Water of the Sea, or otherwise, looketh Blacker when it is moued, and Whiter when it resteth. The Cause is, for that by meanes of the Motion, the Beames of light passe not Straight, and therefore must be darkened, whereas, when it resteth, the Beames doe passe Straight. Besides, Splendour hath a Degree of Whitenesse; Especially if there be a little Repercussion: For a Looking-Glasse with the Steele behinde, looketh Whiter, than Glasse Simple. This Experiment deserueth to be driuen further, in Trying by what Meanes Motion may hinder Sight.

Shell-Fish haue beene, by some of the Ancients, compared and sorted with the Insecta; But I see no reason why they should; For they haue Male, and Female, as other Fish haue: Neither are they bred of Putrefaction; Especially such as doe Moue. Neuerthelesse it is certaine, that Oisters, and Cockles, and Mussles, which Moue not, haue no discriminate Sex: Quare in what time, and how they are bred? It seemeth that Shells of Oisters are bred where none were before; A tried, that the great Horse-Mussle, with the fine shell, that breedeth in Ponds, hath bred within thirty yeares: But then, which is strange, it hath beene tried, that they doe not only Gape, and Shut, as the Oisters doe, but Remone from one Place to Another.

The Senses are alike Strong, both on the Right Side, and on the Left; But the Limmes on the Right Side are Stronger. The Cause may be, for that the Braine, which is the Instrument of Sense, is alike on both Sides; But Motion, and Habilities of Mouing, are somewhat holpen from the Liner, which lieth on the Right Side. It may be also, for that the Senses are put in Exercise, indifferently, on both Sides, from the Time of our Birth; But the Limmes are vsed most on the

Right Side, whereby Custome helpeth; For wee see that some are Left-Handed: Which are such, as haue vsed the Left-Hand most.

Frictions make the Parts more Fleshie, and Full: As wee see both in Men; And in Carrying of Horses, &c. The Cause is, for that they draw greater Quantitie of Spirits and Blond to the Parts: And againe, because they draw the Aliment more forcibly from within: And againe, because they relax the Pores, and so make better Passage for the Spirits, Blond, and Aliment: Lastly, because they dissipate and disgest any Inutile or Excrementitious Moisture, which lieth in the Flesh: All which helpe Assimilation. Frictions also doe more F-ll, and Impinguate the Body, than Exercise. The Cause is, for that in Frictions, the Inward Parts are at rest; Which in Exercise are beaten (many times) too much: And for the same Reason, (as we haue noted heretofore,) Gally-Slaues are Fat and Fleshie, because they stirre the Limmes more, and the Inward Parts lesse.

All Globes afarre off appeare Flat. The Cause is, for that Distance, being a Secundary Obiect of Sight, is not otherwise discerned, than by more or lesse Light; which Disparitie when it cannot be discerned, all seemeth One: As it is (generally) in Obiects not distinctly discerned; For so Letters, if they be so farre off, as they cannot be discerned, shew but as a Duskish Paper: And all Engrauings, and Embossings, (afarre off) appeare Plaine.

The Vtmost Parts of Shadowes seeme euer to Tremble. The Cause is, for that the little Moats, which wee see in the Sunne, doe euer Stirre, though there be no Wind; And therefore those Mouing, in the Meeting of the Light and the Shadow, from the Light to the Shadow, and from the Shadow to the Light, doe shew the Shadow to Moue, because the Medium Moueth.

Shallow, and Narrow Seas, Breake more than Deepe, and Large. The Cause is, for that the Impulsion being the same in Both; Where there is great Quantitie of — , and likewise Space Enough; there the Water Rowleth, and Moueth, both more Slowly, and with a Sloper Rise, and Fall: But where there is lesse Water, and lesse Space, and the Water dasheth more against the Bottome; there it moueth more Swiftly, and more in Precipice; For in the Breaking of the Wanes there is euer a Precipice.

It hath beene obserued by the Ancients, that SaltWater Boyled, or Boyled and Cooled againe, is more Potable, than of it selfe Raw: And yet the Taste of Salt, in Distillations by Fire, riseth not; For the Distilled Water will be Fresh. The Cause may be, for that the Salt Part of the Water, doth partly rise into a Kinde of Scumme on the Top; And partly goeth into a Sediment in the Bottome: And so is rather a Separation, than an Euaporation. But it is too grosse to rise into a Vapour: And so is a Bitter Taste likewise; For Simple Distilled Waters, of Wormewood, and the like, are not Bitter.

It hath beene set downe before, that Pits vpon the Sea-Shoare, turne into Fresh Water, by Percolation of the Salt through the Sand: But it is further noted, by some of the Ancients, that in some Places of Affricke, after a time, the Water in such Pits will become Brackish againe. The Cause is, for that after a time, the very Sands, thorow which the SaltWater passeth, become Salt; And so the Strainer it selfe is tincted with Salt. The Remedie therefore is, to digge still New Pits, when the old wax Brackish; As if you would change your Strainer.

It hath beene obserued by the Ancients, that Salt Water, will dissolue Salt put into it, in lesse time, than Fresh Water will dissolue it. The Cause may be, for that the Salt in the Precedent Water, doth, by Similitude of Substance, draw the Salt new put in, vnto it; Whereby it diffuseth in the Liquour more speedily. This is a Noble Experiment, if it be true; For it sheweth Meanes of more Quicke and Easie Infusions; And it is likewise a good Instance of Attraction, by Similitude of Substance. Trie it with Sugar put into Water, formerly Sugred; And into other Water Vnsugred.

Put Sugar into Wine, part of it aboue, part vnder the Wine; And you shall finde, (that which may seeme strange,) that the Sugar aboue the Wine, will soften and dissolue sooner, than that within the Wine. The Cause is, for that the Wine entreth that Part of the Sugar, which is vnder the Wine, by Simple Infusion, or Spreading; But that Part aboue the Wine, is likewise forced by Sacking: For all Spungie Bodies expell the Aire, and draw in Liquour, if it be Contiguous: As wee see it also in Spunges, put part aboue the Water. It is worthy

the Inquiry, to see how you may make more Accurate Infusions, by Helpe of Attraction.

Water in Wells is warmer in Winter, than in Summer: And so Aire in Caues. The Cause is, for that in the Hither Parts, vnder the Earth, there is a Degree of some Heat; (As appeareth in Sulphureous Veines, &c.) Which shur close in, (as in Winter,) is the More; But if it Peripire, (as it doth in Summer,) it is the Lesse.

It is reported, that amongst the Leucadians, in Ancient time, vpon a Superstition, they did vse to Precipitate a Man, from a High Cliffe into the Sea; Tying about him, with Strings, at some distance, many great Fowles; And fixing vnto his Body diuers Feathers, spred, to breake the Fast. Certainly many Birds of good Wing, (As Kites, and the like,) would beare vp a good Weight, as they file; And Spreading of Feathers, thinne, and close, and in great Bredth, will likewise beare vp a great Weight; Being euen laid, without Tilting vpon the Sides. The further Extension of this Experiment for Flying may be thought vpon.

There is, in some Places, (namely in Cephalonia,) a little Shrub, which they call Holy-Oake, or Dwarfe-Oake: Vpon the Leaues whereof there riseth a Tumour, like a Blister; Which they gather, and rub out of it, a certaine Red Dust, that conuerteth (after a while) into Wormes, which they kill with Wine, (as is reported,) when they begin to Quicken: With this Dust they die Scarlet.

In Zant, it is very ordinary, to make Men Impotent, to accompany with their Wines. The like is Practised in Gasconie; Where it is called Nouër l' eguillette. It is practised alwayes vpon the Wedding Day. And in Zant, the Mothers themselues doe it, by way of Preuention; Because thereby they hinder other Charmes, and can vndoe their Owne. It is a Thing the Ciuill Law taketh knowledge of; And therefore is of no Light Regard.

It is a Common Experiment, but the Cause is mistaken. Take a Pot, (Or better a Glasse, because therein you may see the Motion,) And set a Candle lighted in the Bottome of a Basen of Water; And turne the Mouth of the Pot, or Glasse, ouer the Candle, and it will make the Water rise. They ascribe it, to the Drawing of Heat; Which is not true: For it appeareth plainly to be but a Motion of Nexe, which they call Ne detur vacuum; And it proceedeth thus. The Flame of the

Candle, as soone as it is couered, being suffocated by the Close Aire, lesseneth by little and little: During which time, there is some little Ascent of Water, but not much: For the Flame Occupying lesse and lesse Roome, as it lesseneth, the Water succeedeth. But vpon the Instant of the Candles Going out, there is a sudden Rise, of a great deale of Water; For that the Body of the Flame filleth no more Place; And so the Aire, and the Water succeed. It worketh the same Effect, if in stead of Water, you put Flower, or Sand, into the Basen: Which sheweth, that it is not the Flames Drawing the Liquour, as Nourishment; As it is supposed; For all Bodies are alike vnto it; As it is euer in Motion of Nexe; Insomuch as I haue seene the Glasse, being held by the Hand, hath lifted vp the Basen, and all: The Motion of Nexe did so Claspe the Bottome of the Basen. That Experiment, when the Basen was lifted vp, was made with Oyle, and not with Water; Neuerthelesse this is true, that at the very first Setting of the Mouth of the Glasse, vpon the Bottome of the Basen, it draweth vp the Water a little, and then standeth at a Stay, almost till the Candles Going out, as was said. This may shew some Attraction at first: But of this we will speake more, when we handle Attractions by Heat.

Of the Power of the Gelestiall Bodies, and what more Secret Influences they haue, besides the two Manifest Influences of Heat, and Light, We shall speake, when we handle Experiments touching the Celestiall Bodies: Meane-while, wee will giue some Directions for more certaine Trials, of the Vertue and Influences of the Moone; which is our Nearest Neighbour.

The Influences of the Moone, (most obserued,) are Foure. The Drawing forth of Heat: The Inducing of Putrefaction: The Increase of Moisture: The Exciting of the Motions of Spirits.

For the Drawing forth of Heat, we haue formerly prescribed, to take Water Warme, and to set Part of it against the Moone-Beames, and Part of it with a Skreene betweene; And to see whether that which standeth Exposed to the Beames, will not Coole sooner. But because this is but a Small Interposition, (though in the Sunne wee see a Small Shade doth much,) it were good to try it, when the Moone shineth, and when the Moone shineth not at all; And with

Water Warme in a Glasse-Bottle, as well as in a Dish; And with C — rs; And with Iron Red-Hot; &c.

For the In — ing of Putrefaction, it were good to try it with Flesh, or Fish, Exposed to the Moone-Beames; And againe Exposed to the Aire, when the Moone shineth not, for the like time; To see whether will corrupt sooner: And try it also with Capon, or some other Fowle, laid abroad, to see whether it will mortifie, and become tender sooner? Try it also with Dead Flies, or Dead Wormes, hauing a little Water cast vpon them, to see whether will Putrifie sooner. Try it also with an Apple, or Orenge, hauing Holes made in their Tops, to see whether will Rot or Mould sooner-Try it also with Holland-Cheese, hauing Wine put into it, whether will breed Mites sooner, or greater?

For the Increase of Moisture, the Opinion Receiued is; That Seeds will grow soonest; And Haire, and Nailes, and Hedges, and Herbs, Cut, &c. will grow soonest, if they be Set, or Cut, in the Increase of the Moone. Also that Braines in Rabits, Woodcocks, Calues, &c. are fullest in the Full of the Moone: And so of — in the Bones; And so of Oysters, and — , which of all the rest are the easiest tried, if you haue them in Pits.

Take some —— —— and set some of them immediately after the Change; And others of the same kinde immediately after the Full: Let them be as Like as can be: The Earth also the Same as neare as may be; And therefore beft in Pots: Let the Pots also stand, where no Raine, or Sunne may come to them, lest the Difference of the Weather confound the Experiment: And then see in what Time, the Seeds Set in the Increase of the Moone, come to a certaine Height; And how they differ from chose that are Set in the Decrease of the Moone.

It is like, that the Braine of Man waxeth Moister, and Fuller, vpon the Full of the Moone: And therefore it were good for those that haue Moist Braines, and are great Drinkers, to take Fume of Lignum Aloës, RoseMary —— about the full of the Moone. It is like also, that the — in mens Bodies, Increase, and Decrease, as the Moone doth; And therefore it were good to Purge, some day, or two, after the Full; For that then the — will not replenish so soone againe.

As for the — of the Motion of the Spirits, you must note that the Growth of Hedges, Herbs, Haire, — is caused from the Moone, by — of the Spirits, as well as by Increase of the Moisture. But for Spirite in particular, the great Instante is in — .

There may be other Secret Effects of the Influence of the Moone, which are not yet brought into Obseruation. It may be, that if it so fill out, that the Wind be North, or North-East, in the Full of the Moone, it increaseth Cold; And if South, or South-West, it disposeth the Aire, for a good while, to Warmth, and Raine; Which would be obserued.

It may be, that Children, and Young Cattell, that are Brought forth in the Full of the Moone, are stronger, & larger, than those that are brought forth in the Wane: And those also which are Begotten in the Full of the Moone: So that it might be good Husbandry, to put Rams, and Bulls to their Females, somewhat before the Full of the Moone. It may be also, that the Egs lay'd in the Full of the Moone, breed the better Bird: And a Number of the like Effects, which may be brought into Obseruation: Quare also, whether great Thunders, and Earth-Quakes, be not most in the Full of the Moone?

The Turning of Wine to Vinegar, is a Kinde of Putrefaction: And in Making of Vinegar, they vse to set Vessels of Wine ouer against the Noone-Sunne; which calleth out the more Oyly Spirits, and leaueth the Liquour more Soure, and Hard. We see also, that Burnt-Wine is more Hard, and Astringent, than Wine Vnburnt. It is said, that Cider in Nauigations vnder the Line ripeneth, when Wine or Beere soureth. It were good to set a Rundlet of Veriuyce ouer against the Sunne, in Summer, as they doe Vinegar, to see whether it will Ripen, and Sweeten.

There be diuers Creatures, that Sleepe all Winter; As the Beare, the Hedge-hog, the Bat, the Bee, &c. These all wax Fat when they Sleepe, and egest not. The Cause of their Fattening, during their Sleeping time, may be the Want of Assimilating, For whatsoeuer Attimilation not to Flesh, turneth either to Sweat, or Fat. These Creatures, for part of their Sleeping Time, haue been obserued not to Stirre at all; And for the other part, to Stirre, but not to Remoue. And they get

Warme and Close Places to Sleepe in. When the Flemmings Wintred in Noua Zembla, the Beares, about the Middle of Nouember, went to Sleepe; And then the Foxes began to come forth, which durst not before. It is noted by some of the Ancients, that the Shee-Beare breedeth, and lyeth in with her Young, during that time of Rest: And that a Beare, Big with Young, hath seldome beene seene.

Some Liuing Creatures are Procreated by Copulation betweene Male, and Female: Some by Putrefaction; And of those which come by Putrefaction, many doe (neuerthelesse) afterwards procreate by Copulation. For the Cause of both Generations: First, it is most certaine, that the Cause of all Viuification, is a Gentle and Proportionable Heat, working vpon a Glutinous and Yeelding Substance: For the Heat doth bring forth Spirit in that Substance: And the Substance, being Glutinous, produceth Two Effects: The One, that the Spirit is Detained, and cannot Breake forth: The Other, that the Matter being Gentle, and Yeelding, is driuen forwards by the Motion of the Spirits, after some Swelling into Shape, and Members. Therefore all Sperme, all Menstruous Substance, all Matter whereof Creatures are produced by Putrefaction, haue euermore a Closenesse, Lentour, and Sequacity. It seemeth therefore, that the Generation by Sperme onely, and by Putrefaction, haue two Different Causes. The First is, for that Creatures, which haue a Definite and Exact Shape, (as those haue which are Procreated by Copulation,) cannot be produced by a Weake, and Casuall Heat; Nor out of Matter, which is not exactly Prepared, according to the Species. The Second is, for that there is a greater Time required, for Maturation of Perfect Creatures; For if the Time required in Viuification be of any length, then the Spirit will Exhale, before the Creature be Mature: Except it be Enclosed in a Place where it may haue Continuance of the Heat, Accesse of some Nourishment to maintaine it, and Closenesse that may keepe it from Exhaling. And such Places are the Wombes, and Matrices, of the Females. And therefore all Creatures, made of Putrefaction, are of more Vncertaine Shape; And are made in Shorter Time; And need not so Perfect an Enclosure, though some Closenesse be commonly required. As for the Heathen Opinion, which was, that vpon great Mutations of the World, Perfect Creatures were first Engendred of Concretion;

As well as Frogs, and Wormes, and Flies, and such like, are now; Wee know it to be vaine: But if any such Thing should be admitted, Discoursing according to Sense, it cannot be, except you admit a Chaos first, & Commixture of Heauen, and Earth. For the Frame of the World, once in Order, cannot effect it by any Extesse, or Casualtie.

X. Century.

THe Philosophie of Pythagoras, (which was full of Superstition,) did first plant a Monstrous Imagination, Which afterwards was, by the Schoole of Plato, and Others, Warred, and Nourished. It was, that the World was One, Entire, Perfect, Liuing Creature; Insomuch as Apolloni-of Tya-a, a Pythagorean Prophet, affirmed, that the Ebbing and Flowing of the Sea, was the Respiration of the World, drawing in Water as Breath, and putting it forth againe. They went on, and inferred; That if the World were a Liuing Creature, it had a Soule, and Spirit; Which also they ha — calling it Spiritus Mundi; The Spirit or Soule of the World: By which they did not intend God; (for they did admit of a Deitie besides;) But only the Soule, or Essentiall Forme of the Vniue-se. This Foundation being laid, they mought build vpon it, what they would; For in a Liuing Creature, though neuer so great, (As for Example, in a great Whale,) the Sense, and the Affects of any one Part of the Body, instantly make a Transcursion tho-rowout the whole Body: So that by this they did insinuate, that no Distance of Place, nor Want or Indisposition of Matter, could hinder Magicall Operations; But that, (for Example,) wee mought here in Europe, haue Sense and Feeling of that, which was done in China: And likewise, we mought worke any Effect, without, and against Matter: And this, not Holpen by the Cooperation of Angels, or Spirits, but only by the Vnitie and Harmonie of Nature. There were some also, that staid not here; but went further, and held; That if the Spirit of Man, (whom they call the Microcosme,) doe giue a fit touch to the Spirit of the World, by strong Imaginations, and Beleefes, it might command Nature; For Paracelsus, and some darksome Authors of Magicke, doe ascribe to Imagination Exalted, the Power of Miracle-working Faith. With these Vast and Bottomelesse Follies, Men haue been (in part) entertained.

But wee, that hold firme to the Works of God; And to the Sense, which is Gods Lampe; (Lucerna Dei Spiraculum Hominis;) willen quire, with all Sobrietie, and Seueritie, whether there be to be found, in the Foot-steps of

Nature, any such Transmission and Influx of Immateriate Vertues; And what the Force of Imagination is; Either vpon the Body Imaginant, or vpon another Body: Wherein it will be like that Labour of Hercules, in Purging the Stable of Augeas, to separate from Superstitious, and Magicall Arts, and Obseruations, any thing that is cleane, and pure Naturall; And not to be either Contemned, or Condemned. And although wee shall haue occasion to speake of this in more Places than One, yet we will now make some Entrance thereinto.

Men are to be Admonished, that they doe not with-draw Credit, from the Operations by Transmission of Spirits, and Force of Imagination, because the Effects faile sometimes. For as in Infection, and Contagion from Body to Body, (as the Plague, and the like,) it is most certaine, that the Infection is receiued (many times) by the Body Passiue, but yet is by the Strength, and good Disposition thereof, Repulsed, and wrought out, before it be formed into a Disease; So much more in Impressions from Minde to Minde, or from Spirit to Spirit, the Impression taketh, but is Encountred, and Ouercome, by the Minde and Spirit, which is Passiue, before it worke any manifest Effect. And therefore, they worke most vpon Weake Mindes, and Spirits: As those of Women; Sicke Persons; Superstitious, and Fearfull Persons; Children, and Young Creatures;

Nescio quis teneros Oculus mihi fascinat Agnos:

The Poet speaketh not of Sheepe, but of Lambs. As for the Weaknesse of the Power of them, vpon Kings, and Magistrates; It may be ascribed, (besides the maine, which is the Protection of God, ouer those that Execute his Place,) to the Weaknesse of the Imagination of the Imaginant: For it is hard, for a Witch, or a Sorcerer, to put on a Beleefe, that they can hurt such Persons.

Men are to be Admonished, on the other side, that they doe not easily giue Place and Credit to these Operations, because they Succeed many times; For the Cause of this Successe, is (oft) to be truly ascribed, vnto the Force of Affection and Imagination, vpon the Body Agent; And then by a Secondary Meanes, it may worke vpon a Diuers Body: As for Example; If a Man carry a Planets Seale, or a Ring, or some Part of a Beast, beleeuing strongly, that it will helpe him to obtaine his Loue; Or to keepe him from danger of hurt in Fight; Or to preuaile in

a Suit; &c. it may make him more Actiue, and Industrious; And againe, more Confident, and Persisting, than otherwise he would be. Now the great Effects that may come of Industrie, and Perseuerance, (especially in Ciuill Businesse,) who knoweth not? For wee see Audacitie doth almost binde and mare the weaker Sort of Minds; And the State of Humane Actions is so variable, that to trie Things oft, and neuer to giue ouer, doth Wonders: Therefore, it were a Meere Fallacie and Mistaking, to ascribe that to the Force of Imagination, vpon another Body, which is but the Force of Imagination vpon the Proper Body: For there is no doubt, but that Imagination, and Vehement Affection, worke greatly vpon the Body of the Imaginant: As wee shall shew in due place.

Men are to be Admonished, that as they are not to mistake the Causes of these Operations; So, much lesse, they are to mistake the Fact, or Effect; And rashly to take that for done, which is not done. And therefore, as diuers wise Indges haue prescribed, and cautioned, Men may not too rashly beleeue, the Confessions of Witches, nor yet the Enidence against them. For the Witches themselues are Imaginatiue, and beleeue oft-times, they doe that, which they doe not: And People are Credulous in that point, and ready to impute Accidents, and Naturall Operations, to Witch Craft. It is worthy the Obseruing, that both in Ancient, and Late times; (As in the Thassalian Witches, and the Meetings of Witches that haue beene recorded by so many late Confessions;) the great Wonders which they tell, of Carrying in the Aire; Transforming themselues into other Bodies; &c. are still reported to be wrought, not by Incantations, or Ceremonies; But by Ointments, and Annointing themselues all ouer. This may iustly moue a Man to thinke, that these Fables are the Effects of Imagination: For it is certaine, that Ointments doe all, (if they be laid on any thing thicke,) by Stopping of the Pores, shut in the Vapours, and send them to the Head extremely. And for the Particular Ingredients of those Magicall Ointments, it is like they are Opiate, and Soporiferous. For Annointing of the Fore-head, Necke, Feet, Back-Bone, we know is vsed for Procuring Dead Sleepes: And if any Man say, that this Effect would be better done by Inward Potions; Answer may be made, that the Medicines, which goe to the Ointments, are so strong, that if they

were vsed inwards, they would kill those that vse them: And therefore they worke Potently, though Outwards.

We will diuide the Seuerall Kindes of the Operations, by Transmission of Spirits, and Imagination; Which will giue no small Light to the Experiments that follow. All Operations by Transmission of Spirits, and Imagination haue this; That they Worke at Distance, and not at Touch; And they are these being distinguished.

The First is the Transmission or Emission, of the Thinner, and more Airy Parts of Bodies; As in Odours, and Infections; And this is, of all the rest, the most Corporeall. But you must remember withall, that there be a Number of those Emissions, both Wholesome, and Vnwholesome, that giue no Smell at all: For the Plague, many times, when it is taken, giueth no Sent at all: And there be many Good and Healthfull Aires, that doe appeare by Habitation, and other Proofes, that differ not in Smell from other Aires. And vnder this Head, you may place all Imbibitions of Aire, where the Substance is Materiall, Odour-like; Whereof some neuerthelesse are strange, and very suddenly diffused; As the Alteration, which the Aire receiueth in AEgypt, almost immediately, vpon the Rising of the Riuer of Nilus, whereof we haue spoken.

The Second is the Transmission or Emission of those Things that wee call Spirituall Species; As Visibles, and Sounds: The one whereof wee haue handled; And the other we shall handle in due place. These moue swiftly, and at great distance; But then they require a Medium well disposed; And their Transmission is easily stopped.

The Third is the Emissions, which cause Attraction of Certaine Bodies at Distance; Wherein though the Loadstone be commonly placed in the First Ranke, yet we thinke good to except it, and referre it to another Head: But the Drawing of Amber, and let, and other Electricke Bodies; And the Attraction in Gold of the Spirit of Quick-Siluer, at distance; And the Attraction of Heat at distance; And that of Fire to Naphtha; And that of some Herbs to Water, though at distance; And diuers others; We shall handle, but yet not vnder this present Title, but vnder the Title of Attraction in generall.

The Fourth is the Emission of Spirits, and Immateriate Powers and Vertues, in those Things, which worke by the Vniuersall Configuration, and Sympathy of the World; Not by Formes, or Colestiall Influxes, (as is vainly caught and receiued,) but by the Primitiue Nature of Matter, and the Seeds of Things. Of this kinde is, (as we yet suppose,) the Working of the Load-Stone, which is by Consent with the Globe of the Earth: Of this Kinde is the Motion of Grauity, which is by Consent of De-se Bodies, with the Globe of the Earth: Of this kinde is some Disposition of Bodies to Rotation, and particularly from East to West: Of which kinde we conceiue the Maine Float and Re-float of the Sea is, which is by Consent of the Vniuerse, as Part of the Diurnall Motion. These I — teriate Vertues haue this Property differing from Others; That the Diuersity of the Medium hindreth them not; But they passe through all Mediums; yet at Determinate distances. And of these we shall speake, as they are incident to seuerall Titles.

The Fifth is the Emissions of Spirits; And this is the Principall in our Intention to handle now in this Place Namely, the Operation of the Spirits of the Minde of Man, vpon other Spirits: And this is of a Double Nature: The Operations of the Affections, if they be Vehement; And the Operation of the Imagination, if it be Strong. But these two are so Conp — d, as we shall handle them together: For when an E — io-, or Am-ro — Aspect doth infect the Spirits of Another, there is Ioyned both Affection, and Imagination.

The Sixth is, the Influxes of the Hea — ly Bodies, besides those two Manifest Oues, of Heat, and Light. But these we will handle, where we handle the C-lestiall Bodies, and Motions.

The Seuenth is the Operations of Sympathy; Which the Writers of Naturall Magicke haue brought into an Art, or Precept: And it is this; That if you desire to Super-induce, any Vertue or Disposition, vpon a Person, you should take the Liuing Creature, in which that Vertue is most Emine — , and in Perfection: Of that Creature you must take the Parts, wherein that Virtue chiefly is Collecate: Againe, you must take those Parts, in the Time, and Act, when that Vertue is most in Exercise; And then you must apply it to that Part of Man, wherein that

Vertue chiefly Consisteth. As if you would Super-induce Courage and Fortitude, take a Lion, or a Coche; And take the Heart, Teeth, or Paw of the Lion; Or the Heart, or Spurre of the Cocke: Take those Parts immediately after the Lion, or the Cocke haue beene in Fight; And let them be worne, vpon a Mans Heart, or Wrest. Of these and such like Sympathies, we shall speake vnder this present Title.

The Eighth and last is, an Emission of Immateriate Vertues; Such as we are a little doubtfull to Propound; It is so predigious: But that it is so conste-ly a-ouched by many: And wee hour set it downe, as a Law to our Selues, to examine things to the Bottome; And not to receiue vpon Credit, or reiect vpon Improbabilities, vntill there hath passed a due Examination. This is, the Sympathy of Indiuiduals: For as there is a Sympathy of Species; So, (it may be) there is a Sympathy of Indiuiduals: That is, that in Things, or the Parts of Things, that haue beene once Contiguous, or Entire, there should remaine a Transmission of Vertue, from the One to the Other: As betweene the Weapon, and the Wound. Whereupon is blazed abroad the Operation of Vnguentum Teli: And so of a Peece of Lard, or Sticke of Elder, &c. that if Part of it be Consumed or Putrified, it will worke vpon the other Part Seuered. Now wee will pursue the Instances themselues.

The Plague is many times taken without Manifest Sense, as hath beene said. And they report, that where it is found, it hath a Sent, of the Smell of a Mellow Apple; And (as some say) of May-Flowers: And it is also receiued, that Smels of Flowers, that are Mellow and Lushious, are ill for the Plague; As White Lillies, Cowslips, and Hyacinths.

The Plague is not easily receiued by such, as continually are about them, that haue the Plague; As Keepers of the Sicke, and Physitians; Nor againe by such as take Antidotes, either Inward, (as Mithridate; InniperBerries; Rue, Leafe and Seed; &c.) Or Outward, (as Angelica, Zedoary, and the like, in the Mouth; Tarre, Galbanum, and the like, in Perfume;) Nor againe by Old People, and such as are of a Dry and Cold Complexion. On the other side, the Plague taketh soonest hold

of those, that come out of a Fresh Aire; And of those that are Fasting; And of Children; And it is likewise noted to goe in a Bloud, more than to a Stranger.

The most Pernicious Infection, next the Plague, is the Smell of the Iayle; When Prisoners haue beene Long, and Close, and Nastily kepti Whereof we haue had, in our time, Experience, twice or thrice; when both the Iudges that sate vpon the Iayle, and Numbers of those that attended the Businesse, or were present, Sickned vpon it, and Died. Therfore it were good wisdome, that in such Cases, the Iayle were Aired, before they be brought forth.

Out of question, if such Foule Smels be made by Art, and by the Hand, they consist chiefly of Mans Flesh, or Sweat, Putrified; For they are not those Stinckes, which the Nosthrils streight abhorre, and expell, that are most Pernicious; But such Aires, as haue some Similitude with Mans Body; And so insinuate themselues, and betray the Spirits. There may be great danger, in vsing such Compositions, in great Meetings of People, within Houses; As in Churches; At Arraignments; At Playes and Solemnities; And the like; For Poysoning of Aire is no lesse dangerous than Poysoning of Water; Which hath beene vsed by the Turkes in the Warres; And was vsed by Emanuel Commenus towards the Christians, when they passed thorow his Countrey to the Holy Land. And these Empoisonments of Aire, are the more dangerous in Meetings of People; Because the much Breath of People, doth further the Reception of the Infection: And therefore, where any such Thing is feared, it were good, those Publique Places were perfumed, before the Assemblies.

The Empoysonment of Particular Persons, by Odours, hath beene reported to be in Perfumed Gloues, or the like: And it is like, they Mingle the Poyson that is dexdly, with some Smels that are Sweet, which also maketh it the sooner receiued. Plagues also haue been raised by Annointings of the Chinckes of Doores, and the like; Nor so much by the Touch, as for that it is common for Men, when they finde any thing Wet vpon their Fingers, to put them to their Nose; Which Men therefore should take heed how they doe. The best is, that these Compositions of Infectious Aires, cannot be made without Danger of

Death, to them that make them. But then againe, they may haue some Antidotes to saue themselues, So that Men ought not to be secure of it.

There haue beene, in diuers Countries, great Plagues, by the Putrefaction, of great Swarmes of Grasse-Hoppers, and L-custs, when they haue beene dead, and cast vpon Heaps.

It hapneth oft in Mines, that there are Damps, which kill, either by Suffocation, or by the Poysonous Nature of the Minerall: And those that deale much in Refining, or other Workes about Metals, and Minerals, haue their Braines Hurt and Stupefied by the Metalline Vapours. Amongst which, it is noted, that the Spirits of Quick-Siluer, euer fly to the Skull, Teeth, or Bones; In so much as Gilders vse to haue a Peece of Gold in their Mouth, to draw the Spirits of the Quick-Siluer; Which Gold afterwards they finde to be Whintened. There are also certaine Lakes, and Pits, such as that of Anernus, that Poyson Birds, (as is said,) which fly ouer them; Or Men, that stay too long about them.

The Vapour of Char-Code, or Sea-Coale, in a Close Roome, hath killed many: And it is the more dangerous, because it commeth without any Tll Smell; But stealeth on by little and little; Enducing only a F — nesse, without any Manifest Strangling. When the Dutch-Men Wintred at Noua Zembla, and that they could gather no more Stickes, they fell to make Fire of some Sea-Coale they had, wherewith (at first) they were much refreshed; But a little after they had sit about the Fire, there grew a Generall Silence, and lothnesse to speake amongst them; And immediately after, One of the Weakest of the Company, fell downe in a Swoune; Whereupon they doubting what it was, opened their doore, to let in Aire, and so saued themselues. The Effect (no doubt) is wrought by the Inspissation of the Aire; And so of the Breath, and Spirits. The like ensueth in Roomes newly Plastered, if a Fire be made in them; Whereof no lesse Man than the Emperour Ioninianus Died.

Vide the Experiment, 803. touching the Infectious Nature of the Aire, vpon the First Showers, after long Drought.

It hath come to passe, that some Apothecaries, vpon Stamping of Coloquintida, haue beene put into a great Sk — ring, by the Vapour onely.

It hath beene a Practise, to burne a Pepper, they call Ginny-Pepper; Which hath such a strong Spirit, that it prouoketh a Continuall Sneezing, in those that are in the Roome.

It is an Ancient Tradition, that Bleare-Byes infect Sound-Eyes; And that a Menstruous Woman, looking vpon a Glasse, doth rust it. Nay they haue an Opinion, which seemeth Fabulous; That Menstruous Women, going ouer a Field, or Garden, doe Corne and Herbes good by Killing the Wormes.

The Tradition is no lesse Ancient, that the Bafiliske killeth by Aspect; And that the Wolfe, if he see a Man first, by Aspect striketh a Man hoarse.

Perfumes Conuenient doe dry and strengthen the Braine; And stay Rbeumes and Defluxions; As we finde in Fame of Rose-Mary dryed, and Lignum Aloës, and Calamus, taken at the Mouth, and Nosthrils; And no doubt there be other Perfumes, that doe moisten, and refresh; And are fit to be vsed in Burning Agues, Consumptions, and too much Wakefulnesse; Such as are, Rose-Water, Vinegar, Limon-Pills, Violets, the Leanes of Vines sprinckled with a little Rose-Water, &c.

They doe vse in Sudden Faintings, and Swonnings, to put a Handkerchiefe with Rose Water, or a Little Vinegar, to the Nose; Which gathereth together againe the Spirits, which are vpon point to resolue, and fall away.

Tobacco comforteth the Spirits, and dischargeth Wearinesse; Which it worketh partly by Opening; But chiefly by the Opiate Vertue, which condenseth the Spirits. It were good therefore to try the Taking of Fumes by Pipes, (as they doe in Tobacco,) of other Things; As well to dry, and comfort, as for other Intentions. I wish Triall be made of the Drying Fume, of Rose-Mary, and Lignum Aloës, before mentioned, in Pipe; And so of Nutmeg, and Folium Indum; &c.

The Following of the Plough, hath been approued, for Refreshing the Spirits, and Procuring Appetite: But to doe it in the Ploughing for Wheat, or Rye, is not so good; Because the Earth hath spent her Sweet Breath, in Vegetables, put forth in Summer. It is better therefore to doe it, when you sow Barley. But because Ploughing is tied to Seasons, it is best to take the Aire of the Earth, new turned

vp, by Digging with the Spade; Or Standing by him that Diggeth. Gentlewomen may doe themselues much good by kneeling vpon a Cushion, and Weeding. And these Things you may practise in the best Seasons; Which is euer the Early Spring. before the Earth putteth forth the Vegetables; And in the Sweetest Earth you can chuse. It would be done also, when the Dew is a little off the Ground, lest the Vapour be too Moist. I knew a great Man, that liued Long, who had a Cleane Clod of Earth, brought to him euery Morning, as he sate in his Bed; And he would hold his Head ouer it, a good pretty while. I Commend also, sometimes, in Digging of New Earth, to poure in some Malmesey, or Greeke Wine; That the Vapour of the Earth, and Wine together, may comfort the Spirits, the more; Prouided alwaies, it be not taken, for a Heathen Sacrifice, or Libation to the Earth.

They haue, in Physicke, Vse of Pomanders, and Knots of Powders, for Drying of Rheumes, Comforting of the Heart, Prouking of Sleepe, &c. For though those Things be not so Strong as Perfumes, yet you may haue them continually in your Hand; whereas Perfumes you can take but at Times; And besides, there be diuers Things, that breath better of themselues, than when they come to the Fire; As Nigella Romana, the Seed of Melanthium, A-o-num, &c.

There be two Things, which (inwardly vsed) doe Coole and condense the Spirits; And I wish the same to be tried outwardly in Vapours. The One is Nitre, which I would haue dissoluted in Malmesey, or GreekeWine, and so the Smell of the Wine taken; Or if you would haue it more forcible, poure of it vpon a Fire-pan, well heated, as they doe Rose-Water, and Vinegar. The other is, the Distilled Water of Wilde Poppy; which I wish to be mingled, at halfe, with Rose-Water, and so taken with some Mixture of a few Clones, in a Perfuming-Pan. The like would be done with the Distilled Water of Saffron Flowers.

Smells of Muske, and Amber, and Ciuit, are thought to further Venereous Appetite: Which they may doe by the Refreshing and Calling forth of the Spirits.

Incense, and Nidorous Smells, (such as were of Sacrifices,) were thought to Intoxicate the Braine, and to dispose Men to Deuotion: Which they may doe, by a kinde of Sadnesse, and Contristation of the Spirits: And partly also by Heating,

and Exalting them. Wee see, that amongst the Iewes, the Principall Perfume of the Sanctuary, was forbidden all Common Vses.

There be some Perfumes, prescribed by the Writers of Naturall Magicke, which procure Pleasant Dreames; And some others, (as they say,) that procure Propheticall Dreames; As the Seeds of Flax, Fleawort, &c.

It is certaine, that Odours doe, in a small Degree, Nourish; Especially the Odour of Wine: And we see Men a hungred, doe loue to smell Hot Bread. It is related, that Democritus, when he lay a dying, heard a Woman, in the House, complaine, that she should be kept from being at a Feast, and Solemnity, (which she much desired to see,) because there would be a Corps in the House; Whereupon he caused Loaues of New Bread to be sent for, and opened them; And powred a little Wine into them; And so kept himselfe aliue with the Odour of them, till the Feast was past. I knew a Gentleman, that would fast (sometimes) three or foure, yea fiue dayes, without Meat, Bread, or Drinke; But the same Man vsed to haue continually, a great Wispe of Herbes, that he smelled on: And amongst those Herbes, some Esculent Herbs of strong Sent; As Onions, Garlicke, Leekes, and the like.

They doe vse, for the Accident of the Mother, to burne Feathers, and other Things of Ill Odour: And by those Ill Smells, the Rising of the Mother is put downe.

There be Aires, which the Physitians aduise their Patients to remoue vnto, in Consumptions, or vpon Recouery of Long Sicknessess Which (commonly) are Plaine Champaignes, but Grasing, and not Ouen-growne with Heath, or the like: Or else Timber-Shades, as in Forrests, and the like. It is noted also, that Groues of Bayes doe forbid Pestilent Aires; Which was accounted a great Cause of the Wholesome Aire of Antiochia. There be also some Soyles that put forth Odorate Herbes of themselues; As Wilde Thyme; Wilde Maioram; Penny-Roiall; Camomill; And in which the BriarRoses smell almost like Muske-Roses; Which (no doubt) are Signes that doe discouer an Excellent Aire.

It were good for Men, to thinke of hauing Healthfull Aire, in their Houses; Which will neuer be, if the Roomes be Low-roosed, or full of Windowes, and

Doores; For the one maketh the Aire Close, and not Fresh; And the other maketh it Exceeding Vnequall; Which is a great Enemy to Health. The Windowes also should not be high vp to the Roofe, (which is in vse for Beauty, and Magnificence,) but Low. Also Stone-Walls are not wholesome; But Timber is more wholesome; And especially Brick. Nay it hath beene vsed by some, with great Successe, to make their Walls thicke; And to put a Lay of Chalke betweene the Brickes, to take away all Dampishnesse.

These Emissions, (as we said before,) are handled, and ought to be handled, by themselues, vnder their Proper Titles: That is, Visibles, and Andibles, each a-part: In this Place, it shall suffice to giue some generall Obseruations, Common to both. First, they seeme to be Incorporeall. Secondly, they Worke Swiftly. Thirdly, they Worke at Large Distances. Fourthly, in Curious Varieties. Fifthly, they are not Effectiue of any Thing; Nor leaue no Worke behinde them; But are Energies meerely; For their Working vpon Mirrours, and Places of Eccho, doth not alter any Thing in those Bodies; But it is the same Action with the Originall, onely Repercussed. And as for the Shaking of windowes, or Rarefying the Aire by Great Noyses; And the Heat caused by Burning-Glasses; They are rather Concomitants of the Andible, and Visible Species, than the Effects of them. Sixthly, they seeme to be ofso Tender, and Weake a Nature, as they affect onely such a Rare, and Attenuate Substance, as is the spirit of Liuing Creatures.

It is mentioned in some Stories, that where Children haue been Exposed, or taken away young from their Parents; And that afterwards they haue approached to their Parents presence, the Parents, (though they haue not knowne them,) haue had a Secret Ioy, or Other Alteration thereupon.

There was an AEgyptian South-Sayer, that made Anthonius beleeue, that his Genius, (which otherwise was Braue, and Confident,) was, in the Presence of Octanianus Caesar, Poore, and Cowardly: And therefore, he aduised him, to absent himselfe, (as much as he could,) and remoue far from him. This South-Sayer was thought to be suborned by Cleopatra, to make him liue in AEgypt, and other Remote Places from Rome. Howsouer the Conceit of a Perdominant

or Mastering Spirit, of one Man ouer Another, is Ancient, and Receiued still, euen in Vulgar Opinion.

There are Conceits, that some Men, that are of an Ill, and Melancholy Nature, doe incline the Company, into which they come, to be Sad; and Ill disposed; And contrariwise, that Others, that are of a Iouiall Nature, doe dispose the Company to be Merry and Cheerefull. And againe, that some Men are Lucky to be kept Company with, and Employed; And Others Vnlucky. Certninly, it is agreeable to Reason, that there are, at the least, some Light Effluxions from Spirit to Spirit, when Men are in Presence one with another, as well as from Body to Body.

It hath beene obserued, that Old Men, who haue loued Toung Company, and beene Conuersant continually with them, haue beene of Long Life; Their Spirits, (as it seemeth,) being Recreated by such Company. Such were the Ancient Sophists, and Rhetoricians; Which euer had Young Auditours, and Disciples; As Gorgias, Protagoras, Isocrates, &c. Who liued till they were an Hundred yeares Old. And so likewise did many of the Grammarians, and Schoole-Masters; such as was Orbilius, &c.

Audacity and Confidence doth; in Ciuill Businesse, so great Effects, as a Man may (reasonably) doubt, that besides the very Daring, and Earnestnesse, and Persisting and Importunity, there should be some Secret Binding, and Stooping of other Mens Spirits, to such Persons.

The Affections (no doubt) doe make the Spirits more Powerfull, and Actiue; And especially those Affections, which draw the Spirits into the Eyes: Which are two: Loue, and Enuy, which is called Oculus Malus. As for Loue, the Platonists, (some of them,) goe so farre, as to hold that the Spirit of the Louer, doth passe into the Spirits, of the Person Loued; Which causeth the desire of Returne into the Body, whence it was Emitted: Whereupon followeth that Appetite of Contact, and Coninuction. which is in Louers. And this is obserued likewise, that the Aspects that procure Loue, are not Gazings, but Sudden Glances, and Dartings of the Eye. As for Enuy, that emitteth some Maligne and Poysonous Spirit, which taketh hold of the Spirit of Another; And is likewise of greatest

Force, when the Cast of the Eye is Oblique. It hath beene noted also, that it is most Dangerous, when an Enuious Eye is cast vpon Persons in Glory, and Triumph, and Ioy. The Reason whereof is, for that, at such times, the Spirits come forth most, into the Outward Parts, and so meet the Percussion of the Enuious Eye, more at Hand: And therefore it hath beene noted, that after great Triumphs, Men haue beene ill disposed, for some Daies following. We see the Opinion of Fascination is Ancient, for both Effects; Of Procuring Loue; And Sicknesse caused by Envy: And Fascination is euer by the Eye. But yet if there be any such Infection from Spirit to Spirit, there is no doubt, but that it worketh by Presence, and not by the Eye alone; Yet most Forcibly by the Eye.

Feare, and Shame, are likewise Infection; For we see that the Starting of one will make another ready to Start: And when one Man is out of Conntenance in a Company, others doe likewise Blush in his behalfe.

Now we will speake of the Force of Imagination vpon other Bodies; And of the Meanes to Exalt and Strengthen it. Imagination, in this Place, I vnderstand to be, the Representation of an Indiuiduall Thought. Imagination is of three Kinds: The First Ioyned with Beleefe of that which is to Come: The Second Ioyned with Memory of that which is Past: And the Third is of Things Present, or as if they were Present; For I comprehend in this, Imaginations Faigned, and at Pleasure; As if one should Imagine such a Man to be in the Vestments of a Pope; Or to haue Wings. I single out, for this time, that which is with Faith, or Beleefe of that which is to Come. The Inquisition of this Subiect, in our way, (which is by Induction,) is wonderfull hard; for the Things that are reported, are full of Fables; And New Experiments can hardly be made, but with Extreme Caution, for the Reason which wee will hereafter declare.

The Power of Imagination is in three Kindes; The First, vpon the Body of the Imaginant; Including likewise the Childe in the Mothers Wombe; The Second is, the Power of it vpon Dead Bodies, as Plants, Wood, Stone, Metall, &c. The Third is, the Power of it, vpon the Spirits of Men, and Liuing Creatures: And with this last we will onely meddle.

The Probleme therefore is, whether a Man Constantly and Strongly Beleeuing, that such a Thing shall be; (As that such an One will Loue Him; Or that such an One will Grant him his Request; Or that such an One shall Recouer a Sicknesse; Or the like;) It doth helpe any thing to the Effecting of the Thing it selfe. And here againe we must warily distinguish; For it is not meant, (as hath beene partly said before,) that it should helpe by Making a Man more Stout, or more Industrious; (In which kinde a Constant Beleefe doth much;) But meerely by a Secret Operation, or Binding, or Changing the Spirit of Another: And in this it is hard, (as we began to say,) to make any New Experiment; For I cannot command my Selfe to Beleeue what I will, and so no Triall can be made. Nay it is worse; For whatsoeuer a Man Imagineth doubtingly, or with Feare, must needs doe hurt, if Imagination haue any Power at all; For a Man representeth that oftner, that he feareth, than the contrary.

The Helpe therefore is, for a Man to worke by Another, in whom he may Create Beleefe, and not by Himselfe; Vntill Himselfe haue found by Experience, that Imagination doth preuaile; For then Experience worketh in Himselfe Beleefe; If the Beleefe, that such a Thing shall be, be ioyned with a Beleefe, that his Imagination may procure it.

For Example; I related one time to a Man, that was Curious, and Vaine enough in these Things; That I saw a Kinds of Iugler, that had a Paire of Cards, and would tell a Man what Card he thought. This Pretended Learned Man told me; It was a Mistaking in Me; For (said he) it was not the Knowledge of the Mans Thought, (for that is Proper to God,) but it was the Inforcing of a Thought vpon him, and Binding his Imagination by a Stronger, that he could Thinke no other Card. And thereupon he asked me a Question, or two, which I thought he did but cunningly, knowing before what vsed to be the Feats of the Iugler. Sir, (said hee,) doe you remember whether he told the Card, the Man thought, Himselfe, or bade Another to tell it. I answered (as was true;) That be bade Another tell it. Whereunto he said; so I thought: For (said he) Himselfe could not haue put on so strong an Imagination; But by telling the other the Card, (who beleeued that the Iugler was some Strange Man, and could doe Strange Things,)

that other Man caught a strong Imagination. I harkened vnto him, thinking for a Vanity he spoke prettily. Then he asked me another Question: Saith he; Doe you remember, whether he had the Man think the Card first, and afterwards told the other Man in his Eare, what he should thinke, Or else that he did whisper first in the Mans Eare, that should tell the Card, telling that such a Man should thinke such a Card, and after bade the Man thinke a Card? I told him, as was true; That he did first whisper the Man in the Eare, that such a Man should thinke such a Card: Vpon this the Learned Man did much Exult, and Please himselfe, saying; Loe, you may see that my Opinion is right: For if the Man had: thought first, his Thought had beene Fixed; But the other Imagining first, bound his Thought. Which though it did somewhat sinke with mee, yet I made it Lighter than I thought, and said; I thought it was Confederacy, betweene the Iugler, and the two Seruants: Though (Indeed) I had no Reason so to thinke: For they were both my Fathers Seruants; And he had neuer plaid in the House before. The Iugler also did cause a Garter to be held vp; And tooke vpon him, to know, that such a One, should point in such a Place, of the Garter; As it should be neare so many Inches to the Longer End, and so many to the Shorter; And still he did it, by First Telling the Imaginer, and after Bidding the Actour Thinke.

Hauing told this Relation, not for the Weight thereof, but because it doth handsomely open the Nature of the Question; I returne to that I said; That Experiments of Imagination, must be practised by Others, and not by a Mans Selfe. For there be Three Meanes to fortifie Beleefe: The First is Experience: The Second is Reason: And the Third is Authoritie: And that of these, which is farre the most Potent, is Authoritie: For Beleefe vpon Reason, or Experience, will Stagger.

For Authoritie, it is of two Kindes; Beleefe in an Art; And Beleefe in a Man. And for Things of Beleefe in an Art; A Man may exercise them by Himselfe; But for Beleefe in a Man, it must be by Another. Therfore, if a Man beleeue in Astrologie, and finde a Figure Prosperous; Or beleeue in Naturall Magicke, and that a Ring with such a Stone, or such a Peece of a Liuing Creature, Carried, will doe good; It may helpe his Imagination: But the Beleefe in a Man is farre the

more Actiue. But howsoeuer, all Authoritie must be out of a Mans Selfe, turned (as was said,) either vpon an Art, or vpon a Man: And where Authoritie is from one Man to another, there the Second must be Ignorant, and not Learned, or Full of Thoughts; And such are (for the most part) all Witches, and Superstitious Persons; Whose Beleefes, tied to their Teachers, and Traditions, are no whit controlled, either by Reason, or Experience: And vpon the same Reason, in Magicke, they vse (for the most part,) Boyes, and Young People; whose Spirits easiliest take Beleefe, and Imagination.

Now to fortifie Imagination, there be three Wayes: The Authoritie whence the Beleefe is deriued; Meanes to Quicken and Corroborate the Imagination; And Meanes to Repeat it, and Refresh it.

For the Authoritie, wee haue already spoken: As for the Second; Namely the Meanes to Quicken, and Corroborate the Imagination; Wee see what hath beene vsed in Magicke; (If there be in those Practises any thing that is purely Naturall;) As Vestments; Characters; Words; Seales; Some Parts of Plants, or Liuing Creatures; Stones; Choice of the Houre; Gestures and Motions; Also Incenses, and Odours; Choice of Societie, which increaseth Imagination; Diets and Preparations for some time before. And for Words, there haue beene euer vsed, either Barbarous Words, of no Sense, lest they should disturbe the Imagination; Or Words of Similitude, that may second and feed the Imagination: And this was euer as well in Heathen Charmes, as in Charmes of latter Times. There are vsed also Scripture-Words; For that the Beleefe, that Religious Texts, and Words, haue Power, may strengthen the Imagination: And for the same Reason, Hebrew Words, (which amongst vs is counted the Holy Tongue, and the Words more Mysticall,) are often vsed.

For the Refreshing of the Imagination, (which was the Third Meanes of Exalting it;) Wee see the Practises of Magicke, as in Images of Wax,

and the like, that should Melt by little, and little; Or some other Things Buried in Mucke, that should Putrifie by little and little; Or the like: For so oft as the Imaginant doth thinke of those Things, so oft doth he represent to his Imagination, the Effect of that he desireth.

If there be any Power in Imagination, it is lesse credible, that it should be so Incorporcall and Immateriate a Vertue, as to worke at great Distances; Or through all Mediums Or vpon all Bodies: But that the Distance must be Competent; The Medium not Aduerse; And the Body Apt and Proportionate. Therefore if there be any Operation vpon Bodies, in Absence, by Nature; it is like to be conueyed from Man to Man, as Fame is; As if a Witch, by Imagination, should hurt any afarre off, it cannot be naturally, but by Working vpon the Spirit of some, that commeth to the Witch; And from that Party vpon the Imagination of Another; And so vpon Another; till it come to one that hath resort to the Party Intended; And so by Him to the Party intended himselfe. And although they speake, that it sufficeth, to take a Point, or a Peece of the Garment, or the Name of the Party, or the like; yet there is lesse Credit to be giuen to those Things, except it be by Working of euill Spirits.

The Experiments, which may certainly demonstrate the Power of Imagination, vpon other Bodies, are few, or none: For the Experiments of Witchcraft, are no cleare Proofes; For that they may be, by a Tacite Operation of Maligne Spirits: We shall therefore be forced, in this Enquire, to resort to New Experiments: Wherein wee can giue only Directions of Trialls, and not any Positiue Experiments. And if any Man thinke, that wee ought to haue staied, till wee had made Experiment, of some of them, our selues, (as wee doe commonly in other Titles,) the Truth is, that these Effects of Imagination vpon other Bodies, haue so little Credit with vs, as we shall trie them at leisure: But in the meane Time, we will lead others the way.

When you worke by the Imagination of Another, it is necessary, that He, by whom you worke, haue a Precedent Opinion of you, that you can doe Strange Things; Or that you are a Man of Art, as they call it; For else the Simple Affirmation to Another, that this or that shall be, can worke but a weake Impression, in his Imagination.

It were good, because you cannot discerne fully of the Strength of Imagination, in one Man more than another, that you did vse the Imagination of more than One; That so you may light vpon a Strong One. As if a Physitian

should tell Three, or Foure, of his Patients Seruants, that their Master shall surely recouer.

The Imagination of One, that you shall vse, (such is the Variety of Mens Mindes,) cannot be alwaies alike Constant, and Strong; And if the Successe follow not speedily, it will faint and leese Strength. To remedy this, you must pretend to Him, whose Imagination you vse, seuerall Degrees of Meanes, by which to Operate; As to prescribe him, that euery three Dayes, if he finde not the Successe Apparent, he doe vse another Root, or Part of a Beast, or Ring, &c. As being of more Force; And if that faile, Another; And if that, Another; till Seuen Times. Also you must prescribe a good Large Time for the Effect you promise; As if you should tell a Seruant of a Sick-Man, that his Master shall recouer, but it will be Fourteene daies, eare he findeth it apparently, &c. All this to entertaine the Imagination, that it wauer lesse.

It is certaine, that Potions, or Things taken into the Body: Incenses and Perfumes taken at the Nosthrills; And Ointments of some Parts; doe (naturally) worke vpon the Imagination of Him that taketh them. And therefore it must needs greatly Cooperate with the Imagination of him, whom you vse, if you presribe him, before he doe vse the Receit, for the Worke which he desireth, that he doe take such a Pill, or a Spoonefull of Liquour, Or burne such an Incense; Or Annoint his Temples, or the Soles of his Feet, with such an Ointment, or Oyle: And you must chuse, for the Composition of such Pill, Perfume, or Ointment, such Ingredients, as doe make the Spirits, a little more Grosse, or Muddy: Whereby the Imagination will fix the better.

The Body Passiue, and to be Wrought Vpon, (I meane not of the Imaginant,) is better wrought vpon, (as hath beene partly touched,) at some Times, than at other: As if you should prescribe a Seruant, about a Sick Person, (whom you haue possessed, that his Master shall recouer,) when his Master is fast asleepe, to vse such a Root, or such a Root. For Imagination is like to worke better vpon Sleeping Men, than Men Awake, As wee shall shew when we handle Dreames.

We finde in the Art of Memory, that Images Visible, worke better than other Conceits: As if you would remember the Word Philosophy, you shall more

surely doe it, by Imagining that such a Man, (For Men are best Places,) is reading vpon Aristotles Physickes; Than if you should Imagine him to say; I'le goe study Philosophy. And therefore, this Obseruation would be translated to the Subiect wee now speake of: For the more Lustrous the Imagination is, it filleth and fixeth the better. And therefore I conceiue, that you shall, in that Experiment, (whereof wee spake before,) of Binding of Thoughts, lesse faile, if you tell One, that such an One shal name one of Twenty Men, than if it were One of Twenty Cards. The Experiment of Binding of Thoughts, would be Diuersified, and tried to the Full: And you are to note, whether it hit for the most part, though not alwaies.

It is good to consider, vpon what Things, Imagination hath most Force: And the Rule, (as I conceiue,) is, that it hath most Force vpon Things, that haue the Lightest, and Easiest Motions. And therefore aboue all, vpon the Spirits of Men: And in them, vpon such Affections, as moue Lightest; As vpon Procuring of Loue; Binding of Lust, which is euer with Imagination; vpon Men in Feare; Or Men in Irresolution; And the like. Whatsoeuer is of this kinde would be throughly enquired. Trialls likewise would be made vpon Plants. and that diligently: As if you should tell a Man, that such a Tree would Dye this yeare; And will him, at these and these times, to goe vnto it, to see how it thriueth. As for In — imate Things, it is true, that the Mount of Shuffling of Cards, or Casting of Dice, are very Light Motions; And there is a Folly very vsuall, that Gamesters imagine, that some that stand by them, bring them ill Lucke. There would be Triall also made, of holding a Ring by a Threed in a Glasse, and telling him that holdeth it, before, that it shall strike so many times against the Side of the Glasse, and no more; Or of Holding a Key betweene two Mens Fingers, without a Charme; And to tell those that hold it, that at such a Name, it shall goe off their Fingers: For these two are Extreme Light Motions. And howsoeuer I haue no Opinion of these things, yet so much I conceiue to be true; That Strong Imagination hath more Force vpon Things Liuing, Or that haue, been Liuing, than Things meerely Inauimate; And more Force likewise vpon Light, and Subtill Motions, than vpon Motions Vehement, or P-nderous.

It is an vsuall Obseruation, that if the Body of One Murthered, be brought before the Murtherer, the Wounds will bleed a-fresh, Some doe affirme, that the Dead Body, vpon the Presence of the Murtherer, hath opened the Eyes; And that there haue beene such like Motions, as well where the Party Murthered hath beene Strengled, or Drew-ed, as where they haue beene Killed by Wounds, It may be, that this participateth of a Miracle, by Gods Iust Iudgement, who vsually bringeth Murthers to Lights But if it be Naturall, it must be referred to Imagination.

The Tying of the Point vpon the day of Mariage, to make Men Impotent towards their Wiues, which (as we haue formerly touched,) is so frequent in Zant, and Gascony, if it be Naturall, must be referred to the Imagination of Him that Tieth the Point. I conceiue it to haue the lesse Affinity with Witchcraft, because not Peculiar Persons onely, (such as Witches are,) but any Body may doe it.

There be many Things that worke vpon the Spirits of Man, by Secret Sympathy, and Antipathy; The Vertues of Pretious Stones worne, haue beene anciently and generally Receiued: And curiously assigned to Worke seuerall Effects. So much is true; That Stones haue in them fine Spirits; As appeareth by their Splendour: And therefore they may worke by Consort vpon the Spirits of Men, to Comfort, and Exhilarate them. Those that are the best, for that Effect, are the Diamond. the Emerald, the Iacinth Orientall, and the Gold-Stone, which is the Yellow Topaze. As for their particular Proprieties, there is no Credit to be giuen to them. But it is manifest, that Light, aboue all things, excelleth in Comforting the Spirits of Men: And it is very probable, that Light Varied doth the same Effect, with more Nouelty. And this is one of the Causes, why Pretious Stones comfort. And therefore it were good to haue Tincted Lanthornes. or Tincted Skreenes, of Glasse Coloured into Greene, Blew, Carnation, Crimson, Purple, &c. And to vse them with Candles in the Night. So likewise to haue Round Glasses, not onely of Glasse Coloured thorow, but with Colours laid betweene Crystals, with Handles to hold in ones Hand. Prismes are also Comfortable Things. They haue of Paris-Worke, Looking-Glasses, bordered

with broad Borders of small Crystall, and great Counterfete Pretious Stones, of all Colours, that are most Glorious and Pleasant to behold; Especially in the Night. The Pictures of Indian Feathers, are likewise Comfortable, and Pleasant to behold. So also Faire and Cleare Pooles doe greatly comfort the Eyes, and Spirits; Especially when the Sunne is not Glaring, but Ouercast; Or when the Moone shineth.

There be diuers Sorts of Bracelets fit to Comfort the Spirits; And they be of Three Intentions: Refrigerant; Corroborant; and Aperient. For Refrigerant, I wish them to be of Pearle, or of Corall, as is vsed: And it hath beene noted that Corall, if the Party that weareth it be ill disposed, will wax Pale: Which I beleeue to be true, because otherwise Distemper of Heat will make Corall lose Colour. I Commend also Beads, or little Plates of Lapis Lazuli; And Beads of Nitre, either alone, or with some Cordiall Mixture.

For Corroboration and Confortation, take such Bodies as are of Astringent Quality, without Manifest Cold. I commend Bead-Amber; which is full of Astriction, but yet is Vnctuous, and not Cold; And is conceiued to Impinguate those that weare such Beads: I commend also, Beads of HartsHorne, and Iuory, which are of the like Nature; Also Orenge-Beads; Also Beads of Lignum Aloës, Macerated first in Rose-Water, and Dryed.

For Opening, I Commend Beads, or Peeces of the Roots of Cardius Benedictus: Also of the Roots of Piony the Male; And of Orris; And of Calamus Aromaticus; And of Rew.

The Crampe, (no doubt,) commeth of Contraction of Sinnewes; Which is Manifest, in that it commeth either by Cold, or Drinesse; As after Consumptions, and Long Agues: For Cold and Drinesse doe (both of them) Contract, and Corrugate. We see also, that Chasing a little aboue the Place in paine, easeth the Crampe; Which is wrought by the Dilatation, of the Contracted Sinnewes, by Heat. There are in vse, for the Preuention of the Crampe, two Things; The one Rings of Sea Horse Teeth, worne vpon the Fingers; The other Bands of Greene Periwinckle, (the Herbe,) tied about the Calfe of the Leg, or the Thigh, &c. where the Crampe vseth to come. I doe finde this the more strange, because

Neither of these haue any Relaxing Vertue, but rather the Contrary. I iudge therefore, that their Working, is rather vpon the Spirits, within the Nerues, to make them striue lesse; Than vpon the Bodily Substance of the Nerues.

I would haue Triall made of two other Kindes of Bracelets, for Comforting the Heart, and Spirits; The one of the Trechisch of Vipers, made into little Peeces of Beads; For since they doe great Good Inwards, (especially for Pestilent Agues, it is like they will be Effectuall Outwards; Where they may be applied in greater Quantity. There would be Trochish likewise made of Snakes; Whose Flesh dried, is thought to haue a very Opening, and Cordiall Vertue. The other is, of Beads made of the Scarlet Powder, which they call Kermes; Which is the Principall Ingredient in their Cordiall Confection Alkermes: The Beads would be made vp with AmberGrice, and some Pomander.

It hath beene long receiued, and confirmed by diuers Trialls; That the Root of the Male-Piony, dried, tied to the Necke, doth helpe the Falling-Sicknesse; And likewise the Incubus, which wee call the Mare. The Cause of both these Diseases, and especially of the Epilepsie from the Stomach, is the Grossenesse of the Vapours, which rise and enter into the Cells of the Braine: And therfore the Working is, by Extreme, and Subtill Attenuations; Which that Simple hath. I iudge the like to be in Castoreum, Muske, Rew-Seed, Agnus Castus Seed, &c.

There is a Stone, which they call the Bloud-Stone, which worne is thought to be good for them that Bleed at the Nose: Which (no doubt) is by Astriction, and Cooling of the Spirits. Quare, if the Stone taken out of the Toads Head, be not of the like Vertue? For the Toade loueth Shade, and Coolenesse.

Light may be taken from the Experiment of the Horse-Tooth-Ring, and the Garland of Periwinckle, how that those things, which asswage the Strife of the Spirits, doe helpe diseases, contrary to the Intention desired: For in the Curing of the Crampe, the Intention is to relax the Sinnewes; But the Contraction of the Spirits, that they striue lesse, is the best Helpe: So to procure easie Tranailes of Women, the Intention is to bring downe the Childe; But the best Helpe is, to stay the Comming downe too Fast: Whereunto they say, the Toad-Stone likewise helpeth. So in Pestilent Feaners, the Intention is to expell the Intection by Sweat,

and Enapouration; But the best Meanes to doe it, is by Nitre, Diascordium, and other Coole Things, which doe for a time arrest the Expulsion, till Nature can doe it more quietly. For as one faith prettily; In the Quenching of the Flame of a Pestilent Ague, Nature is like People, that come to quench the Fire of a House; which are so busie, as one of them letteth another. Surely, it is an Excellent Axiome, and of Manifold Vse, that whasoeuer appeaseth the Contention of the Spirits, furthereth their Action.

The Writers of Naturall Magick, commend the Wearing of the Spoile of a Snake, for Preseruing of Health; I doubt it is but a Conceit; For that the Snake is thought to renue her Touth, by Casting her Spoile. They might as well take the Beake of an Eagle, or a Peece of a HartsHorne, because those Renue.

It hath beene Anciently Receiued, (For Pericles the Athenian vsed it,) and it is yet in vse, to weare little Bladders of Quick-Siluer, or Tablets of Arsenicke, as Preseruatines against the Plague: Not as they conceiue, for any Comfort they yeeld to the Spirits, but for that being Poysons themselues, they draw the Venome to them, from the Spirits.

Vide the Experiments 95.96. and 97. touching the Seuerall Sympathies, and Antipathies, for Medicinall Vse.

It is said, that the Guts or Skin of a Wolfe being applyed to the Belly, doe cure the Cholicke. It is true, that the Wolfe is a Beast of great Edacity, and Disgestion; And so, it may be, the Parts of him comfort the Bowels.

We see Scare-Crowes, are set vp to keep Birds from Corne, and Fruit; It is reported by some, that the Head of a Wolfe, whole, dried, and hanged vp in a Done-House, will scare away Vermine; Such as are Weasils, Polcats, and the like. It may be, the Head of a Dog will doe as much; For those Vermine with vs, know Dogs better than Wolues.

The Braines of some Creatures, (when their Heads are roasted) taken in Wine, are said to strengthen the Memory: As the Braines of Hares; Braines of Hens; Braines of Deeres, &c. And it seemeth, to be incident to the Braines of those Creatures, that are Fearefull.

The Ointment, that Witches vse, is reported to be made, of the Fat of Children, digged out of their Granes; Of the Iuyees of Smallage, Wolfebane, and Cinquefoile; Mingled with the Meale of fine Wheat. But I suppose that the Soperiferous Medicines are likest to doe it; Which are Henbane, Hemlocke, Mandrake, Moone-Shade, Tabacco, Opium, Saffron, PoplarLeaues, &c.

It is reported by some, that the Affections of Beasts, when they are in Strength, doe adde some Vertue, vnto Inanimate Things; As that the Skin of a Sheepe, deuoured by a Wolfe, moueth Itching; That a Stone, bitten by a Dog in Anger, being throwne at him, drunke in Powder, prouoketh Choler.

It hath beene obserued, that the Diet of Women with Childe, doth worke much vpon the Infant; As if the Mother eat Quinces much, and Coriander-Seed, (the Nature of both which is to represse and stay Vapours, that ascend to the Braine,) it will make the Childe Ingenious: And on the contrary side, if the Mother eat (much) Onions, or Beanes, or such Vapourous Food; Or drinke Wine, or Strong Drinke, immoderately; Or Fast much; Or be giuen to much Musing; (All which send, or draw Vapours to the Head,) It endangereth the Childe to become Lunaticke, or of Ionperfect Memory: And I make the same Iudgement of Tobacco, often taken by the Mother.

The Writers of Naturall Magicke report, that the Heart of an Ape, worne neare the Heart, comforteth the Heart, and increaseth Audacity. It is true, that the Ape is a Merry and Bold Beast. And that the same Heart likewise of an Ape, applied to the Necke, or Head, helpeth the Wit; And is good for the Falling-Sicknesse: The Ape also is a Witty Beast, and hath a Dry Braine; Which may be some Cause of Attenuation of Vapours in the Head. Yet it is said to moue Dreames also. It may be, the Heart of a Man would doe more, but that is more against Mens Mindes to vse it; Except it be in such as weare the Reliques of Saints.

The Flesh of a Hedge-Hog, Dressed, & Eaten, is said to be a great Drier: It is true, that the Iuyce of a Hedge-Hog, must needs be Harsh, and Dry, because it putteth forth so many Prickles: For Plants also, that are full of Prickles, are

generally Dry: As Briars, Thornes, Berberries: And therefore the Ashes of a Hedge-Hog are said to be a great Desiccatiue of Fistula's.

Mummy hath great force in Stanching of Bloud; which, as it may be ascribed to the Mixture of Balmes, that are Glutinous; So it may also partake of a Secret Propriety; In that the Bloud draweth Mans Flesh. And it is approued, that the Mosse, which groweth vpon the Skull of a Dead Men, vnburied, will stanch Bloud potently. And so doe the Dregs, or Powder of Bloud, seuered from the Water, and Dried.

It hath beene practised, to make White Swallowes, by Annointing of the Egs with Oyle. Which Effect may be produced, by the Stopping of the Pores of the Shell, and making the Iuyce, that putteth forth the Feathers afterwards, more Penurious. And it may be, the Annointing of the Egs, will be as Effectuall, as the Annointing of the Body; Of which Vide the Experiment 93.

It is reported, that the White of an Egge, or Bloud, mingled with Salt-Water, doth gather the Saltnesse, and maketh the Water sweeter. This may be by Adhesion; As in the 6. Experiment of Clarification: It may be also, that Bloud, and the White of an Egge, (which is the Malter of a Liuing Creature,) haue some Sympathy with Salt: For all Life hath a Sympathy with Salt. We see that Salt, laid to a Cut Finger, healeth it; So as it seemeth Salt draweth Bloud, as well as Bloud draweth Salt.

It hath beene anciently receiued, that the Sea-Hare, hath an Antipathy with the Lungs, (if it commeth neare the Body,) and erodeth them. Where of the Cause is conceiued to be, a Quality it hath of Heating the Brath, and Spirits; As Cantharides haue vpon the Watery Parts of the Body; As -ine and Hydro-icall Water. And it is a good Rule, that whatsoeuer hath an Operation vpon certaine Kindes of Matters, that, in Mars Body; worketh most vpon those Parts, wherein that kinde of Matter — .

Generally, that which is Dead, or Corrapted, or Excerned, hath Antipathy with the same Thing, when it is Aliue, and when it is Sound; And with those Parts which doe Excerne: As a Carkasse of Man is most Infectious, and Odious to Man; A Carrion of an Horse to an Horse, &c. Puro — Matter of Wounds, and

Vlcers, Car — ctes, Pockes, Scabs, Leprousie, to Sound Flesh; And the Excrement of euery Species to that Creature that Externeth them. But the Excrements are lesse Pericious than the Corruptions.

It is a Common Experience, that Dog know the Dog-Killer; When as in times of Infection. some Petty F ——— — is sent out to kill the Dogges; And that, though they haue neuer seene him before; yet they will all come forth, and barke, and fly at him.

The Relutions touching the Force of — , and the Secret — of Nature are so vncertaine, as they require a great deale of Examination, ere — conclude vpon them. I would haue it first throughly inquired, whether there be any Secret Passages of Sympathy, betweene Persons of neare Bloud; As Parents, Children, Brothers, Sisters, NurseChildren, Husbands, Wiues, &c. There be many Reports in Historie, that vpon the Death of Persons of such Nearenesse, Men haue had an inward Feeling of it. I my Selfe remember, that being in Paris, and my Father dying in London, two or three dayes before my Fathers death, I had a Dreame, which I told to diuers English Gentlemen; That my Fathers House, in the Countrey, was Plastered all ouer with Blacke Mortar. There is an Opinion abroad, (whether Idle or no I cannot say,) That louing and kinde Husbands, haue a Sense of their Wiues Breeding Childe, by some Accident in their owne Body.

Next to those that are Neare in Bloud, there may be the like Passage, and Instincts of Nature, betweene great Friends, and Enemies: And sometimes the Reucaling is vnto Another Person, and not to the Party Himselfe. I remember Philippus Commineus, (a graue Writer,) reporteth; That the Arch-Bishop of Vienna, (a Reuerend l'relate,) said (one day) after Masse, to King Lewis the eleuenth of France; Sir, your Mortall Enemie is dead; What time Duke Charles of Burgundie was Slaine, at the Battell of Granson, against the Switzers. Some triall also would be made, whether Pact or Agreement doe any thing; As if two Friends should agree, that such a Day in euery Weeke, they being in farre Distant Places, should Pray one for Another; Or should put on a Ring, or Tablet, one for anothers Sake; Whether if one of them should breake their Vow and Promise, the other should haue any Feeling of it, in Absence.

If there be any Force in Imaginations and Affections of Singular Persons; It is Probable the Force is much more in the Ioynt Imaginations and Affections of Multitudes: As if a Victorie should be won, or lost, in Remote Parts, whether is there not some Sense thereof, in the People whom it concerneth; Because of the great Ioy, or Griefe, that many Men are prossest with, at once? Pius Quintus, at the very time, when that Memorable Victorie was won, by the Christians, against the Turks, at the Nauall Battell of Lepanto, being then hearing of Causes in Consistorie, brake off suddenly, and said to those about him; It is now more time, we should giue thanks to God, for the great Victorie he hath granted vs, against the Turks. It is true, that Victorie had a Sympathie with his Spirit; For it was meerely his Worke, to conclude that League. It may be, that Reuelation was Diuine; But what shall wee say then, to a Number of Examples, amongst the Grecians, and Romans? Where the People, being in Theaters at Playes, haue had Newes of Victories, and Ouerthrowes, some few dayes, before any Messenger could come.

It is true, that that may hold in these Things, which is the generall Root of Superstition; Namely, that Men obserue when Things Hit, and not when they Misse: And commit to Memory the one, And forget and passe ouer the other. But touching Diuination, and the Misgiuing of Mindes, wee shall speake more, when wee handle in generall, the Nature of Mindes, and Soules, and Spirits.

Wee haue giuen formerly some Rules of Imgination; And touching the Fortifying of the Same. Wee haue set downe also some few Instances, and Directions, of the Force of Imagination, vpon Beasts, Birds, &c. vpon Plants; And vpon Inanimate Bodies: Wherein you must still obserue, that your Trialls be vpon Subtill and Light Motions, and not the contrary; For you will sooner, by Imagination, binde a Bird from Singing, than from Eating, or Flying: And I leaue it to euery Man, to choose Experiments, which himself thinketh most Commodious; Giuing now but a few Examples of euery of the Three Kindes.

Vse some Imaginant, (obseruing the Rules formerly prescribed,) for Binding of a Bird from Singing; And the like of a Dogge from Barking. Trie also the Imagination of some, whom you shall accommodate with things to fortifie it, in

Cocke-Fights, to make one Cocke more Hardy, and the other more Cowardly. It would be tried also, in Flying of Hawkes; Or in Coursing of a Deere, or Hare, with Grey-hounds; Or in Horse-Races; And the like Comparatiue Motions: For you may sooner by Imagination, quicken or slacke a Motion, than raise or cease it; As it is easier to make a Dogge goe slower, than to make him stand still that he may not run.

In Plants also, you may trie the Force of Imagination, vpon the Lighter Sort of Motions: As vpon the Sudden Fading, or Liuely Comming vp of Herbs; Or vpon their Bending one way, or other; Or vpon their Closing, and Opening; &c.

For Inanimate Things, you may trie the Force of Imagination, vpon Staying the Working of Beere, when the Barme is put in; Or vpon the Comming of Butter, or Cheese, after the Cherming, or the Rennet bee put in.

It is an Ancient Tradition, euery where alleaged, for Example of Secret Proprieties and Influxes, that the Torpede Marina, if it be touched with a long Stick, doth stupefie the Hand of him that toucheth it. It is one degree of Working at Distance, to worke by the Continuance of a Fit Medium; As Sound will be conueyed to the Eare, by striking vpon a Bow-String, if the Horne of the Bow be held to the Eare.

The Writers of Naturall Magicke, doe attribute much to the Vertues, that come from the Parts of Liuing Creatures; So as they be taken from them, the Creatures remaining still aliue: As if the Creature still liuing did infuse some Immateriate Vertue, and Vigour, into the Part Seuered. So much may be true; that any Part, taken from a Liuing Creature, newly Slaine, may be of greater force, than if it were taken from the like Creature dying of it Selfe, because it is fuller of Spirit.

Triall would be made, of the like Parts of Indiuidualls, in Plants, and Liuing Creatures; As to cut off a Stocke of a tree; And to lay that, whith you cut off, to Putrifie, to see whether it will Decay the Rest of the Stocke: Or if you should cut off part off the Taile, or Legge of a Dogge, or a Cat, and lay it to Putrifie, and so see whether it will Fester, or keepe from Healing, the Part which remaineth.

It is receiued, that it helpeth to Continue Loue, if one weare a Ring, or a Bracelet, of the Haire of the Party Beloued. But that may be by the Exciting of the Imagination: And perhaps a Gloue, or other like Fauour, may as well doe it.

The Sympathie of Indiuiduals, that haue beene Entire, or haue Touched, is of all others the most Incredible: Yet according vnto our faithfull Manner of Examination of Nature, wee will make some little mention of it. The Taking away of Warts, by Rubbing them with Somewhat that afterwards is put to waste, and consume, is a Common Experiment: And I doe apprehend it the rather, because of mine owne Experience. I had, from my Childhood, a Warts, vpon one of my Fingers: Afterwards when I was about Sixteene Yeeres old, being then at Paris, there grew vpon both my Hands a Number of Warts, (at the least an hundred,) in a Moneths Space. The English Embassadours Lady, who was a Woman farre from Superstition, told me, one day; She would helpe me away with my Warts: Whereupon she got a Peece of Lard, with the Skin on, and rubbed the Warts all ouer, with the Fat Side; And amongst the rest that Wart, which I had had from my Childhood; Then she uailed the Peece of Lord, with the Fat towards the Sunne, vpon a Poast of her Chamber Window, which was to the South, The Successe was, that within fiue weekes space, all the Warts went quite away: And that Wart, which I had so long endured, for Company. But at the rest I did little maruell, because they came in a Short time, and might goe away in a Short Time againe: But the Going away of that, which had staid so long, doth yet sticke with mee. They say the like is done, by the Rubbing of Warts with a Greene Elder Sticke, and then Burying the Sticke to Rot in Mucke. It would be tried, with Cornes, and Wenns, and such other Excrescences. I would haue it also tried, with some Parts of Liuing Creatures, that are nearest the Nature of Excrescences; As the Combes of Cocks, the Spurres of Cocks, the Hornes of Beasts, &c. And I would haue it tried both wnyes; Both by Rubbing those Parts with Lord, or Elder, as before; And by Cutting off some Peece of those Parts, and laying it to Consume; To see whether it will Worke any Effect, towards the Consumption of that Part, which was once Ioyned with it.

It is constantly Receiued, and touched, that the Anointing of the Weapon, than maketh the Wound, will heale the Wound it selfe. In this Experiment, vpon the Relation of Men of Credit, (though my selfe, as yet, am not fully inclined to beleoue it,) you shall note the Points following. First the Ointment, wherewith this is done, is made of Diuers Ingredients; whereof the Strangest and Hardest to come by, are the Mosse vpon the Skull of a dead Men, Vnburied; And the Fats of a Beare, and a Beare, killed in the Act of Generation. These two last I could easily suspect to be prescribed at a Starting Hole; That if the Experiment proued not, it mouight be pretended, that the Beasts were not killed in the due Time; For as for the Mosse, it is certaine, there is great Quantitie of it in Ireland, vpon Slaine Bodies, laid on Heaps, Vnburied. The other Ingredients are, the Bloud-Stone in Powder, and some other Things, which seeme to haue a Vertue to Stanch Bloud; As also the Mosse hath. And the Description of the Whole Ointment is to be found in the Chymicall Dispensatorie of Crollius. Secondly, the same Kinde of Ointment, applied to the Hurt it selfe, worketh not the Effect; but only applied to the Weapon. Thirdly, (which I like well) they doe not obserue the Confecting of the Ointment, vnder any certaine Constellation; which commonly is the Excuse of Magicall Medicines, when they faile, that they were not made vnder a fit Figure of Heauen. Fourthly, it may be applied to the Weapon, though the Party Hurt be at great Distance. Fifthly, it seemeth the Imagination of the Party, to be Cured, is not needfull to Concurre; For it may be done, without the Knowledge, of the Party Wounded; And thus much hath beene tried, that the Ointment (for Experiments sake,) hath beene wiped off the Weapon, without the knowledge of the Party Hurt, and presently the Party Hurt, hath beene in great Rage of Paine, till the Weapon was Reannointed. Sixthly, it is affirmed, that if you cannot get the Weapon, yet if you put an Instrument of Iron, or Wood, resembling the Weapon, into the Wound, whereby it bleedeth, the Annointing of that Instrument will serue, and worke the Effect. This I doubt should be a Deuice, to keepe this strange Forms of Cure, in Request, and Vse; Because many times you cannot come by the Weapon it selfe. Seuenthly, the Wound must be at first Washed cleans, with White Wine, or the Parties owne

Water; And then bound vp close in Fine Linnen, and no more Dressing renewed, till it be whole. Eighthly, the Sword it selfe must be Wrapped vp Close, as farre as the Ointment goeth, that it taketh no Wind. Ninthly, the Ointment, if you wipe it off from the Sword, and keepe it, will Serue againe; and rather Increase in Vertue, than Diminish. Tenthly, it will Cure in farte Shorter Time, than Ointments of Wounds commonly doe. Lastly, it will Cure a Beast, as well as a Man; which I like best of all the rest, because it subiecteth the Matter, to an Easie Triall.

I would haue Men know, that though I reprehend, the Easie Passing ouer, of the Causes of Things, by Ascribing them to Secret and Hidden Vertues, and Proprieties; (For this hath arrested, and laid asleepe, all true Enquiry, and Indications;) yet I doe not vnderstand, but that in the Practicall Part of Knowledge, much will be left to Experience, and Probation, whereunto Indication cannot so fully reach: And this not onely in Specie, but in Indiuiduo. So in Physicke, if you will cure the Iaundies, it is not enough to say, that the Medicine must not be Cooling; For that will hinder the Opening which the Disease requireth: That it must not be Hot; For that will exasperate Choler: That it must goe to the Gall; For there is the Obstruction which causeth the Disease, &c. But you must receiue from Experience, that Powder of Chamapytis, or the like, drunke in Beere, is good for the Iaundies: So againe, a wise Physitian doth not continue still the same Medicine, to a Patient; But he will vary, if the first Medicine doth not apparently succeed; For of those Remedies, that are good for the Iaundies, Stone, Agues, &c. that will doe good in one Body, which will not doe good in Another; According to the Correspondence the Medicine hath to the Indiuduall Body.

The Delight which Men haue in Popularity, Fame, Honour, Submission, and Subiection of other Mens Mindes, Wills, or Affections, (although these Things may be desired for other Ends,) seemeth to be a Thing, in it selfe, without Contemplation of Consequence, Gratefull & agreeable to the Nature of Man. This Thing (surely) is not without some Signification, as if all Spirits and Soules of Men, came forth out of one Diuine Limbus; Else why should Men be so much

affected with that, which others thinke, or say? The best Temper of Mindes desireth Good Name, and True Honour: The Lighter, Popularity, and Applause; The more depraued, Subiection, and Tyranny; As is seene in great Conquerours, and Troublers of the World: And yet more in Arch-Heretickes; for the Introducing of new Doctrines, is likewise an Affectation of Tyranny, ouer the Vnderstandings, and Beleefes of Men.

A TABLE OF the Experiments.

Century. I.

OF Strayning or Percolation, Outward and inward; Experiments 8.
page 1
Of Motion vpon Pressure. Experiments 5.
page 3
Of Separations of Bodies Liquid by weight. Exper. 3.

THE STUDENT’S PRAYER.
THE WRITER’S PRAYER.

A PRAYER, OR PSALM, MADE BY THE LORD BACON, CHANCELLOR OF ENGLAND.

Most gracious Lord God, my merciful Father, from my youth up, my Creator, my Redeemer, my Comforter. Thou, Lord, soundest and searchest the depths and secrets of all hearts: thou acknowledges! the upright of heart: thou judgest the hypocrite: thou ponderest men's thoughts and doings as in a balance: thou measurest their intentions as with a line: vanity and crooked ways cannot be hid from thee.

Remember, O Lord, how thy servant hath walked before thee: remember what I have first sought, and what hath been principal in my intentions. I have loved thy assemblies: I have mourned for the divisions of thy church: I have delighted in the brightness of thy sanctuary. This vine, which thy right hand hath planted in this nation, I have ever prayed unto thee, that it might have the first and the latter rain; and that it might stretch her branches to the seas and to the floods. The state and bread of the poor and oppressed have been precious in mine eyes: I have hated all cruelty and hardness of heart: I have, though in a despised weed, procured the good of all men. If any have been my enemies, I thought not of them; neither hath the sun almost set upon my displeasure; but I have been as a dove, free from superfluity of maliciousness. Thy creatures have been my books, but thy Scriptures much more. I have sought thee in the courts, fields, and gardens, but I have found thee in thy temples.

Thousands have been my sins,and ten thousands my transgressions; but thy sanctifications have remained with me, and my heart, through thy grace, hath been an unquenched coal upon thine altar. O Lord, my strength, I have since my youth met with thee in all my ways, by thy fatherly compassions, by thy comfortable chastisements, and by thy most visible providence. As thy favours have increased upon me, so have thy corrections; so as thou hast been always near me, O Lord; and ever as my worldly blessings were exalted, so secret darts from thee have pierced ire; and when I have ascended before men, I have

descended in humiliation before thee. And now, when I thought most of peace and honour, thy hand is heavy upon me, and hath humbled me according to thy former loving-kindness, keeping me still in thy fatherly school, not as a bastard, but as a child. Just are thy judgments upon me for my sins, which are more in number than the sands of the sea, but have no proportion to thy mercies; for what are the sands of the sea, earth, heavens, and all these are nothing to thy mercies. Besides my innumerable sins, I confess before thee, that I am debtor to thee for the gracious talent of thy gifts and graces, which I have neither put into a napkin, nor put it, as I ought, to exchangers, where it might have made best profit, but misspent it in things for which I was least fit: so I may truly say, my soul hath been a stranger in the course of my pilgrimage. Be merciful unto me, Lord, for my Saviour's sake, and receive me into thy bosom, or guide me in thy way.

A PRAYER MADE AND USED BY THE LORD CHANCELLOR BACON

O eternal God, and most merciful Father in Jesus Christ: Let the words of our mouths, and the meditations of our hearts be now and ever gracious in thy sight, and acceptable unto thee, Lord, our God, our strength, and our Redeemer.

O eternal God, and most merciful Father in Jesus Christ, in whom thou hast made a covenant of grace and mercy with all those that come unto thee in him; in his name and mediation we humbly prostrate ourselves before the throne of thy mercies seat, acknowledging that, by the breich of all thy holy laws and commandments, we are become wild olive branches, strangers to thy covenant of grace; we have defaced in ourselves thy sacred image imprinted in us by creation; we have sinned against heaven and before thee, and are no more worthy to be called thy children. O admit us into the place even of hired servants. Lord, thou hast formed us in our mothers' wombs, thy providence hath hitherto watched over us, and preserved us unto this period of time: stay not the course of thy mercies and loving-kindness towards us: have mercy upon us, O Lord, for thy dear Son Christ Jesus sake, who is the way, the truth, and the life. In him, O Lord, we appeal from thy justice to thy mercy, beseeching thee in his name, and for his sake only, thou wilt be graciously pleased freely to pardon and forgive us all our sins and disobedience, whether in thought, word, or deed, committed against thy divine majesty; and in his precious blood-shedding, death, and perfect obedience, free us from the guilt, the stain, the punishment, and dominion of all our sins, and clothe us with his perfect righteousness. There is mercy with thee, O Lord, that thou mayest be feared; yea, thy mercies swallow up the greatness of our sins: speak peace to our souls and consciences; make us happy in the free remission of all our sins, and be reconciled to thy poor servants in Jesus Christ, in whom thou art well pleased: suffer not the works of thine own hands to perish; thou art not delighted in the death of sinners, but in their conversion. Turn our hearts, and we shall be turned; convert us, and we shall be

converted; illuminate the eyes of our minds and understanding with the bright beams of thy Holy Spirit, that we may daily grow in the saving knowledge of the heavenly mystery of our redemption, wrought by our dear Lord and Saviour Jesus Christ; sanctify our wills and affection by the same Spirit, the most sacred fountain of all grace and goodness; reduce them to the obedience of thy most holy will in the practice of all piety toward thee, and charity towards all men. Inflame our hearts with thy love, cast forth of them what displeaseth thee, all infidelity, hardness of heart, profaneness, hypocrisy, contempt of thy holy word and ordinances, all uncleanness, and whatsoever advanceth itself in opposition to thy holy will. And grant that henceforth, through thy grace, we may be enabled to lead a godly, holy, sober, and Christian life, in true sincerity and uprightness of heart before thee. To this end, plant thy holy fear in our hearts, grant that it may never depart from before our eyes, but continually guide our feet in the paths of thy righteousness, and in the ways of thy commandments: increase our weak faith, grant it may daily bring forth the true fruits of unfeigned repentance, that by the power of the death of our Lord and Saviour Jesus Christ we may daily die unto sin, and by the power of his resurrection we may be quickened, and raised up to newness of life, may be truly born anew, and may be effectually made partakers of the first resurrection, that then the second death may never have dominion over us. Teach us, O Lord, so to number our days, that we may apply our hearts unto wisdom; make us ever mindful of our last end, and continually to exercise the knowledge of grace in our hearts, that in the said divorce of soul and body, we may be translated here to that kingdom of glory prepared for all those that love thee, and shall trust in thee; even then and ever, O Lord, let thy holy angels pitch their tents round about us, to guard and defend us from all the malice of Satan, and from all perils both of soul and body. Pardon all our unthankfulness, make us daily more and more thankful for all thy mercies and benefits daily poured down upon us. Let these our humble prayers ascend to the throne of grace, and be granted not only for these mercies, but for whatsoever else thy wisdom knows needful for us; and for all those that are in need, misery, and distress, whom, Lord, thou hast afflicted either in soul of

body; grant them patience and perseverance in the end, and to the end: And that, O Lord, not for any merits of ours, but only for the merits of thy Son, and our alone Saviour Christ Jesus; to whom with thee and the Holy Spirit be ascribed all glory, &c. *Amen*.

THE STUDENT'S PRAYER.

To God the Father, God the Word, God the Spirit, we pour forth most humble and hearty supplications; that he remembering the calamities of mankind, and the pilgrimage of this our life, in which we wear out days few and evil, would please to open to us new refreshments out of the fountains of his goodness, for the alleviating of our miseries. This also we humbly and ear nestly beg, that human things may not prejudice such as are divine; neither that from the unlocking of the gates of sense, and the kindling of a greater natural light, any thing of incredulity, or intellectual night, may arise in our minds towards divine mysteries. But, rather, that by our mind thoroughly cleansed and purged from fancy and vanities, and yet subject and perfectly given up to the divine oracles, there may be given unto faith the things that are faith's. *Amen*.

THE WRITER'S PRAYER.

Thou, O Father, who gavest the visible light as the first-born of thy creatures, and didst pour into man the intellectual light as the top and consummation of thy workmanship, be pleased to protect and govern this work, which coming from thy goodness, returneth to thy glorv. Thou after thou hadst reviewed the works which thy hands had made, beheldest that every thing was very good, and thou didst rest with complacency in them. But man, reflecting on the works which he had made, saw that all was vanity and vexation of spirit, and could by no means acquiesce in them. Wherefore, if we labour in thy works with the sweat of our brows, thou wilt make us partakers of thy vision and thy Sabbath We humbly beg that this mind may he steadfastly in us; and that thou, by our hands, and also by the hands of others, on whom thou shall bestow the same spirit, wilt please to convey a largess of new alms to thy family of mankind. These things we commend to thy everlasting love, by our Jesus, thy Christ, God with us. *Amen*.

The Union of the Two Kingdoms of Scotland and England

CERTAIN ARTICLES OR CONSIDERATIONS, TOUCHING THE UNION OF THE KINGDOMS OF ENGLAND AND SCOTLAND.

THE UNION OF THE TWO KINGDOMS OF SCOTLAND AND ENGLAND: OR, The elaborate Papers of Sir Francis Bacon, Lord Verulam, Viscount of St. Alban, sometime High Chancellor of England; The greatest Sates-man of his Nation, and Schollar of his Age, concerning that Affair.

Published in this form, for publick satisfaction.

Nullum numen abest.

Edinburgh, Printed in the year, 1670.

FOR THE RIGHT HONOURABLE, SIR ANDREW RAMSAY KNIGHT, BARRON OF ABBOTS-HALL, &C. LORD PROVOST OF EDINBURGH, AND ONE OF HIS MAJESTIES MOST HONOURABLE PRIVY COUNCIL.

My Lord, OF the Union of the two Kingdoms now happily intended, these being the Elaborate and most Learned Thoughts and Resolutions of that great States-man, yet more great Lawyer, but most of all, the far greatest Schollar of his Age and Nation, Sir Francis Bacon, Lord Verulam, Viscount of St. Alban, presented to our sometimes Great SOVERAIGN, King James, the most Wise and Learned; I have advised them again to the Press, for the satisfaction of divers Noble and Worthy Persons, the Book in which they first came to light, being too voluminous for ordinary use, and rarely to be found in this Kingdom. And now, my Lord, I have made bold to give you the trouble of this Address, and present these few Papers, though small in bulk, yet vast in matter, to your hands, both upon my own, and the Authors account. Upon mine own, who have ever been your most humble Client, and have had your noble Friendship and Favour to countenance me in all my private concerns: And moreover, you do as Chief Magistrate, govern that City in which I was first educate in the Peripatetickwalks, and under, and in which, I have for divers years profest Letters, or practised Chyrurgery and Physick; and with the rest of my fellow Citizens, have found such refreshment under your Shade and Care, that I thought it my duty to signifie it by this small testimony of my thankfulness. And I am sure, that upon the Authors account, there is not a fitter Person, to whom these Papers could be committed. The great prudence and knowledge he had in State Affairs, made him very acceptable to the Kings and People of his own Nation; and the great moderation, watchfulness and wisdom you have used in governing this City, one of the greatest Interests of this Kingdom, hath endeared you to all

the Princes and Chiefs of this People. What labour and trouble you put upon your self to preserve it under the late Usurpers, your very enemies do acknowledge and praise. How your care and resolution preserved it from ruine, when the VVest Male-contents came marching to its very Gates, all that were faithful to His Majesties Service are ready to witness. And with what sweetness and calmness you have keeped together the Union of the Burgesses, who were ready, through heat and unadvisedness, to divide themselves, your late appearance before the Right Honourable Committee of Trade, and your oppose to those that were ready to violate the old Sett of the Good-Town, is a testimony above exception. I could add many more evidences of your great Prudence and Moderation; but I will rather forbear them, then give the least blush or trouble to your modesty: Only this I must add, that as your Lordship hath been a great Preserver of the Union of this Burgh; So I do not doubt, but you, who are the most eminent Member of a Party not least concerned in this Affair, I mean the Burroughs, will with your good advices, endeavour such an Union of the two Kingdoms, as shall most advance the Glory and Prerogative of our Gracious King, and promove most the Honour, Trade and Safety of both People. This and your Preservation, shall ever be the sincere Devotion of, My Lord, Your most humble Servant, C. Irvin.

A SPEECH USED BY SIR FRANCIS BACON IN THE LOWER HOUSE OF PARLIAMENT, 50. JACOBI, CONCERNING THE ARTICLE OF GENERAL NATURALIZATION OF THE SCOTS NATION.

IT may please you (Mr. Speaker) Preface I will use none, but put my self upon your good Opinions, to which I have been accustomed beyond my deservings. Neither will I hold you in suspence, what way I will choose; but now at the first, declare my self, that I mean to counsel the House to Naturalize this Nation. Wherein, nevertheless, I have a request to make unto you; which is of more efficacy to the purpose I have in hand, then all that I shall say afterwards. And it is the same which Demosthenes did, more then once in great Causes of Estate, to the people of Athens, Ut cum calcul• Suffragiorum, sumant Magnanimitatem Reip. That when they took into their hands, the Balls whereby to give their Voices, (according as the manner of them was) They would raise their thoughts, and lay aside those considerations which their private Vocations and Degrees mought minister and represent unto them; And would take upon them cogitations and minds, agreeable to the Dignity and Honour of the Estate.

For, (Mr. Speaker) as it was aptly and sharply said by Alexander to Parmenio; when upon the Recital of the great offers which Darius made, Parmenio said unto him, I would accept these offers, were I as Alexander: He turned it upon him again, So would I (saith he) were I as Parmenio. So in this cause, if an honest English Merchant (I do not single out that State in disgrace, for this Island ever held it Honourable, but only for an instance of a private profession) If an English Merchant should say, Surely I would proceed no further in the Union, were I as the King; It mought be reasonably answered, No more would the King, were He as an English Merchant. And the like may be said of a Gentleman of the Countrey, be he never so worthy and sufficient; Or of a

Lawyer, be he never so wise and learned; Or of any other particular condition in this Kingdom. For certainly (Mr. Speaker) if a man shall be only or chiefly sensible of those respects, which his particular Vocation and Degree shall suggest and infuse into him, and not enter into true and worthy considerations of Estate, he shall never be able aright to give counsel, or to take counsel in this matter. So that it this request be granted, I account the cause obtained.

But to proceed to the matter it self. All Consultations do rest upon Questions comparative. For when a question is de Vero, it is simple, for there is but one Truth: But when a question is de Bono, it is for the most part comparative: For there be differing degrees of Good and Evil; and the best of the Good is to be preferred and chosen, and the worst of the Evil is to be declined and avoided. And therefore, in a Question of this nature, you may not look for Answers proper to every inconvenience alledged; For somewhat that cannot be specially answered, may nevertheless be encountred and overweighed, by matter of greater moment. And therefore, the matter which I shall set forth unto you, will naturally receive this distribution of three parts.

First, an Answer unto those inconveniences which have been alledged to ensue, if we should give way to this Naturalization; which, I suppose, you will find not to be so great as they have been made; but that much dross is put into the ballance, to help to make weight.

Secondly, an Encounter against the remain of those inconveniences which cannot properly be answered, by much greater inconveniences which we shall incur, if we do not proceed to this Naturalization.

Thirdly, an Encounter likewise, but of another nature; That is, by the gain and benefit which we shall draw and purchase to our selves, by proceeding to this Naturalization. And yet to avoid confusion, which evermore followeth of too much Generality, it is necessary for me, before I proceed to perswasion, to use some distribution of the Points or Parts of Naturalization: which certainly can be no better nor none other, than the ancient distribution of Jus Civitatis, Jus Suffragii, vel Tribus, and Petitionis, sive Honorum. For all ability and capacity is either of private Interest, of Meum & Tuum, or of publick Service: And the

publick consisteth chiefly, either in Voice or in Office. Now it is the first of these (Mr. Speaker) that I will only handle at this time, and in this place; and reserve the other two for a Committee, because they receive more distinction and restriction.

To come therefore to the inconveniences alledged on the other part. The first of them is, that there may ensue of this Naturalization, a surcharge of people upon this Realm of England, which is supposed already to have the full charge and content; and therefore, there cannot be an adm•ssion of the adoptive, without a diminution of the Fortunes and Conditions of those that are Native Subjects of this Realm. A grave objection (Mr. Speaker) and very dutiful; for it proceedeth not of any unkindness to the Scots Nation, but of a natural fastness to our selves. For that Answer of the Virgins, Ne forte non sufficiat Vobis & Nobis, proceeded not out of any envy or malign humour, but out of providence, and that original charity which begins with our selves. And I must confess (Mr. Speaker) that as the Gentleman said, when Abraham and Lot, in regard of the greatness of their Families, grew pent and straitned; it is true, that (Brethren though they were) they grew to difference, and to those words, Vade tu ad dextram, & ego ad sinistram, &c. But certainly, I should never have brought that example on that side; for we see what followed of it, how that this separation, ad dextram and ad sinistram, caused the miserable captivity of the one Brother, and the dangerous, though prosperous war, of the other, for his rescous and recovery.

But to this objection (M. Speaker) being so weighty and so principal, I mean to give three several Answers; every one of them being, to mine understanding, by it self sufficient.

The first is, that this Opinion of the numbers of the Scots Nation, that should be likely to plant themselves here amongst us, will be found to be a thing rather in conceit then in event. For (Mr. Speaker) you shall find these plausible similitudes, of a Tree that will thrive the better if it be removed into the more fruitful Soil; And of Sheep or Cattel, that if they find a gap or passage open, will leave the more barren Pasture, and get into the more rich and plentiful; To be but Arguments meerly superficial, and to have no sound resemblance with the

transplanting or transferring of Families. For the Tree, we know, by nature, as soon as it is set in the better ground, can fasten upon it and take nutriment from it; And a Sheep, as soon as he gets into the better Pasture, what should let him to graze and feed? But there belongeth more (I take it) to a Family or particular person, that shall remove from one Nation to another: For if (Mr. Speaker) they have not Stock, Means, Acquaintance and Custom, Habitation, Trades, Countenance and the like; I hope, you doubt not but they will starve in the midst of the rich Pasture, and are far enough off from grazing at their pleasure. And therefore, in this point which is conjectural, experience is the best Guide; for the time past is a Pattern of the time to come. I think no man doubteth (Mr. Speaker) but his Majesties first coming in was as the greatest Spring-tide, for the confluence and entrance of that Nation. Now I would fain understand, in these four years space, and in the fulness and strength of the Current and Tide, how many Families of the Scots men are planted in the Cities, Burroughs and Towns of this Kingdom? For I do assure my self, that, more then some persons of Quality about his Majesties Person here at the Court and in London, and some other inferiour persons that have a dependancy upon them; The Return and Certificate, if such a Survey should be made, would be of a number extremely small. I report me to all your private knowledges, of the places where you inhabite.

Now (Mr. Speaker) as I said, Si in Ligno viridi it a fit, quid fiet in arido? I am sure there will be no more such Spring-tides. But, you will tell me of a multitude of Families of the Scots Nation in Polonia; And if they multiply in a Country so far off, how much more here at hand? For that, (Mr. Speaker) you must impute it, of necessity, to some special accident of time and place, that draweth them thither. For you see plainly, before your eyes, that in Germany, which is much nearer, and in France, where they are invited with Priviledges, and with this very Priviledge of Naturalization, yet no such number can be found: So as it cannot be either nearness of place or priviledge of person, that is the cause. But shall I tell you (Mr. Speaker) what I think; Of all the places in the world, near or far off, they will never take that course of life in this Kingdom, which they content

themselves with in Poland: For we see it to be the nature of all men, that they will rather discover poverty abroad then at home. There is never a Gentleman that hath over-reached himself in expence, and thereby must abate his Countenance, but he will rather travel and do it abroad then at home. And we know well, they have good high Stomachs, and have ever stood in some terms and emulation with us; and therefore they will never live here, except they can live in good fashion. So as I assure you (Mr. Speaker) I am of opinion, that the strife which we have now to admit them, will have like sequel as that contention had between the Nobility and People of Rome, for the admitting of a Plebeian Consul; which while it was in passing, was very vehement and mightily stood upon: and when the people had obtained it, they never made any Plebeian Consul, no not in sixty years after. And so will this be for many years, as I am perswaded, rather a matter in opinion, then in use or effect. And this is the first Answer that I give to this main inconvenience pretended, of surcharge of People.

The second Answer which I give to this Objection, is this. I must have leave to doubt, (Mr. Speaker) that this Realm of England is not yet peopled to the full. For certain it is, that the Territories of France, Italy, Flanders and some parts of Germany, do in equal space of ground bear and contain a far greater quantity of People, if they were mustered by the Poll. Neither can I see, that this Kingdom is so much inferiour unto those forraign parts in fruitfulness, as it is in population; which makes me conceive, we have not our full charge. Besides, I do see manifestly among us, the badges and tokens rather of scarceness then of press of people; as drowned Grounds, Commons, Wastes and the like: Which is a plain demonstration, that howsoever there may bean over swelling throng and press of people here about London; which is most in our eye, yet the body of the Kingdom is but thin sown with People. And whosoever shall compare the ruines and decayes of ancient Towns in this Realm, with the erections and augmentations of new; cannot but judge, that this Realm hath been far better peopled in former times, It may be, in the Heptarchy or otherwise: For generally the Rule holdeth, The Smaller State, the greater Population, proratd. And whether this be true or no, we need not seek further then to call to our

remembrance, how many of us serve here in this place, for desolate and decayed Burroughs. Again (Mr. Speaker) whosoever looketh into the Principles of Estate, must hold it, that it is the Mediterrane Countries, and not the Maritime, which need to fear surcharge of People. For all Sea-Provinces, especially Islands, have another Element besides the Earth and Soil, for their sustentation. For what an infinite number of people are and may be sustained by Fishing, Carriage by Sea and Merchandizing? wherein I do again discover, that we are not at all pinched by multitude of people: For if we were, it were not possible that we should relinquish and resign such an infinite benefit of Fishing to the Flemmings, as it is well known we do. And therefore, I see that we have wastes by Sea, as well as by Land: which still is an infallible Argument, that our Industry is not awaked to seek maintainance, by any over great press or charge of People.

And lastly (Mr. Speaker) there was never any Kingdom, in the Ages of the world, had, I think, so fair and happy means to issue and discharge the multitude of their People (if it were too great) as this Kingdom hath; in regard of that desolate and avasted Kingdom of Ireland, which (being a Countrey blessed with almost all the Dowries of Nature, as Rivers, Havens, Woods, Quarries, good Soil and temperate Climate, and now at last, under his Majesty, blessed also with obedience) doth, as it were, continually call unto us for our Colonies and Plantations. And so I conclude my second Answer to this pretended inconvenience of surcharge of People.

The third Answer (Mr. Speaker) which I give is this. I demand, what is the worst effect which can follow of surcharge of People? Look into all Stories, and you shall find it none other then some honourable War, for the enlargement of their Borders, which find themselves pent, upon foreign parts. Which inconvenience, in a valourous and warlike Nation, I know not whether I should term an inconvenience or no: For the saying is most true, though in another sense, Omne solum forti Patria. It was spoken indeed of the patience of an exil'd man; but it is no less true of the valout of a warlike Nation. And certainly (Mr. Speaker) I hope I may speak it without offence, That if we did hold our selves worthy, whensoever just cause should be given, either to recover our ancient

Rights, or to revenge our late wrongs, or to attain the Honour of our Ancestors, or to enlarge the Patrimony of our Posterity; We would never in this manner forget considerations of Amplitude and Greatness, and fall at variance about Profit and Reckonings; fitter a great deal for private Persons, then for Parliaments and Kingdoms. And thus (Mr. Speaker) I leave this first Objection, to such satisfaction as you have heard.

The second Objection is, that the Fundamental Laws of both these Kingdoms of England and Scotland, are yet divers and several; Nay more, that it is declared by the Instrument, that they shall so continue, and that there is no intent in his Majesty to make innovation in them: And therefore, that it should not be seasonable to proceed to this Naturalization, I hereby to endow them with our Rights and Priviledges, except they should likewise receive and submit themselves to our Laws. And this Objection likewise (Mr. Speaker) I allow to be a weighty Objection, and worthy to be well answered and discussed.

The Answer which I shall offer, is this. It is true, for mine own part (Mr. Speaker) that I wish the Scots Nation governed by our Laws; for I hold our Laws, with some reducement, worthy to govern, if it were the world. But, this is that which I say, and I desire therein your attention; That, according to the true reason of Estate, Naturalization is, in order, first and precedent to Union of Laws; in degree, a less matter then Union of Laws; and in nature, separable, not inseparable, from Union of Laws. For, Naturalization doth but take out the marks of a Forraigner; but Union of Laws makes them entirely as our selves: Naturalization taketh away separation, but Union of Laws doth take away distinction. Do we not see (Mr. Speaker) that in the administration of the world, under the great Monarch, God himself, that His Laws are divers; one Law in Spirits, another in Bodies; One Law in Regions Coelestial, another Elementary; And yet the Creatures are all one Mass and Lump, without any vacuum or separation? Do we not see likewise, in the State of the Church, that amongst people of all Languages and Linages, there is one Communion of Saints; and that we are all fellow Citizens, and naturalized of the Heavenly Hierusalem: And yet, nevertheless, divers and several Ecclesiastical Laws, Policies and

Hierarchies? According to the Speech of that worthy Father, In veste varietas sit, scissura non sit. And therefore, certainly (Mr. Speaker) the Bond of Law is the more special and private Bond; and the Bond of Naturalization the more common and general. For the Laws are rather Figura Reip. then Forma; and rather Bonds of Perfection, then Bonds of Entireness. And therefore, we see in the experience of our own Government, that in the Kingdom of Ireland, all our Statute-Laws, since Poyning-Laws, are not in force; and yet we deny them not the benefit of Naturalization. In Gersey, Guernsey and the Isle of Man, our Common Laws are not in force; and yet they have the benefit of Naturalization. Neither need any man doubt, but that our Laws and Customs must in small time gather and win upon theirs. For, here's the Seat of the Kingdom, whence come the supreme Directions of Estate; Here is the Kings Person and Example, of which the Verse saith,

Regis ad exemplum tot us componitur Orbis.

And therefore, it is not possible, although not by solemn and formal Act of Estates, yet by the secret operation of no long time, but they will come under the yoke of our Laws; and so, Dulcis tractus pari jugo. And this is the Answer I give to this second Objection.

The third Objection is, some inequality in the Fortunes of these two Nations, England and Scotland; By the commixture whereof, there may ensue advantage to them, and loss to us: Wherein (Mr. Speaker) it is well, that this difference or disparity consisteth but in external Goods of Fortune. For indeed, it must needs be confessed, that for the Goods of the Mind and Body, they are Alteri Nos, Other our selves. For, to do them but right, we know in their capacity and understanding, they are a People ingenious; in Labour industrious; in Courage valiant; in Body hard, active and comely. More might be said, but in commending them, we do but in effect commend our selves: for they are of one piece and continent with us; and the truth is, we are participant both of their Virtues and Vices. For, if they have been noted to be a Pople not so tractable in Government, we cannot without flattering our selves, free our selves altogether from that fault, being a thing indeed incident to all Martial People. As we see it

evident by the example of the Romans and others: Even like unto fierce Horses, that though they be of better service then others, yet are they harder to guide and to mannage.

But for this Objection (Mr. Speaker) I purpose to answer it, not by Authority of Scripture, which saith, Beatius est dare quam accipere; but by an Authority, framed and derived from the judgement of our selves and our Ancestors, in the same case as to this point. For (Mr. Speaker) in all the Line of our Kings, none useth to carry greater commendation then his Majesties Noble Progenitour, King Edward, the first of that Name: And amongst his other commendations both of War and Policy, none is more celebrated then his purpose and enterprise for the Conquest of Scotland; as not bending his designs to glorious Acquests abroad, but to solid strength at home: which nevertheless, if it had succeeded well, could not but have brought in all those inconveniences, of the commixture of a more opulent Kingdom, with a less, that are now alledged. For it is not the yoke either of our Armes or of our Laws, that can alter the nature of the Climate, or the nature of the Soil: Neither is it the manner of the commixture, that can alter the matter of the commixture. And therefore (Mr. Speaker) if it were good for us then, it is good for us now; and not to be prised the less because we paid not so dear for it. But a more full Answer to this Objection, I refer over to that which will come after to be spoken, touching Surety and Greatness.

The fourth Objection (Mr. Speaker) is not properly an Objection, but rather a pre-occupation of an Objection of the other side: For it may be said, and very materially, whereabout do we contend? The benefit of Naturalization is by the Law, in as many as have been, or shall be born since his Majesties coming to the Crown, already settled and invested. There is no more then, but to bring the Ante-nati into the degree of the Post-nati; that men grown that have well-deserved, may be in no worse case then children which have not deserved; and elder brothers in no worse case then younger brothers. So as we stand upon Quiddam, not Quantum; being but a little difference of time, of one Generation from another.

To this (Mr. Speaker) it is said by some, that the Law is not so, but that the Post-nati are Aliens as well as the rest. A point that I mean not much to argue; both because it hath been well spoken to, by the Gentleman that spoke last before me; and because I do desire in this case and in this place, to speak rather of Convenience than of Law. Only this will I say, That that opinion seems to me contrary to reason of Law, contrary to form of pleading in Law, and contrary to Authority and Experience of Law. For reason of Law, when I meditate of it, Methinks the wisdom of the Common Laws of England, well observed, is admirable, in the distribution of the benefit and protection of the Laws, according to the several conditions of persons, in an excellent proportion. The degrees are four, but bipartite; Two of Aliens, and two of Subjects. The first degree is of an Alien, born under a King or State that is an enemy. If such an one come into this Kingdom without safe conduct, it is at his peril: The Law giveth him no protection, neither for Body, Lands nor Goods; So as if he be slain, there is no remedy by any Appeal at the parties sute, although his Wife were an English woman: Marry at the Kings sute the case may be otherwise, in regard of the offence to the Peace. The second degree, is of an Alien that is born under the Faith and Allegiance of a King or State that is a friend. Unto such a person, the Law doth impart a greater benefit and protection; that is, concerning things personal, transitory and moveable; as Goods and Chattels, Contracts and the like: But not concerning Freehold and Inheritance: And the reason is, because he may be an enemy, though he be not. For the State, under the obeysance of which he is, may enter into quarrel and hostility; and therefore, as the Law hath but a transitory assurance of him, so it rewards him but with transitory benefits. The third degree is of a Subject, who having been an Alien, is by Charter made Denizen. To such an one, the Law doth impart yet a more ample benefit: For, it gives him power to purchase Freehold and Inheritance to his own use, and likewise enables the Children, born after his Denization, to inherit: But yet, nevertheless, he cannot make Title, or convey Pedegree from any Ancestour Paramount. For the Law thinks not good to make him in the same degree with a Subject born; because he was once an Alien, and so mought once have been an

enemy. And Nemo subitò fingitur: Mens affections cannot be so settled by any benefit, as when from their Nativity they are inbred and inherent. And the fourth degree, which is the perfect degree, is of such a person that neither is enemy, nor can be enemy in time to come, nor could have been enemy at any time past; And therefore, the Law gives unto him the full benefit of Naturalization. Now (Mr. Speaker) if these be the true steps and paces of the Law, no man can deny, but whosoever is born under the Kings Obedience, never could, in aliquo puncto temporis, be an enemy; (a Rebel he mought be, but no Enemy) And therefore, in reason of Law, is naturalized: Nay, contrary-wise, he is bound, Jure Nativitatis, to defend this Kingdom of England against all Invaders or Rebels: And therefore, as he is oblieged to the protection of Arms, and that perpetually and universally; So he is to have the perpetual and universal benefit and protection of Law, which is Naturalization.

For form of Pleading, it is true, that hath been said, That if a man would plead another to be an Alien, he must not only set forth negatively and privatively, that he was born out of the obedience of our Soveraign Lord the King, but affirmatively, under the obedience of a forreign King or State in particular; which never can be done in this case.

As for Authority, I will not press it; you know all what hath been published by the Kings Proclamations.

And for experience of Law, we see it in the Subjects of Ireland, in the Subjects of Gersey and Guernsey, parcels of the Dutchy of Normandy; in the Subjects of Calleis (when it was English) which was parcel of the Crown of France. But, as I said, I am not willing to enter into an Argument of Law, but to hold my self to point of Convenience.

So as for my part, I hold all Post-nati naturalized, ipso jure. But yet, I am far from opinion, that it should be a thing superfluous to have it done by Parliament; chiefly, in respect of that true principle, Principum Actiones praecipuè ad famam sunt componendae. It will lift up a Sign to all the world, of our love towards them, and good agreement with them. And these are (Mr. Speaker) the matterial Objections which have been made of the other side, whereunto you have heard

mine Answers: Weigh them in your wisdoms. And so I conclude that general part.

Now (Mr. Speaker) according as I promised, I must fill the other ballance, in expressing unto you the inconveniencies which we shall incur, if we shall not proceed to this Naturalization: Wherein, that inconvenience, which of all others and alone by it self, if there were none other, doth exceedingly move me, and may move you, is a Position of Estate, collected out of the Records of time; which is this, That wheresoever several Kingdoms or Estates have been united in Soveraignty, if that Union hath not been fortified and bound in with a further Union, and namely that which is now in question, of Naturalization; this hath followed, That at one time or other they have broken again, being upon all occasions apt to revolt, and relapse to the former separation.

Of this assertion, the first example which I will set before you, is of that memorable Union which was between the Romans and the Latines, which continued from the Battail at the Lake of Regilla, for many years, untill the Consulships of T. Manlius and P. Decius. At what time, there began about this very point of Naturalization, that War which was called, Bellum Sociale; being the most bloody and pernicious War, that ever the Roman State endured; wherein, after numbers of Battails, and infinite Sieges and Surprises of Towns, the Romans in the end prevailed, and mastered the Latines. But assoon as ever they had the honour of the War, looking back into what perdition and confusion they were near to have been brought, they presently naturalized them all. You speak of a Naturalization in blood; there was a Naturalization indeed in blood.

Let me set before you again, the example of Sparta, and the rest of Peloponnesus their Associats. The State of Sparta was a nice and jealous State in this point, of imparting Naturalization to their Confederates: But what was the issue of it? After they had held them in a kind of Society and Amity for divers years, upon the first occasion given (which was no more, then the surprize of the Castle of Thebes, by certain desperate Conspirators in the habit of Masquers) There ensued immediatly a general revolt and defection of their Associats; which was the ruine of their State, never afterwards to be recovered.

Of later time, let me lead your consideration to behold the like events in the Kingdom of Arragon; which Kingdom was united with Castille and the rest of Spain, in the persons of Ferdinando and Isabella, and so continued many years; But yet so, as it stood a Kingdom severed and divided from the rest of the Body of Spain in Priviledges; and directly in this point of Naturalization, or capacity of Inheritance. What came of this? Thus much; That now of fresh memory, not past twelve years since, only upon the voice of a condemned man, out of the Grate of a Prison towards the Street, that cried, Fueros, (which is as much as Liberties, or Priviledges) There was raised a dangerous Rebellion, which was suppressed with difficulty with an Army Royal, and their Priviledges disannulled, and they incorporated with the rest of Spain. Upon so small a spark, notwithstanding so long continuance, were they ready to break and severe again.

The like may be said of the States of Florence and Pisa; which City of Pisa being united unto Florence, but not endued with the benfite of Naturalization, upon the first light of forraign Assistance, by the expedition of Charles the eighth of France into Italy, did revolt; though it be since again re-united and incorporated.

The same effect we see in the most barbarous Government; which shews it the rather to be an effect of Nature. For, it was thought a fit Policy by the Council of Constantinople, to retain the three Provinces of Transilvania, Valachia and Moldavia, (which were as the very Nurses of Constantinople, in respect of their Provisions) to the end, they moght be the less wasted, only under Vayvods as Vaslals and Homagers, and not under Bassa's and Provinces of the Turkish Empire; which Policy we see, by late experience, proved unfortunate, as appeared by the revolt of the same three Provinces, under the Arms and conduct of Sigismund Prince of Transilvania, a Leader very famous for a time; which Revolt is not yet fully recovered. Whereas we seldom or never hear of revolts of Princes incorporate to the Turkish Empire.

On the other part (Mr. Speaker) because it is true which the Logicians say, Opposita, juxta se posita, magis elucescunt: let us take a view and we shall find, That wheresoever Kingdoms and States have been united, and that Union

corroborate by the Bond of mutual Naturalization; you shall never observe them afterwards, upon any occasion of trouble or otherwise, to break and severe again: As we see most evidently before our eyes, in divers Provinces of France; that is to say, Guien, Provence, Normandy, Brittain, which, notwithstanding the infinite infesting troubles of that Kingdom, never offered to break again.

We see the like effect in all the Kingdoms of Spain, which are mutually naturalized; As Leon, Castile, Valencia, Andaluzia, Granada and the rest; except Arragon, which held the contrary course, and therefore had the contrary successe, as we said; and Portugal, of which there is not yet sufficient Trial.

And lastly, we see the effect in our own Nation, which never rent assunder, after it was once united; so as we now scarce know whether the Heptarchy were a Story or a Fable. And therefore (Mr. Speaker) when I revolve with my self these examples and others, so lively expressing the necessity of a Naturalization, to avoid a relapse into a separation, and do hear so many arguments and scruples made on the other side; It makes me think on the old Bishop, which upon a publick Disputation of certain Divines, Christians, with some learned men of the Heathens, did extremely press to be heard; and they were loath to suffer him, because they knew he was unlearned, though otherwise an holy and well-meaning Man: But at last, with much ado, he got to be heard; and when he came to speak, in stead of using Arguments, he did only say over his Belief; but did it with such assurance and constancy, as did strike the minds of those that heard him, more then any Argument had done. And so (Mr. Speaker) against all these witty and subtile Arguments, I say that I do believe, and would be sorry to be found a Prophet in it, That except we proceed with this Naturalization (though not perhaps in his Majesties time, who hath such Interest in both Nations) yet in the time of his Descendants, these Realms will be in continual danger to divide and break again. Now if any man be of that careless mind,

—— Maneat nostras ca cura Nepotes;

Or of that hard mind, to leave things to be tryed by the sharpest Sword; sure I am, he is not of St. Paul's opinion, who affirmeth, That whosoever useth not fore-sight and provision for his Family, is worse then an unbeliever: Much more,

if we shall not use fore-sight for these two Kingdoms, that comprehend so many Families, but leave things open to the peril of future divisions. And thus have I expressed unto you, the inconvenience which of all other sinketh deepest with me, as the most weighty.

Neither do their want other inconveniences (Mr. Speaker) the effect and influence whereof, I fear, will not be adjourned to so long a day, as this that I have spoken of. For, I leave it to your wisdom to consider, whether you do not think, in case by the denyal of this Naturalization, any pike of alienation or unkindness (I do not say where) should be thought to be, or noised to be, between these two Nations, whether it will not quicken and excite all the envious and malicious humours wheresoever (which are now covered) against us, either forraign or at home; and so open the way to practices and other engines and machinations, to the disturbance of this State? As for that other inconvenience of his Majesties engagement into this Action, it is too binding and pressing to be spoken of, and may do better a great deal in your minds, then in my mouth, or in the mouth of any man else; because, I say, it doth press our Liberty too far. And therefore (Mr. Speaker) I come now to the third general part of my division, concerning the Benefits which we shall purchase, by this knitting of the knot surer and streighter between these two Kingdoms, by the communicating of Naturalization.

The Benefits may appear to be two; the one Surety, the other Greatness. Touching Surety (Mr. Speaker) it was well said by Titus Quintius the Roman, touching the State of Peloponnesus, That the Tortois is safe within her shell; Testudo intra tegumen tuta est; but if there be any parts that lye open, they endanger all the rest. We know well, that although the State at this time, be in a happy Peace; yet, for the time past, the more ancient enemy to this Kingdom hath been the French, and the more late the Spaniard; and both these had, as it were, their several postern Gates, whereby they mought have approach and entrance to annoy us. France had Scotland, and Spain had Ireland. For these were the two accesses which did comfort and encourage both these enemies, to assail and trouble us. We see that of Scotland is cut off, by the Union of both

these Kingdoms, if that it shall now be made constant and permanent. That of Ireland is likewise cut off, by the convenient situation of the North of Scotland toward the North of Ireland, where the sore was: Which we see, being suddainly closed, hath continued closed by means of this Salve; So as now, there are no parts of this State exposed to danger, to be a temptation to the ambition of Forraigners, but the approaches and avenues are taken away. For, I do little doubt, but those Forraigners, which had so ill success when they had these advantages, will have much less comfort now, that they be taken from them. And so much for Surety.

For Greatness (Mr. Speaker) I think a man may speak it soberly, and without bravery; That this Kingdom of England, having Scotland united, Ireland reduced, the Sea Provinces of the Low-Countreys contracted, and Shipping maintained, is one of the greatest Monarchies in Forces, truly esteemed, that hath been in the world. For certainly, the Kingdoms here one Earth, have a resemblance with the Kingdom of Heaven; which our Saviour compareth, not to any great Kernel or Nut, but to a very small Grain; yet such an one, as is apt to grow and spread. And such, do I take to be, the constitution of this Kingdom; if indeed we shall refer our Counsels to Greatness and Power, and not quench them too much with consideration of Utility and Wealth. For (Mr. Speaker) was it not, think you, a true Answer that Solon of Greece made to the rich King Cresus of Lydia, when he shewed unto him a great quantity of Gold that he had gathered together, in ostentation of his Greatness and Might? But Solon said unto him, contrary to his expectation; Why, Sir, if another come that hath better Iron then you, he will be Lord of all your Gold. Neither is the Authority of Machiavel to be despised, who scorneth the Proverb of Estate, taken first from a Speech of Mucianus, That Moneys are the Sinews of War; And saith, There are no true Sinews of War, but the very Sinews of the Arms of valiant men. Nay more (Mr. Speaker) whosoever shall look into the seminaries and beginnings of the Monarchies of the world, he shall find them founded in Poverty. Persia, a Countrey barren and poor, in respect of the Medes whom they subdued. Macedon, a Kingdom ignoble and mercenary, until the time of Philip, the Son of

Amyntas. Rome had poor and pastoral beginnings. The Turks, a Band of Sarmatian Scythes, that in a vagabond manner, made impression upon that part of Asia, which is yet called Turcomania. Out of which, after much variety of Fortune, sprung the Ottoman Family, now the terrour of the world. So we know the Goths, Vandals, Alanes, Huns, Lombards, Normans, and the rest of the Northern people, in one Age of the world made their descent or expedition upon the Roman Empire; And came not as Rovers, to carry away prey and be gone again, but planted themselves in a number of fruitful and rich Provinces; where not only their Generations, but their Names, remain till this day: witness Lombardy, Catalonia, a name compounded of Goth and Alane; Andaluzia, a name corrupted from Vandelicia; Hungary, Normandy and others. Nay, the fortune of the Swizzes of late years, (which ate bred in a barren and mountainous Countrey) is not to be forgotten, who first ruined the Duke of Burgandy, the same who had almost ruined the Kingdom of France; what time, after the Battail of Granson, the Rich Jewel of Burgandy, prized at many thousands, was sold for a few pence by a common Souldier, that knew no more what a Jewel meant, then did Aesops Cock. And again, the same Nation, in revenge of a scorn, was the ruine of the French Kings Affairs in Italy, Lewis the 12th. For, that King, when he was pressed somewhat rudely by an Agent of the Swizzes to raise their Pensions, brake into words of choller, What (said he) will these Villains of the Mountains put a Tax upon me? which words lost him his Dutchy of Millain, and chased him out of Italy. All which examples (Mr. Speaker) do well prove Solons opinion, of the Authority and Mastery that Iron hath over Gold. And therefore, if I shall speak unto you mine own heart, Methinks we should a little disdain, that the Nation of Spain (which, howsoever of late it hath grown to Rule, yet of ancient time served many Ages, first, under Carthage, then under Rome, after under Saracens, Goths and others) should of late years, take unto themselves that Spirit, as to dream of a Monarchy in the West, according to that devise, Video Solem Orientem in Occidente; only because they have ravished from some wild and unarmed People, Mines and store of Gold: And on the other side, that this Island of Brittany, seated and manned as it is, and that hath (I make no question)

the best Iron in the world, (that is, the best Souldiers of the world) should think of nothing but reckonings and audits, and Meum and Tuum, and I cannot tell what.

Mr. Speaker, I have (I take it) gone through the Parts which I propounded to my self; Wherein, if any man shall think that I have sung Placebo, for mine own particular, I would have him know, that I am not so unseen in the world, but that I discern it were much alike, for my private Fortune, to rest a Tacebo, as to sing a Placebo, in this Business. But I have spoken out of the Fountain of my Heart, Credidi, propter quod locutus sum; I believed therefore I spake. So as my Duty is performed, the Judgement is yours. God direct it for the best.

A SPEECH USED BY SIR FRANCIS BACON IN THE LOWER HOUSE OF PARLIAMENT, BY OCCASION OF A MOTION CONCERNING THE UNION OF LAWS.

AND it please you (Mr. Speaker) were it now a time to wish, as it is to advise, no man should be more forward or more earnest then my self in this wish, That his Majesties Subjects of England and Scotland were governed by one Law; And that for many Reasons:

First, because it will be an infallible assurance, that there will never be any relapse in succeeding Ages to a separation.

Secondly, Dulcis tractus pari jugo; If the Draught lye most upon us, and the yoke lightest upon them, it is not equal.

Thirdly, the Qualities, and (as I may term it) the Elements of their Laws and ours are such, as do promise an excellent temperature in the compounded Body: For if the Prerogative here be too indefinite, it may be the Liberty there is too unbounded: If our Laws and proceedings be too prolix and formal; it may be theirs are too informal and summary.

Fourthly, I do discern, to my understanding, there will be no great difficulty in this work. For their Laws, by that I can learn, compared with ours, are like their Language compared with ours: For, as their Language hath the same roots that ours hath, but hath a little more mixture of Latine and French; So their Laws and Customs have the like grounds that our have, with a little more mixture of the Civil Law, and French Customs.

Lastly, the mean to this work seemeth to me no less excellent then the work it self; For if both Laws shall be united, it is of necessity, for preparation and inducement thereunto, that our own Laws be reviewed and compiled; Then the which, I think, there cannot be a work that his Majesty can undertake, in these

times of Peace, more Politick, more Honourable, nor more Beneficial to his Subjects for all Ages;

Pace datâ Terris, Animum ad Civilia vertit
Fura suum, Legesque tulit justissimus Auctor.

For this continual heaping up of Laws, without digesting them, maketh but a Chaos and confusion, and turneth the Laws many times, to become but snares for the People, as is said in the Scripture, Pluet super eos Laqueos. Now, Non sunt pejores Laquei, quam Laquei Legum: And therefore, this work, I esteem to be indeed a work (rightly to term it) Heroical. So that for this good wish of Union of Laws, I do consent to the full; And I think, you may perceive by that which I have said, that I come not in this to the opinion of others, but that I was long ago settled in it my self. Nevertheless, as this is moved out of zeal, so I take it to be moved out of time, as commonly zealous motions are; while men are so fast carried on to the End, as they give no attention to the Mean. For, if it be time to talk of this now, it is either because the business now in hand cannot proceed without it; or because in time and order, this matter should be precedent; or because we shall leese some advantage, towards this effect so much desired, if we should go on in the course we are about. But none of these three, in my judgement, are true; And therefore, the motion, as I said, unseasonable.

For first, that there may not be a Naturalization, without an Union in Laws, cannot be maintained. Look into the example of the Church, and the Union thereof, you shall see several Churches that joyn in one Faith, one Baptism, (which are the points of spiritual Naturalization) do many times in Policy, Constitutions and Customs, differ. And therefore, one of the Fathers made an excellent observation, upon the two Mysteries; the one, that in the Gospel, where the Garment of Christ is said to have been without seam; the other, that in the Psalm, where the Garment of the Queen is said to have been of divers colours; And concludeth, In veste variet as sit, scissura non sit. So in this case, (Mr. Speaker) we are now in hand to make this Monarchy of one piece, and not of one colour. Look again into the examples of forraign Countries, and take that next us of France; and there you shall find, that they have this distribution, Pais

du droit Escript, and Pais du droit Constumier. For Gascoign, Languedock, Provence, Daulphenie, are Countries governed by the Letter or Text of the Civil Law; But the Isle of France, Tourrain, Berry, Anjou and the rest, and most of all Britain and Normandy, are governed by Customs, which amount unto a Municipal Law, and use the Civil Law but only for Grounds, and to decide new and rare cases; and yet, nevertheless, Naturalization passeth through all.

Secondly, that this Union of Laws should precede the Naturalization, or that it should go on, pari passu, hand in hand, I suppose likewise can hardly be maintained; but the contrary, that Naturalization ought to precede. Of which my opinion, as I could yield many reasons, so because all this is but a digression, and therefore ought to be short, I will hold my self now only to one, which is briefly and plainly this; That the Union of Laws will ask a great time to be perfected, both for the compiling, and for the passing; dureing all which time, if this mark of Strangers should be denyed to be taken away, I fear it may induce such a habit of Strangeness, as will rather be an impediment than a preparation to further proceeding. For he was a wise man that said, Opportuni magnis conatibus transitus Rerum. And in those cases, Non progredi est regredi. And like, as in a pair of Tables, you must put out the former writing, before you can put in new; and again, that which you write in, you write Letter by Letter; but that which you put out, you put out at once: So we have now to deal with the Tables of mens Hearts, wherein it is in vain to think you can enter the willing acceptance of our Laws and Customs; except you first put forth all Notes either of Hostility or forraign Condition. And these are to be put out simul & semel, at once, without gradations; whereas the other points are to be imprinted and engraven distinctly and by degrees.

Thirdly, whereas it is conceived by some, that the communication of our Benefits and Priviledges is a good hold that we have over them, to draw them to submit themselves to our Laws. It is an Argument of some probability, but yet to be answered many wayes: For first, the intent is mistaken, which is not, as I conceive it, to draw them wholly to a subjection to our Laws; but to draw both Nations to one uniformity of Law. Again, to think that there should be a kind of

articulate and indented Contract, that they should receive our Laws to obtain our Priviledges, it is a matter, in reason of Estate, not to be expected; being that which scarcely a private man will acknowledge, if it come to that, whereof Seneca speaketh, Beneficium accipere, est Libertatem vendere: No, but courses of Estate do describe and delineat another way; which is, to win them either by Benefit or Custom. For, we see in all Creatures, that men do feed them first, and reclaim them after: And so in the first institution of Kingdoms, Kings did first win people by many Benfits and Protections, before they prest any yoke. And for Custom, which the Poets call, imponere Morem; who doubts, but that the Seat of the Kingdom, and the example of the King resting here with us, our manners will quickly be there, to mak all things ready for our Laws:

And lastly, the Naturalization which is now propounded, is qualified with such restrictions, as there will be enough kept back, to be used at all times, for an Adamant of drawing them further on to our desires. And therefore, to conclude, I hold this motion, of Union of Laws, very worthy, and arising from very good minds, but not proper for this time.

To come therefore to that which is now in question; It is no more, but whether there should be a difference made in this priviledge of Naturalization, between the Ante-nati and the Postnati; not in point of Law (for that will otherwise be decided) but only in point of Convenience [as if a Law were now to be made, de novo] In which question, I will at this time, only answer two Objections, and use two Arguments, and so leave it to your judgement.

The first Objection hath been, that if a difference should be, it ought to be in favour of the Ante-nati; because they are persons of merit, service and proof; whereas the Postnati are infants, that (as the Scripture saith) know not the right hand from the left.

This were good reason (Mr. Speaker) if the question were, of Naturalizing some particular persons by a private Bill; but it hath no proportion with the general. For now, we are not to look to respects that are proper to some, but to those which are common to all. Now then, how can it be imagined, but that those that took their first breath, since this happy Union, inherent in his Majesties

person, must be more assured and affectionat to this Kingdom, then those generally can be presumed to be, which were sometimes Strangers. For, Nemo subitò fingitur; the conversions of Minds are not so swift as the conversions of times. Nay, in effects of Grace, which exceed far the effects of Nature, we see St. Paul makes a difference between those he calls Neophites, that is, newly grafted into Christianity; and those that are brought up in the Faith. And so we see, by the Laws of the Church, that the Children of Christians shall be baptized, in regard of the Faith of their Parents; But the Child of an Ethnick may not receive Baptism, till he be able to make an understanding Profession of his Faith.

Another Ojection hath been made, that we ought to be more provident and reserved, to restrain the Postnati then the Ante-nati; because, during his Majesties time, being a Prince of so approved Wisdom and Judgement, we need no better caution, then the confidence we may repose in him: But in the future Reigns of succeeding ages, our caution must be in Re, and not in Persona.

But, (Mr. Speaker) to this I answer, That as we cannot expect a Prince hereafter, less like to erre in respect of his Judgement; So again, we cannot expect a Prince so like to exceed (if I may so term it) in this point of Benificence to that Nation, in respect of the occasion. For, whereas all Princes and all men are won, either by merit or conversation, there is no appearance that any of his Majesties Descendents, can have either of these causes of Bounty towards that Nation, in so ample degree as his Majesty hath. And these be the two Objections which seemed to me most material, why the Postnati should be left free, and not be concluded in the same restrictions with the Ante-nati, whereunto you have heard the Answers.

The two Reasons which I will use on the other side, are briefly these; The one being a Reason of Common Sense, the other a Reason of Estate. We see (Mr. Speaker) the time of the Nativity is, in most cases, principally regarded. In Nature, the time of planting and setting is chiefly observed. And we see, the Astrologers pretend to judge of the fortune of the party, by the time of the Nativity. In Laws, we may not unfitly apply the case of Legitimation, to the case of Naturalization. For, it is true, that the common Canon Law doth put the Ante-

natos and the Post-natos in one degree; But when it was moved to the Parliament of England, Barones unâ voce responderunt, Nolumus Leges Angliae mutare. And though it must be confessed, that the Ante-nati and Postnati are in the same degree in Dignities, yet were they never so in Abilities: For, no man doubts, but the Son of an Earl or Baron, before his Creation or Call, shall inherite the Dignity, as well as the Son born after.

But the Son of an Attainted Person, born before the Attainder, shall not inherite as the after-born shall, notwithstanding Charter of Pardon.

The Reason of Estate is, That any restriction of the Ante-nati is temporary, and expireth with this Generation: But if you make it in the Postnati also, you do but in substance, pen a perpetuity of Separation.

Mr. Speaker, in this point I have been short, because I little expected this doubt, as to point of Convenience; and therefore, will not much labour, where, I suppose, there is no greater opposition.

A BRIEF DISCOURSE, OF THE HAPPY UNION OF THE KINGDOMES OF ENGLAND AND SCOTLAND.

Dedicated in private to His MAJESTY.

I Do not find it strange (excellent King) that when Heraclitus (he that was surnamed, the Obscure) had set forth a certain Book (which is not now extant) many men took it for a Discourse of Nature, and many others took it for a Treatise of Policy. For there is a great affinity and consent between the Rules of Nature, and the true Rules of Policy. The one being nothing else, but an Order in the Government of the World; And the other, an Order in the Government of an Estate. And therefore, the education and erudition of the Kings of Persia was in a Science, which was termed by a Name then of great Reverence; but now degenerate, and taken in the ill part. For the Perasin Magick, which was the secret Literature of their Kings, was an application of the Contemplations and Observations of Nature, unto a sense Politick; taking the fundamental Laws of Nature, and the Branches and Passages of them, as an Original or first Model, whence to take and describe a Copy and Imitation for Government.

After this manner, the foresaid Instructers set before their Kings, the examples of the Celestial Bodies, the Sun, the Moon and the rest, which have great glory and veneration, but no rest or intromission, being in a perpetual office of motion, for the cherishing (in turn and in course) of inferiour Bodies: Expressing likewise the true manner of the motions of Government; which though they ought to be swift and rapide, in respect of dispatch and occasions; yet are they to be constant and regular, without wavering or confusion.

So did they represent unto them, how the Heavens do not enrich themselves by the Earth and the Sea; nor keep no dead Stock nor untouched Treasures of that they draw to them from below: But whatsoever moisture they do levy and take from both Elements in vapours, they do spend and turn back again in

showers; only holding and storing them up for a time, to the end, to issue and distribute them in season.

But, chiefly, they did expresse and expound unto them, that fundamental Law of Nature, whereby all things do subsist and are preserved; which is, that every thing in Nature, although it hath his private and particular affection and appetite, and doth follow and pursue the same in small moments, and when it is free and delivered from more general and common respects; yet, neverthelesse, when there is question or case, for sustaining of the more general, they for sake their own particularities, and attend and conspire to uphold the publick.

So we see, the Iron, in small quantity, will ascend and approach to the Load-stone, upon a particular sympathy; But, if it be any quantity of moment, it leaveth his appetite of amity to the Load-stone, and like a good Patriot, falleth to the Earth; which is the Place and Region of massy Bodies.

So again, the Water, and other like Bodies, do fall towards the Center of the Earth, which is (as was said) their Region or Countrey: And yet, we see nothing more usual in all Water-works and Engines, then that the Water (rather then to suffer any distraction or dis-union in Nature) will ascend, for saking the love to his own Region or Countrey, and applying it self to the Body next adjoyning.

But, it were too long a digression to proceed to more examples of this kind. Your Majesty your self, did fall upon a passage of this nature, in your gracious Speech of thanks unto your Council; when acknowledging Princely, their vigilancies and well-deservings, it pleased you to note, that it was a success and event above the course of nature, to have so great Change, with so great a Quiet; Forasmuch as suddain mutations, as well in State as in Nature, are rarely without violence and perturbation. So as still I conclude, there is (as was said) a congruity between the principles of Nature and Policy. And lest that instance may seem to oppone to this Assertion, I may, even in that particular, with your Majesties favour, offer unto you a Type or Pattern in Nature, much resembling this event in your State: Namely Earthquakes, which many of them bring ever much terrour and wonder, but no actual hurt; the Earth trembling for a moment, and suddenly stablishing in perfect quiet, as it was before.

This knowledge then, of making the Government of the World a mirrour for the Government of a State, being a Wisdom almost lost (whereof the reason I take to be, because of the difficulty for one man to imbrace both Philosophies) I have thought good to make some proof (as far as my weakness, and the straights of my time will suffer) to revive in the handling of one particular, wherewith now I most humbly present your Majesty: For surely, as hath been said, it is a form of Discourse anciently used towards Kings; And to what King should it be more proper, then to a King that is studious to conjoin contemplative Vertue and active Vertue together?

Your Majesty is the first King that had the Honour to be Lapis Angularis, to unite these two mighty and warlike Nations of England and Scotland, under one Soveraignty and Monarchy. It doth not appear, by the Records and Memories of any true History, or scarcely by the fiction and pleasure of any fabulous Narration or Tradition, That ever, of any Antiquity, this Island of Great Britain was united under one King before this day. And yet there be no Mountains or races of Hills, there be no Seas nor great Rivers, there is no diversity of Tongue or Language, that hath invited or provoked this ancient Separation or Divorce. The lot of Spain was, to have the several Kingdoms of that Continent (Portugal only except) to be united in an Age not long past; and now in our Age, that of Portugal also, which was the last that held out, to be incorporate with the rest. The lot of France hath been, much about the same time, likewise to have re-annexed unto that Crown, the several Dutchies and Portions which were in former times dismembred. The lot of this Island is the last, reserved for your Majesties happy times, by the special Providence and Favour of God; who hath brought your Majesty to this happy conjunction with great consent of Hearts, and in the strength of your Years, and in the maturity of your Experience. It resteth but, that (as I promised) I set before your Majesties Princely consideration, the grounds of Nature touching the Union and Commixture of Bodies; and the correspondence which they have with the grounds of Policy, in the conjunction of States and Kingdoms.

First, therefore, that Position, Vis unita fortior, being one of the common notions of the Mind, needeth not much to be induced or illustrate.

We see the Sun, when he entereth, and while he continueth, under the Sign of Leo, causeth more vehement heats then when he is in Cancer; what time, his Beams are nevertheless more perpendicular. The reason whereof, in great part, hath been truly ascribed to the conjunction and corradiation, in that place of Heaven, of the Sun, with the four Stars of the first magnitude; Syrius, Canicula, Cor Leonis, and Cauda Leonis.

So the Moon likewise, by ancient tradition, while she is in the same Sign of Leo, is said to be at the Heart; which is not for any affinity which that place of Heaven can have with that part of mans Body; but only, because the Moon is then, by reason of the conjunction and nearness with the Stars aforenamed, in the greatest strength of influence; and so worketh upon that part in inferiour Bodies, which is most Vital and Principal.

So we see, Waters and Liquors, in small quantity, do easily putrifie and corrupt; but in large quantity, subsist long, by reason of the strength they receive by union.

So in Earthquakes, the more general do little hurt, by reason of the united weight which they offer to subvert; but narrow and particular Earthquakes have many times overturned whole Towns and Cities.

So then, this point, touching the force of Union, is evident. And therefore, it is more fit to speak of the manner of Union; wherein again, it will not be pertinent to handle one kind of Union, which is Union by Victory, when one Body doth meerly subdue another, and converteth the same into his own nature, extinguishing and expulsing what part soever of it it cannot overcome. As when the Fire converteth the Wood into Fire, purging away the smoak and the ashes, as unapt Matter to enflame: Or, when the Body of a Living Creature doth convert and assimilate Food and Nourishment, purging and expelling whatsoever it cannot convert. For, these Representations do answer, in matter of Policy, to Union of Countries by conquest, where the conquering State doth extinguish, extirpate and expulse any part of the State conquered, which it findeth so

contrary, as it cannot alter and convert it. And therefore, leaving violent Unions, we will consider only of natural Unions.

The difference is excellent, which the best Observers in Nature do take between Compositio and Mistio, putting together and mingling; the one being but a conjunction of Bodies in place, the other in quality and consent; the one the Mother of Sedition and Alteration; the other of Peace and Continuance; the one rather a Confusion then an Union, the other properly an Union. Therefore, we see those Bodies, which they call imperfectè mista, last not, but are speedily dissolved. For, take for example, Snow or Froath, which are compositions of Air and Water, and in them you may behold, how easily they severe and dissolve, the Water closing together and excluding the Air.

So those three Bodies, which the Alchymists do so much celebrate, as the three Principles of things; that is to say, Earth, Water and Oyl, (which it pleaseth them to term, Salt, Mercury and Sulphur) we see, if they be united only by composition or putting together, how weakly and rudely they do incorporate: For Water and Earth maketh but an unperfect slime; and if they be forced together by agitation, yet by a little settling, the Earth resideth in the bottom. So Water and Oyl, though by agitation it be brought into an Oyntment; yet, after a little settling, the Oyl will float on the top: So as such imperfect mistures continue no longer then they are forced; and still in the end, the worthiest getteth above.

But otherwise it is of perfect mistures. For we see these three Bodies of Earth, Water and Oyl, when they are joined in a Vegetable or Mineral, they are so united, as without great subtilty of Art and force of Extraction, they cannot be separated and reduced into the same simple Bodies again. So as the difference between Compositio and Mistio, clearly. set down is this; That Compositio is the joining or putting together of Bodies, without a new Form; and Mistio is the joining or putting together of Bodies, under a new Form. For, the new form is commune Vinculum; and without that, the old Form will be at strife and discord.

Now, to reflect this Light of Nature upon matter of Estate: There hath been put in practice, these two several kinds of Policy, in uniting and conjoining of States and Kingdoms: The one to retain the ancient Form still severed, and only

conjoined in Soveraignty; The other to superinduce a new Form, agreeable and convenient to the entire State. The former of these hath been more usual, and is more easie; but the latter is more happy. For, if a man do attentively revolve Histories of all Nations, and judge truly thereupon, he will make this conclusion, That there was never any States that were good commixtures, but the Romans. Which because it was the best State of the World, and is the best Example of this Point, we will chiefly insist thereupon.

In the Antiquities of Rome, Virgil bringeth in Jupiter by way of Oracle or Prediction, speaking of the mixture of the Trojans and the Italians:

Sermonem Ausonii Patrum, moresque tenebant,
Utque est nomen erit; Commixti Corpore tantum,
Subsident Teucri, Morem, Ritusque Sacrorum,
Adjiciam; faciamque omnes uno ore Latinos.
Hinc genus Ausonio mistum, quod sanguine surget,
Supra Homines, supra ira Deos, pietate videbis.

Wherein Jupiter maketh a kind of partition or distribution, That Italy should give the Language and the Laws; Troy should give a mixture of Men, and some Religious Rites; and both people should meet in one name of Latines.

Soon after the foundation of the City of Rome, the people of the Romans and the Sabines mingled upon equal terms. Wherein the interchange went so even, that (as Livy noteth) the one Nation gave the Name to the Place, the other to the People. For, Rome continued the name, but the people were called Quirites; which was the Sabine word, derived of Cures, the Countrey of Tatius.

But that which is chiefly to be noted, in the whole continuance of the Roman Government, they were so liberal of their Naturalizations, as in effect, they made perpetual mixtures. For the manner was, to grant the same, not only to particular Persons, but to Families and Linages; and not only so, but to whole Cities and Countries. So as in the end, it came to that, that Rome was communis Patria, as some of the Civilians call it.

So we read of Saint Paul, after he had been beaten with Rods, and thereupon charged the Officer with the violation of the Priviledge of a Citizen of Rome; The Captain said to him, Art thou then a Romane? That Priviledge hath cost me dear. To whom Saint Paul replyed, But I was so born. And yet in another place, Saint Paul professeth himself that he was a Jew by Tribe: So as it is manifest, that some of his Ancestors were naturalized; and so it was conveyed to him and their other descendants.

So we read, that it was one of the first despites that was done to Julius Casar; That whereas he had obtained Naturalization for a City in Gaule, one of the City was beaten with Rods of the Consul Marcellus.

So we read in Tacitus, that in the Emperor Claudius time, the Nation of Gaule, (that part which is called Comata, the wilder part) were Suiters to be made capable of the honour of being Senators and Officers of Rome. His words are these: Cum de supplendo Senatu agitaretur, primoresque Galliae, quae Comata appellatur, faedera & Civitatem Romanam pridem assecuti, Jus adipiscendorum in urbe Honorum, expeterent; multus, eâsuper re, variusque Rumor, & studiis diversis, apud Principem, certabatur. And in the end, after long debate, it was ruled they should be admitted.

So likewise, the Authority of Nicholas Matchiavel seemeth not to be contemned; who enquiring the causes of the growth of the Roman Empire, doth give Judgement, there was not one greater then this, That the State did so easily compound and incorporate with Strangers.

It is true, that most Estates and Kingdoms have taken the other course. Of which this effect hath followed, That the addition of further Empire and Territory hath been rather matter of Burthen then matter of Strength unto them: yea, and further, it hath kept alive the seeds and roots of Revolts and Rebellions for many Ages: As we may see, in a fresh and notable Example of the Kingdom of Arragon; which though it were united to Castile by Marriage, and not by Conquest, and so descended in hereditary Union, by the space of more then one hundred years; yet, because it was continued in a divided Government, and not

well incorporated and cemented with the other Crowns; entred into a Rebellion, upon point of their Fueros, or Liberties, now of very late years.

Now, to speak briefly of the several parts of that form, whereby States and Kingdoms are perfectly united, they are (besides the Soveraignty it self) four in number; Union in Name, Union in Language, Union in Laws, Union in Employments.

For Name, though it seem but a superficial and outward matter, yet it carrieth much impression and enchantment: The general and common name of Grecia made the Greeks alwayes apt to unite (though otherwise full of divisions amongst themselves) against other Nations, whom they called Barbarous. The Helvetian Name is no small Band, to knit together their Leagues and Confederacies the faster. The common Name of Spain (no doubt) hath been a special means of the better Union and Conglutination of the several Kingdoms of Castile, Aragon, Granada, Navarrc, Valentia, Catalonia and the rest; comprehending also now lately Portugal.

For Language, it is not needful to insist upon it, because both your Majesties Kingdoms are of one Language, though of several Dialects; and the difference is so small between them, as promiseth rather an enriching of one Language, then a continuance of two.

For Laws, which are the principal Sinews of Government, they be of three natures; Jura, which I will term Freedoms or Abilities, Leges and Mores.

For Abilities and Freedoms, they were amongst the Romans of four kinds, or rather degrees. Jus Connubii, Jus Civitatis, and Jus Suffragii, Jus Petitionis, or Honoram. Jus Connubii is a thing in these times, out of use; for Marriage is open between all diversities of Nations. Jus Civitatis answereth to that we call Denization or Naturalization. Jus Suffragii answereth to the Voice in Parliament. Jus Petitionis answereth to place in Council or Office. And the Romans did many times severe these Freedoms, granting Jus Connubii, sine Civitate; And Civitatem, sine suffragio; And Suffragium, sine Jure Petitionis, which was commonly with them the last.

For those we called Leges, it is a matter of curiosity and inconveniency, to seek either to extirpate all particular Customs, or to draw all Subjects to one place or resort of Judicature and Session. It sufficeth there be an uniformity in the Principal and Fundamental Laws, both Ecclesiastical and Civil: For in this point, the Rule holdeth which was pronounced by an ancient Father, touching the diversity of Rites in the Church; For, finding the Vesture of the Queen in the Psalm (which did prefigure the Church) was of divers colours; and finding again, that Christs Coat was without a seam, he concludeth well, In Veste varietas sit, scissura non sit.

For Manners, a consent in them is to be sought industriously, but not to be enforced: For nothing amongst people breedeth so much pertinacy in holding their Customs, as suddain and violent offer to remove them.

And as for Employments, it is no more but in indifferent hand, and execution of that Verse,

Tyrôs, Triusque mihi nullo discrimine agetur.

There remaineth only to remember, out of the grounds of Nature, the two conditions of perfect mixture; whereof the former is Time. For the Natural Philosophers say well, that Compositio is opus Hominis; and Mistio, opus Naturae. For it is the duty of Man, to make a fit application of Bodies together: But the perfect fermentation and incorporation of them, must be left to Time and Nature; and unnatural hasting thereof, doth disturb the work, and not dispatch it.

So we see, after the Graft is put into the Stock and bound, it must be left to Time and Nature to make that continuum, which at the first was but contiguum. And it is not any continual pressing or thrusting together that will prevent Natures season, but rather hinder it. And so in Liquors, those commixtures which are at the first troubled, grow after clear and settled, by the benefit of rest and time.

The second condition is, That the greater draw the less. So we see, when two Lights do meet, the greater doth darken and dim the less. And when a smaller River runneth into a greater, it loseth both his Name and Stream. And hereof, to conclude, wee see an excellent example in the Kingdoms of Judah and Israel.

The Kingdom of Judah contained two Tribes; the Kingdom of Israel contained ten: King David raigned over Judah for certain years; And after the death of Isbosheth, the Son of Saul obtained likewise the Kingdom of Israel. This Union continued in him, and likewise in his Son Salomon, by the space of seventy years at least, between them both: But yet, because the Seat of the Kingdom was kept still in Judah, and so the lesse sought to draw the greater; upon the first occasion offered, the Kingdoms brake again, and so continued ever after.

Thus having, in all humbleness, made oblation to your Majesty of these simple Fruits of my Devotion and Studies; I do wish, and do wish it, not in the nature of an impossibility (to my apprehension) That this happy Union of your Majesties two Kingdoms of England and Scotland, may be in as good an hour, and under the like Divine Providence, as that was between the Romans and the Sabines.

CERTAIN ARTICLES OR CONSIDERATIONS, TOUCHING THE UNION OF THE KINGDOMS OF ENGLAND AND SCOTLAND.

Collected and dispersed for His MAJESTIES better Service.

YOur Majesty being (I do not doubt) directed and conducted by a better Oracle, then that which was given for light to Aeneas in his peregrination, (Antiquam exquirite Matrem) hath a Royal, and indeed an Heroical desire, to reduce these two Kingdoms of England and Scotland, into the Unity of their ancient Mother Kingdom of Britain. Wherein, as I would gladly applaud unto your Majesty, or sing aloud that Hymn or Anthem, Sic itur ad Astra; So in a more soft and submiss voice, I must necessarily remember unto your Majesty, that Warning or Caveat, Ardua, quae pulchra; It is an action that requireth, yea, and needeth much, not only of your Majesties Wisdom, but of your Felicity. In this Argument, I presumed, at your Majesties first entrance, to write a few Lines indeed Scholastically and Speculatively, and not Actively or Politickly, as I held it fit for me at that time, when neither your Majesty was, in that your desire, declared, nor my self in that Service, used or trusted. But now, that both your Majesty hath opened your desire and purpose, with much admiration, even of those who give it not so full an approbation; and that my self was by the Commons, graced with the first Vote of all the Commons, selected for that Cause; Not in any estimation of my ability (for therein so wise an Assembly could not be so much deceived) but in an acknowledgement of my extream labours and integrity in that business, I thought my self every wayes bound, both in duty to your Majesty, and in trust to that House of Parliament, and in consent to the matter it self, and in conformity to my own travails and beginnings; not to neglect any pains that may tend to the furtherance of so excellent a work: Wherein I will indeavour, that that which I shall set down be Nihil minus quam verba: For length and ornament of Speech are to be used for perswasion of

Multitudes, and not for information of Kings; especially such a King, as is the only instance that ever I knew, to make a man of Plato's opinion, That all knowledge is but remembrance, and that the mind of Man knoweth all things, and demandeth only to have her own Notions excited and awaked. Which your Majesties rare and indeed singular gift and faculty of swift apprehension, and infinite expansion or multiplication of another mans knowledge by your own, as I have often observed, so I did extremely admire in Goodwins Cause, being a matter full of Secrets and Mysteries of our Laws, meerly new unto you, and quite out of the path of your Education, Reading and Conference: Wherein, nevertheless, upon a spark of light given, your Majesty took in so dexterously and profoundly, as if you had been indeed Anima Legis, not only in execution, but in understanding: The remembrance whereof, as it will never be out of my mind, So it will alwayes be a warning to me, to seek rather to excite your Judgement briefly, then to inform it tediously; and if in a matter of that nature, how much more in this, wherein your Princely cogitations have wrought themselves and been conversant, and wherein the principal Light proceeded from your Self.

And therefore, my purpose is only to break this matter of the Union into certain short Articles and Questions; and to make a certain kind of Anatomy or Analysis of the Parts and Members thereof; not that I am of opinion, that all the Questions which I now shall open, were fit to be in the Consultation of the Commissioners propounded. For I hold nothing so great an enemy to good resolution, as the making of too many questions; specially in Assemblies, which consist of many. For Princes, for avoiding of distraction, must take many things by way of admittance; and if questions must be made of them, rather to suffer them to arise from others, then to grace them and authorize them, as propounded from themselves. But unto your Majesties private consideration, to whom it may better sort with me, rather to speak as a Remembrancer, then as a Counceller, I have thought good to lay before you, all the Branches, Lineaments and Degrees of this Union, that upon the view and consideration of them and their circumstances, your Majesty may the more clearly discern, and more readily call

to mind, which of them is to be imbraced, and which to be rejected; And of these which are to be accepted, which of them is presently to be proceeded in, and which to be put over to further time; And again, which of them shall require Authority of Parliament, and which are fitter to be effected by your Majesties Royal Power and Prerogative, or by other Policies or Means; And lastly, which of them is liker to pass with difficulty and contradiction, and which with more facility and smoothness:

First therefore, to begin with that Question, that I suppose will be out of question.

Whether it be not meet, that the Statutes which were made touching Scotland, or the Scots Nation, while the Kingdoms stood severed, be repealed?

It is true, there is a diversity in these; For some of these Laws consider Scotland as an Enemy Countrey; Other Laws consider it, as a Forraign Countrey only: As for example, the Law of Rich. 2. Anno 70. which prohibiteth all Armour or Victual to be carried to Scotland; And the Law of 70. of K. H. the 7. that Enacteth all the Scots Men to depart the Realm, within a time prefixed; Both these Laws and some others, respect Scotland as a Countrey of hostility: But the Law of 22. of Ed. 4. that endueth Barwick with the Liberty of a Staple, where all Scots Merchandizes should resort, that should be uttered for England; And likewise all English Merchandizes that should be uttered for Scotland: This Law beholdeth Scotland only as a Forraign Nation, and not so much neither; for there have been erected Staples in Towns in England for some Commodities, with an exclusion and restriction of other parts of England.

But this is a matter of the least difficulty; your Majesty shall have a Calendar made of the Laws, and a Brief of the Effect, and so you may judge of them: And the like, or reciproque, is to be done by Scotland, for such Laws as they have concerning England and the English Nation.

The second Question is, what Laws, Customs, Commissions, Officers, Garrisons and the like, are to be put down, discontinued or taken away, upon the Borders of both Realms?

This point, because I am not acquainted with the Orders of the Marches, I can say the less.

Herein falleth that question, Whether that the Tennants, who hold their Tennant-Rights in a greater freedom and exemption, in consideration of their service, upon the Borders; and that the Countreys themselves, which are in the same respect, discharged of Subsidies and Taxes, should not now be brought to be in one degree with other Tennants and Countreys? Nam cessante causâ, tollitur effectus; wherein, in my opinion, some time would be given, Quia adhuc corum Messis in herbâ est: But some present Ordinance would be made, to take effect at a future time; considering it is one of the greatest points and marks of the division of the Kingdoms. And because Reason doth dictate, that where the principal Solution of Continuity was, there the healing and consolidating Plaister should be chiefly applyed; There would be some further device, for the utter and perpetual confounding of those imaginary Bounds (as your Majesty termeth them) And therefore, it would be considered, whether it were not convenient to plant and erect at Carleil or Barwick, some Council or Court of Justice, the Jurisdiction whereof might extend part into England, and part into Scotland; With a Commission, not to proceed precisely, or meerly according to the Laws and Customs either of England or Scotland, but mixtly, according to Instructions by your Majesty to be set down, after the imitation and precedent of the Council of the Marches here in England, erected upon the Union of Wales.

The third Question is, that which many will make a great question of, though perhaps, your Majesty will make no question of it; And that is, Whether your Majesty should not make a stop, or stand here, and not to proceed to any further Union, contenting your Self with the two former Articles or Points?

For it will be said, That we are now well (thanks be to God) and your Majesty and the State of neither Kingdom is to be repented of; And that it is true which Hippocrates saith, That, Sana Corpora difficilè medicationes ferunt; It is better to make alterations in sick Bodies, then in found. The consideration of which point, will rest upon these two Branches; What inconveniencies will ensue with time, if the Realms stand as they are divided, which are yet not found nor sprung up. For

it may be, the sweetness of your Majesties first entrance, and the great Benefit that both Nations have felt thereby, hath covered many inconveniencies; Which nevertheless, be your Majesties Government never so gracious and politick, continuance of time and the accidents of time may breed and discover, if the Kingdoms stand divided.

The second Branch is, Allow no manifest or important peril or inconvenience should ensue, of the continuing of the Kingdoms divided; yet, on the other side, whether that, upon the further uniting of them, there be not like to follow that addition and encrease of Wealth and Reputation, as is worthy your Majesties Vertues and Fortune to be the Author and Founder of, for the advancement and exaltation of your Majesties Royal Posterity, in time to come.

But, admitting that your Majesty should proceed to this more perfect and entire Union, wherein your Majesty may say, Majus opus moveo; To enter into the parts and degrees thereof, I think fit, first, to set down, as in a brief Table, in what points the Nations stand now at this present time already united, and in what points yet still severed and divided; that your Majesty may the better see what is done, and what is to be done; and how that which is to be done, is to be inferred upon that which is done.

The Points wherein the Nations stand already united are,

In Soveraignty.

In the Relative thereof, which is Subjection.

In Religion.

In Continent.

In Language.

And now lastly, by the Peace your Majesty concluded with Spain in Leagues and Confederacies; For now both Nations have the same Friends and the same Enemies.

Yet notwithstanding, there is none of the six Points wherein the Union is perfect and consummate; But every of them hath some scruple, or rather grain of separation, enwrapped and included in them.

For the Soveraignty, the Union is absolute in your Majesty and your Generation; But if it should so be, (which God of his infinite mercy defend) that your Issue should fail, then the descent of both Realms doth resort to the several Lines of the several Blouds Royal.

For Subjection, I take the Law of England to be clear, (what the Law of Scotland is, I know not) That all Scots men, from the very instant of your Majesties Reign begun, are become Denizens; And the Post-nati are naturalized Subjects of England, for the time forwards: For, by our Laws, none can be an Alien, but he that is of another Allegiance then our Soveraign Lord the Kings; For there be but two sorts of Aliens, whereof we find mention in our Law; an Alien Ami, and an Alien Enemy; whereof the former is a Subject of a State in amity with the King, and the latter a Subject of a State in hostility: But, whether he be one or other, it is an essential difference unto the definition of an Alien, if he be not of the Kings Allegiance; As we see it evidently in the precedent of Ireland, who since they were Subjects to the Crown of England, have ever been inheritable and capable, as Natural Subjects; And yet, not by any Statute or Act of Parliament, but meerly by the common Law, and the Reason thereof. So as there is no doubt, that every Subject in Scotland was and is in like plight and degree, since your Majesties coming in, as if your Majesty had granted particularly your Letters of Denization or Naturalization to every of them, and the Post-nati wholly Natural. But then, on the other side, for the time backwards, and for those that were Ante-nati, the Blood is not by Law naturalized; So as they cannot take it by descent from their Ancestors, without Act of Parliament. And therefore, in this point, there is a defect in the Union of Subjection.

For matter of Religion, the Union is perfect in points of Doctrine; but in matter of Discipline and Government, it is imperfect.

For the Continent; It is true, there are no natural Boundaries of Mountains or Seas, or Navigable Rivers; But yet there are Badges and Memorials of Borders: Of which point, I have spoken before.

For the Language; It is true, the Nations are unius Labii, and have not the first curse of disunion, which was Confusion of Tongues, whereby one understood

not another: But yet the Dialect is differing, and it remaineth a kind of mark of distinction. But for that, Tempori permittendum, it is to be left to time: For, considering that both Languages do concur in the principal Office and Duty of Language, which is to make a mans self understood; For the rest, it is rather to be accounted (as was said) a diversity of Dialect then of Language; and as I said in my first Writing, it is like to bring forth the enriching of one Language, by compounding and taking in the proper and significant Words of either Tongue, rather then a continuance of two Languages.

For Leagues and Confederacies; It is true, that neither Nation is now in hostility with any State, wherewith the other Nation is in amity: but yet so, as the Leagues and Treaties have been concluded with either Nation respectively, and not with both jointly; which may contain some diversity of Articles of straitness with one, more then with the other.

But many of these matters may perhaps be of that kind, as may fall within that Rule, In veste variet as sit, scissura non sit.

Now to descend to the particular points, wherein the Realms stand severed and divided, over and besides the former six points of separation, which I have noted and placed as the defects or abatements of the six points of the Union, and therefore shall not need to be repeated. The points, I say, yet remaining, I will divide into External and into Internal.

The External Points therefore of the separation, are four.

1. The several Crowns; I mean, the ceremonial and material Crowns.
2. The second is, the several Names, Stiles or Appellations.
3. The third is, the several Prints of the Seals.
4. The fourth is, the several Stamps or Marks of the Coins of Monies.

It is true, that the External are, in some respect and parts, much mingled and interlaced with considerations Internal; and that they may be as effectual to the true Union, which must be the work of time, as the Internal, because they are operative upon the conceits and opinions of the People: The uniting of whose hearts and affections, is the life and true end of this Work.

For the Ceremonial Crowns, the question will be, whether there shall be framed one new Imperial Crown of Britain, to be used for the time to come?

Also, admitting that to be thought convenient, whether in the Frame thereof, there shall not be some reference to the Crowns of Ireland and France?

Also, whether your Majesty should repeat or iterate your own Coronation and your Queens; or only ordain, that such new Crown shall be used by your Posterity hereafter?

The difficulties will be, in the conceit of some inequality, whereby the Realm of Scotland may be thought to be made an accession unto the Realm of England. But that resteth in some circumstances; for the compounding of the two Crowns is equal; The calling of the new Crown, The Crown of Britain, is equal. Only the place of Coronation, if it shall be at Westminster, which is the ancient, august and sacred place for the Kings of England, may seem to make an inequality: And again, if the Crown of Scotland be discontinued, then that Ceremony which I hear is used in the Parliament of Scotland, in the absence of the Kings, to have the Crowns carried in solemnity, must likewise cease.

For the Name, the main question is, whether the contracted Name of Britain shall be by your Majesty used, or the divided Names of England and Scotland.

Admitting there shall be an alteration, then the case will require these following Questions.

First, whether the Name of Britain shall not only be used in your Majesties Stile, where the entire Stile is recited; and in all other forms, the divided Names to remain, both of the Realms and of the People; Or otherwise, that the very divided Names of Realms and People, shall likewise be changed or turned into special or sub-divided Names of the general Name; That is to say, for example, whether your Majesty in your Stile, shall denominate your self, King of Britain, France and Ireland, &c. And yet, nevertheless, in any Commission, Writ or otherwise, where your Majesty mentioneth England or Scotland, you shall retain the ancient Names, as Secundum consuetudinem Regni nostri Angliae; or whether those divided Names shall be for ever lost and taken away, and turned into the sub-divisions of South-Britain and North-Britain, and the People to be

South-Britains and North-Britains; And so in the example foresaid, the Tenour of the like clause to run, Secundum consuetudinem Britanniae Australis.

Also, if the former of these shall be thought convenient, whether it were not better for your Majesty, to take that Alteration of Stile upon you by Proclamation, as Edward the third did the Stile of France, then to have it enacted by Parliament?

Also, in the alteration of the Stile, whether it were not better to transpose the Kingdom of Ireland, and put it immediately after Britain, and so place the Islands together; and the Kingdom of France, being upon the Continent, last? In regard these Islands of the Western Ocean seem, by Nature and Providence, an entire Empire in themselves; and also, that there was never King of England so entirely possest of Ireland as your Majesty is: So as your Stile to run, King of Britain, Ireland, and the Islands adjacent, and of France, &c.

The difficulties in this have been already throughly beaten over, but they gather but to two Heads.

The one, point of Honour, and love to the former Names.

The other, Doubt; left the alteration of the Name may induce and involve an alteration of the Laws and Policies of the Kingdom: Both which, if your Majesty shall assume the Stile by Proclamation, and not by Parliament, are in themselves satisfied: For then the usual Names must needs remain in Writs and Records; the Forms whereof cannot be altered, but by Act of Parliament, and so the point of Honour satisfied. And again, your Proclamation altereth no Law; and so the scruple of a tacite or implyed alteration of Laws likewise satisfied. But then, it may be considered, whether it were not a Form of the greatest Honour, if the Parliament, though they did not enact it, yet should become Suiters and Petitioners to your Majesty to assume it?

For the Seals, That there should be but one Great Seal of Britain, and one Chancellor; and that there should only be a Seal in Scotland for Processes and ordinary Justice; And that all Patents of Grants of Lands or otherwise, as well in Scotland as in England, should pass under the Great Seal here, kept about your Person: It is alteration Internal whereof I do not now speak.

But the Question in this place is, whether the Great Seals of England and Scotland should not be changed into one and the same form of Image and Superscription of Britain? which nevertheless is requisite should be, with some one plain or manifest alteration, lest there be a Buz, and suspect that Grants of things in England may be passed by the Seal of Scotland; Or è converso.

Also, whether this alteration of Form may not be done without Act of Parliament, as the Great Seals have used to be heretofore changed, as to their Impressions?

For the Moneys, as to the Real and internal consideration thereof, the question will be, Whether your Majesty should not continue two Mints? which (the distance of Territory considered) I suppose, will be of necessity.

Secondly, how the Standards (if it be not already done, as I hear some doubt made of it in popular rumour) may be reduced into an exact proportion for the time to come; and likewise the computation, tale, or valuation to be made exact, for the Moneys already beaten?

That done, the last Question is, (which is only proper to this place) whether the Stamp, or the Image and Superscription of Britain, for the time forwards, should not be made the self same in both places, without any difference at all? A matter also which may be done, as our Law is, by your Majesties Prerogative, without Act of Parliament.

These points are points of Demonstration, ad faciendum Populum; But so much the more they go to the root of your Majesties intention, which is to imprint and inculcate into the Hearts and Heads of the People, that they are one People and one Nation.

In this kind also, I have heard it pass abroad in speech, of the erection of some new Order of Knighthood, with a Reference to the Union, and an Oath appropriat thereunto; which is a point likewise deserveth a Consideration. So much for the External Points.

The Internal Prints of Separation, are as followeth.

1. Several Parliaments.

2. Several Councils of Estate.
3. Several Officers of the Crown.
4. Several Nobilities.

5. Several Laws.
6. Several Courts of Justice, Trials and Processes.
7. Several Receipts and Finances.
8. Several Admiralties and Merchandizings.
9. Several Freedoms and Liberties,
10. Several Taxes and Imposts.

As touching the several States Ecclesiastical, and the several Mints and Standards, and the several Articles and Treaties of Intercourse with Forraign Nations, I touched them before.

In these points, of the straight and more inward Union, there will interveen one principal difficulty and impediment, growing from that root, which Aristotle in his Politicks, maketh to be the root of all division and diffention in Common-wealths; And that is, Equality and Inequality. For the Realm of Scotland is now an Ancient and Noble Realm, substantive of it self: But, when this Island shall be made Britain, then Scotland is no more to be considered as Scotland, but as a part of Britain; no more then England is to be considered as England, but as a part likewise of Britain: And consequently, neither of these are to be considered as things entire in themselves, but in the proportion that they bear to the whole. And therefore, let us imagine (Nam id Mente possumus, quod Actu non possumus) that Britain had never been divided, but had ever been one Kingdom; then that part of Soil or Territory, which is comprehended under the name of Scotland, is in quantity (as I have heard it esteemed, how true I know not) not past a third part of Britain; And that part of Soil or Territory which is comprehended under the name of England, is two parts of Britain; leaving to speak of any difference of Wealth or Population, and speaking only of Quantity. So then, if for example, Scotland should bring to Parliament as much Nobility as England, then a third part should countervail two parts, Nam si inaequalibus

aequalia addas, omnia erunt inaequalia. And this, I protest before God and your Majesty, I do speak, not as a man born in England, but as a man born in Britain. And therefore, to descend to particulars.

1. Parliament.

For the Parliaments, the consideration of that Point will fall into four Questions.

1. The first, what proportion shall be kept between the Votes of England, and the Votes of Scotland.

2. The second, touching the manner of Proposition, or possessing of the Parliament of Causes there to be handled, which in England is used to be done immediately by any Member of the Parliament, or by the Prolocutor; and in Scotland is used to be done immediately by the Lords of the Articles; whereof the one form seemeth to have more Liberty, and the other more Gravity and Maturity: And therefore, the Question will be, whether of these shall yield to other? Or, whether there should not be a mixture of both by some Commissions, precedent to every Parliament, in the nature of Lords of the Articles; and yet, not excluding the Liberty of propounding in full Parliament afterwards?

3. The third, touching the Orders of Parliament, how they may be compounded, and the best of either taken.

4. The fourth, how those, which by inheritance or otherwise, have Offices of Honour and Ceremony in both the Parliaments, as the Lord Steward with us, &c. may be satisfied, and duplicitly accommodated?

2. Councils of Estate.

For the Councils of Estate, while the Kingdoms stand divided, it should seem necessary to continue several Councils; But if your Majesty should proceed to a strict Union then, howsoever your Majesty may establish some Provincial Councils in Scotland, as there is here of York, and in the Marches of Wales; Yet the Question will be, whether it will not be more convenient for your Majesty, to have but one Privy Council about your Person; whereof the principal Officers of

the Crown of Scotland to be, for Dignity sake, howsoever their abiding and remaining may be as your Majesty shall imploy their Service? But this point belongeth meerly and wholly to your Majesties Royal Will and Pleasure.

3. Officers of the Crown.

For the Officers of the Crown, the consideration thereof will fall into these Questions.

First, in regard of the latitude of your Kingdom, and the distance of place, whether it will not be matter of necessity to continue the several Officers, because of the impossibility for the Service to be performed by one?

The second, admitting the duplicity of Officers should be continued, yet whether there should not be a difference, that one should be the principal Officer, and the other to be but special and subalterne? As for example, one to be Chancellor of Britain, and the other to be Chancellor, with some special addition; As here of the Dutchy, &c.

The third, if no such specialty or inferiority be thought fit, then whether both Officers should not have the Title and the Name of the whole Island and Precincts? As the Lord Chancellor of England, to be Lord Chancellor of Britain, and the Lord Chancellor of Scotland, to be Lord Chancellor of Britain; But with several Proviso's, that they shall not intromit themselves, but within their several Precincts.

4. Nobilities.

For the Nobilities, the consideration thereof will fall into these Questions.

The first, of their Votes in Parliament (which was touched before) what proportion they shall bear to the Nobility of England? Wherein, if the proportion which shall be thought fit be not full, yet your Majesty may, out of your Prerogative, supply it: For, although you cannot make fewer of Scotland, yet you may make more of England.

The second is, touching the Place and Precedence; wherein, to marshal them according to the Precedence of England in your Majesties Stile, and according to the Nobility of Ireland, that is, all English Earls first, and then Scots, will be thought unequal for Scotland: To marshal them according to Antiquity, will be thought unequal for England, because, I hear their Nobility is generally more ancient: And therefore, the Question will be, whether the indifferentest way were not, to take them interchangeably; As for example, first the ancient Earl of England, and then the ancient Earl of Scotland: And so Alternis vicibus.

5. Laws.

For the Laws, to make an entire and perfect Union, it is a matter of great difficulty and length, both in the collecting of them, and in the passing of them. For, first, as to the collecting of them, there must be made by the Lawyers of either Nation, a Disgest, under Titles, of their several Laws and Customs, as well Common Laws, as Statutes; that they may be collated and compared, and that the diversities may appear and be discerned of. And for the passing of them, we see by experience, that Patrius Mos, is dear to all men, and that men are bred and nourished up in the love of it; and therefore, how harsh Changes and Innovations are. And we see likewise, what Disputation and Argument the alteration of some one Law doth cause and bring forth; How much more the alteration of the whole Corps of the Law? Therefore, the first Question will be, whether it be not good to proceed by parts, and to take that that is most necessary, and leave the rest to time? The parts therefore, or subject of Laws, are for this purpose, fitliest distributed, according to that ordinary didivision of Criminal and Civil; and those of Criminal Causes, into Capital and Penal.

The second Question therefore is, Allowing the general Union of Laws to be too great a Work to embrace, whether it were not convenient, that Cases Capital were the same in both Nations? I say the Cases, I do not speak of the Proceedings or Trials; That is to say, whether the same Offences were not fit to be made Treason or Fellony in both places?

The third Question is, whether Cases Penal, though not Capital, yet if they concern the Publick State, or otherwise the discipline of Manners, were not fit likewise to be brought into one degree? As the case of Misprision of Treason, the Case of Premunire, the Case of Fugitives, the Case of Incest, the Case of Simony and the rest.

But the Question, that is more urgent then any of these, is, Whether these Cases, at the least, be they of an higher or inferiour degree, wherein the Fact committed or Act done in Scotland, may prejudice the State and Subjects of England, or è converso; are not to be reduced to one uniformity of Law and Punishment? As for example, a Perjury committed in a Court of Justice in Scotland, cannot be prejudicial in England, because Depositions taken in Scotland, cannot be produced and used here in England. But a Forgery of a Deed in Scotland, I mean with a false date of England, may be used and given in evidence in England. So likewise, the depopulating of a Town in Scotland, doth not directly prejudice the State of England: But if an English Merchant shall carry Silver and Gold into Scotland, (as he may) and thence transport it into Forraign Parts, this prejudiceth the State of England, and may be an evasion to all the Laws of England ordained in that case: and therefore, had need to be bridled with as severe a Law in Scotland, as it is here in England.

Of this kind, there are many Laws.

The Law of the 50. of Rich. the 2. of going over without Licence, if there be not the like Law in Scotland, will be frustrated and evaded: For any Subject of England, may go first into Scotland, and thence into Forraign parts.

So the Laws prohibiting transportation of sundry Commodities, as Gold and Silver, Ordnance, Artillery, Corn, & c. if there be not a correspondence of Laws in Scotland, will in like manner be deluded and frustrate: For any English Merchant or Subject may carry such Commodities first into Scotland, as well as he may carry them from Port to Port in England; And out of Scotland to Forraign parts, without any peril of Law.

So Libels may be devised and written in Scotland, and published and scattered in England.

Treasons may be plotted in Scotland, and executed in England.

And so in many other cases, if there be not the like severity of Law in Scotland, to restrain offences, that there is in England (whereof we are here ignorant, whether there be or no) it will be a gap or stop, even for English Subjects, to escape and avoid the Laws of England.

But for Treasons, the best is, that by the Statute of 26. King Hen. the 8th. Ca. any Treason committed in Scotland, may be proceeded with in England, as well as Treasons committed in France, Rome, or elsewhere.

6. Courts of Justice, and Administration of Laws.

For Courts of Justice, Trials, Processes, and other Administration of Laws, to make any alteration in either Nation, it will be a thing so new and unwonted to either People, that it may be doubted, it will make the Administration of Justice (which of all other things, ought to be known and certain, as a beaten way) to become intricate and uncertain: And besides, I do not see that the severalty of Administration of Justice, though it be by Court Soveraign of last resort, (I mean, without appeal or errour) is any impediment at all to the Union of a Kingdom: As we see by experience, in the several Courts of Parliament in the Kingdom of France. And I have been alwayes of opinion, that the Subjects of England do already fetch Justice somewhat far off, more then in any Nation that I know, the largeness of the Kingdom considered, though it be holpen in some part, by the Circuits of the Judges, and the two Councils at York, and in the Marches of Wales established.

But it may be a good Question, whether as commune vinculum, of the Justice of both Nations, your Majesty should not erect some Court about your Person, in the nature of the Grand Council of France; To which Court you might, by way of evocation, draw Causes from the ordinary Judges of both Nations; For so doth the French King from all the Courts of Parliament in France; many of which are more remote from Paris, then any part of Scotland is from London.

7. Receipts, Finances, and Patrimonies of the Crown.

For Receipts and Finances, I see no Question will arise; in regard it will be matter of necessity, to establish in Scotland a Receipt of Treasure, for Payments and Erogations to be made in those parts: And for the Treasure of Spare, in either Receipts, the custodies thereof may well be several; considering, by your Majesties Commandment, they may be at all times removed or disposed, according to your Majesties occasions.

For the Patrimonies of both Crowns, I see no Question will arise; except your Majesty would be pleased to make one compounded Annexation for an inseparable Patrimony to the Crown, out of the Lands of both Nations; And so the like for the Principality of Britain, and for other Appen•ages, of the rest of your Children; Erecting likewise such Dutchies and Honours, compounded of the Possessions of both Nations, as shall be thought fit.

8. Admiralty, Navy and Merchandizing.

For Admiralty or Navy, I see no great question will arise; For I see no inconvenience your Majesty to continue Shipping in Scotland. And for the Jurisdictions of the Admiralties, and the Profits and Casualties of them, they will be respective unto the Coasts over against which the Seas lye and are situated, As it is here with the Admiralties of England.

And for Merchandizing, it may be a question, whether that the Companies of the Merchant-Adventurers of the Turky Merchants and the Muscovy Merchants (if they shall be continued) should not be compounded of Merchants of both Nations, English and Scots? For, to leave Trade free in the one Nation, and to have it restrained in the other, may, per-case, breed some inconvenience.

9. Freedoms and Liberties.

For Freedoms and Liberties, the Charter of both Nations may be reviewed; And of such Liberties as are agreeable and convenient for the Subjects and People of both Nations, one Great Charter may be made and confirmed to the Subjects of

Britain; And those Liberties which are peculiar or proper to either Nation, to stand in State as they do.

10. Taxes and Imposts.

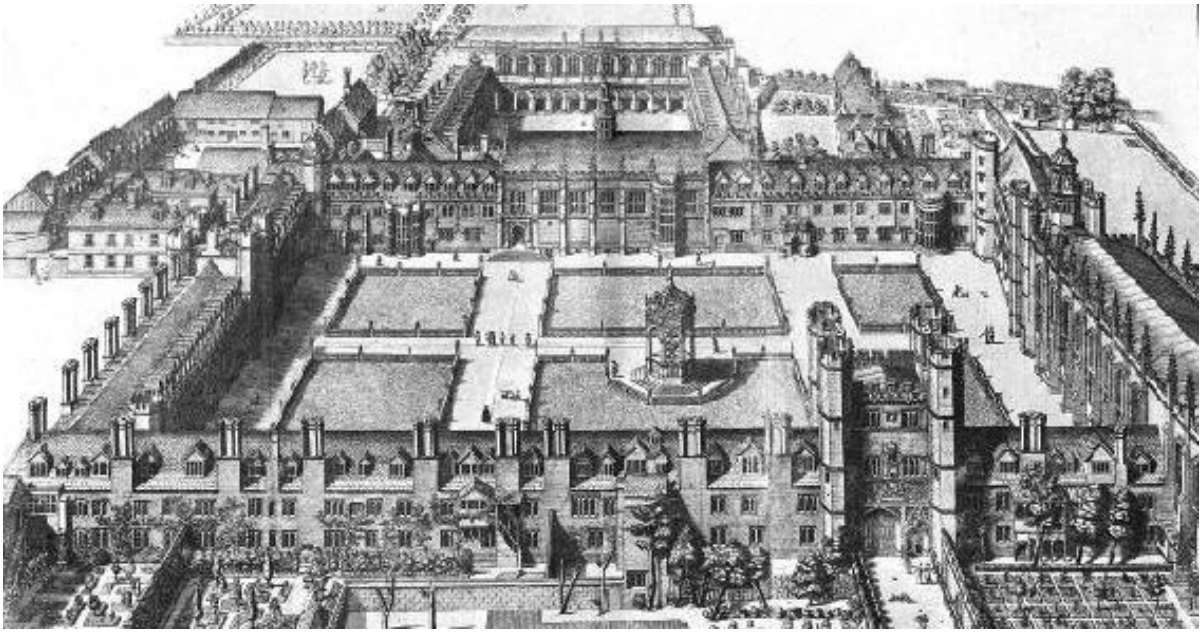
But for Imposts and Customs, it will be a great Question how to accommodate them, and reconcile them: For, if they be much easier in Scotland then they be here in England, (which is a thing I know not) then this inconvenience will follow, That the Merchants of England may unlade in the Ports of Scotland, and this Kingdom to be served from thence, and your Majesties Customs abated.

And for the Question, whether the Scots Merchants should pay Strangers Custom in England? That resteth upon the point of Naturalization, which I touched before.

Thus have I made your Majesty a brief and naked Memorial, of the Articles and Points of this great Cause; which may serve only to excite and stir up your Majesties Royal Judgement, and the Judgements of wiser men, whom you will be pleased to call to it: Wherein I will not presume to perswade, or disswade any thing, nor to interpose mine own opinion; but expect light from your Majesties Royal Directions, unto the which, I shall ever submit my Judgement, and apply my Travails. And I most humbly pray your Majesty, in this which is done, to pardon my errors, and to cover them with my good intention and meaning, and desire I have to do your Majesty service, and to acquit the Trust that was reposed in me; And chiefly, in your Majesties benign and gracious Acceptation.

FINIS.

The Criticism



Trinity College, Cambridge, 1690. Bacon entered Trinity College, on 5 April 1573 at the age of 12, living there for three years, with his older brother Anthony Bacon, under the personal tutelage of Dr John Whitgift, future Archbishop of Canterbury.

Trinity College today

Bacon is Shake-Speare by Sir Edwin Durning-Lawrence

Sir Edwin Durning-Lawrence, 1st Baronet (1837-1914) was a British lawyer and Member of Parliament. He is best known for his advocacy of the Baconian theory of Shakespeare authorship, asserting that Francis Bacon was the author of Shakespeare's plays. Durning-Lawrence published a number of books on the subject and promoted public debates with the academic community. The most notable book on this subject was *Bacon is Shake-Speare* (1910). The most famous argument in the book suggests that the word *Honorificabilitudinitatibus*, used in the play *Love's Labour's Lost*, is an anagram for hi ludi, F. Baconis nati, tuiti orbi, Latin for "these plays, F. Bacon's offspring, are preserved for the world". He derived the argument from an earlier book by Isaac Hull Platt. The later critic Samuel Schoenbaum argued that the anagram overlooks the fact that Bacon would have written the genitive of his name as Baconi (from Baconus), never Baconis (which assumes his name was Baco).

PROMUS OF FOURMES AND ELEGANCYES
PREFACE TO PROMUS
PROMUS OF FORMULARIES.

“Every hollow Idol is dethroned by skill,
insinuation and regular approach.”

TO THE READER

The plays known as Shakespeare's are at the present time universally acknowledged to be the "Greatest birth of time," the grandest production of the human mind. Their author also is generally recognised as the greatest genius of all the ages. The more the marvellous plays are studied, the more wonderful they are seen to be.

Classical scholars are amazed at the prodigious amount of knowledge of classical lore which they display. Lawyers declare that their author must take rank among the greatest of lawyers, and must have been learned not only in the theory of law, but also intimately acquainted with its forensic practice. In like manner, travellers feel certain that the author must have visited the foreign cities and countries which he so minutely and graphically describes.

It is true that at a dark period for English literature certain critics denied the possibility of Bohemia being accurately described as by the sea, and pointed out the "manifest absurdity" of speaking of the "port" at Milan; but a wider knowledge of the actual facts has vindicated the author at the expense of his unfortunate critics. It is the same with respect to other matters referred to in the plays. The expert possessing special knowledge of any subject invariably discovers that the plays shew that their author was well acquainted with almost all that was known at the time about that particular subject.

And the knowledge is so extensive and so varied that it is not too much to say that there is not a single living man capable of perceiving half of the learning involved in the production of the plays. One of the greatest students of law publicly declared, while he was editor of the *Law Times*, that although he thought that he knew something of law, yet he was not ashamed to confess that he had not sufficient legal knowledge or mental capacity to enable him to fully comprehend a quarter of the law contained in the plays.

Of course, men of small learning, who know very little of classics and still less of law, do not experience any of these difficulties, because they are not able to perceive how great is the vast store of learning exhibited in the plays.

There is also shewn in the plays the most perfect knowledge of Court etiquette, and of the manners and the methods of the greatest in the land, a knowledge which none but a courtier moving in the highest circles could by any possibility have acquired.

In his diary, Wolfe Tone records that the French soldiers who invaded Ireland behaved exactly like the French soldiers are described as conducting themselves at Agincourt in the play of "Henry V," and he exclaims, "It is marvellous!" (Wolfe Tone also adds that Shakespeare could never have seen a French soldier, but we know that Bacon while in Paris had had considerable experience of them.)

The mighty author of the immortal plays was gifted with the most brilliant genius ever conferred upon man. He possessed an intimate and accurate acquaintance, which could not have been artificially acquired, with all the intricacies and mysteries of Court life. He had by study obtained nearly all the learning that could be gained from books. And he had by travel and experience acquired a knowledge of cities and of men that has never been surpassed.

Who was in existence at that period who could by any possibility be supposed to be this universal genius? In the days of Queen Elizabeth, for the first time in human history, one such man appeared, the man who is described as the marvel and mystery of the age, and this was the man known to us under the name of Francis Bacon.

In answer to the demand for a "mechanical proof that Bacon is Shakespeare" I have added a chapter shewing the meaning of "Honorificabilitudinitatibus," and I have in Chapter XIV. shewn how completely the documents recently discovered by Dr. Wallace confirm the statements which I had made in the previous chapters.

I have also annexed a reprint of Bacon's "Promus," which has recently been collated with the original manuscript. "Promus" signifies Storehouse, and the collection of "Fourmes and Elegancyes" stored therein was largely used by Bacon in the Shakespeare plays, in his own acknowledged works, and also in some other works for which he was mainly responsible.

I trust that students will derive considerable pleasure and profit from examining the “Promus” and from comparing the words and phrases, as they are there preserved, with the very greatly extended form in which many of them finally appeared.

EDWIN DURNING-LAWRENCE.

CHAPTER I.

"What does it matter whether the immortal works were written by Shakespeare (of Stratford) or by another man who bore (or assumed) the same name?"

Some twenty years ago, when this question was first propounded, it was deemed an excellent joke, and I find that there still are a great number of persons who seem unable to perceive that the question is one of considerable importance.

When the Shakespeare revival came, some eighty or ninety years ago, people said "pretty well for Shakespeare" and the "learned" men of that period were rather ashamed that Shakespeare should be deemed to be "*the*" English poet.

"Three poets in three distant ages born,
Greece, Italy and England did adorn,
. . . . . .
The force of Nature could no further go,
To make a third she joined the other two."

Dryden did not write these lines in reference to Shakespeare but to Milton. Where will you find the person who to-day thinks Milton comes within any measurable distance of the greatest genius among the sons of earth who was called by the name of Shakespeare?

Ninety-two years ago, viz.: in June 1818, an article appeared in *Blackwood's Edinburgh Magazine*, under the heading "Time's Magic Lantern. No. V. Dialogue between Lord Bacon and Shakspeare" [Shakespeare being spelled Shakspeare]. The dialogue speaks of "Lord" Bacon and refers to him as being engaged in transcribing the "Novum Organum" when Shakspeare enters with a letter from Her Majesty (meaning Queen Elizabeth) asking him, Shakspeare, to see "her own" sonnets now in the keeping of *her* Lord Chancellor.

Of course this is all topsy turvydom, for in Queen Elizabeth's reign
Bacon was never "Lord" Bacon or Lord Chancellor.

But to continue, Shakspeare tells Bacon “Near to Castalia there bubbles also a fountain of petrifying water, wherein the muses are wont to dip whatever posies have met the approval of Apollo; so that the slender foliage which originally sprung forth in the cherishing brain of a true poet becomes hardened in all its leaves and glitters as if it were carved out of rubies and emeralds. The elements have afterwards no power over it.”

Bacon. Such will be the fortune of your own productions.

Shakspeare. Ah my Lord! Do not encourage me to hope so. I am but a poor unlettered man, who seizes whatever rude conceits his own natural vein supplies him with, upon the enforcement of haste and necessity; and therefore I fear that such as are of deeper studies than myself, will find many flaws in my handiwork to laugh at both now and hereafter.

Bacon. He that can make the multitude laugh and weep as you do Mr. Shakspeare need not fear scholars…. More scholarship might have sharpened your judgment but the particulars whereof a character is composed are better assembled by force of imagination than of judgment….

Shakspeare. My Lord thus far I know, that the first glimpse and conception of a character in my mind, is always engendered by chance and accident. We shall suppose, for instance, that I, sitting in a taproom, or standing in a tennis court. The behaviour of some one fixes my attention…. Thus comes forth Shallow, and Slender, and Mercutio, and Sir Andrew Aguecheek.

Bacon. These are characters who may be found alive in the streets. But how frame you such interlocutors as Brutus and Coriolanus?

Shakspeare. By searching histories, in the first place, my Lord, for the germ. The filling up afterwards comes rather from feeling than observation. I turn myself into a Brutus or a Coriolanus for the time; and can, at least in fancy, partake sufficiently of the nobleness of their nature, to put proper words in their mouths…. My knowledge of the tongues is but small, on which account I have read ancient authors mostly at secondhand. I remember, when I first came to London, and began to be a hanger-on at the theatres, a great desire grew in me for more learning than had fallen to my share at Stratford; but fickleness and

impatience, and the bewilderment caused by new objects, dispersed that wish into empty air….

This ridiculous and most absurd nonsense, which appeared in 1818 in *Blackwood's Edinburgh Magazine* was deemed so excellent and so *instructive* that (slightly abridged) it was copied into "Reading lessons for the use of public and private schools" by John Pierpont, of Boston, U.S.A., which was published in London nearly twenty years later, viz., in 1837.

As I said before, the dialogue is really all topsy turvydom, for the writer must have known perfectly well that Bacon was not Lord Keeper till 1617, the year after Shakspeare's death in 1616, and was not made Lord Chancellor till 1618, and that he is not supposed to have began to write the "Novum Organum" before the death of Queen Elizabeth.

I have therefore arrived at the conclusion that the whole article was really intended to poke fun at the generally received notion that the author of the plays was an *un*lettered man, who picked up his knowledge at tavern doors and in taprooms and tennis courts. I would specially refer to the passage where Bacon asks "How frame you such interlocutors as Brutus and Coriolanus?" and Shakspeare replies "By searching histories, in the first place, my Lord, for the germ. The filling up afterwards comes rather from feeling than observation. I turn myself into a Brutus or a Coriolanus for the time and can at least in fancy partake sufficiently of the nobleness of their nature to put proper words in their mouths."

Surely this also must have been penned to open the eyes of the public to the absurdity of the popular conception of the author of the plays as an *un*lettered man who "had small Latin and less Greek"!

The highest scholarship not only in this country and in Germany but throughout the world has been for many years concentrated upon the classical characters portrayed in the plays, and the adverse criticism of former days has given place to a reverential admiration for the marvellous knowledge of antiquity displayed throughout the plays in the presentation of the historical

characters of bygone times; classical authority being found for nearly every word put into their mouths.

What does it matter whether the immortal works were written by Shakspeare (of Stratford) or by a great and learned man who assumed the name Shakespeare to “Shake a lance at Ignorance”? We should not forget that this phrase “Shake a lance at Ignorance” is contemporary, appearing in Ben Jonson’s panegyric in the Shakespeare folio of 1623.

CHAPTER II.

The Shackspere Monument, Bust, and Portrait.

In the year 1909 Mr. George Hookham in the January number of the *National Review* sums up practically all that is really known of the life of William Shakspeare of Stratford as follows: —

'We only know that he was born at Stratford, of illiterate parents — (we do *not* know that he went to school there) — that, when 18-1/2 years old, he married Anne Hathaway (who was eight years his senior, and who bore him a child six months after marriage); that he had in all three children by her (whom with their mother he left, and went to London, having apparently done his best to desert her before marriage); — that in London he became an actor with an interest in a theatre, and was reputed to be the writer of plays; — that he purchased property in Stratford, to which town he returned; — engaged in purchases and sales and law-suits (of no biographical interest except as indicating his money-making and litigious temperament); helped his father in an application for coat armour (to be obtained by false pretences); promoted the enclosure of common lands at Stratford (after being guaranteed against personal loss); made his will — and died at the age of 52, without a book in his possession, and leaving nothing to his wife but his second best bed, and this by an afterthought. No record of friendship with anyone more cultured than his fellow actors.

No letter, — only two contemporary reports of his conversation, one with regard to the commons enclosure as above, and the other in circumstances not to be recited unnecessarily.

In a word we know his parentage, birth, marriage, fatherhood, occupation, his wealth and his chief ambition, his will and his death, and absolutely nothing else; his death being received with unbroken and ominous silence by the literary world, not even Ben Jonson who seven years later glorified the plays *in excelsis*, expending so much as a quatrain on his memory.'

To this statement by Mr. George Hookham I would add that we know W. Shakspeare was christened 26th April 1564, that his Will which commences "In the name of god Amen! I Willim Shackspeare, of Stratford upon Avon, in the countie of warr gent in perfect health and memorie, god be praysed," was dated 25th (January altered to) March 1616, and it was proved 22nd June 1616, Shakspeare having died 23rd April 1616, four weeks after the date of the Will.

We also know that a monument was erected to him in Stratford Church. And because L. Digges, in his lines in the Shakespeare folio of 1623 says "When Time dissolves thy Stratford Moniment,"[1] it is supposed that the monument must have been put up before 1623. But we should remember that as Mrs. Stopes (who is by no means a Baconian) pointed out in the *Monthly Review* of April 1904, the original monument was not like the present monument which shews a man with a pen in his hand; but was the very different monument which will be found depicted in Sir William Dugdale's "Antiquities of Warwickshire," published in 1656. The bust taken from this is shewn on Plate 5, Page 14, and the whole monument on Plate 3, Page 8.

The figure bears no resemblance to the usually accepted likeness of Shakspeare. It hugs a sack of wool, or a pocket of hops to its belly and does not hold a pen in its hand.

In Plate 6, Page 15, is shewn the bust from the monument as it exists at the present time, with the great pen in the right hand and a sheet of paper under the left hand. The whole monument is shewn on Plate 4, Page 9.

The face seems copied from the mask of the so-called portrait in the 1623 folio, which is shewn in Plate 8.

It is desirable to look at that picture very carefully, because every student ought to know that the portrait in the title-page of the first folio edition of the plays published in 1623, which was drawn by Martin Droeshout, is cunningly composed of two left arms and a mask. Martin Droeshout, its designer, was, as Mr. Sidney Lee tells us, but 15 years of age when Shakspeare died. He is not likely therefore ever to have seen the actor of Stratford, yet this is the "Authentic," that is the "Authorised" portrait of Shakspeare, although there *is* no question — there *can be* no possible question — that in fact it is a cunningly drawn cryptographic picture, shewing two left arms and a mask.

The back of the left arm which does duty for the right arm is shewn in
Plate 10, Page 26.

Every tailor will admit that this is not and cannot be the front of the right arm, but is, without possibility of doubt, the back of the left arm.

Plate 11 shews the front of the left arm, and you at once perceive that you are no longer looking at the back of the coat but at the front of the coat.

Head, from the [so-called]
Portrait, by Droeshout, in the 1623 Folio]

Now in Plate 12, Page 32, you see the mask, especially note that the ear is a mask ear and stands out curiously; note also how distinct the line shewing the edge of the mask appears. Perhaps the reader will perceive this more clearly if he turns the page upside down.

Plate 13, Page 33, depicts a real face, that of Sir Nicholas Bacon, eldest son of the Lord Keeper, from a contemporary portrait by Zucchero, lately in the Duke of Fife's Collection. This shews by contrast the difference between the portrait of a living man, and the drawing of a lifeless mask with the double line from ear

to chin. Again examine Plates 8, Pages 20, 21, the complete portrait in the folio. The reader having seen the separate portions, will, I trust, be able now to perceive that this portrait is correctly characterised as cunningly composed of two left arms and a mask.

While examining this portrait, the reader should study the lines that describe it in the Shakespeare folio of 1623, a facsimile of which is here inserted.

To the Reader.

This Figure, that thou here seest put,
It was for gentle Shakespeare cut;
Wherein the Grauer had a strife
with Nature, to out-doo the life:
O, could he but haue drawne his wit
As well in brasse, as he hath hit
His face; the Print would then surpasse
All, that was euer writ in brasse.
But, since he cannot, Reader, looke
Not on his Picture, but his Booke.

B.I.

Plate IX.

VERSES ASCRIBED TO BEN JONSON, FROM THE 1623 FOLIO EDITION OF SHAKESPEARE'S WORKS.

B.I. call the ridiculous dummy a "portrait" but describes it as the "Figure put for" (that is "instead of") and as "the Print," and as "his Picture"; he likewise most clearly tells us to "looke not on his (ridiculous) Picture, but (only) his Booke." It seems, therefore, evident that he knew the secret of Bacon's authorship and intended to inform those capable of understanding that the graver had done out the life when he writes, "Out-doo the life." In the New English Dictionary, edited by Sir J.A.H. Murray, there are upwards of six hundred words

beginning with “Out,” and every one of them, with scarcely a single exception, requires, in order to be fully understood, to be read reversed. Out-law does not mean outside of the law, but lawed out by a legal process. “Out-doo” was used only in the sense of “do out”; thus, in the “Cursor Mundi,” written centuries before the days of Elizabeth, we read that Adam was out done [of Paradise]; and in Drayton’s “Barons’ Wars,” published in 1603, we find in Book V. s. li.

“That he his foe not able to withstand,
Was ta’en in battle and his eyes out-done.”

The graver has indeed done out the life so cleverly that for hundreds of years learned pedants and others have thought that the figure represented a real man, and altogether failed to perceive that it was a mere stuffed dummy clothed in an impossible coat, cunningly composed of the front of the left arm buttoned on to the back of the same left arm, as to form a double left armed apology for a man. Moreover, this dummy is surmounted by a hideous staring mask, furnished with an imaginary ear, utterly unlike anything human, because, instead of being hollowed in, it is rounded out something like the rounded outside of a shoe-horn, in order to form a cup which would cover and conceal any real ear that might be behind it.

Perhaps the reader will more fully understand the full meaning of B.I.’s lines if I paraphrase them as follows: —

To the Reader.

The dummy that thou seest set here,
Was put instead of Shake-a-speare;
Wherein the Graver had a strife
To extinguish all of Nature’s life;
O, could he but have drawn his mind
As well as he’s concealed behind
His face; the Print would then surpasse

All, that was ever writ in brasse.
But since he cannot, do not looke
On his mas'd Picture, but his Booke.

Do out appears in the name of the little instrument something like a pair of snuffer which was formerly used to extinguish the candles and called a "Doute." Therefore I have correctly substituted "extinguished" for "out-doo." At the beginning I have substituted "dummy" for "figure" because we are told that the figure is "put for" (that is, put instead of) Shakespeare. In modern English we frequently describe a chairman who is a mere dummy as a figurehead. Then "wit" in these lines means absolutely the same as "mind," which I have used in its place because I think it refers to the fact that upon the miniature of Bacon in his 18th year, which was painted by Hilliard in 1578, we read:— "Si tabula daretur digna animum mallem." This line is believed to have been written at the time by the artist, and was translated in "Spedding":— "If one could but paint his mind."

In March, 1911, the *Tailor and Cutter* newspaper stated that the Figure, put for Shakepeare in the 1623 folio, was undoubtedly clothed in an impossible coat, composed of the back and the front of the same left arm. And in the following April the *Gentleman's Tailor Magazine*, under the heading of a "Problem for the Trade," shews the two halves of the coat as printed on page 28a, and says: "It is passing strange that something like three centuries should have been allowed to elapse before the tailors' handiwork should have been appealed to in this particular manner."

"The special point is that in what is known as the authentic portrait of William Shakespeare, which appears in the celebrated first folio edition, published in 1623, a remarkable sartorial puzzle is apparent."

"The tunic, coat, or whatever the garment may have been called at the time, is so strangely illustrated that the right-hand side of the forepart is obviously the left-hand side of the backpart; and so gives a harlequin appearance to the figure,

which it is not unnatural to assume was intentional, and done with express object and purpose."

"Anyhow, it is pretty safe to say that if a Referendum of the trade was taken on the question whether the two illustrations shown above represent the foreparts of the same garments, the polling would give an unanimous vote in the negative."

"It is outside the province of a trade journal to dogmatise on such a subject; but when such a glaring incongruity as these illustrations show is brought into court, it is only natural that the tailor should have something to say; or, at any rate, to think about."

This one simple fact which can neither be disputed nor explained away, viz., that the "Figure" put upon the title-page of the First Folio of the Plays in 1623 to represent Shakespeare, is a doubly left-armed and stuffed dummy, surmounted by a ridiculous putty-faced mask, disposes once and for all of any idea that the mighty Plays were written by the illiterate clown of Stratford-upon-Avon.

"He hath *hit* his face"

It is thought that *hit* means *hid* as in Chaucer's Squiere's Tale, line 512 *etc.*

"Right as a serpent *hit* him under floures
Til he may seen his tyme for to byte"

If indeed "hit" be intended to be read as "hid" then these ten lines are no longer the cryptic puzzle which they have hitherto been considered to be, but in conjunction with the portrait, they clearly reveal the true facts, that the real author is writing left-handedly, that means secretly, in shadow, with his face hidden behind a mask or pseudonym.

We should also notice "out-doo" is spelled with a hyphen. In the language of to-day and still more in that of the time of Shakespeare all, or nearly all, words beginning with *out* may be read reversed, out-bar is bar out, out-bud is bud out, out-crop is crop out, out-fit is fit out, and so on through the alphabet.

If therefore we may read "out-doo the life" as "doo out the life" meaning "shut out the real face of the living man" we perceive that here also we are told

“that the real face is hidden.”

The description, with the head line “To the Reader” and the signature “B.I.,” forms twelve lines, the words of which can be turned into numerous significant anagrams, etc., to which, however, no allusion is made in the present work. But our readers will find that if all the letters are counted (the two v.v.’s in line nine being counted as four letters) they will amount to the number 287. In subsequent chapters a good deal is said about this number, but here we only desire to say that we are “informed” that the “Great Author” intended to reveal himself 287 years after 1623, the date when the First Folio was published, that is in the present year, 1910, when very numerous tongues will be loosened.

Examine once more the original Stratford Bust, Plate 5, Page 14, and the present Stratford Bust, Plate 6, Page 15, *with the large pen in the right hand*.

If the Stratford actor were indeed the author of the plays it was most appropriate that he should have a pen in his hand. But in the original monument as shewn in Plate 3, Page 8, the figure hugs a sack of wool or a pocket of hops or may be a cushion. For about 120 years, this continued to be the Stratford effigy and shewed nothing that could in any way connect the man portrayed, with literary work. I believe that this was not accidental. I think that everybody in Stratford must have known that William “Sha*c*kspeare” could not write so much as his own name, for I assert that we possess nothing which can by any reasonable possibility be deemed to be his signature.

CHAPTER III.

The so-called “Signatures.”

In Plate 14, Page 36, are shewn the five so-called signatures. These five being the only pieces of writing in the world that can, even by the most ardent Stratfordians, be supposed to have been written by Shakspeare’s pen; let us consider them carefully. The Will commences “In the name of God Amen I Willum Shackspeare.” It is written upon three sheets of paper and each sheet bears a supposed signature. The Will is dated in Latin “Vicesimo quinto die [Januarij] Mtij Anno Regni Dni nri Jacobi, nunc R Anglie, &c. decimo quarto & Scotie xlix° annoq Dni 1616”, or shortly in English 25th March 1616.

Shakspeare died 23rd April 1616 just four weeks after publishing his will.

I say after “PUBLISHING his Will” advisedly, for such is the attestation, viz., “Witnes to the publyshing hereof,”

“Fra: Collyns
Julius Shawe
John Robinson
Hamnet Sadler
Robert Whattcott”

Nothing is said about the witnessing of the signing hereof. The Will might therefore have been, and I myself am perfectly certain that it was, marked with the name of William Shakspeare by the Solicitor, Fra (ncis) Collyns, who wrote the body of the Will.

He also wrote the names of the other witnesses, which are all in the same handwriting as the Will; shewing that Shakspeare’s witnesses were also unable to write their names.

This fact, that Shakspeare's name is written by the solicitor, is conclusively proved by the recent article of Magdalene Thumm-Kintzel in the Leipzig magazine, *Der Menschenkenner*, which was published in January 1909.

In this publication, photo reproductions of certain letters in the body of the Will, and in the so-called Shakspeare signatures are placed side by side, and the evidence is irresistible that they are written by the same hand. Moreover when we remember that the Will commences "I Willim Sha*c*kspeare" with a "c" between the "a" and "k," the idea that Shakspeare himself wrote his own Will cannot be deemed worthy of serious consideration. The whole Will is in fact in the handwriting of Francis Collyns, the Warwick solicitor, who added the attestation clause.

I myself was sure that the solicitor had added the so-called signatures, when, many years ago, I examined under the strongest magnifying glasses the Will at Somerset House.

Look first at the upper writings and never again call them "signatures." The top one is on the first page of the Will, the second on the second page, the third on the last page of the Will.

The original of the top one has been very much damaged but the "W" remains quite clear. Look first only at the "W's". If the writings were signatures what could induce a man when signing his last Will to make each "W" as different from the others as possible, and why is the second Christian name written Willm?

Compare also the second and third "Shakspeare" and note that every letter is formed in a different manner. Compare the two "S's", next compare the two "h's", the "h" of the second begins at the bottom, the "h" of the third begins at the top, the same applies to the next letter the "a", so also with respect to the "k's "; how widely different these are.

Plate 14 shews at the bottom two other names also. These are taken, the one on the left from a deed of purchase of a dwelling house in Blackfriars dated March 10th 1612-13 (now in the City Library of the Corporation of London); the

other on the right is from a mortgage of the same property executed on the following day, viz: March 11th 1612-13, which is now in the British Museum.

Neither of these documents states that it was "signed" but only says that it was "sealed," and it was at that date in no way necessary that any signatures should be written over the seals, but the clerks might and evidently did, place upon these deeds an abbreviated name of William Shakspeare over the seal on each document. In the case of the other two parties to the documents, the signatures are most beautifully written and are almost absolutely identical in the two deeds.

Look at these two supposititious signatures. To myself it is difficult to imagine that anyone with eyes to see could suppose them to be signatures by the same hand.

Note on the so-called "Signatures."

When part of the purchase money is what is commonly called "left on mortgage," the mortgage deed is always dated one day *after*, but is always signed one moment *before*, the purchase deed, because the owner will not part with his property before he receives his security.

The Shakespeare purchase deed and the mortgage deed were therefore both signed at the same time, in the same place, with the same pen, and the same ink.

This is evidently true with respect to the signatures of Wm. Johnson and Jno. Jackson, the other parries to both of the deeds.

But as I wrote to the City authorities and the British Museum authorities, it would be impossible to discover a scoundrel who would venture to perjure himself and falsely swear that it was even remotely possible that the two supposed signature of Wm. Shakespeare could have been written at the same time, in the same place, with the same pen, and the same ink, by the *same hand*.

They are widely different, one having been written by the law clerk of the seller, the other by the law clerk of the purchaser.

According to the law of England, anyone may (by request) attach any person's name to any document, and if that person touch it, any third person may

witness it as a signature.

Some years ago by the courtesy of the Corporation of London, the Librarian and the Chairman of the Library Committee carried the Purchase Deed to the British Museum to place it side by side with the Mortgage Deed there.

After they had with myself and the Museum Authorities most carefully examined the two deeds, the Librarian of the City Corporation said to me, there is no reason to suppose that the Corporation deed has upon it the signature of Wm. Shakespeare, and the British Museum Authorities likewise told me that they did not think that the Museum Mortgage Deed had upon it a signature of William Shakespeare.

The more you examine the whole five the more you will be certain, as the writer is, after the most careful study of the Will and of the Deeds, that not one of the five writings is a "signature," or pretends to be a "signature," and that therefore there is a probability, practically amounting to a certainty, that the Stratford Actor could not so much as manage to scrawl his own name.

No! We possess not a scrap of writing, not even an attempt at a signature, [see also Chapter XIV., p. 161] that can be reasonably supposed to be written by the Stratford *gentleman*.

He is styled "gentle Shakespeare": this does not refer to anything relating to his character or to his manners but it means that possessing a coat of arms he was legally entitled to call himself a "gentleman."

Chapter IV.

Contemporary Allusions to Shackspere.

Shakspeare the Actor purchased New Place at Stratford-on-Avon in 1597 for £60 and he became a "gentleman" and an esquire when he secured a grant of arms in 1599.

How did the stage “honour” the player who had bought a coat of arms and was able to call himself a “gentleman”?

Three contemporary plays give us scenes illustrating the incident:

1st. Ben Jonson’s “Every man out of his humour” which was acted in 1599 the very year of Shakspeare’s grant of arms.

2nd. Shakespeare’s “As you like it” which was entered at Stationers’ Hall in 1600, although no copy is known to exist before the folio of 1623.

3rd. “The Return from Parnassus” which was acted at St. John’s College, Cambridge in 1601, though not printed till 1606.

In addition to these three plays, there is a fourth evidence of the way in which the Clown who had purchased a coat of arms was regarded, in a pamphlet or tract of which only one copy is known to exist. This tract which can be seen in the Rylands Library, Manchester, used to be in Lord Spencer’s library at Althorp, and is reprinted by Halliwell-Phillipps in “Outlines of the Life of Shakespeare,” 1889, Vol. I, pages 325-6.

To commence with Ben Jonson’s “Every man out of his humour.” The clown who had purchased a coat of arms is said to be the brother of Sordido (a miser), and is described as an “essential” clown (that is an uneducated rustic), and is styled Sogliardo which is the Italian for the filthiest possible name.

The other two characters in the scene (act iii. sc. I) are Puntarvolo who, as his crest is a *Boar*, must be intended to represent Bacon;[2] and Carlo Buffone who is a buffoon or jester.

Enter Sogliardo (the filth), who is evidently the Stratford Clown, who has just purchased a coat of arms: —

Actus Tertius, Scena Prima,
Sogliardo, Punt., Carlo.

Sog. Nay I will haue him, I am resolute for that, by this Parchment Gentlemen, I haue ben so toil'd among the Harrots [meaning *Heralds*] yonder, you will not beleeue, they doe speake i' the straungest language, and giue a man the hardest termes for his money, that euer you knew.

Car. But ha' you armes? ha' your armes?

Sog. Yfaith, I thanke God I can write myselfe Gentleman now, here's my Pattent, it cost me thirtie pound by this breath.

Punt. A very faire Coat, well charg'd and full of Armorie.

Sog. Nay, it has, as much varietie of colours in it, as you haue seene a Coat haue, how like you the Crest, Sir?

Punt. I vnderstand it not well, what is't?

Sog. Marry Sir, it is your Bore without a head Rampant.

Punt. A Bore without a head, that's very rare.

Car. I, [Aye] and Rampant too: troth I commend
the Herald's wit, he has deciphered him well:
A Swine without a head, without braine, wit,
anything indeed, Ramping to Gentilitie. You
can blazon the rest signior? can you not?

. . . . . .

. . . . . .

Punt. Let the word be, *Not without mustard*, your
Crest is very rare sir.

Shakspeare's "word" that is his "motto" was — non sanz droict — not without right — and I desire the reader also especially to remember Sogliardo's words "Yfaith I thanke God" a phrase which though it appears in the quartos is changed in the 1616 Ben Jonson folio into "I thank *them*" which has no meaning.

Next we turn to Shakespeare's "As you like it." This play though entered at Stationers' Hall in 1600 and probably played quite as early is not known in print

till it appeared in the folio of 1623. The portion to which I wish to refer is the commencement of Actus Quintus, Scena Prima.

Act 5, Scene i. Enter Clowne and Awdrie.

Clow. We shall finde a time *Awdrie*, patience gentle
Awdrie.

Awd. Faith the priest was good enough, for all the
olde gentlemans saying.

Clow. A most wicked Sir *Oliver, Awdrie*, a most vile *Mar-text.* But *Awdrie*, there is a youth heere in the forrest layes claime to you.

Awd. I, I know who 'tis: he hath no interest in mee in the world: here comes the man you meane.

(Enter William)

Clo. It is meat and drinke to me to see a clowne, by my troth, we that haue good wits, haue much to answer for: we shall be flouting: we cannot hold.

Will. Good eu'n *Audrey.*

Awd. God ye good eu'n *William*.

Will. And good eu'n to you sir.

Clo. Good eu'n gentle friend. Couer thy head, couer thy head: Nay prethee bee couer'd. How olde are you Friend?

Will. Fiue and twentie Sir.

Clo. A ripe age: Is thy name *William*?

Will. *William*, Sir.

Clo. A faire name. Was't borne i' the Forrest heere?

Will. I [Aye] Sir, I thanke God.

Clo. Thanke God: A good answer: Art rich?

Will. 'Faith Sir, so, so.

Clo. So, so, is good, very good, very excellent good: and yet it is not, it is but so, so: Art thou wise?

Will. I [Aye] sir, I haue a prettie wit.

Clo. Why, thou saist well. I do now remember a saying: The Foole doth thinke he is wise, but the wise man knowes himselfe to be a Foole…. You do loue this maid?

Will. I do Sir.

Clo. Giue me your hand: art thou Learned?

Will. No Sir.

Clo. Then learne this of me, To haue is to haue. For it is a figure in Rhetoricke, that drink being powr'd out of a cup into a glasse, by filling the one, doth empty the other. For all your Writers do consent, that *ipse* is hee: now you are not *ipse*, for I am he.

Will. Which he Sir?

Clo. He Sir, that must marrie this woman.

Firstly I want to call your attention to Touchstone the courtier who is playing clown and who we are told "uses his folly like a stalking horse and under the presentation of that he shoots his wit." Notice that Touchstone refuses to be married to Awdrey (who probably represents the plays of Shakespeare) by a-Mar-text, and she declares that the Clown William "has no interest in mee in the world." William — shall we say Shakspeare of Stratford? — enters and is greeted as "gentle" (*i. e*. he is possessed of a coat of arms). He says "Thank God" he was born in the forest here (Ardennes, very near in sound to Arden). "Thank God" is repeated by Touchstone and as it is the same phrase that is used by Sogliardo in Ben Jonson's play I expect that it was an ejaculation very characteristic of the real man of Stratford and I am confirmed in this belief because in the folio edition of Ben Jonson's plays the phrase is changed to "I thank *them*" which has no meaning.

The clown of Ardennes is rich but only rich for a clown (Shakspeare of Stratford was not really rich, New Place cost only £60).

Asked if he is wise, he says “aye,” that is “yes,” and adds that he has “a pretty wit,” a phrase we must remember that is constantly used in reference to the Stratford actor. Touchstone mocks him with a paraphrase of the well-known maxim “If you are wise you are a Foole if you be a Foole you are wise” which is to be found in Bacon’s “Advancement of Learning” Antitheta xxxi. Then he asks him “*Art thou learned*” and William replies “*No sir*.” This means, *unquestionably*, as every lawyer must know, that William replies that he cannot *read* one line of print. I feel sure the man called Shackspeare of Stratford was an uneducated rustic, never able to read a single line of print, and that this is the reason why no books were found in his house, this is the reason why his solicitor, Thomas Greene, lived with him in his house at New Place (Halliwell-Phillipps: Outlines, 1889, Vol. i, p. 226); — a well-known fact that very much puzzles those who do not realize the depth of Shakspeare’s illiteracy.

Chapter V.

“The Return from Parnassus” and “Ratsei’s Ghost.”

The next play to which attention must be called is “The Return from Parnassus” which was produced at Cambridge in 1601 and was printed in 1606 with the following title page: —

The Returne from Parnassus
or
The Scourge of Simony.
Publiquely acted by the Students
in Saint Johns Colledge in
Cambridge.

At London
Printed by G. Eld for John Wright, and
are to bee sold at his shop at

Christchurch Gate.
1606.

The portion to which I wish to direct attention is: —
Actus 5, Scena i.

Studioso. Fayre fell good *Orpheus*, that would rather be
King of a mole hill, then a Keysars slaue:
Better it is mongst fidlers to be chiefe,
Then at plaiers trencher beg reliefe.
But ist not strange this mimick apes should prize
Vnhappy Schollers at a hireling rate.
Vile world, that lifts them vp to hye degree,
And treades vs downe in groueling misery.
England affordes those glorious vagabonds,
That carried earst their fardels on their backes,
Coursers to ride on through the gazing streetes
Sooping it in their glaring Satten sutes,
And Pages to attend their maisterships:
With mouthing words that better wits haue framed,
They purchase lands, and now Esquiers are made.

Philomusus. What ere they seeme being euen at the best
They are but sporting fortunes *scornfull* iests.

Can these last two lines refer to Shakspeare the actor seeming to be the poet? Note that they are spoken by Philomusus that is friend of the poetic muse. Mark also the words "this mimick apes." Notice especially "with mouthing words that *better* wits haue framed, they purchase lands and now Esquiers are made" *i.e.* get grants of arms. Who at this period among mimics excepting W. Shakspeare of Stratford purchased lands and obtained also a grant of arms?

That this sneer "mouthing words that better wits have framed" must have been aimed at Shakspeare is strongly confirmed by the tract (reprinted by Halliwell-Phillipps in his "Outlines of Shakespeare," 1889, Vol. I, p. 325) which is called "Ratsei's Ghost or the second part of his mad prankes and Robberies."

This pamphlet bears no date, but was entered at Stationers' Hall May 31st 1605. There is only a single copy in existence, which used to be in Earl Spencer's library at Althorp but is now in the Rylands; Library at Manchester. As I said, it is reprinted by Halliwell-Phillipps, and Stratfordians are obliged to agree with him that the reference is unquestionably to "Wm Shakespeare of Stratford." The most important part which is spoken by Ratsei the robber to a country player is as follows: —

Ratsei. And for you sirra, saies hee to the chiefest of them, thou hast a good presence upon a stage; methinks thou darkenst thy merite by playing in the country. Get thee to London, for if one man were dead, they will have much neede of such a one as thou art. There would be none in my opinion fitter then thyselfe to play his parts. My conceipt is such of thee, that I durst venture all the mony in my purse on thy head to play Hamlet with him for a wager. There thou shalt learn to be frugall, — for players were never so thriftie as they are now about London — and to feed upon all men, to let none feede upon thee; to make thy hand a stranger to thy pocket, thy hart slow to performe thy tongues promise, and when thou feelest thy purse well lined, buy thee some place of lordship in the country, that, growing weary of playing, thy mony may there bring thee to dignitie and reputation; then thou needest care for no man, nor not for them that before made thee prowd with speaking their words upon the stage.

The whole account of buying a place in the country, of feeding upon all men (that is lending money upon usury) of never keeping promises, of never giving anything in charity, agrees but too well with the few records we possess of the man of Stratford. And therefore Stratfordians are obliged to accept Halliwell-Phillipps' dictum that this tract called Ratsei's Ghost refers to the actor of Stratford and that "*he* needed not to care for them that before made *him* proud with speaking *their* words upon the stage." How is it possible that Stratfordians

can continue to refuse to admit that the statement in the “Return from Pernassus” “with mouthing words that better wits haue framed they purchase lands and now Esquiers are made” must also refer to the Stratford Actor?

CHAPTER VI.

Shackspere's Correspondence!

There is only a single letter extant addressed to Shakspeare, and this asks for a loan of £30 It is dated 25th October 1598, and is from Richard Quiney. It reads

"Loveinge Countreyman I am bolde of vow as of a ffrende,
craveinge yowr helpe wth xxxll vppon mr Bushells & my
securytee or mr Myttons wth me. mr Rosswell is nott come
to London as yeate & I have especiall cawse. yow shall
ffrende me muche in helpeinge me out of all the debttes I
owe in London I thancke god & muche quiet my mynde wch
wolde nott be indebeted I am nowe towardes the Cowrte in
hope of answer for the dispatche of my Buysenes. yow shall
nether loase creddytt nor monney by me the Lorde wyllinge
and nowe butt perswade yowr selfe soe as I hope & yow shall
nott need to feare butt wth all hartie thanckefullenes I wyll
holde my tyme & content yowr ffrende & yf we Bargaine

(*addressed*)

LS To my Loveinge good ffrend
& contreymann mr wm

Shackespere d[e]l[ive]r thees."

This letter is the only letter known to exist which was ever addressed to William Shackspere, the illiterate householder of Stratford, who as has been pointed out in these pages was totally unable to read a line of print, or to write even his own name. There are however in existence three, and three only, contemporary letters referring in any way to him, and these are not about literature with which the Stratford man had nothing whatever to do — but about mean and sordid small business transactions.

One is from Master Abraham Sturley, who writes in 1598 to a friend in London in reference to Shakspeare lending "Some monei on some od yarde land or other att Shottri or neare about us."

Another is dated Nov. 4th 1598, and is from the same Abraham Sturley to Richard Quiney in which we are told that "our countriman Mr Wm Shak would procure us monei wc I will like of."

A third from Adrian Quiney written (about 1598-1599) to his son Rycharde Quiney in which he says "yff yow bargen with Wm Sha or receve money therfor, brynge youre money homme."

There exists no contemporary letter from anyone to anyone, referring to the Stratford actor as being a poet or as being in any way connected with literature. But from the Court Records we learn that;

In 1600 Shakespeare brought action against John Clayton in London for £7 and got judgment in his favour. He also sued Philip Rogers of Stratford for two shillings loaned.

In 1604 he sued Philip Rogers for several bushels of malt sold to him at various times between March 27th and the end of May of that year, amounting in all to the value of £1. 15s. 10d. The poet a dealer in malt?

In 1608 he prosecuted John Addenbroke to recover a debt of £6 and sued his surety Horneby.

Halliwell-Phillipps tells us that "The precepts as appears from memoranda in the originals, were issued by the poet's solicitor Thomas Greene who was then residing under some unknown conditions[3] at New Place."

Referring to these sordid stories, Richard Grant White, that strong believer in the Stratford man, says in his "Life and genius of William Shakespeare," p. 156 "The pursuit of an impoverished man for the sake of imprisoning him and depriving him both of the power of paying his debts and supporting himself and his family, is an incident in Shakespeare's life which it requires the utmost allowance and consideration for the practice of the time and country to enable us to contemplate with equanimity — satisfaction is impossible."

"The biographer of Shakespeare must record these facts because the literary antiquaries have unearthed and brought them forward as new particulars of the life of Shakespeare. We hunger and receive these husks; we open our mouths for food and we break our teeth against these stones."

Yes! The world has broken its teeth too long upon these stones to continue to mistake them for bread. And as the accomplished scholar and poetess the late Miss Anna Swanwick once declared to the writer, she knew nothing of the Bacon and Shakespeare controversy, but Mr. Sidney Lee's "Life of Shakespeare" had convinced her that his man never wrote the plays. And that is just what everybody else is saying at Eton, at Oxford, at Cambridge, in the Navy, in the Army, and pretty generally among unprejudiced people everywhere, who are satisfied, as is Mark Twain, that the most learned of works could not have been written by the most *un*learned of men.

Yes! It does matter that the "Greatest Birth of Time" should no longer be considered to have been the work of the unlettered rustic of Stratford; and the hour has at last come when it should be universally known that this mighty work was written by the man who had taken all knowledge for his province, the man who said "I have, though in a despised weed [that is under a Pseudonym]

procured the good of all men”; the man who left his “name and memory to men’s charitable speeches, and to foreign nations, and the next ages.”

CHAPTER VII.

Bacon acknowledged to be a Poet.

In discussing the question of the Authorship of the plays many people appear to be unaware that Bacon was considered by his contemporaries to be a great poet. It seems therefore advisable to quote a few witnesses who speak of his pre-eminence in poetry.

In 1645 there was published "The Great Assises holden in Parnassus by Apollo and his assessours" a facsimile of the title of which is given on page 57. This work is anonymous but is usually ascribed to George Withers and in it Bacon as Lord Verulan is placed first and designated "Chancellor of Parnassus" that is "Greatest of Poets."

After the title, the book commences with two pages of which facsimiles are given on pages 58, 59.

Apollo appears at the top, next comes Lord Verulan as Chancellor of Parnassus, Sir Philip Sidney and other world renowned names follow and then below the line side by side is a list of the jurors and a list of the malefactors.

A little examination will teach us that the jurors are really the same persons as the malefactors and that we ought to read right across the page as if the dividing line did not exist.

Acting on this principle we perceive that George Wither [Withers] is correctly described as Mercurius Britanicus. Mr. Sidney Lee tells us that Withers regarded "Britain's Remembrancer" 1628 and "Prosopopaeia Britannica" 1648 as his greatest works.

Thomas Cary [Carew] is correctly described as Mercurias Aulicus — Court Messenger. He went to the French Court with Lord Herbert and was made Gentleman of the Privy Chamber by Charles I who presented him with an

estate at Sunninghill.

Thomas May is correctly described as Mercurius Civicus. He applied for the post of Chronologer to the City of London and James I wrote to the Lord Mayor (unsuccessfully) in his favour.

Josuah Sylvester is correctly described as The Writer of Diurnals. He translated Du Bartas "Divine Weekes," describing day by day, that is "Diurnally," the creation of the world.

Georges Sandes [Sandys] is The Intelligencer. He travelled all over the world and his book of travels was one of the popular works of the period.

Michael Drayton is The Writer of Occurrences. Besides the "Poly-Olbion," he wrote "England's Heroicall Epistles" and "The Barron's Wars."

Francis Beaumont is The Writer of Passages. This exactly describes him as he is known as writing in conjunction with Fletcher. "Beamount and Fletcher make one poet, they single dare not adventure on a play."

William Shakespeere is "The writer of weekely accounts." This exactly describes him, for the only literature for which he was responsible was the accounts sent out by his clerk or attorney.

Turning over the pages of the little book on page 9 the cryer calls out "Then Sylvester, Sands, Drayton, Beaumont, Fletcher, Massinger, Shakespeare (sic) and Heywood, Poets good and true." This statement seems to be contradicted so far as Shakespeare is concerned by the defendant who says on page 31 "Shakespear's (sic) a mimicke" (that is a mere actor not a poet).

"Beamount and Fletcher make one poet, they
Single, dare not adventure on a play."

Each of these statements seems to be true. And on Page 33
Apollo[4] says

"We should to thy exception give consent
But since we are assur'd, 'tis thy intent,

By this refusall, onely to deferre
That censure, which our justice must conferre
Upon thy merits; we must needs decline
From approbation of these pleas of thine."

That is, Apollo *admits* that Shakespeare is not a poet but a "mimic," the word to which I called your attention in the "Return from Parnassus" in relation to "this mimick apes." In this little book Shakespeare's name occurs three times, and on each occasion is spelled differently.

This clear statement that the actor Shakespeare was not a poet but only a tradesman who sent out his "weekly accounts" is, I think, here for the first time pointed out. It seems very difficult to conceive of a much higher testimony to Bacon's pre-eminence in poetry than the fact that he is placed as "Chancellor of Parnassus" under Apollo. But a still higher position is accorded to him when it is suggested that Apollo feared that he himself should lose his crown which would be placed on Bacon's head.

Walter Begbie in "Is it Shakespeare?" 1903, p. 274, tells us: — That Thomas Randolf, in Latin verses published in 1640 but probably written some 14 years earlier says that Phoebus was accessory to Bacon's death because he was afraid lest Bacon should some day come to be crowned King of poetry or the Muses. Farther on the same writer declares that as Bacon "was himself a singer" he did not need to be celebrated in song by others, and that George Herbert calls Bacon the colleague of Sol [Phoebus Apollo].

George Herbert was himself a dramatic poet and Bacon dedicated his "Translation of the Psalms" to him "who has overlooked so many of my works."

Mr. Begbie also tells us that Thomas Campion addresses Bacon thus "Whether the thorny volume of the Law or the Schools or the *Sweet Muse* allure thee."

It may be worth while here to quote the similar testimony which is borne by John Davies of Hereford who in his "Scourge of Folly" published about 1610, writes

"To the royall, ingenious, and all-learned
Knight, —

Sr Francis Bacon.
Thy *bounty* and the *Beauty* of thy Witt
Comprisd in Lists of *Law* and learned *Arts*,
Each making thee for great *Imployment* fitt
Which now thou hast, (though short of thy
deserts)
Compells my pen to let fall shining *Inke*
And to bedew the *Baies* that *deck* thy *Front*; —
And to thy health in *Helicon* to drinke
As to her *Bellamour* the *Muse* is wont:
For thou dost her embozom; and dost vse
Her company for sport twixt grave affaires;
So vtterst Law the liuelyer through thy *Muse*.
And for that all thy *Notes* are sweetest *Aires*;
My Muse thus notes thy worth in eu'ry Line,
With yncke which thus she sugers; so, to shine."

But nothing can much exceed in value the testimony of Ben Jonson who in his "Discoveries," 1641, says "But his learned, and able (though unfortunate) *Successor* [Bacon in margin] is he, who hath fill'd up all numbers, and perform'd that in our tongue, which may be compar'd or preferr'd either to insolent *Greece*, or haughty *Rome*."

"He who hath filled up all numbers" means unquestionably "He that hath written every kind of poetry."[5]

Alexander Pope the poet declares that he himself "lisped in numbers for the numbers came." Ben Jonson therefore bears testimony to the fact that Bacon was so great a poet that he had in poetry written that "which may be compar'd or preferr'd either to insolent *Greece* or haughty *Rome*."

But in 1623 Ben Jonson had said of the AUTHOR of the plays

"Or when thy sockes were on Leaue thee alone, for the comparison Of all, that insolent Greece *or haughtie* Rome *Sent forth, or since did from their ashes come."*

Surely the statements in the "Discoveries" were intended to tell us who was the AUTHOR of the plays.

After perusing these contemporary evidences, and they might be multiplied, it is difficult to understand how anyone can venture to dispute Bacon's position as pre-eminent in poetry. But it may be of interest to those who doubt whether Bacon (irrespective of any claim to the authorship of the plays) could be deemed to be a great poet, to quote here the words of Percy Bysshe Shelley, who in his "Defence of Poetry" says

"Bacon was a poet. His language has a sweet and majestic rhythm, which satisfies the sense, no less than the almost superhuman wisdom of his philosophy satisfies the intellect. It is a strain which distends and then bursts the circumference of the reader's mind, and pours itself forth together with it into the universal element with which it has perpetual sympathy."

The immortal plays are the "Greatest Birth of Time," and contain a short summary of the wisdom of the world from ancient times, and they exhibit an extent and depth of knowledge in every branch which has never been equalled at any period of the world's history. In classic lore, as the late Mr. Churton Collins recently pointed out, they evince the ripest scholarship. And this is confirmed by classical scholars all the world over.

None but the profoundest lawyers can realise the extent of the knowledge not only of the theory but of the practice of Law which is displayed. Lord Campbell says that Lord Eldon [supposed to have been the most learned of judges] need not have been ashamed of the law of Shakespeare. And as an instance of the way in which the members of the legal profession look up to the mighty author I may mention that some years ago, at a banquet of a Shakespeare Society at which Mr. Sidney Lee and the writer were present, the late Mr. Crump, Q.C., editor of the *Law Times*, who probably possessed as much knowledge of law as any man in

this country, declared that to tell him that the plays were not written by the greatest lawyer the world has ever seen, or ever would see, was to tell him what he had sufficient knowledge of law to know to be nonsense. He said also that he was not ashamed to confess that he himself, though he had some reputation for knowledge of law, did not possess sufficient legal knowledge to realise one quarter of the law that was contained in the Shakespeare plays.

It requires a philologist to fully appreciate what the enormous vocabulary employed in the plays implies.

Max Muller in his "Science of Language," Vol. I, 1899, p. 379, says

"A well-educated person in England, who has been at a public school and at the University … seldom uses more than about 3,000 or 4,000 words. … The Hebrew Testament says all that it has to say with 5,642 words, Milton's poetry is built up with 8,000; and Shakespeare, who probably displayed a greater variety of expression than any writer in any language … produced all his plays with about 15,000 words."

Shakspeare the householder of Stratford could not have known so many as one thousand words.

But Bacon declared that we must make our English language capable of conveying the highest thoughts, and by the plays he has very largely created what we now call the English language. The plays and the sonnets also reveal their author's life.

In the play of "Hamlet" especially, Bacon seems to tell us a good deal concerning himself, for the auto-biographical character of that play is clearly apparent to those who have eyes to see. I will, however, refer only to a single instance in that play. In the Quarto of 1603, which is the first known edition of the play of "Hamlet," we are told, in the scene at the grave, that Yorick has been dead a dozen years; but in the 1604 Quarto, which was printed in the following year, Yorick is stated to have been dead twenty-three years. This corrected number, twenty-three, looks therefore like a real date of the death of a real person. The words in the Quarto of 1604 are as follows: —

Hamlet, Act v, Scene i.

"[Grave digger called.] Clow[n] … heer's a scull now hath lyen you i' th' earth 23 yeeres … this same scull, sir, was, sir, Yorick's skull, the Kings jester …

Ham[*let*]. Alas poore *Yoricke*, I knew him *Horatio*, a fellow of infinite iest, of most excellent fancie, hee hath bore me on his backe a thousand times … Heere hung those lyppes that I haue kist, I know not howe oft, where be your gibes now? your gamboles, your songs, your flashes of merriment, that were wont to set the table on a roare, not one now to mocke your owne grinning…."

The King's Jester who died about 1580-1, just twenty-three years before 1604 (as stated in the play), was John Heywood, the last of the King's Jesters. The words spoken by Hamlet exactly describe John Heywood, who was wont to set the table in a roar with his jibes, his gambols, his songs, and his flashes of merriment. He was a favourite at the English Court during three if not four reigns, and it is recorded that Queen Elizabeth as a Princess rewarded him. It is an absolutely gratuitous assumption that he was obliged permanently to leave England when she became Queen. Indeed it is believed that he was an intimate friend of the Bacon family, and must have carried little Francis Bacon any number of times upon his back, and the little fellow must have kissed him still more oftentimes. The story in the play of "Hamlet" seems, therefore, to fit in exactly with the facts of Bacon's life; but it is not possible that the most fertile imagination of the most confirmed Stratfordian can suppose that the Stratford actor ever saw John Heywood, who died long before Shakspere came to London.

CHAPTER VIII.

The Author revealed in the Sonnets.

Bacon also reveals much of himself in the play "As you like it," which of course means "Wisdom from the mouth of a fool." In that play, besides giving us much valuable information concerning his "mask" William Shakespeare, he also tells us why it was necessary for him to write under a pseudonym.

Speaking in the character of Jaques, who is the alter ego of Touchstone, he says,

Act ii, Scene 7.

"O that I were a foole,
I am ambitious for a motley coat.
Duke. Thou shalt haue one.
Jag. It is my onely suite,
Prouided that you weed your better judgements
Of all opinion that growes ranke in them,
That I am wise. I must haue liberty
Wiithall, as large a Charter as the winde,
To blow on whom I please, for so fooles haue:
And they that are most gauled with my folly,
They most must laugh….
Inuest me in my motley: Giue me leaue
To speake my minde, and I will through and through
Cleanse the foule bodie of th' infected world
If they will patiently receiue my medicine."

He also gives us most valuable information in Sonnet 81.

Or I shall liue your Epitaph to make,
Or you suruiue when I in earth am rotten,
From hence your memory death cannot take,
Although in me each part will be forgotten,
Your name from hence immortall life shall haue,
Though I (once gone) to all the world must dye,
The Earth can yeeld me but a common graue,
When you intombed in men's eyes shall lye,
Your monument shall be my gentle verse,
Which eyes not yet created shall ore read,
And toungs to be, your being shall rehearse,
When all the breathers of this world are dead,
You still shall liue (such vertue hath my Pen)
Where breath most breaths euen in the mouths of men.

Stratfordians tell us that the above is written in reference to a poet whom Shakespeare "evidently" regarded as a rival. But it is difficult to imagine how sensible men can satisfy their reason with such an explanation. Is it possible to conceive that a poet should write *against a rival*

"Your name from hence immortall life shall haue
Though I (once gone) to all the world must dye"

or should say *against* a *rival*,

"The Earth can yeeld me but a common graue
While you intombed in men's eyes shall lye."

or should have declared "*against* a *rival*,"
"Your monument shall be my gentle verse"

No! This sonnet is evidently written in reference to the writer's mask or pseudonym which would continue to have immortal life (even though he himself

might be forgotten) as he says

"Although in me each part will be forgotten."

It is sometimes said that Shakespeare (meaning the Stratford actor) did not know the value of his immortal works. Is that true of the writer of this sonnet who says

"my gentle verse
Which eyes not yet created shall ore read"

No! The writer knew his verses were immortal and would immortalize the pseudonym attached to them

"When all the breathers of this world are dead."

Perhaps the reader will better understand Sonnet 81 if I insert the words necessary to fully explain it.

Or shall I [Bacon] live your Epitaph to make,
Or you [Shakespeare] survive when I in Earth am rotten,
From hence your memory death cannot take,
Although in me each part will be forgotten.
Your name [Shakespeare] from hence immortal life shall have,
Though I [Bacon] once gone to all the world must die,
The earth can yield me but a common grave,
When you entombed in men's eyes shall lie,
Your monument shall be my [not your] gentle verse,
Which eyes not yet created shall ore read,
And tongues to be your being [which as an author
was not] shall rehearse,
When all the breathers of this world are dead,
You [Shakespeare] still shall live, such vertue
hath my pen [not your own pen, for you never wrote a line]
Where breathe most breaths even in the mouths of men.

This Sonnet was probably written considerably earlier than 1609, but at that date Bacon's name had not been attached to any work of great literary importance.

After the writer had learned the true meaning of Sonnet 81, his eyes were opened to the inward meaning of other Sonnets, and he perceived that Sonnet No. 76 repeated the same tale.

"Why write I still all one, euer the same,
And keep inuention in a noted weed,
That euery word doth almost sel my name,
Shewing their birth and where they did proceed?"

(Sel may mean spell or tell or possibly betray.)

Especially note that "Invention" is the same word that is used by Bacon in his letter to Sir Tobie Matthew of 1609 (same date as the Sonnets), and also especially remark the phrase "in a noted weed," which means in a "pseudonym," and compare it with the words of Bacon's prayer, "I have (though in a 'despised weed') procured the good of all men." [Resuscitatio, 1671.] Was not the pseudonym of the Actor Shakespeare a very "despised weed" in those days?

Let us look also at Sonnet No. 78.

"So oft have I enuoked thee for my Muse,
And found such faire assistance in my verse,
As every *alien* pen hath got my use,
And under thee their poesy disperse."

Here again we should understand how to read this Sonnet as under: —

"So oft have I enuoked thee [Shakespeare] for my Muse,
And found such faire assistance in my verse,
As every *alien* pen hath got my use,
And under thee [Shakespeare] their poesy disperse."

“Shakespeare” is frequently charged with being careless of his works and indifferent to the piracy of his name; but we see by this Sonnet, No. 78, that the real author was not indifferent to the false use of his pseudonym, though it was, of course, impossible for him to take any effectual action if he desired to preserve his incognito, his mask, his pseudonym.

CHAPTER IX.

Mr. Sidney Lee and the Stratford Bust.

One word to the Stratfordians. The "Shakespeare of Stratford-on-Avon" myth has been shattered and destroyed by the mass of inexactitudes collected in the supposititious "Life of Shakespeare" by Mr. Sidney Lee, who has done his best to pulverise what remained of that myth by recently writing as follows: —

"Most of those who have pressed the question [of Bacon being the real Shakespeare] on my notice, are men of acknowledged intelligence and reputation in their own branch of life, both at home and abroad. I therefore desire as respectfully, but also as emphatically and as publicly, as I can, to put on record the fact, as one admitting to my mind of no rational ground for dispute, that there exists every manner of contemporary evidence to prove that Shakspere, the householder of Stratford-on-Avon, wrote with his own hand, and exclusively by the light of his only genius (merely to paraphrase the contemporary inscription on his tomb in Stratford-on-Avon Church) those dramatic works which form the supreme achievement in English Literature."

As a matter of fact, not a single scrap of evidence, contemporary or otherwise, exists to show that Shakspere, the householder of Stratford-on-Avon, wrote the plays or anything else; indeed, the writer thinks that he has conclusively proved that this child of illiterate parents and father of an illiterate child was himself so illiterate that he was never able to write so much as his own name. But Mr. Sidney Lee seems prepared to accept *anything* as "contemporary evidence," for on pages 276-7 (1898 edition) of his "Life of Shakespeare" he writes

"Before 1623 an elaborate monument, by a London sculptor of Dutch birth, Gerard Johnson, was erected to Shakespeare's memory in the chancel of the parish church. It includes a half-length bust, depicting the dramatist on the point of writing. The fingers of the right hand are disposed as if holding a pen, and under the left hand lies a quarto sheet of paper."

As a matter of fact, the *present* Stratford monument was not put up till about one hundred and twenty years *after* Shakspeare's death. The original monument, see Plate 3 on Page 8, was a very different monument, and the figure, as I have shewn in Plate 5, instead of holding a pen in its hand, rests its two hands on a wool-sack or cushion. Of course, the false bust in the existing monument was substituted for the old bust for the purpose of fraudulently supporting the Stratford myth.

When Mr. Sidney Lee wrote that the present monument was erected before 1623 he did not do this consciously to deceive the public; still, it is difficult to pardon him for this and the other reckless statements with which his book is filled. But what are we to say of his words (respecting the *present* monument) which we read on page 286? "It was first engraved — very imperfectly — in Rowe's edition of 1709." An exact full size photo facsimile reproduction of Rowe's engraving is shown in Plate 19, Page 77.

As a matter of fact, the real Stratford monument of 1623 was first engraved in Dugdale's "Warwickshire" of 1656, where it appears opposite to page 523. We can, however, pardon Mr. Sidney Lee for his ignorance of the existence of that engraving; but how shall we pardon him for citing Rowe as a witness to the early existence of the present bust? To anyone not wilfully blinded by passion and prejudice, Rowe's engraving [see Plate 19, Page 77] clearly shews a figure absolutely different from the Bust in the present monument. Rowe's figure is in the same attitude as the Bust of the original monument engraved by Dugdale, and does not hold a pen in its hand, but its two hands are supported on a wool-sack or cushion, in the same manner as in the Bust from Dugdale which I have shewn in Plate 5, on Page 14.

What are we to say respecting the frontispiece to the 1898 edition of what he is pleased to describe as the "Life of William Shakespeare," which Mr. Sidney

Lee tells us is “from the ‘Droeshout’ painting now in the Shakespeare Memorial Gallery at Stratford-on-Avon”?

As a matter of fact there is no “Droeshout” painting. The picture falsely so called is a manifest forgery and a palpable fraud, for in it all the revealing marks of the engraving by Martin Droeshout which appeared in the 1623 folio are purposely omitted. A full size photo facsimile of Martin Droeshout’s engraving is shewn in Plate 8, pp. 20-21. In the false and fraudulent painting we find no double line to shew the mask, and the coat is really a coat and not a garment cunningly composed of two left arms.

Still it does seem singularly appropriate and peculiarly fitting that Mr. Sidney Lee should have selected as the frontispiece of the romance which he calls the “Life” of Shakespeare, an engraving of the false and fraudulent painting now in the Stratford-on-Avon Gallery for his first edition of 1898; and should also have selected an engraving of the false and fraudulent monument now in Stratford-on-Avon Church as the frontispiece for his first Illustrated Library Edition of 1899.

Mr. Sidney Lee is aware of the fact that Martin Droeshout was only fifteen years old when the Stratford actor died. But it is possible that he may not know that (in addition to the Shakespeare Mask which Droeshout drew for the frontispiece of the 1623 folio edition of the Plays of Shakespeare, in order to reveal, to those who were able to understand, the true facts of the Authorship of those plays), Martin Droeshout also drew frontispieces for other books, which may be similarly correctly characterised as cunningly composed, in order to reveal the true facts of the authorship of such works, unto those who were capable of grasping the hidden meaning of his engravings.

One other point it is worth while referring to. The question is frequently asked, if Bacon wrote under the name of Shakespeare, why so carefully conceal the fact? An answer is readily supplied by a little anecdote related by Ben Jonson, which was printed by the Shakespeare Society in 1842, in their “Notes of Ben Jonson’s conversations with William Drummond of Hawthornden”.

“He [Ben Jonson] was dilated by Sir James Murray to the King, for writting something against the Scots, in a play Eastward Hoe, and voluntarly

imprissonned himself with Chapman and Marston who had written it amongst them. The report was that they should then [have] had their ears cut and noses. After their delivery, he banqueted all his friends; there was Camden, Selden, and others; at the midst of the feast his old Mother dranke to him, and shew him a paper which she had (if the sentence had taken execution) to have mixed in the prisson among his drinke, which was full of lustie strong poison, and that she was no churle, she told, she was minded first to have drunk of it herself."

This was in 1605, and it is a strange and grim illustration of the dangers that beset men in the Highway of Letters.

It was necessary for Bacon to write under pseudonyms to conceal his identity, but he intended that at some time posterity should do him justice and it was for this purpose that, among the numerous clues he supplied to reveal himself he wrote "The Tempest" in its present form, which Emile Montegut writing in the *Revue des Deux Mondes* in 1865 declared to be the author's literary Testament.

The Island is the Stage. Prospero the prime Duke, the great Magician, represents the Mighty Author who says "my brother … called Anthonio who next thyself of all the world I lov'd" … "graves at my command have wak'd their sleepers op'd and let them forth by my so potent Art" …

"and deeper than ever plummet sound
He drown my booke."

Yet he does not forget finally to add "I do … require my Dukedome of thee, which perforce I know thou must restore."

The falsely crowned and gilded king of the Island who had stolen the wine (the poetry) "where should they find this grand liquor that hath gilded them" and whose name is Stephanos (Greek for crown) throws off at the close of the play, his false crown while Caliban says "What a thrice double asse was I to take this drunkard for a God."

The mighty Magician Prospero says "knowing I lov'd my bookes, he furnished me from mine own Library, with volumes, that I prize above my

Dukedome." Bacon when he was dismissed from his high offices, devoted himself to his books. Not a book of any kind was found at New Place, Stratford. Bacon's brother "whom next himself he loved" was called Anthony. "Gentle" Shakespeare of Stratford died from the effects of a "Drunken" bout!

It does matter whether it is thought that the Immortal works were written by the sordid money-lender of Stratford, the "Swine without a head, without braine, wit, anything indeed, Ramping to Gentilitie"; or were written by him who was himself the "Greatest Birth of Time"; the man pre-eminently distinguished amongst the sons of earth; the man who in order to "do good to all mankind," disguised his personality "in a despised weed," and wrote under the name of William Shakespeare.

It does matter, and England is now declining any longer to *dishonour* and *defame* the greatest Genius of all time by continuing to identify him with the mean, drunken, ignorant, and absolutely unlettered, rustic of Stratford who never in his life wrote so much as his own name and in all probability was totally unable to read one single line of print.

The hour has come for revealing the truth. The hour has come when it is no longer necessary or desirable that the world should remain in ignorance that the Great Author of Shakespeare's Plays was himself alive when the Folio was published in 1623. The hour has come when all should know that this the greatest book produced by man was given to the world more carefully edited by its author as to every word in every column, as to every italic in every column, as to every apparent misprint in every column, than any book had ever before been edited, and more exactly printed than there seems any reasonable probability that any book will ever again be printed that may be issued in the future.

The hour has come when it is desirable and necessary to state with the utmost distinctness that

BACON IS SHAKESPEARE.

CHAPTER X

Bacon is Shakespeare.

Proved mechanically in a short chapter on the long word Honorificabilitudinitatibus.

The long word found in "Loves Labour's lost" was not created by the author of Shakespeare's plays. Mr. Paget Toynbee, writing in the *Athenoeum* (London weekly) of December 2nd 1899, tells us the history of this long word.

It is believed to have first appeared in the Latin Dictionary by Uguccione, called "Magnae Derivationes," which was written before the invention of printing, in the latter half of the twelfth century and seems never to have been printed. Excerpts from it were, however, included in the "Catholicon" of Giovanni da Geneva, which was printed among the earliest of printed books (that is, it falls into the class of books known as "incunabula," so called because they belong to the "cradle of printing," the fifteenth century).

In this "Catholicon," which, though undated, was printed before A.D. 1500, we read

> "Ab *honorifico, hic* et *hec honorificabilis, — le* et
> — hec honororificabilitas, — tis et *hec*
> *honorificabilitudinitas*, et est longissima dictio,
> que illo versu continetur —
> Fulget Honorificabilitudinitatibus iste."

It is perhaps not without interest to call the reader's attention to the fact that "Fulget hon|orifi |cabili|tudini|tatibus|iste" forms a neat Latin hexameter. It will be found that the revelation derived from the long word Honorificabilitudinitatibus is itself also in the form of a Latin hexameter.

The long word Honorificabilitudinitatibus occurs in the Quarto edition of "Loues Labor's Lost," which is stated to be "Newly corrected and augmented by

W. Shakespere." Imprinted in London by W.W. for Cutbert Burby. 1598.

This is the very first play that bore the name W. Shakespere, but so soon as he had attached the name W. Shakespere to that play, the great author Francis Bacon caused to be issued almost immediately a book attributed to Francis Meres which is called "Palladis Tamia, Wits Treasury" and is stated to be Printed by P. Short for Cuthbert Burbie, 1598. This is the same publisher as the publisher of the Quarto of "Loues Labor's lost" although both the Christian name and the surname are differently spelled.

This little book "Palladis Tamia, Wits Treasury" tells us on page 281, "As Plautus and Seneca are accounted the best for comedy and tragedy among the Latines, so Shakespeare among ye English, is the most excellent in both kinds for the stage; for Comedy, witness his Gentlemen of Verona, his Errors, his Love Labors lost, his Love Labours wonne, his Midsummers night dreame, and his Merchant of Venice: for Tragedy, his Richard the 2, Richard the 3, Henry the 4, King John, Titus Andronicus, and his Romeo and Juliet."

Here we are distinctly told that eleven other plays are also Shakespeare's work although only Loues Labors lost at that time bore his name.

We refer on page 138 to the reason why it had become absolutely necessary for the Author to affix a false name to all these twelve plays. For our present purpose it is sufficient to point out that on the very first occasion when the name W. Shakespere was attached to any play, viz., to the play called "Loues Labor's lost," the Author took pains to insert a revelation that would enable him to claim his own when the proper time should arrive. Accordingly he prepared the page which is found F 4 (the little book is not paged) in the Quarto of "Loues Labor's lost" which was published in 1598. A photo-facsimile of the page is shewn, Page 105, Plate 22.

So far as is known there never was any other edition printed until the play appeared in the Folio of 1623 under the name of "Loues Labour's lost," and we put before the reader a reduced facsimile of the whole page 136 of the 1623 Folio, on which the long word occurs, Page 86, Plate 20, and we give also an

exact full size photo reproduction of a portion of the first column of that page. Page 87, Plate 21.

On comparing the page of the Quarto with that of the Folio, it will be seen that the Folio page commences with the same word as does the Quarto and that each and every word, and each and every italic in the Folio is exactly reproduced from the Quarto excepting that Alms-basket in the Folio is printed with a hyphen to make it into two words. A hyphen is also inserted in the long word as it extends over one line to the next. The only other change is that the lines are a little differently arranged. These slight differences are by no means accidental, because Alms-basket is hyphened to count as two words and thereby cause the long word to be the 151st word. This is exceedingly important and it was only by a misprint in the Quarto that it incorrectly appears there as the 150th word. By the rearrangement of the lines, the long word appears on the 27th line, and the line, "What is A.B. speld backward with the horn on his head" appears as it should do on the 33rd line. At the time the Quarto was issued, when the trouble was to get Shakespere's name attached to the plays, these slight printer's errors in the Quarto — for they are printer's errors — were of small consequence, but when the play was reprinted in the Folio of 1623 all these little blemishes were most carefully corrected.

The long word Honorificabilitudinitatibus is found in "Loues Labour's lost" not far from the commencement of the Fifth Act, which is called Actus Quartus in the 1623 folio, and on Page 87, Plate 21, is given a full size photo facsimile from the folio, of that portion of page 136, in which the word occurs in the 27th line.

On lines 14, 15 occurs the phrase, "Bome boon for boon prescian, a little scratcht, 'twil serve." I do not know that hitherto any rational explanation has been given of the reason why this reference to the pedantic grammarian "Priscian" is there inserted.

The mention of Priscian's name can have no possible reference to anything apparent in the text, but it refers solely and entirely to the phrase which is to be formed by the transposition of the twenty-seven letters contained in the long

word Honorificabilitudinitatibus; and it was absolutely impossible that the citation of Priscian could ever have been understood before the sentence containing the information which is of the most important description had been "revealed." We say "revealed" because the riddle could never have been "guessed."

The "revealed" and "all revealing" sentence forms a correct Latin hexameter, and we will proceed to prove that it is without possibility of doubt or question the real solution which the "Author" intended to be known at some future time, when he placed the long word Honorificabilitudinitatibus, which is composed of twenty-seven letters, on the twenty-seventh line of page 136, where it appears as the 151st word printed in ordinary type.

The all-important statement which reveals the authorship of the plays in the most clear and direct manner (every one of the twenty-seven letters composing the long word being employed and no others) is in the form of a correct Latin hexameter, which reads as follows —

HI LUDI F. BACONIS NATI TUITI ORBI
These plays F. Bacon's offspring are preserved for the world.

This verse will scan as a spondaic hexameter as under

HI LU |DI F | BACO | NIS NA | TI TUI | TI ORBI

HI One long syllable meaning "these."

LUDI Two long syllables meaning "stage plays," and especially "stage plays" in contradistinction to "Circus games." (Suetonius Hist: Julius Caes: 10. Venationes autem Ludosque et cum collega et separatim edidit).

F, One long syllable. Now for the first time can the world be informed why the sneer "Bome boon for boon prescian, a little scratcht, 'twil serve" was inserted on lines 14, 15, page 136 of the folio of 1623. Priscian declares that F was a mute and Bacon mocks him for so doing. Ausonius while giving the

pronunciation of most letters of the alphabet does not afford us any information respecting the sound of F, but Quintilian xii. 10, s. 29, describes the pronunciation of the Roman F. Some scholars understand him as indicating that the Roman F had rather a rougher sound than the English F. Others agree with Dr. H.J. Roby, and are of opinion that Quintilian means that the Roman F was "blown out between the intervals of the teeth with no sound of voice." (See Roby's Grammar of the Latin language, 1881, xxxvi.) But Dr. A. Bos in his "Petit Traite de prononciation Latine," 1897, asserts that the old Latin manner of pronouncing F was effe. Even if Dr. A. Bos is correct it is not at all likely that effe was a dissyllable, but most probably it would be sounded very nearly like the Greek "[Greek: phi]," that is as "pfe." In any case (even if it were a dissyllable) F would, with the DI of LUDI, form two long syllables and scan as a spondee. The use of single consonants to form long or short syllables was very common among the Romans, but such appear mostly in lines impossible to quote.

But the Great Author was well acquainted with such instances, and in this same page 136, in lines 6, 7, 8, he gives an example, shewing that the letter "B," although silent in debt, becomes, when debt is spelled, one of the four full words — d e b t, each of which has to be counted to make up the number "151."[6]

This, which is an example of the great value and importance of what, in many of the plays, appears to be merely "silly talk" affords a strong additional evidence of the correctness of the "revealed" and "revealing" sentence which we shew was intended by the author to be constructed out of the long word. Bacon therefore was amply justified in making use of F as a long syllable to form the second half of a spondee.

BACONIS Three long syllables, the final syllable being long by position. Pedantic grammarians might argue that natus being a participle ought not to govern a genitive case, but should be followed by a preposition with the ablative case, and that we ought to say "e Bacone nati" or "de Bacone nati." Other pedants have declared that natus is properly, i.e., classically, said of the mother only, although in low Latin, such as the Vulgate, we find 1 John v. 2, "Natos

Dei," "born of God." But the Author of the plays, who instead of having "small Latin and less Greek" knew "*All* Latin and very much Greek," was well aware that Vergil, Aeneid i. 654 (or 658 when the four additional lines are inserted at the beginning) gives us "Maxima natarum Priami," "greatest of the daughters of Priam," and in Aeneid ii. 527 "Unus natorum Priami," "one of the sons of Priam." There exists therefore the highest classical authority for the use of "Nati" in the sense of "Sons" or "offspring" governing a genitive case. "F. Baconis nati," "Francis Bacon's offspring," is therefore absolutely and classically correct.

NATI Two long syllables. A noun substantive meaning as shewn above "sons" or "offspring."

TUITI Two short syllables and one long syllable, which last is elided and disappears before the "o" of orbi. Tuiti which is the same word as tuti is a passive past participle meaning saved or preserved. It is derived from tueor, which is generally used as a deponent or reflexive verb, but tueor is used by Varro and the legal writers as a passive verb.

ORBI Two long syllables. The word orbi may be either the plural nominative of orbus meaning "deprived" "orphaned," or it may be the dative singular of Orbis meaning "for the world." Both translations make good sense because the plays are "preserved for the world" and are "preserved orphaned." The present writer prefers the translation "for the world," indeed he thinks that to most classical scholars "tuiti orbi," "preserved discarded," looks almost like a contradiction in terms.

Note on Honorficabilitudinitatibus

BACONIS. — On page 131 is shewn a photogravure of the title page of Bacon's "De Augmentis," 1645, which is in fact a pictorial representation of an anagram "Hi ludi F. Baconis nati tuiti orbi." On this title page we find "Baconis" used as the genitive of Bacon's name in Latin. Baconis is also found in XIII th century manuscript copies of Roger Bacon's works, where the title reads "Opus minus Fratris Rogeri Baconis," and in 1603 there was published in 12° at Frankfurt "Rogeri Baconis … De Arte Chymiae."

TUITI. — Pedanticgrammarians such as Priscian whom the author mocks at in the line “Bome boom for boon precian, a little scratcht, ‘twil serve,” falsely tel us that there is a passive verb “tueor” with a past participle “tutus.” As a matter of fact it is the same verb “tueor” that is used both as a passive and as a deponent, and “tutus” or “tuitus” may be used indifferently at the pleasure of the writer. Sallust uses “tutus,” not “tuitus,” as the past participle of the deponent verb.

Opposite to the next page is shewn a type transcript of the cover or outside page of a collection of manuscripts in the possession of the Duke of Northumberland, which were discovered in 1867 at Northumberland House. Three years later, viz., in 1870, James Spedding published a thin little volume entituled “A Conference of Pleasure,” in which he gave a full size Facsimile of the original of the outside page which is here shewn in *reduced type* facsimile. He also gave a few particulars of the MSS. themselves.

In 1904 Mr. Frank J. Burgoyne brought out a Collotype Facsimile of every page that now remains of the collection of MSS. in an edition limited to 250 copies I a fine Royal Quarto at the price of £4 4s. 0d. O f the MSS. mentioned on the cover nine now remain, and of these, six are certainly by Francis Bacon; the first being written by him for a masque or “fanciful devise” which Mr. Spedding thinks was presented at the Court of Elizabeth in 1592.

The list of contents was written upon this outside page about 1597, and among those original contents which are now missing were Richard II. and Richard III. Mr. Spedding was satisfied that these were the so-called Skakespearean plays. There are also the tiles of various other works to which it is not now necessary to allude, but the reader’s attention should be especially directed to the (so-called) scribblings. Mr. Spedding says: “I find nothing either in these later scribblings or in what remains of the book itself to indicate a date later than the reign of Elizabeth.” The “scribblings” are therefore written by a contemporary hand. For the purpose of reference I have placed the letters *a, b, c, d, e*, outside of the facsimile.

(*a*) “honorificabilitudine.” This curious long word when taken in conjunction with the words “your William Shakespeare.” which are also found upon this page, appears to have some reference to the same curious long word which is found in the ablative plural in “Loves Labour’s lost,” which appeared I 1597, and was the play to which Shakespeare’s name was for the first time attached, and, as I shew, in Chapter X., p. 84, it was placed there in order to give with absolute certainty a key to the real authorship.

(*b*) “By Mr ffrauncis William Shakespeare Baco” — with ffrauncis written upside down over it and your/yourself written upside down at the commencement of the line. Baco would require Baconis as its genitive.

(*c*) “revealing day through every crany peepes.” We think that this is an accurate statement of the revelations here afforded.

(*d*) your
“William Shakespeare.” Almost directly above this
your
appears also William Shakespeare.

(*e*) The three curious scrolles at the top right-hand corner are very similar to the scrolls which are found upon the title page of a law book entitled, “Les Tenures de Monsieur Littleton,” printed in 1591, in the possession of the writer, which is throughout noted in what the authorities at the British Museum say is undoubtedly the handwriting of Francis Bacon.

As I have pointed out upon page 114 and upon various other pages in my book “upside down” printing is a device continually employed by the authors of certain books in order to afford revelations concerning Bacon and Shakespeare. As a whole this curious scribbled page affords remarkable evidence that William Shakespeare is “yourself” Francis Bacon.

Now and now only can a reasonable explanation be given for the first time of the purpose of the reference to Priscian, in lines 14 and 15, Plate 21, Page 87. And it is a singular circumstance that so far as the writer is aware not one of the critics has perceived that the mockery of Priscian forms a neat English iambic hexameter, indeed, in almost all modern editions of the Shakespeare plays, both the form and the meaning of the line have been utterly destroyed. In the original the line reads "Bome boon for boon prescian, a little scracht, 'twil serve."

Perhaps the reader will be enabled better to understand the sneer and the mockery by reading the following couplet —

A fig for old Priscián, a little scrátcht, 'twil serve
A poet súrely need not áll his rúles observe.

And we still more perfectly understand the purpose of the hexameter form of the reference to Priscian if we scan the line side by side with the "revealed" interpretation of the long word honorificabilitudinitatibus.

Bome boon | for boon | prescian | a lit | tle scratcht | 'twil serve
HI LU | DI F | BACO | NIS NA | TI TUI | TI ORBI

These plays F Bacon's offspring are preserved for the world.

This explanation of the real meaning to be derived from the long word honorificabilitudinitatibus seems to be so convincing as scarcely to require further proof. But the Author of the plays intended when the time had fully come for him to claim his own that there should not be any possibility of cavil or doubt. He therefore so arranged the plays and the acts of the plays in the folio of 1623 that the long word should appear upon the 136th page, be the 151st word thereon, should fall on the 27th line and that the interpretation should indicate the numbers 136 and 151, thus forming a mechanical proof so positive that it can neither be misconstrued nor explained away, a mechanical proof that provides an evidence which absolutely compels belief.

The writer desires especially to bring home to the reader the manifest fact that the revealed and revealing sentence must have been constructed before the play of “Loues Labor’s lost” first appeared in 1598, and that when the plays were printed in their present form in the 1623 folio the scenes and the acts of the preceding plays and the printing of the columns in all those plays as well as in the play of “Loues Labour’s lost” required to be arranged with extraordinary skill in order that the revealing page in the 1623 folio should commence with the first word of the revealing page in the original quarto of 1598, and that that page should form the 136th page of the folio, so that the long word “Honorificabilitudinitatibus” should appear on page 136, be the 151st word, and fall upon the 27th line.

Bacon tells us that there are 24 letters in the alphabet (*i* and *j* being deemed to be forms of the same letter, as are also *u* and *v*). Bacon was himself accustomed frequently to use the letters of the alphabet as numerals (the Greeks similarly used letters for numerals). Thus A is 1, B is 2 … Y is 23, Z is 24. Let us take as an example Bacon’s own name — B=2, a=1, c=3, O=14, n=i3; all these added together make the number 33, a number about which it is possible to say a good deal.[7] We now put the numerical value to each of the letters that form the long word, and we shall find that their total amounts to the number 287, thus:

H O N O R I F I C A B I L I T U
8 14 13 14 17 9 6 9 3 1 2 9 11 9 19 20

D I N I T A T I B U S
4 9 13 9 19 1 19 9 2 20 18 = 287

From a word containing so large a number of letters as twenty-seven it is evident that we can construct very numerous words and phrases; but I think it “surpasses the wit of man” to construct any “sentence” other than the “revealed sentence,” which by its construction shall reveal not only the number of the page on which it appears — which is 136 — but shall also reveal the fact that the long

word shall be the 151st word printed in ordinary type counting from the first word.

On one side of the facsimile reproduction of part of page 136 of the 1623 folio, numbers are placed shewing that the long word is on the 27th line, which was a skilfully purposed arrangement, because there are 27 letters in the word. There is also another set of numbers at the other side of the facsimile page which shews that, counting from the first word, the long word is the 151st word. How is it possible that the revealing sentence, "Hi ludi F. Baconis nati tuiti orbi," can tell us that the page is 136 and the position of the long word is the 151st word? The answer is simple. The numerical value of the initial letters and of the terminal letters of the revealed sentence, when added together, give us 136, the number of the page, while the numerical value of all the other letters amount to the number 151, which is the number of words necessary to find the position of the long word "Honorificabilitudinitatibus," which is the 151st word on page 136, counting those printed in ordinary type, the italic words being of course omitted.

The solution is as follows

HI
LUDI
F
BACONIS
NATI
TUITI
ORBI

the initial letters of which are

H L F B N T O

their numerical values being

8 11 6 2 13 19 14 = total 73

and the terminal letters are

I I S I I I

their numerical values being

9 9 18 9 9 9 = total 63

Adding this 63 to 73 we get 136

while the intermediate letters are

U D A C O N I A T U I T R B

their numerical values being

20 4 1 3 14 13 9 1 19 20 9 19 17 2 = 151

Total 287

The reader thus sees that it is a fact that in the "revealed" sentence the sum of the numerical values of the initial letters, when added to the sum of the numerical values of the terminal letters, do, with mathematical certainty produce 136, the number of the page in the first folio, which is 136, and that the sum of the numerical values of the intermediate letters amounts to 151, which gives the position of the long word on that page, which is the 151st word in ordinary type. These two sums of 136 and 151, when added together, give 287, which is the sum of the numerical value of all the letters of the long word "Honorificabilitudinitatibus," which, as we saw on page 99, amounted to the same total, 287.

As a further evidence of the marvellous manner in which the Author had arranged the whole plan, the long word of 27 letters is placed on the 27th line. Can anyone be found who will pretend to produce from the 27 letters which form the word "Honorificabilitudinitatibus" another sentence which shall also tell the number of the page, 136, and that the position of the long word on the page is the 151st word?

I repeat that to do this "surpasses the wit of man," and that therefore the true solution of the meaning of the long word "Honorificabilitudinitatibus," about

which so much nonsense has been written, is without possibility of doubt or question to be found by arranging the letters to form the Latin hexameter.

HI LUDI F. BACONIS NATI TUITI ORBI

These plays F. Bacon's offspring are preserved for the world.

It is not possible to afford a clearer mechanical proof that

THE SHAKESPEARE PLAYS ARE BACON'S OFFSPRING.

It is not possible to make a clearer and more definite statement that

BACON IS THE AUTHOR OF THE PLAYS.

It is not possible that any doubt can any longer be entertained respecting the manifest fact that

BACON IS SHAKESPEARE.

CHAPTER XI.

On the revealing page 136 in “Loves Labour’s lost.”

In the previous chapter it was pointed out that using letters for numbers, Bacon’s name is represented by 33.

B A C O N .
2 1 3 14 13 = 33

and that the long word possesses the numerical value of 287.

H O N O R I F I C A B I L I T U
8 14 13 14 17 9 6 9 3 1 2 9 11 9 19 20
D I N I T A T I B U S
4 9 13 9 19 1 19 9 2 20 18 = 287

In the Shakespeare folio, Page 136, shewn in Plate 20 and Plate 21, on Pages 86-7, ON LINE 33, we read “What is Ab speld backward with the horn on his head?”

The answer which is given is evidently an incorrect answer, it is “Ba, puericia with a horne added,” and the Boy mocks him with “Ba most seely sheepe, with a horne: you heare his learning.”

The reply should of course have been in Latin. The Latin for a horn is cornu. The real answer therefore is “Ba corn-u fool.”

This is the exact answer you might expect to find on the line 33, since the number 33 indicates Bacon’s name. And now, and now only, can be explained the very frequent use of the ornament representing a Horned Sheep, inside and outside “Baconian” books, under whatever name they may be known. An example will be found at the head of the present chapter on page 103. The uninitiated are still “informed” or rather “misinformed” that this ornament alludes to the celebrated Golden Fleece of the Argonauts and they little suspect that they have been purposely fooled, and that the real reference is to Bacon.

It should be noted here that in the Quarto of "Loues Labor's lost," see Plate 22, Page 105, if the heading "Loues Labor's lost" be counted as a line, we read on the 33rd line: "Ba most seely sheepe with a horne: you heare his learning." This would direct you to a reference to Bacon, although not so perfectly as the final arrangement in the folio of 1623.

Proceeding with the other lines in the page, we read: —

"Quis quis, thou consonant?"

This means "Who, who"? [which Bacon] because in order to make the revelation complete we must be told that it is "Francis" Bacon, so as to leave no ambiguity or possibility of mistake. How then is it possible that we can be told that it is Francis Bacon? We read in answer to the question:

"Quis quis, thou consonant?
The last of five vowels if you repeat them, the
fifth if I.
I will repeat them a, e, I.
The Sheepe, the other two concludes it o, u."

Now here we are told that a, e, I, o, u is the answer to Quis quis, and we must note that the I is a capital letter. Therefore a is followed by e, but I being a capital letter does not follow e but starts afresh, and we must read I followed by o, and o followed by u.

Is it possible that these vowels will give us the Christian name of Bacon? Can it be that we are told on what page to look? The answer to both these questions is the affirmative "Yes."

The great Folio of Shakespeare was published in 1623, and in the following year, 1624, there was brought out a great Cryptographic book by the "Man in the Moon." We shall speak about this work presently; suffice for the moment to say that this book was issued as the key to the Shakespeare Folio of 1623. If we turn

to page 254 in the Cryptographic book we shall find Chapter XIV. “De Transpositione Obliqua, per dispositionem Alphabeti.”

.]

This chapter describes how, by means of square tables, one letter followed by another letter will give the cypher letter. On the present page appears the square, which is shown in Plate 24, which enables us to answer the question “Quis quis.”

By means of this square we perceive that “a” followed by “e” gives us the letter F, that “I” followed by “o” gives us the letter R, and that “o” followed by “u” gives us the letter A. The answer therefore to Quis quis (which Bacon do you mean) is Fra [Bacon]. *See* Plate 23, Page 107.

But what should induce us to look at this particular chapter on page 254 of the Cryptographic book for the solution? The answer is clearly given in the wonderful page 136 of the 1623 Folio of Shakespeare.

As has been pointed out the numerical value of the long word Honorificabilitudinitatibus is 287, and the numerical value of Bacon is 33. We have found Bacon from Ba with a horn, and we require the remainder of his name, accordingly deduct 33 from 287, and we get the answer 254 which is the number of the required page in the Cryptographic book of 1624. But the wise Author knew that someone would say “How does this apply to the 1598 Quarto published twenty-six years before the great Cryptographic book appeared?” On Plate 24, Page 108, taken from page 255 of the Cryptographic book of 1624, it is shewn that the following lines are attached to the square

“Quarta Tabula, ex Vigenerio, pag. 202.b, etc.”
=Square table taken from Vigenerio, page 202.b.

This reference is to the work entitled, “Traicte des chiffres ou secretes manieres d’escrire”: par Blaise de Vigenere, which was published in Paris in

1586. Spedding states (Vol. I. of "Bacon's Letters and Life," p. 6-8) that Francis Bacon went in 1576 to France, with Sir Amias Paulet, the English Ambassador. Bacon remained in France until 1578-9, and when in 1623 he published his "De Augmentis Scientiarum" — (the Advancement of Learning) he tells us that while in Paris he invented his own method of secret writing. *See* Spedding's "Works of Bacon," Vol. 4, p. 445.

The system which Bacon then invented is now known as the Biliteral Cypher, and it is in fact practically the same as that which is universally employed in Telegraphy under the name of the Morse Code.

A copy of Vigenere's book will be found in the present writer's Baconian library, for he knew by the ornaments and by the other marks that Bacon must have had a hand in its production.

Anyone, therefore, reading the Quarto edition of "Loues Labor's lost," 1598, and putting *two* and *two* together will find on p. 202.b of Vigenere's book, the Table, of which a facsimile is here given, Plate 25, Page 109. This square is even more clear than the square table in the great Cryptographic book.

Thus, upon the same page 136 in the Folio, or on F. 4 in the Quarto, in addition to Honorificabilitudinitatibus containing the revealing sentence "Hi ludi F Baconis nati tuiti orbi"— "These plays F Bacon's offspring are entrusted to the world," we see that we are able to discover on line 33 the name of Bacon, and by means of the lines which follow that it is Fra. Bacon who is referred to.

Before parting with this subject we will give one or two examples to indicate how often the number 33 is employed to indicate Bacon.

We have just shewn that on page 136 of the Folio we obtain Bacon's name on line 33. On page 41 we refer to Ben Jonson's "Every man out of his Humour." In an extremely rare early Quarto [*circa* 1600] of that play some unknown hand has numbered the pages referring to Sogliardo (Shakespeare) and Puntarvolo (Bacon) 32 and 32 repeated. Incorrect pagination is a common method used in "revealing" books to call attention to some statements, and anyone can perceive that the second 32 is really 33 and as usual reveals something about Bacon.

On page 61 we point out that on page 33 of the little book called "The Great Assizes holden in Parnassus" Apollo speaks. As the King speaks in a Law Court only through the mouth of his High Chancellor so Apollo speaks in the supposititious law action through the mouth of his Chancellor of Parnassus, who is Lord Verulam, *i.e.* Bacon. Thus again Bacon is found on Page 33. The writer could give very numerous examples, but these three which occur incidentally will give some idea how frequently the number 33 is used to indicate Bacon.[8]

The whole page 136 of the Folio is cryptographic, but we will not now proceed to consider any other matters contained upon it, but pass on to discuss the great Cryptographic book which was issued under Bacon's instructions in the year following the publication of the great Folio of Shakespeare. Before, however, speaking of the book, we must refer to the enormous pains always taken to provide traps for the uninitiated.

If you go to Lunaeburg, where the Cryptographic book was published, you will be referred to the Library at Wolfenbuttel and to a series of letters to be found there which contain instructions to the engraver which seem to prove that this book has no possible reference to Shakespeare. We say, seem to prove, for the writer possesses accurate photographs of all these letters and they really prove exactly the reverse, for they are, to those capable of understanding them, cunningly devised false clues, quite clear and plain. That these letters are snares for the uninitiated, the writer, who possesses a "Baconian" library, could easily prove to any competent scholar.

Before referring to the wonderful title page of the Cryptographic book which reveals the Bacon-Shakespeare story, it is necessary to direct the reader's attention to Camden's "Remains," published 1616. We may conclude that Bacon had a hand in the production of this book, since Spedding's "Bacon's Works," Vol. 6, p. 351, and Letters, Vol. 4, p. 211, informs us that Bacon assisted Camden with his "Annales."

In Camden's "Remains," 1616, the Chapter on Surnames, p. 106, commences with an ornamental headline like the head of Chapter 10, p. 84, but printed

"*upside down*." A facsimile of the heading in Camden's book is shewn in Plate 26, page 113.

This trick of the upside down printing of ornaments and even of engravings is continually resorted to when some revelation concerning Bacon's works is given. Therefore in Camden's "Remains" of 1616 in the Chapter on Surnames, because the head ornament is printed upside down, we may be perfectly certain that we shall find some revelation concerning Bacon and Shakespeare.

Accordingly on p. 121 we find as the name of a village "Bacon Creping." There never was a village called "Bacon Creping." And on page 128 we read "such names as Shakespeare, Shotbolt, Wagstaffe." In referring to the great Cryptographic book, we shall realise the importance of this conjunction of names.

On Plate 27, Page 115, we give a reduced facsimile of the title page, which as the reader will see, states in Latin that the work is by Gustavus Selenus, and contains systems of Cryptographic writing, also methods of the shorthand of Trithemius. The Imprint at the end, under a very handsome example of the double A ornament which in various forms is used generally in books of Baconian learning, states that it was published and printed at Lunaeburg in 1624. Gustavus Selenus we are told in the dedicatory poems prefixed to the work is "Homo lunae" [the man in the Moon].

Look first at the whole title page; on the top is a tempest with flaming beacons, on the left (of the reader) is a gentleman giving something to a spearman, and there are also other figures; on the right is a man on horseback, and at the bottom in a square is a much dressed up man taking the "Cap of Maintenance" from a man writing a book.

Examine first the left-hand picture shewn enlarged, Plate 28, Page 118. You see a man, evidently Bacon, giving his writing to a Spearman who is dressed in actor's boots (see Stothard's painting of Falstaff in the "Merry Wives of Windsor" wearing similar actor's boots, Plate 32, Page 127). Note that the

Spearman has a sprig of bay in the hat which he holds in his hand. This man is a Shake-Spear, nay he really is a correct portrait of the Stratford householder, which you will readily perceive if you turn to Dugdale's engraving of the Shakespeare bust, Plate 5, Page 14. In the middle distance the man still holding a spear, still being a Shake-Speare, walks with a staff, he is therefore a Wagstaffe. On his back are books — the books of the plays. In the sky is seen an arrow, no, it is not sufficiently long for an arrow, it is a Shotbolt (Shakespeare, Wagstaffe, Shotbolt, of Camden's "Remains"). This Shotbolt is near to a bird which seems about to give to it the scroll it carries in its beak. But is it a real bird? No, it has no real claws, its feet are Jove's lightnings, verily, "it is the Eagle of great verse."

Next, look on Plate 29, Page 119, which is the picture on the right of the title page. Here you see that the same Shakespear whom we saw in the left-hand picture is now riding on a courser. That he is the same man is shewn by the sprig of bay in his hat, but he is no longer a Shakespear, he is a Shake-*spur*. Note how much the artist has emphasised the drawing of the spur. It is made the one prominent thing in the whole picture. We refer our reader to "The Returne from Pernassus" (see pp. 47-48) where he will read,

"England affordes those glorious vagabonds
That carried earst their fardels on their backes
Coursers to ride on through the gazing streetes."

Now glance at the top picture on the title page (see Plate 27, Page 115,) which is enlarged in Plate 30, Page 122. Note that the picture is enclosed in the magic circle of the imagination, surrounded by the masks of Tragedy, Comedy, and Farce (in the same way as Stothard's picture of the "Merry Wives of Windsor," Plate 32, Page 127).

The engraving represents a tempest with beacon lights; No; it represents
"The Tempest" of Shakespeare and tells you that the play is filled with

Bacon lights. (In the sixteenth century Beacon was pronounced Bacon.
"Bacon great Beacon of the State.")

We have already pointed out that "The Tempest," as Emile Montegut shewed in the *Revue des Deux Mondes* in 1865, is a mass of Bacon's revelations concerning himself.

At the bottom (see Plate 27, Page 115, and Plate 31, Page 123), within the "four square corners of fact," surrounded with disguised masks of Tragedy, Comedy, and Farce, is shewn the same man who gave the scroll to the Spearman, see Plate 29, Page 118 (note the pattern of his sleeves). He is now engaged in writing his book, while an Actor, very much overdressed and wearing a mask something like the accepted mask of Shakespeare, is lifting from the real writer's head a cap known in Heraldry as the "Cap of Maintenance." Again we refer to our quotation on page 48.

"Those glorious vagabonds….
Sooping it in their glaring Satten sutes."

Is not this masquerading fellow an actor "Sooping it in his glaring Satten sute"? The figure which we say represents Bacon, see Plate 28, wears his clothes as a gentleman. Nobody could for a moment imagine that the masked creature in Plate 31 was properly wearing his own clothes. No, he is "sooping it in his glaring Satten sute."

The whole title page clearly shows that it is drawn to give a revelation about Shakespeare, who might just as well have borne the name of Shotbolt or of Wagstaffe or of Shakespur, see "The Tempest," Act v., Scene I.

"The strong bass'd promontorie
Have I made shake, and by the spurs pluckt up."

There are also revealing title pages in other books, shewing a spear and an actor wearing a single spur only (see Plate 35, Page 153).

It will be of interest to shew another specially revealing title page, which for upwards of a hundred years remained unaltered as the title page to Vol. I. of Bacon's collected works, printed abroad in Latin. A different engraving, representing the same scene was also published in France. These engravings, however, were never reproduced or used in England, because the time for revelation had not yet come. Bacon is shewn seated (see Plate 33, Page 131). Compare his portrait with the engraving of the gentleman giving his scroll to the Spearman in the Gustavus Silenus frontispiece, Plate 27, Page 115, and Plate 28, Page 118. Bacon is pointing with his right hand in full light to his open book, while his left hand in deepest shadow is putting forward a figure holding in both its hands a closed and clasped book, which by the cross lines on its side (the accepted symbol of a mirror) shows that it represents the mirror up to Nature, i.e., Shakespeare's plays. Specially note that Bacon puts forward with his LEFT hand the figure holding the book which is the mirror up to Nature. In the former part of this treatise the writer has proved that the figure that forms the frontispiece of the great folio of Shakespeare's plays, which is known as the Droeshout portrait of Wm. Shakespeare, is really composed of two LEFT arms and a mask. The reader will now be able to fully realise the revelation contained in Droeshout's masked figure with its two left arms when he examines it with the title page shown, Plate 33, Page 131.

Bacon is putting forward what we described as a "figure"; it is a "man" with false breasts to represent a woman (women were not permitted to act in Bacon's time), and the man is clothed in a goat skin. Tragedos was the Greek word for a goat skin, and Tragedies were so called because the actors were dressed in goat skins. This figure therefore represents the Tragic Muse. Here in the book called *De Augmentis Scientiarum*, which formed one part of the Great Instauration, is placed an engraving to show that another part of the Great Instauration known as Shakespeare's Plays was issued LEFT-HANDEDLY, that is, was issued under the name of a mean actor, the actor Shakespeare. This title page is very revealing, and should be taken in conjunction with the title page of the

Cryptographic book which under the name of Gustavus Silenus, "*Homo lunae*," the "Man in the Moon," was published in 1624 in order to form a key to certain cyphers in the 1623 Folio of Shakespeare's Plays.

These two title pages were prepared with consummate skill in order to reveal to the world, when the time was ripe, that

BACON IS SHAKESPEARE.

CHAPTER XII.

The “Householder of Stratford.”

We have in Chapter II. printed Mr. George Hookham’s list of the very few incidents recorded concerning Shakespeare’s life, but, as we have already shewn, a great deal of the “authentic history” of the Stratford clown has in fact been revealed to us. Ben Jonson calls the Stratford man who had purchased a coat of arms “Sogliardo” (scum of the earth), says he was brother to Sordido, the miser (Shakspeare was a miser), describes him as an essential clown (that means that he was a rustic totally unable to read and write), shews that he speaks “i’ th’ straungest language,” and calls Heralds “Harrots,” and finally sums him up definitely as a “Swine without a head, without braine, wit, anything indeed, Ramping to Gentilitie.” In order that there should be no mistake as to the man who is referred to, “Sogliardo’s” motto is stated to be “Not without Mustard,” Shakespeare’s motto being “Not without right” (Non sanz droict). Ben Jonson’s account of the real Stratford man is confirmed by Shakespeare’s play of “As You Like it,” where Touchstone, the courtier playing clown, says, “It is meat and drinke to me to see a clowne” (meaning an essential clown, an uneducated rustic); yet he salutes him as “gentle,” shewing that the mean fellow possesses a coat of arms.

The Clown is born in the Forest of Ardennes (Shakespeare’s mother’s name was Arden). He is rich, but only so-so rich, that is rich for a clowne (New Place cost only £60). He says he is wise, and Touchstone mocks him with Bacon’s words, “The Foole doth think he is wise, but the wise man knows himself to be a Fool.” He says he has “a prettie wit” (pretty wit is the regular orthodox phrase as applied to Shakespeare). But when asked whether he is learned, he distinctly replies “No,” which means that he says that he cannot read one line of print. A man who could read one line of print was at that period in the eye of the law “learned,” and could not be hanged when convicted for the first time except for murder. If any persons be found to dispute the fact that the reply “No” to the

question “Art thou learned?” meant in Queen Elizabeth’s day “I cannot read one line of print” such persons must be totally unacquainted with Law literature.[9]

The play “As You Like it” confirms Ben Jonson’s characterisation of Shakespeare being “an essential clowne.” Next let us turn to Ratsei’s *Ghost* (see p. 49), which, as Mr. Sidney Lee, in his “Life of William Shakespeare,” p. 159, 1898 ed., confesses, refers to Shakespeare. Ratsei advises the young actor to copy Shakespeare, “and to feed upon all men, to let none feede upon thee” (meaning Shakespeare was a cruel usurer). As we shew, page 53, Grant White says: “The pursuit of an impoverished man for the sake of imprisoning him and depriving him both of the power of paying his debts and supporting himself and his family, is an incident in Shakespeare’s life which it requires the utmost allowance and consideration for the practice of the time and country to enable us to contemplate with equanimity — satisfaction is impossible.”

Ratsei continues, “Let thy hand be a stranger to thy pocket” [like the miser, Shakespeare], “thy hart slow to perform thy tongues promise” [like the lying rascal Shakespeare], “and when thou feelest thy purse well lined, buy thee a place of lordship in the country” [as Shakespeare had bought New Place, Stratford] “that, growing weary of playing, thy mony may there bring thee to dignitie and reputation” [as Shakespeare obtained a coat of arms], “then thou needest care for no man, nor not for them that before made thee prowd with speaking their words upon the stage.” This manifestly refers to two things, one that Shakespeare when he bought New Place, quitted London and ceased to act; the other that he continually tried to exact more and more “blackmail” from those to whom he had sold his name.

Now we begin at last to understand what we are told by Rowe, in his “Life of Shakespeare,” published in 1709, that is, 93 years after Shakespeare’s death in 1616, when all traces of the actual man had been of set purpose obliterated, because the time for revealing the real authorship of the plays had not yet come. Rowe, page x., tells us: “There is one Instance so singular in the Magnificence of this Patron of Shakespeare’s, that if I had not been assur’d that the Story was handed down by Sir William D’Avenant, who was probably very well

acquainted with his Affairs, I should not have ventured to have inserted, that my Lord Southampton, at one time, gave him a thousand Pounds, to enable him to go through with a Purchase which he heard he had a mind to."

This story has been hopelessly misunderstood, because people did not know that a large sum had to be paid to Shakespeare to obtain his consent to allow his name to be put to the plays, and that New Place had to be purchased for him, 1597 (the title deeds were not given to him for five or six years later), and that he had also to be sent away from London before "W Shakespeare's" name was attached to any play, the first play bearing that name being, as we have already pointed out, page 89, "Loues Labor's lost," with its very numerous revelations of authorship. Then, almost immediately, the world is informed that eleven other plays had been written by the same author, the list including the play of "Richard II."

The story of the production of the play of "Richard II." is very curious and extremely instructive. It was originally acted with the Parliament scene, where Richard II. is made to surrender, commencing in the Folio of 1623 with the words —

"Fetch hither Richard, that in common view he may surrender,"

continuing with a description of his deposition extending over 167 lines to the words —

"That rise thus nimbly by a true king's fall."

This account of the deposition of a king reached Queen Elizabeth's ears; she was furiously angry and she exclaimed: "Seest thou not that I am Richard II."

A copy of the play without any author's name was printed in 1597, omitting the story of the deposition of Richard II.; this was followed by a second and probably a third reprint in 1597, with no important alterations, but still without any author's name. Then, after the actor had been sent away to Stratford, Shakespeare's name was put upon a fourth reprint, dated 1598.

The story of Richard II.'s deposition was not printed in the play till 1608, five years after the death of Queen Elizabeth.[10]

This history of the trouble arising out of the production of the play of "Richard II." explains why a name had to be found to be attached to the plays. Who would take the risk? An actor was never "hanged," he was often whipped, occasionally one lost his ears, but an actor of repute would probably have refused even a large bribe. There was, however, a grasping money-lending man, of little or no repute, that bore a name called Shaxpur, which might be twisted into Bacon's pen-name Shake-Speare, and that man was secured, but as long as he lived he was continually asking for more and more money. The grant of a coat of arms was probably part of the original bargain. At one time it seems to have been thought easier to grant arms to his father. This, however, was found impossible. But when in 1597 Bacon's friend Essex was Earl Marshal and chief of the Heralds' College, and Bacon's servant Camden (whom Bacon had assisted to prepare the "Annales" — see Spedding's "Bacon's Works," Vol. 6, p. 351, and Letters, Vol. 4, p. 211), was installed as Clarenceux, King-of-Arms, the grant of arms to Shakespeare was recognised, 1599. Shakespeare must have been provisionally secured soon after 1593, when the "Venus and Adonis" was signed with his name, because in the next year, 1594, "The Taming of a Shrew" was printed, in which the opening scene shews a drunken "Warwickshire" rustic [Shakspeare was a drunken Warwickshire rustic], who is dressed up as "My lord," for whom the play had been prepared. (In the writer's possession there is a very curious and absolutely unique masonic painting revealing "on the square" that the drunken tinker is Shakspeare and the Hostess, Bacon.)

The early date at which Shakspeare had been secured explains how in 1596 an application for a grant of arms seems to have been made (we say seems) for the date may possibly be a fraud like the rest of the lying document.

We have referred to Shakspeare as a drunken Warwickshire rustic who lived in the mean and dirty town of Stratford-on-Avon. There is a tradition that Shakespeare as a very young man was one of the Stratfordians selected to drink against "the Bidford topers," and with his defeated friends lay all night senseless under a crab tree, that was long known as Shakespeare's crab tree.

Shakespeare's description of the Stratford man as the drunken tinker in "The Taming of a Shrew" shews that the actor maintained his "drunken" character. This habit seems to have remained with him till the close of his life, for Halliwell-Phillipps says: "It is recorded that the party was a jovial one, and according to a somewhat late but apparently reliable tradition when the great dramatist [Shakespeare of Stratford] was returning to New Place in the evening, he had taken more wine than was conducive to pedestrian accuracy. Shortly or immediately afterwards he was seized by the lamentable fever which terminated fatally on Friday, April 23rd."

The story of his having to leave Stratford because he got into very bad company and became one of a gang of deer-stealers, has also very early support.

We have already proved that Shakspeare could neither read nor write. We must also bear in mind that the Stratford man never had any reputation as an actor.

Rowe, p. vi., thus writes: "His Name is Printed, as the Custom was in those Times, amongst those of the other Players, before some old Plays,[11] but without any particular Account of what sort of Parts he us'd to play; and tho' I have inquir'd I could never meet with any further Account of him this way than that the top of his Performance was the Ghost in his own Hamlet." The humblest scene-shifter could play this character, as we shall shew later. What about being manager of a Theatre? Shakspeare never was manager of a Theatre. What about being master of a Shakespeare company of actors? There never existed a Shakespeare company of actors. What about ownership of a Theatre? Dr. Wallace, says in the *Times* of Oct. 2nd 1909, that at the time of his death Shakespeare owned one fourteenth of the Globe Theatre, and one-seventh of the Blackfriars Theatre. The profit of each of these was probably exceedingly small. The pleadings, put forth the present value at £300 each, but as a broad rule, pleadings always used to set forth at least ten times the actual facts. In the first case which the writer remembers witnessing in Court, the pleadings were 100 oxen, 100 cows, 100 calves, 100 sheep, and 100 pigs, the real matter in dispute being one cow and perhaps one calf. If we assume, therefore, that the total

capital value of the holding of W. Shakespeare in both theatres taken together amounted to £60 in all, we shall probably, even then, considerably over-estimate their real worth. Now having disposed of the notion that Shakespeare was ever an important actor, was ever a manager of a Theatre, was ever the master of a company of actors, or was ever the owner of any Theatre, let us consider what Rowe means by the statement that the top of his performance was the Ghost in "Hamlet."

This grotesque and absurd fable has for two hundred years been accepted as an almost indisputable historical fact. Men of great intelligence in other matters seem when the life of Shakespeare of Stratford-on-Avon is concerned, quite prepared to refuse to exercise either judgment or common sense, and to swallow without question any amount of preposterous nonsense, even such as is contained in the above statement. The part of the Ghost in the play of "Hamlet" is one of the smallest and most insignificant possible, and can be easily played by the most ignorant and most inexperienced of actors. All that is required is a suit of armour with somebody inside it, to walk with his face concealed, silently and slowly a few times across the stage. Then on his final appearance he should say a few sentences (84 lines in the Folio, 1623), but these can be and occasionally are spoken by some invisible speaker in the same manner as the word "*Swear*" which is always growled out by someone concealed beneath the stage. No one knows, and no one cares, for no one sees who plays the part, which requires absolutely no histrionic ability. Sir Henry Irving, usually, I believe, put two men in armour upon the stage, in order to make the movements of the Ghost more mysterious. What then can be the meaning of the statement that the highest point to which the actor, Shakespeare, attained was to play the part of the Ghost in "Hamlet"? The rumour is so positive and so persistent that it cannot be disregarded or supposed to be merely a foolish jest or a senselessly false statement put forward for the purpose of deceiving the public. We are compelled, therefore, to conclude that there must be behind this fable some real meaning and some definite purpose, and we ask ourselves; What is the purpose of this puzzle? What can be its real meaning and intention? As usual, the Bacon

key at once solves the riddle. The moment we realise that BACON is HAMLET, we perceive that the purpose of the rumour is to reveal to us the fact that the highest point to which the actor, Shakespeare, of Stratford-on-Avon, attained was to play the part of Ghost to Bacon, that is to act as his "PSEUDONYM," or in other words, the object of the story is to reveal to us the fact that

BACON IS SHAKESPEARE.

Chapter XIII.

Conclusion, with further evidences from title pages.

Bacon had published eleven plays anonymously, when it became imperatively necessary for him to find some man who could be purchased to run the risk, which was by no means inconsiderable, of being supposed to be the author of these plays which included "Richard II."; the historical play which so excited the ire of Queen Elizabeth. Bacon, as we have already pointed out, succeeded in discovering a man who had little, if any, repute as an actor, but who bore a name which was called Shaxpur or Shackspere, which could be twisted into something that might be supposed to be the original of Bacon's pen name of Shake-Speare.

When in 1597 through the medium of powerful friends, by means of the bribe of a large sum of money, the gift of New Place, and the promise of a coat of arms, this man had been secured, he was at once sent away from London to the then remote village of Stratford-on-Avon, where scarcely a score of people could read, and none were likely to connect the name of their countryman, who they knew could neither read nor write and whom they called Shak or Shackspur, with "William Shakespeare" the author of plays the very names of which were absolutely unknown to any of them.

Bacon, when Shackspur had been finally secured in 1597, brought out in the following year 1598 "Loues Labor's lost" with the imprint "newly corrected and augmented by W. Shakespere," and immediately he also brought out under the

name of Francis Meres "Wits Treasury," containing the statement that eleven other plays, including "Richard II.," were also by this same Shakespeare who had written the poems of "Venus and Adonis" and "Lucrece."

Francis Meres says: "As the soule of Euphorbus was thought to live in Pythagoras so the sweete wittie soule of Ovid lives in mellifluous and honytongued Shakespeare, witnes his 'Venus and Adonis,' his 'Lucrece,' his sugred Sonnets among his private friends."

The Sonnets were not printed, so far as is known, before 1609, and they as has been shown in Chapter 8 repeat the story of Bacon's authorship of the plays.

Bacon in 1598, as we have stated in previous pages, fully intended that at some future period posterity should do him justice.

Among his last recorded words are those in which he commends his name and fame to posterity, "after many years had past." Accordingly we find, as we should expect to find, that when he put Shakespeare's name to "Loues Labor's lost" (the first play to bear that name) Bacon took especial pains to secure that at some future date he should be recognised as the real author. Does he not clearly reveal this to us by the wonderful words with which the play of "Loues Labor's lost" opens?

"Let Fame, that all hunt after in their lyues,
Liue registred vpon our brazen Tombes,
And then grace vs, in the disgrace of death:
When spight of cormorant deuouring Time,
Thendeuour of this present breath may buy:
That honour which shall bate his sythes keene edge,
And make us heires of all eternitie."

Bacon intended that "Spight of cormorant devouring Time" … honour…. should make [him] heir of all eternitie.

Compare the whole of this grand opening passage of "Loues Labor's lost" with the lines ascribed to Milton in the 1632 edition of Shakespeare's plays

when Bacon was [supposed to be] dead. No epitaph appeared in the 1623 edition, but in the 1632 edition appeared the following:

"An Epitaph on the admirable Dramaticke Poet,
W. Shakespeare.

What neede my Shakespeare for his honour'd bones,
The labour of an Age in piled stones
Or that his hallow'd Reliques should be hid
Under a starrey-pointed Pyramid?
Deare sonne of Memory, great Heire of Fame,
What needst thou such dull witnesse of thy Name?
Thou in our wonder and astonishment
Hast built thy selfe a lasting Monument:
For whil'st, to th' shame of slow-endevouring Art
Thy easie numbers flow, and that each part,
Hath from the leaves of thy unvalued Booke,
Those Delphicke Lines with deepe impression tooke
Then thou our fancy of her selfe bereaving,
Dost make us Marble with too much conceiving,
And so Sepulcher'd, in such pompe dost lie
That Kings for such a Tombe would wish to die."

We have pointed out in Chapter 10 and in Chapter 11 how clearly in "Loues Labour's lost," on page 136 of the folio of 1623, Bacon reveals the fact that he is the Author of the Plays, and we have shewn how the title pages of certain books support this revelation, beginning with the title page of the first folio of 1623 with its striking revelation given to us in the supposititious portrait which really consists of "a mask supported on two left arms."

We may, however, perhaps here mention that instructions are specially given to all who can understand, in the little book which is said to be a continuation of

Bacon's "Nova Atlantis," and to be by R. H., Esquire, [whom no one has hitherto succeeded in identifying].

On Plate 34, Page 149, we give a facsimile of its Title Page which describes the book and states that it was printed in 1660.

In this book a number of very extraordinary inventions are mentioned such as submarine boats to blow up ships and harbours, and telegraphy by means of magnetic needles, but the portion to which we now wish to allude is that which refers to a "solid kind of Heraldry." This will be found on pp. 23-4, and reads as follows:

"We have a solid kind of Heraldry, not made specious with ostentative pydecoats and titular Atcheivements, which in Europe puzzel the tongue as well as memory to blazon, and any Fool may buy and wear for his money. Here in each province is a Register to record the memorable Acts, extraordinary qualities and worthy endowments of mind of the most eminent Patricians. Where for the Escutcheon of Pretence each noble person bears the Hieroglyphic of that vertue he is famous for. E.G. If eminent for Courage, the Lion; If for Innocence, the White Lamb; If for Chastity, a Turtle; If for Charity, the Sun in his full glory; If for Temperance, a slender Virgin, girt, having a bridle in her mouth; If for Justice, she holds a Sword in the right, and a Scales in the left hand; If for Prudence, she holds a Lamp; If for meek Simplicity, a Dove in her right hand; If for a discerning Judgment, an Eagle; If for Humility, she is in Sable, the head inclining and the knees bowing; If for Innocence, she holds a Lilie; If for Glory or Victory, a Garland of Baies; If for Wisdom, she holds a Salt; If he excels in Physic, an Urinal; If in Music, a Lute; If in Poetry, a Scrowle; If in Geometry, an Astrolabe; If in Arithmetic, a Table of Cyphers; If in Grammar, an Alphabetical Table; If in Mathematics, a Book; If in Dialectica she holds a Serpent in either hand; and so of the rest; the Pretence being ever paralel to his particular Excellency. And this is sent him cut in brass, and in colours, as he best phansies for the Field; only the Hieroglyphic is alwayes proper."

These references to a solid kind of Heraldry refer to the title pages and frontispieces of books which may be characterised broadly as Baconian books, and examples of every one of them can be found in books extending from the Elizabethan period almost up to the present date.

We place Plate 35, Page 153, before the reader, which is a photo enlargement of the title page of Bacon's "History of Henry VII.," printed in Holland, 1642, the first Latin edition (in 12mo).

Here is seen the Virgin holding the Salt, shewing the Wisdom of the Author. In her right hand, which holds the Salt, she holds also two other objects which seem difficult to describe. They represent "a bridle without a bit," in order to tell us the purpose of the Plate is to unmuzzle Bacon, and to reveal to us his authorship of the plays known as Shakespeare's.

But in order to prove that the objects represent a bridle without a bit, we must refer to two emblem books of very different dates and authorship.

First we refer our readers to Plate 36, Page 156, which is a photo enlargement of the figure of Nemesis in the first (February 1531) edition of Alciati's Emblems. The picture shews us a hideous figure holding in her left hand a bridle with a tremendous bit to destroy false reputations, *improba verba*.

We next put before our readers the photo reproduction of the figure of Nemesis, which will be found on page 484, of Baudoin's Emblems, 1638. Baudoin had previously brought out in French a translation of Bacon's "Essays," which was published at Paris in 1621. In the preface to his book of Emblems he tells us that he was induced to undertake the task by BACON (printed in capital letters), and by Alciat (printed in ordinary type). In this book of Emblems, Baudoin, on page 484, placed his figure of Nemesis opposite to Bacon's name. If the reader carefully examines Plate 37 he will perceive that it is no longer a grinning hideous figure, but is a figure of FAME, and carries a bridle in which there is found to be no sign of any kind of bit, because the purpose of the Emblem is to shew that Nemesis will unmuzzle and glorify Bacon.

In order to make the meaning of Baudoin's Emblem still more emphatically explicit a special Rosicrucian Edition of the same date, 1638, was printed, in

which Baudoin's Nemesis is printed "upside down"; we do not mean bound upside down, but printed upside down, for there is the printing of the previous page at the back of the engraving. We have already alluded on page 113 to the frequent practice of the upside down printing of ornaments and engravings when a revelation concerning Bacon's connection with Shakespeare is afforded to us.

The writer possesses an ordinary copy of Baudoin's Emblems, 1638, and also a copy of the edition with the Nemesis printed upside down which appears opposite Bacon's name. The copy so specially printed is bound with Rosicrucian emblems outside.

The reader, by comparing Baudoin's Nemesis, Plate 37, and the Title Page of Henry VII., Plate 35, will at once perceive that the objects in the right hand of the Virgin holding the salt box are correctly described as representing a "bridle without a bit," and he will know that a revelation concerning Bacon and Shakespeare is going to be given to him. Now we will tell him the whole story. On the right of the picture, Plate 35 (the reader's left) we see a knight in full armour, and also a philosopher who is, as the roses on his shoes tell us, a Rosicrucian philosopher. On the left on a lower level is the same philosopher, evidently Bacon, but without the roses on his shoes. He is holding the shaft of a spear with which he seems to stop the wheel. By his side stands what appears to be a Knight or Esquire, but the man's sword is girt on the wrong side, he wears a lace collar and lace trimming to his breeches, and he wears actor's boots (see Plate 28, Page 118, and Plate 132, Page 127).

We are therefore forced to conclude that he is an Actor. And, lo, he wears but ONE SPUR. He is therefore a Shake-spur Actor (on Plate 27, Page 115, is shewn a Shake-spur on horseback). This same Actor is also shaking the spear which is held by the philosopher. He is therefore also a Shakespear Actor. And now we can read the symbols on the wheel which is over his head: the "mirror up to nature," "the rod for the back of fools," the "basin to hold your guilty blood" ("Titus Andronicus," v. 2), and "the fool's bawble." On the other side of the spear: the spade the symbol of the workman, the cap the symbol of the

gentleman, the crown the symbol of the peer, the royal crown, and lastly the Imperial crown. Bacon says Henry VII. wore an Imperial crown. Quite easily now we can read the whole story.

The "History of Henry VII.," though in this picture displayed on a stage curtain, is set forth by Bacon in prose while the rest of the Histories of England are given to the world by Bacon by means of his pseudonym the Shakespear Actor at the Globe to which that figure is pointing.

Plain as the plate appears to the instructed eye it seems hitherto to have failed to reveal to the *un*instructed its clear meaning that

BACON IS SHAKESPEARE.

CHAPTER XIV.

Postscriptum.

Most fortunately before going to press we were able to see at the Record Office, Chancery Lane, London, the revealing documents recently discovered by Dr. Wallace and described by him in an article published in the March number of *Harper's Monthly Magazine*, under the title of "New Shakespeare Discoveries." The documents found by Dr. Wallace are extremely valuable and important. They tell us a few real facts about the Householder of Stratford-upon-Avon, and they effectually once and for all dispose of the idea that the Stratford man was the Poet and Dramatist, — the greatest genius of all the ages.

In the first place they prove beyond the possibility of cavil or question that "Shakespeare, of Stratford-upon-Avon, Gentleman," was totally unable to write even so much as any portion of his own name. It is true that the Answers to the Interrogatories which are given by "William Shakespeare, of Stratford-upon-Avon, Gentleman," are marked at the bottom "Wilm Shaxpr," but this is written by the lawyer or law clerk, in fact "dashed in" by the ready pen of an extremely rapid writer. A full size photographic facsimile of this "so-called" signature, with a portion of the document above it, is given in Plate 38, Page 164, and on the opposite page, in Plate 39, is shewn also in full size facsimile the real signature of Daniell Nicholas with a portion of the document, which he signed, above it.

In order that the reader may be able more easily to read the law writing we give on page 167, in modern type, the portion of the document photographed above the name Wilm Shaxp'r, and on the same page a modern type transcript of the document above the signature of Daniell Nicholas.

Any expert in handwriting will at once perceive that "Wilm Shaxp'r" is written by the same hand that wrote the lower portion of Shakespeare's Answers to Interrogatories, and by the same hand that wrote the other set of Answers to Interrogatories which are signed very neatly by "Daniell Nicholas."

The words “Daughter Marye” occur in the portion photographed of both documents, and are evidently written by the same law writer, and can be seen in Plate 38, Page 164, just above the “Wilm Shaxp’r,” and in Plate 39, Page 165, upon the fifth line from the top. The name of “Shakespeare” also occurs several times in the “Answers to Interrogatories.” One instance occurs in Plate 39, Page 165, eight lines above the name of Daniell Nicholas, and if the reader compares it with the “Wilm Shaxp’r” on Plate 38, Page 164, it will be at once seen that both writings are by the same hand.

portion What c’tayne he . . . . . plt twoe hundered pounds decease. But sayth that his house. And they had amo about their marriadge w’ch nized. And more he can ponnt saythe he can saye of the same Interro for cessaries of houshould stuffe his daughter Marye WILM SHAXPR

TYPE FACSIMILE OF PLATE XXXVIII.

*

Interr this depnnt sayth that the deft did beare ted him well when he by him the said Shakespeare his daughter Marye that purpose sent him swade the plt to the solempnised uppon pmise of nnt. And more he can this deponnt sayth is deponnt to goe wth DANIELL NICHOLAS.

TYPE FACSIMILE OF PLATE XXXIX.

Answers to Interrogatories are required to be signed by the deponents. In the case of “Johane Johnsone,” who could not write her name, the depositions are signed with a very neat cross which was her mark. In the case of “William Shakespeare, of Stratford-upon-Avon, Gentleman,” who was also unable to write his name, they are signed with a dot which might quite easily be mistaken for an accidental blot. Our readers will see this mark, which is not a blot but a purposely made mark, just under “Wilm Shaxp’r.”

Dr. Wallace reads the “so-called” signature as Willm Shaks, but the Christian name is written quite clearly Wilm. And we should have supposed that any one possessing even the smallest acquaintance with the law writing of the period must have known that the scroll which looks like a flourish at the end of the surname is not and cannot be an “s,” but is most certainly without any possibility of question a “p,” and that the dash through the “p” is the usual and accepted abbreviation for words ending in “per,” or “peare,” *etc.*[12]

Then how ought we, nay how arewe, compelled to read the so-called signature? The capital S is quite clear, so also is the “h,” then the next mass of strokes all go to make up simply the letter “a.” Then we come to the blotted letter,

this is not and cannot be “kes” or “ks” because in the law writing of the period every letter “s” (excepting “s” at the end of a word) was written as a very long letter. This may readily be seen in the word Shakespeare which occurs in Plate 39 on the eighth line above the signature of Daniell Nicholas. What then is this blotted letter if it is not kes or ks? The answer is quite plain, it is an “X,” and a careful examination under a very strong magnifying glass will satisfy the student that it is without possibility of question correctly described as an “X.”[13] Yes, the lawclerk marked the Stratford Gentleman’s “Answers to Interrogatories” with the name “Wilm Shaxp’r.” Does there exist a Stratfordian who will contend that William Shakespeare, of Stratford-upon-Avon, Gentleman, if he had been able to write any portion of his name would have marked his depositions Wilm Shaxp’r? Does there exist any man who will venture to contend that the great Dramatist, the author of the Immortal plays, would or could have so signed his name? We trow not; indeed, such an abbreviation would be impossible in a legal document in a Court of Law where depositions are required to be signed in full.

With reference to the other so-called Shakespeare's signatures we must refer the reader to our Chapter III. which was penned before these "New Shakespeare Discoveries" were announced. And it is perhaps desirable to say that the dot in the "W" which appears in two of those "so-called" signatures of Shakespeare, and also in the one just discovered, is part of the regular method of writing a "W" in the law writing of the period. In the Purchase Deed of the property in Blackfriars, of March 10th 1612-13, mentioned on page 38, there are in the first six lines of the Deed seven "W's," in each of which appears a dot. And in the Mortgage Deed of March 11th 1612-13, there are seven "W's" in the first five lines, in each of which appears a similar dot. The above-mentioned two Deeds are in the handwriting of different law clerks.

It may not be out of place here again to call our readers' attention to the fact that law documents are required to be signed "in full," and that if the very rapid and ready writer who wrote "Wilm Shaxp'r" were indeed the Gentleman of Stratford it would have been quite easy for such a good penman to have written his name in full; this the law writer has not done because he did not desire to forge a signature to the document, but desired only to indicate by an abbreviation that the dot or spot below was the mark of William Shakespeare of Stratford-upon-Avon.

Thus the question, whether William Shakespeare, of Stratford-upon-Avon, Gentleman, could or could not write his name is for ever settled in the negative, and there is no doubt, there can be no doubt, upon this matter.

Dr. Wallace declares "I have had no theory to defend and no hypothesis to propose." But as a matter of fact his whole article falsely assumes that "William Shakespeare, of Stratford-upon-Avon, Gentleman," who is referred to in the documents, is no other than the great Dramatist who wrote the Immortal plays. And the writer can only express his unbounded wonder and astonishment that even so ardent a Stratfordian as Dr. Wallace, after studying the various documents which he discovered, should have ventured to say:

"Shakespeare was the third witness examined. Although, forsooth, the matter of his statements is of no high literary quality and the manner is lacking in

imagination and style, as the Rev. Joseph Green in 1747 complained of the will, we feel none the less as we hear him talk that we have for the first time met Shakespeare in the flesh and that the acquaintance is good."

As a matter of fact none of the words of any of the deponents are their own words, but they are the words of the lawyers who drew the Answers to the Interrogatories. The present writer, when a pupil in the chambers of a distinguished lawyer who afterwards became a Lord Justice, saw any number of Interrogatories and Answers to Interrogatories, and even assisted in their preparation. The last thing that any one of the pupils thought of, was in what manner the client would desire to express his own views. They drew the most plausible Answers they could imagine, taking care that their words were sufficiently near to the actual facts for the client to be able to swear to them.

The so-called signature "Wilm Shaxp'r," is written by the lawyer or law clerk who wrote the lower part of Shakespeare's depositions, and this same clerk also wrote the depositions above the name of another witness who really *signs* his own name, viz., "Daniell Nicholas." The only mark William Shakespeare put to the document was the blot above which the abbreviated name "Wilm Shaxp'r" was written by the lawyer or law clerk.

The documents shew that Shakespeare of Stratford occasionally "lay" in the house in Silver Street, and Ben Jonson's words in "The Staple of News" (Third Intermeane; Act iii.), to which Dr. Wallace refers viz., that "Siluer-Streete" was "a good seat for a Vsurer" are very informing, because as we have before pointed out the Stratford man was a cruel usurer.

Dr. Wallace's contention that Mountjoy, the wig-maker, of the corner house in Silver Street where Shakespeare, of Stratford-upon-Avon, Gentleman, occasionally slept, was the original of the name of the Herald in Henry V.[14] really surpasses, in want of knowledge of History, anything that the writer has ever previously encountered, and he is afraid that it really is a measure of the value of Dr. Wallace's other inferences connecting the illiterate Stratford Rustic with the great Dramatist who "took all knowledge for his province."

Dr. Wallace's "New Shakespeare Discoveries" are really extremely valuable and informing, and very greatly assist the statements which the writer has made in the previous chapters, viz., that the Stratford Householder was a mean Rustic who was totally unable to read or to write, and was not even an actor of repute, but was a mere hanger-on at the Theatre. Indeed, the more these important documents are examined the clearer it will be perceived that, as Dr. Wallace points out, they shew us that the real William Shakespeare, of Stratford-upon-Avon, gentleman, was not the "Aristocrat," whom Tolstoi declares the author of the plays to have been, but was in fact a man who resided [occasionally when he happened to revisit London] "in a hardworking family," a man who was familiar with hairdressers and their apprentices, a man who mixed as an equal among tradesmen in a humble position of life, who referred to him as "One Shakespeare." These documents prove that "One Shakespeare" was not and could not have been the "poet and dramatist." In a word these documents strongly confirm the fact that

BACON IS SHAKESPEARE.

CHAPTER XV.

Appendix.

The facsimile shewn in Plate 41, Page 176, is from “The Attourney’s Academy,” 1630. The reader will perceive that the ornamental heading is printed upside down. In the ordinary copies it is not so printed, but only in special copies such as that possessed by the writer; the object of the upside-down printing being, as we have already pointed out in previous pages, to reveal, to those deemed worthy of receiving it, some secret concerning Bacon.

In the present work, while we have used our utmost endeavour to place in the vacant frame, the true portrait of him who was the wonder and mystery of his own age and indeed of all ages, we have never failed to remember the instructions given to us in “King Lear”: —

> “Have more than thou showest,
> Speak less than thou knowest.”

Our object has been to supply exact and positive information and to confirm it by proofs so accurate and so certain as to compel belief and render any effective criticism an impossibility.

It may however not be without advantage to those who are becoming convinced against their will, if we place before them a few of the utterances of men of the greatest distinction who, without being furnished with the information which we have been able to afford to our readers, were possessed of sufficient intelligence and common sense to perceive the truth respecting the real authorship of the Plays.

LORD PALMERSTON, b. 1784, d. 1865.

Viscount Palmerston, the great British statesman, used to say that he rejoiced to have lived to see three things — the re-integration of Italy, the unveiling of the mystery of China and Japan, and the explosion of the Shakespearian illusions. — *From the Diary of the Right Hon. Mount-Stewart E. Grant.*

LORD HOUGHTON, b. 1809, d. 1885.

Lord Houghton (better known as a statesman under the name of Richard Monckton Milnes) reported the words of Lord Palmerston, and he also told Dr. Appleton Morgan that he himself no longer considered Shakespeare, the actor, as the author of the Plays.

SAMUEL TAYLOR COLERIDGE, b. 1772, d. 1834.

Samuel Taylor Coleridge, the eminent British critic and poet, although he assumed that Shakespeare was the author of the Plays, rejected the facts of his life and character, and says: "Ask your own hearts, ask your own common sense, to conceive the possibility of the author of the Plays being the anomalous, the wild, the irregular genius of our daily criticism. What! are we to have miracles in sport? Does God choose idiots by whom to convey divine truths to man?"

JOHN BRIGHT, b. 1811, d. 1889.

John Bright, the eminent British statesman, declared: "Any man that believes that William Shakespeare of Stratford wrote Hamlet or Lear is a fool." In its issue of March 27th 1889, the *Rochdale Observer* reported John Bright as scornfully angry with deluded people who believe that Shakespeare wrote Othello.

RALPH WALDO EMERSON, b. 1803, d. 1882.

Ralph Waldo Emerson, the great American philosopher and poet, says: "As long as the question is of talent and mental power, the world of men has not his equal to show…. The Egyptian verdict of the Shakespeare Societies comes to mind that he was a jovial actor and manager. I cannot marry this fact to his verse." — *Emerson's Works. London, 1883. Vol. 4, p. 420.*

JOHN GREENLEAF WHITTIER, b. 1807, d. 1892.

John Greenleaf Whittier, the American poet, declared: "Whether Bacon wrote the wonderful plays or not, I am quite sure the man Shakspere neither did nor could."

DR. W. H. FURNESS, b. 1802, d. 1891.

Dr. W. H. Furness, the eminent American scholar, who was the father of the Editor of the Variorum Edition of Shakespeare's Works, wrote to Nathaniel Holmes in a letter dated Oct. 29th 1866: "I am one of the many who have never been able to bring the life of William Shakespeare and the plays of Shakespeare within planetary space of each other. Are there any two things in the world more incongruous? Had the plays come down to us anonymously, had the labor of discovering the author been imposed upon after generations, I think we could have found no one of that day but F. Bacon to whom to assign the crown. In this case it would have been resting now on his head by almost common consent."

MARK TWAIN, b. 1835, d. 1910.

Samuel Langhorne Clemens, who wrote under the pseudonym of Mark Twain, was, — it is universally admitted, — one of the wisest of men. Last year (1909) he published a little book with the title, "Is Shakespeare dead?" In this he treats with scathing scorn those who can persuade themselves that the immortal plays were written by the Stratford clown. He writes, pp. 142-3: "You can trace the life histories of the whole of them [the world's celebrities] save one far and away the most colossal prodigy of the entire accumulation — Shakespeare. About him you can find out *nothing*. Nothing of even the slightest importance. Nothing worth the trouble of stowing away in your memory. Nothing that even remotely indicates that he was ever anything more than a distinctly commonplace person — a manager,[15] an actor of inferior grade, a small trader in a small village that did not regard him as a person of any consequence, and had forgotten him before he was fairly cold in his grave. We can go to the records and find out the life-history of every renowned *race-horse* of modern times — but not Shakespeare's! There are many reasons why, and they have been furnished in cartloads (of guess and conjecture) by those troglodytes; but there is one that is worth all the rest of the reasons put together, and is abundantly sufficient all by itself — *he hadn't any history to record*. There is no way of getting around that deadly fact. And no sane way has yet been discovered of getting round its formidable significance. Its quite plain significance — to any but those thugs (I do not use the term unkindly) is, that Shakespeare had no

prominence while he lived, and none until he had been dead two or three generations. The Plays enjoyed high fame from the beginning."

PRINCE BISMARCK, b. 1815, d. 1898.

We are told in Sydney Whitman's "Personal Reminiscences of Prince Bismarck," pp. 135-6, that in 1892, Prince Bismarck said, "He could not understand how it were possible that a man, however gifted with the intuitions of genius, could have written what was attributed to Shakespeare unless he had been in touch with the great affairs of state, behind the scenes of political life, and also intimate with all the social courtesies and refinements of thought which in Shakspeare's time were only to be met with in the highest circles."

"It also seemed to Prince Bismarck incredible that the man who had written the greatest dramas in the world's literature could of his own free will, whilst still in the prime of life, have retired to such a place as Stratford-on-Avon and lived there for years, cut off from intellectual society, and out of touch with the world."

The foregoing list of men of the very greatest ability and intelligence who were able clearly to perceive the absurdity of continuing to accept the commonly received belief that the Mighty Author of the immortal Plays was none other than the mean rustic of Stratford, might be extended indefinitely, but the names that we have mentioned are amply sufficient to prove to the reader that he will be in excellent company when he himself realises the truth that

BACON IS SHAKESPEARE.

A NEUER WRITER, TO AN EUER READER. NEWES.

Eternall reader, you haue heere a new play, neuer stal'd with the Stage, neuer clapper-clawd with the palmes of the vulger, and yet passing full of the palme comicall; for it is a birth of your braine, that neuer under-tooke any thing commicall, vainely: And were but the vaine names of commedies changde for the titles of Commodities, or of Playes for Pleas; you should see all those grand

censors, that now stile them such vanities, flock to them for the maine grace of their grauities: especially this authors Commedies, that are so fram'd to the life, that they serve for the most common Commentaries, of all the actions of our Hues shewing such a dexteritie, and power of witte, that the most displeased with Playes are pleasd with his Commedies…..

And beleeue this, that when hee is gone, and his Commedies out of sale, you will scramble for them, and set up a new English Inquisition. Take this for a warning, and at the perrill of your pleasures losse, and Judgements, refuse not, nor like this the lesse, for not being sullied, with the smoaky breath of the multitude.[16]

ADDENDA ET CORRIGENDA.

Footnote to page 45. There was a forest of Arden in Warwickshire.
Footnote to page 51. This Richard Quyney's son Thomas married 10th February 1616, Judith, William Shakespeare's younger daughter, who, like her father, the supposed poet, was totally illiterate, and signed the Register with a mark.

Footnote to page 62. In 1615, although nothing of poetical importance bearing Bacon's name had been published, we find in Stowe's "Annales," p. 811, that Bacon's name appears seventh in the list there given of Elizabethan poets.

ERRATA.

P. 5. For "knew little Latin" read "had small Latin."
P. 29. For "line 511" read "line 512."
P. 81. For "Montegut" read "Montegut."
For "Greek for crowned" read "Greek for crown."

P. 93 & 94. For “Quintillian” read “Quintilian.”

P. 133. For “Greek name” read “Greek word.”

PROMUS OF FOURMES AND ELEGANCYES

BY

FRANCIS BACON.

PREFACE TO PROMUS

To these Essays I have attached a carefully collated reprint of Francis Bacon's "Promus of Formularies and Elegancies," a work which is to be found in Manuscript at the British Museum in the Harleian Collection (No. 7,017.)

The folios at present known are numbered from 83 to 132, and are supposed to have been written about A.D. 1594-6, because folio 85 is dated December 5th 1594, and folio 114, January 27 1595.

The pagination of the MS. is modern, and was inserted for reference purposes when the Promus was bound up in one volume together with certain other miscellaneous manuscripts which are numbered from 1 to 82, and from 133 onwards.

A facsimile of a portion of a leaf of the Promus MS., folio 85, is given on pages 190-91, in order to illustrate Bacon's handwriting, and also to shew his method of marking the entries. It will be perceived that some entries have lines //// drawn across the writing, while upon others marks similar to the capital letters T, F, and A are placed at the end of the lines. But as the Promus is here printed page for page as in the manuscript, I am not raising the question of the signification of these marks, excepting only to say they indicate that Bacon made considerable use of these memoranda.

"Promus" means larder or storehouse, and these "Fourmes, Formularies and Elegancyes" appear to have been intended as a storehouse of words and phrases to be employed in the production of subsequent literary works.

Mrs. Pott was the first to print the "Promus," which, with translations and references, she published in 1883. In her great work, which really may be described as monumental, Mrs. Pott points out, by means of some thousands of quotations, how great a use appears to have been made of the "Promus" notes, both in the acknowledged works of Bacon and in the plays which are known as Shakespeare's.

Mrs. Pott's reading of the manuscript was extremely good, considering the great difficulty experienced in deciphering the writing. But I thought it advisable when preparing a reprint to secure the services of the late Mr. F. B. Bickley, of the British Museum, to carefully revise the whole of Bacon's "Promus." This task he completed and I received twenty-four proofs, which I caused to be bound with a title page in 1898. There were no other copies, the whole of the type having unfortunately been broken up. The proof has again been carefully collated with the original manuscript and corrected by Mr. F. A. Herbert, of the British Museum, and I have now reprinted it here, as I am satisfied that the more Bacon's Promus — the Storehouse — is examined, the more it will be recognised how large a portion of the material collected therein has been made use of in the Immortal Plays, and I therefore now issue the Promus with the present essay as an additional proof of the identity of Bacon and Shakespeare.

EDWIN DURNING-LAWRENCE.

PROMUS OF FORMULARIES.

Folio 83, front.

Ingenuous honesty and yet with opposition and strength.
Corni contra croci good means against badd, homes to crosses.
In circuitu ambulant impij; honest by antiperistasis.
Siluj a bonis et dolor meus renouatus est.
Credidj propter quod locutus sum.
Memoria justi cum laudibus at impiorum nomen putrescet
Justitiamque omnes cupida de mente fugarunt.
Non recipit stultus verba prudential nisi ea dixeris quaee uersantur in corde ejus
Veritatem erne et noli vendere
Qui festinat ditari non erat insons
Nolite dare sanctum canibus.
Qui potest capere capiat
Quoniam Moses ad duritiam cordis uestri permisit uobis
Obedire oportet deo magis quam hominibus.
Et vniuscujusque opus quale sit probabit ignis
Non enim possumus aliquid aduersus ueritatem sed pro ueritate.

Folio 83, front — continued.

For which of y'e good woorkes doe yow stone me
Quorundam hominum peccata praecedunt ad judicium

quorundam sequuntur
Bonum certamen certauj
Sat patriae priamoque datum.
Ilicet obruimur numero.
Atque animis illabere nostris
Hoc praetexit nomine culpam.
Procul o procul este prophani
Magnanimj heroes nati melioribus annis

Folio 83, back.

Ille mihi ante alios fortunatusque laborum
Egregiusque animi qui ne quid tale videret
Procubuit moriens et humum semel ore momordit
Fors et uirtus miscentur in vnum.
Non ego natura nec sum tam callidus vsu.
aeuo rarissima nostro simplicitas
Viderit vtilitas ego cepta fideliter edam.
Prosperum et foelix scelus, virtus vocatur
Tibi res antiquas laudis et artis
Inuidiam placare paras uirtute relicta.
Iliacos intra muros peccatur et extra
Homo sum humanj a me nil alienum puto.
The grace of God is woorth a fayre
Black will take no other hue
Vnum augurium optimum tueri patria.
Exigua res est ipsa justitia
Dat veniam coruis uexat censura columbas.
Homo hominj deus
Semper virgines furiae; Cowrting a furye
Di danarj di senno et di fede

Ce ne manco che tu credj
Chi semina spine non vada discalzo
Mas vale a quien Dios ayuda que a quien mucho madruga.
Quien nesciamente pecca nesciamente ua al infierno
Quien ruyn es en su uilla
Ruyn es en Seuilla
De los leales se hinchen los huespitales

Folio 84, front.

We may doe much yll or we doe much woorse
Vultu laeditur saepe pietas.
Difficilia quae pulchra
Conscientia mille testes.
Summum Jus summa injuria
Nequiequam patrias tentasti lubricus artes.
Et monitj meliora sequamur
Nusquam tuta fides
Discite Justitiam moniti et non temnere diuos
Quisque suos patimur manes.
Extinctus amabitur idem.
Optimus ille animi vindex laedentium pectus
Vincula qui rupit dedoluitque semel.
Virtue like a rych geme best plaine sett
Quibus bonitas a genere penitus insita est ij iam non mali esse nolunt sed nesciunt
Oeconomicae rationes publicas peruertunt.
Divitiae Impedimenta virtutis; The bagage of vertue
Habet et mors aram.

Nemo virtuti invidiam reconciliauerit praeter mort …
Turpe proco ancillam sollicitare Est autem virtutis ancilia laus.
Si suum cuique tribuendum est certe et venia humanitati
Qui dissimulat liber non est
Leue efficit jugum fortunae jugum amicitiae
Omnis medecina Innouatio

Folio 84, front — continued.

Auribus mederi difficillimum.
Suspitio fragilem fidem soluit fortem incendit
Pauca tamen suberunt priscae vestigia fraudis
Dulce et decorum est pro patria mori
Mors et fugacem persequitur virum.
Danda est hellebori multo pars maxima avar [is]

Folio 84, back.

Minerall wytts strong poyson and they be not corrected
aquexar.
Ametallado fayned inameled.
Totum est majus sua parte against factions and priuate profite
Galens compositions not paracelsus separations
Full musike of easy ayres withowt strange concordes and discordes
In medio non sistit uirtus
Totem est quod superest

A goode Comediante T (of one that hath good grace in his speach)
To commend Judgments.
// To comend sense of law
// Cunyng in the humors of persons but not in the condicons of actions
Stay a littell that we make an end the sooner. A
// A fooles bolt is soone shott
His lippes hang in his light. A. T

// Best we lay a straw hear
A myll post thwitten to a pudding pricke T
// One swallo maketh no sumer
L'Astrologia e vera ma l'astrologuo non sj truoua
// Hercules pillers non vltra. T
// He had rather haue his will then his wyshe. T
Well to forgett
Make much of yourselfe

Folio 85, front — continued.

Wyshing yow all &c and myself occasion to doe
yow servyce
// I shalbe gladd to vnderstand your newes but none
// rather then some ouerture whearin I may doe
// yow service
// Ceremonyes and green rushes are for strangers T
How doe yow? They haue a better question in cheap side w'lak ye
// Poore and trew. Not poore therefore not trew T

Folio 85, back.

Tuque Inuidiosa vestustas. T
Licentia sumus omnes deteriores. T
Qui dat nivem sicut lanam T
Lilia agri non laborant neque nent T
Mors omnia solvit T
// A quavering tong.
like a cuntry man that curseth the almanach. T
Ecce duo gladij his. T
Arnajore ad minorem. T
In circuitu ambulant impij T

Exijt sermo inter fratres quod discipulus iste non moritur T

Omne majus continet in se mjnus T

Sine vlla controuersia quod minus est majore benedic … T

She is light she may be taken in play T

He may goe by water for he is sure to be well landed T

// Small matters need sollicitacion great are remembred of themselues

The matter goeth so slowly forward that I haue almost forgott it my self so as I maruaile not if my frendes forgett

Not like a crabb though like a snaile

Honest men hardly chaung their name. T

The matter thowgh it be new (if that be new wch) hath been practized in like case thowgh not in this particular

I leaue the reasons to the parties relacions and the consyderacion of them to your wysdome

Folio 86, front.

I shall be content my howrs intended for service leaue me in liberty

// It is in vayne to forbear to renew that greef by

// speach w'ch the want of so great a comfort must

// needes renew.

// As I did not seeke to wynne your thankes so your

// courteous acceptacion deserueth myne

// The vale best discouuereth the hill T.

// Sometymes a stander by seeth more than a plaier T.
The shortest foly is the best. T.
// I desire no secrett newes but the truth of comen
newes. T.
// Yf the bone be not trew[17] sett it will neuer be well
till it be broken. T.
// Cheries and newes fall price soonest. T.
You vse the lawyers fourme of pleading T.
// The difference is not between yow and me but
between your proffite and my trust
// All is not in years some what is in howres well
spent. T.
// Offer him a booke T
// Why hath not God sent yow my mynd or me your
// means.
// I thinke it my dowble good happ both for the
obteynyng and for the mean.
// Shutt the doore for I mean to speak treason T.
I wysh one as fytt as I am vnfitt
I doe not onely dwell farre from neighbors but near
yll neighbors. T

Folio 86, front — continued.

// As please the paynter T.
Receperunt mercedem suam. T.
Secundum tidem vestram fiet vobis
Ministerium meum honorificabo

Folio 86, back.

Atticus in portum
Divinum excipio sermonem
Agamemnonis hostia
With sailes and owres
To way ancre.
To keep strooke (fitt conjunctes).
To myngle heauen and earth together.
To stirr his curteynes (to raise his wyttes and sprites).
Comovere sacra
To iudg the Corne by the strawe.
Domj Conjecturam facere [Greek: oikothen eikax[ein]]
To divine with a sive (?)
Mortuus per somnum vacabis curis (of one that interpretes all thinges to the best).
Nil sacrj es (Hercules to adonis).
Plumbeo iugulare gladio (A tame argument).
Locrensis bos (a mean present).
Ollaris Deus. (a man respected for his profession withowt woorth in himself).
In foribus Vrceus; an earthen pott in the threshold
Numerus

Folio 98, back.

To drawe of the dregges
Lightenyng owt of a payle
Durt tramped w'th bloude.
Ni pater esses
Vates secum auferat omen.
In eo ipso stas lapide vbj praeco praedicat, of one that is abowt to be bowght and sold.
Lydus ostium claudit (of one that is gone away w'th his purpose).
Vtranque paginam facit An auditors booke (of one to whome both good and yll is imputed).
Non navigas noctu (of one that govern[s] himself acaso [bycause] the starres which were wont to be the shipmans direction appear but in the night).
It smelleth of the lampe
You are in the same shippe
Between the hamer and the Andville
Res est in cardine
Vndarum in vinis
Lepus pro carnibus (of a man persecuted for profite and not for malice).
Corpore effugere
Nunquid es saul inter prophetas
A dog in the manger
[Greek: Oaekonous] (a howsedowe a dedman).

Folio 99, front.

Officere luminibus
I may be in their light but not in their way.
Felicibus sunt et timestres liberj.
To stumble at the threshold
Aquilae senectus
Of the age now they make popes of
Nil ad Parmenonis suem
Aquila in nubibus (a thing excellent but remote).
Mox Sciemus melius vate
In omni fabula et Daedali execratio (of one made a party to all complaintes).
Semper tibj pendeat hamus.
Res redit ad triarios.
Tentantes ad trojam pervenere greci
Cignea cantio
To mowe mosse (vnseasonable taking of vse or profite).
Ex tripode
Ominabitur aliquis te conspecto.
He came of an egge
Leporem comedit

Folio 99, back.

H [Greek: Ae tan ae epi tun]
Dormientis rete trahit
Vita doliaris
He castes another mans chaunces.
I neuer liked proceeding vpon Articles before bookes nor betrothinges before mariages.
Lupus circa puteum chorum agit

The woolue danceth about the welle.
Spem pretio emere
Agricola semper in nouum annam diues.
To lean to a staffe of reed
fuimus Troes.
Ad vinum disertj.
To knytt a rope of sand.
Pedum visa est via
Panicus casus
Penelopes webb
[Greek: skiamachein]
To striue for an asses shade
Laborem serere.
Hylam inclamat.
[Greek: theomachein]
To plowe the wyndes
Actum agere
Versuram soluere To euade by a greater mischeef.
Bulbos querit (of those that looke downe
Between the mowth and the morsell).
A Buskin (that will serve both legges
not an indifferent man but a dowble spye).

Folio 100, front.

Chameleon Proteus, Euripus.
Mu[l]ta novit uulpes sed Echinus unum magnum
Semper Africa aliquid monstrj parit
Ex eodem ore calidum et frigidum.
Ex se finxit velut araneus
Laqueus laqueum cepit.

Hinc ille lachrime; Hydrus in dolio
Dicas tria ex Curia (liberty vpon dispaire)
Argi Collis (a place of robbing).
Older then Chaos.
Samiorum flores
A bride groomes life
Samius comatus (of one of no expectacion and great proof).
Adonis gardens (thinges of great pleasure but soone fading).
Que sub axillis fiunt.
In crastinum seria.
To remooue an old tree
[Greek: Kymakophon] (of one that fretteth and vaunteth boldnesse to vtter choler).
To bite the br[i]dle
Lesbia regula.
Vnguis in vlcere
To feed vpon musterd
In antro trophonij (of one that neuer laugheth).
Arctum annulum ne gestato.

Folio 100, back.

Areopagita; Scytala.
Cor ne edito.
Cream of Nectar
Promus magis quam Condus.
He maketh to deep a furrowe
Charons fares
Amazonum cantile[n]a; The Amazons song

(Delicate persons).
To sow curses.
To quench fyre with oyle
Ex ipso boue lora sumere.
Mala attrahens ad se vt Cesias nubes
Pryauste gaudes gaudium.
Bellerophontis literae (producing lettres or evidence against a mans self).
Puer glaciem.
To hold a woolf by the ears
fontibus apros, floribus austrum
Softer then the lippe of the ear
More tractable then wax
Aurem vellere.
[Greek: Aeeritrimma]; frippon
To picke owt the Ravens eyes.
Centones
Improbitas musce (an importune that wilbe soone awnswered but straght in hand agayne).
Argentangina, sylver mumpes
Lupi illum videre priores
Dorica musa.
To looke a gyven horse in the mowth.

Folio 101, front.

Vlysses pannos exuit.
fatis imputandum
Lychnobij
Terrae filius
Hoc jam et vates sciunt

Whear hartes cast their hornes
few dead byrdes fownd.
Prouolvitur ad milvios (a sickly man gladd of the spring).
Amnestia
Odi memorem compotorem.
Delius natator.
Numeris platonis obscurius
Dauus sum non Oedipus
Infixo aculeo fugere
Genuino mordere.
Ansam quaerere.
Que sunt apud inferos sermones.
Et Scellij filium abominor (of him that cannot endure the sound of a matter; from Aristocrates Scellius sonne, whome a man deuoted to a democracy said he could not abide for the nearnesse of his name to an Aristocracy).
Water from the handes (such doctrynes as are polluted by custome).

Folio 101, back.

famis campus an yll horse kept
The thredd is sponne now nedes the neadle
quadratus homo. a Cube.
fenum habet in Cornu.
Armed intreaty.
Omnia secunda saltat senex.
[Greek: theon cheires]
Mopso Nisa datur

Dedecus publicum.
Riper then a mulbery.
Tanquam de Narthecio
Satis quercus; Enowgh of Acornes.
Haile of perle.
Intus canere.
Symonidis Cantilena.
Viam qui nescit ad mare
Alter Janus.
To swyme withowt a barke
An owles egg.
Shake another tree
E terra spectare naufragia
In diem vivere
Vno die consenescere.
[Greek: Porro dios te K[a]i keraunou]
Servire scenae.
Omnium horarum homo
Spartae servi maxime servi
Non sum ex istis heriobus (*sic*) (potentes ad nocendum)

Folio 101, back — continued.

Scopae dissolute
Clavum clauo pellere
Extra querere sese

Folio 102, front.

Cumjnj sector
Laconice lunae.

Coruus aquat.
Ne incalceatus in montes.
Domj Milesia
Sacra hec non aliter constant.
Gallus insistit
Leonis vestigia quaeris (ostentation with couardize)
fumos vendere
Epiphillides.
Calidum mendacium optimum
Solus Currens vincit.
Vulcaneum vinclum.
Salt to water (whence it came).
Canis seviens in lapidem
Aratro iaculari.
Semel rubidus decies pallidus.
Tanto buon che ual niente
So good, as he is good for nothing.
The crowe of the bellfry.
The vinegar of sweet wyne.
En vne nuit naist vn champignon.
He hath more to doe then the ovens in Christmas.
piu doppio ch' una zevola
Il cuopre vn altare & discuopre l' altro
He will hide himself in a mowne medowe
Il se crede segnar & se da de dettj ne gli occhi
He thinkes to blesse himself and thrustes his fingers into his eyes

Folio 102, back.

He is gone like a fay withowt his head
La sopra scritta e buona

La pazzia li fa andare |
La vergogna li fa restare |
Mangia santj & caga Diauolj.
Testa digiuna, barba pasciuta.
L'asne qui porte le vin et boit l'eau
lyke an ancher that is euer in the water and will
neuer learn to swyme
He doth like the ape that the higher he clymbes the
more he shews his ars.
Se no va el otero a Mahoma vaya Mahoma al otero.
Nadar y nadar y ahogar a la orilla
llorar duelos agenos
Si vos sabes mucho tambien se yo mi salm [o?]
Por hazer mi miel comieron mj muxcas
Come suol d'Invierno quien sale tarde y pone presto.
Lo que con el ojo veo con el dedo lo adeuino
Hijo no tenemos y nombre lo ponemos.
Por el buena mesa y mal testamento.
Era mejor lamiendo que no mordiendo
Perro del hortelano
Despues d'yo muerto ni vinna ni huerto
Perdj mj honor hablando mal y oyendo peor
Tomar asino que me lleue y no cauallo que me derruque.

Folio 103, front.

So many heades so many wittes
Happy man happy dole
In space cometh grace
Nothing is impossible to a willing hand
Of two ylles chuze the lest.

Better to bow then to breake
Of suffrance cometh ease
Two eyes are better then one.
Leaue is light
Better vnborn then vntaught.
All is well that endes well
Of a good begynyng comes a good ending
Thinges doone cannot be vndoone
Pride will haue a fall
Some what is better then nothing
Better be envyed then pytied
Every man after his fashon
He may doe much yll ere he doe much woorse
We be but where we were
Vse maketh mastery
Loue me lyttell love me long.
They that are bownd must obey
Foly it is to spurn against the pricke
Better sitt still then rise and fall.
Might overcomes right
No smoke w'th owt some fire
Tyme tryeth troth
Make not to sorowes of one

Folio 103, back.

Thear is no good accord
whear euery one would be a lord
Saieng and doing are two thinges
Better be happy then wise
Who can hold that will away

Allwaies let leasers haue their woordes
Warned and half armed
He that hath an yll name is half hanged
Frenzy Heresy and jalousy are three
That seeldome or neuer cured be
That the ey seeth not the hart rueth not
Better comyng to the ending of a feast then to the
begynyng of a fray
Yll putting a swoord in a mad mans hand
He goes farre that neuer turneth
Principium dimidium totius
Quot homines tot sententiae
Suum cujque pulchrum.
Que supra nos nihil ad nos
Ama tanquam osurus oderis tanquam amaturus.
Amicorum omnia communia
Vultu sepe leditur pietas
Fortes fortuna adjuuat.
Omne tulit punctum.
In magnis et uoluisse sat est
Difficilia quoee pulchra.
Turn tua res agitur paries cum proximus ardet
Et post malam segetem serendum est
Omnium rerum vicissitudo

Folio 103 back — continued.

In nil sapiendo vita jucundissima
Parturiunt montes nascetur ridiculus mus
Dulce bellum inexpertis
Naturam expellas furca licet vsque recurret.

Folio 104, front.

Quo semel est imbuta recens servabit odorem
Bis dat qui cito dat
Consciencia mille testes
In vino veritas
Bonae leges ex malis moribus
Nequicquam sapit qui sibj non sapit
Summum jus summa injuria
Sera in fundo parsimonia
Optimum non nasci
Musa mihi causas memora

Homme de paille vaut vne femme d'or.
Amour de femme, feu d'estoupe.
Fille brunette gaye et nette

Renard qui dort la mattinee, n'a pas la langue
emplumee.

Folio 131, front.

Tout est perdu qu'on donne au fol.
Bonnes paroles n'escorche pas la langue.
Pour durer il faut endurer
Qui veut prendre vn oiseau, qu'il ne l'effarouche.
Soleil qui luise au matin, femme qui parle latin,
enfant nourri du vin ne vient point a bonne fin.
Il peut hardiment heurter a la porte, qui bonnes
novelles apporte.
A bon entendeur ne faut que demy mot.
Qui fol envoye fol attend.
La faim chaisse le loup hors du bois.
Qui pen se prize, Dieu l'advise.
En pont, en planche, en riviere, valett devant,
maistre arriere.
L'oeil du maistre engraisse le chevall.
Qui mal entend, mal respond.
Mal pense qui ne repense.
Mal fait qui ne pairfait.
Si tous les fols portoient marrottes, on ne scauroit
pas de quell bois se chaufer
Mieux vaut en paix vn oeuf, qu'en guerre vn boeuf.
Couper l'herbe sous les pieds.
Toutes les heures ne sont pas meures.
Qui vit a compte, vit a honte.
Meschante parole jettee, va par toute alia volee.
Amour se nourrit de ieune chaire

Innocence porte avec soy sa deffence.
Il ne regard plus loin que le bout de son nez.
A paroles lourdes, aureilles sourdes.

Folio 131, front — continued

Ce n'est pas Evangile, qu'on dit parmi la ville.
Qui n'a patience n'a rien.
De mauvais payeur, foin ou paille
En fin les renards se troue chez le pelletier.
Qui prest a l'ami perd an double
Chantez a l'asne il vous fera de petz
Mieux vault glisser du pied, que de la langue.
Tout vient a point a chi peut attendre.
Il n'est pas si fol qu'il en porte l'habit.
Il est plus fol, qui a fol sens demand.
Nul n'a trop de sens, n'y d'argent.
En seurte dort qui n'a que perdre.
Le trou trop overt sous le nez fait porter soulier dechirez.
A laver la teste d'vn Asne, on ne perd que le temps et la lexive.
Chi choppe et ne tombe pas adiouste a ces pas.

Folio 131, back.

Amour, toux et fumee, en secrett ne sont demeuree.
Il a pour chaque trou vne cheville,
Il n'est vie que d'estre content.
Si tu veux cognoistre villain, baille luy la baggette en main.
Le boeuf sale, fait trover le vin sans chandelle.

Le sage va toujours la sonde a la main.
Qui se couche avec les chiens, se leve avec de puces.
A tous oiseaux leur nids sont beaux
Ovrage de commune, ovrage de nul.
Oy, voi, et te tais, si tu veux vivre en paix.
Rouge visage et grosse panche, ne sont signes de penitence.
A celuy qui a son paste an four, on peut donner de son tourteau.
Au serviteur le morceau d'honneur.
Pierre qui se remue n'accuille point de mousse
Necessite fait trotter la vieille.
Nourriture passe nature.
La mort n'espargne ny Roy ny Roc.
En mangeant l' appetit vient.
Table sans sel, bouche sans salive
Les maladyes vient a cheval, et s'en returne a pieds.
Tenez chauds le pied et la teste, an demeurant vivez en beste.
Faillir est vne chose humaine, se repentir divine, perseverer diabolique.
Fourmage est sain qui vient de ciche main.

Folio 131, back — continued.

Si tu veux engraisser promptement, mangez avec faim, bois a loisir et lentement.
A l'an soixante et douse, temps est qu'on se house.
Vin sur laict c'est souhait, lait sur vin c'est venin
Faim fait disner passetemps souper.
Le maux terminans en ique, font an medecine la

nique.
Au morceau restiffe esperon de vin.
Vn oeuf n'est rien, deux font grand bien, trois c'est assez, quattre c'est fort, cinque c'est la mort.
Apres les poire le vin ou le prestre
Qui a la sante est riche et ne le scait pas.
A la trogne on cognoist l'yvrogne.
Le fouriere de la lune a marque le logis.
Vne pillule fromentine, vne dragme sermentine, et la balbe[32] d'vne galline est vne bonne medecine.
Il faut plus tost prendre garde avec qui tu bois et mange, qu'a ce que tu bois et mange.
Qui tout mange le soir, le lendemain rogne son pain noir
Vin vieux, amy vieux, et or vieux sont amez en tous lieux.

*

Folio 132, front.

Qui veut vivre sain, disne pen et soupe moins.
Lever a six, manger a dix, souper a six, coucher a dix, font l'homme vivre dix fois dix.
De tous poissons fors que la tenche, prenez les dos, lessez le ventre.
Qui couche avec la soif, se leve avec la sante.
Amour de garze et saut de chien, ne dure si l'on ne dit tien.
Il en est plus assotte qu'vn fol de sa marotte.
Qui fol envoye fol attende.

Pennache de boeuf.
Vn Espagnol sans Jesuite est comme perdis sans orange.
C'est la maison de Robin de la vallee, ou il y a ny pott an feu, ny escuelle lavee.
Celuy gouverne bien mal le miel qui n'en taste.
Auiourdhuy facteur, demaine fracteur.
II est crotte en Archidiacre.
Apres trois jours on s'ennuy, de femme, d'hoste, et de pluye.
Il n'est pas eschappe qui son lien traine.
En la terre des aveugles, le borgne est Roy.
Il faut que la faim soit bien grande, quand les loups mange l'vn l'autre.
Il n'est[33] faut qu'vne mouche luy passe, par devant le nez, pour le facher.
La femme est bien malade, quand elle ne se peut tenir sur le dos.

Some choice Frensh Prover[bs.]

ENDNOTES.

[1] Digges really means “When Time dissolves thy Stratford Mask”.

[2] Through the whole play the fact that Puntarvolo represents Bacon is continually apparent to the instructed reader. Note especially Act II., Scene 3, where Puntarvolo addresses his wife, who appears at a window, in a parody of the address of Romeo to Juliet. Again in Act II., Scene 3, Carlo Buffone calls Puntarvolo "A yeoman pheuterer." Pheuter or feuter means a rest or supportfor a spear — which is informing.

[3] This fact so puzzling to Halliwell-Phillipps is fully explained when it is realised that William Shackspere of Stratford could neither read or write.

[4] The words attriuted to Apollo, are of course spoken by his Chancellor Bacon. See note on the number 33 on page 112.

[5] While I am perfectly satisfied that the above explanation of the meaning of the expression "All numbers" is the correct one; I am not unaware that at the date at which the Discoveries appeared "All numbers" would be generally understood in its classical sense; Jonson of course not being permitted to speak too plainly. He was foreman of Bacon's good pens and one of his "left-hands"; as any visitor to Westminster Abbey may learn, the attendants there being careful to point out that the sculptor has "accidentally" clothed Jonson's Bust in a left-handed coat. (With respect to the meaning of this the reader is referred to Plate 33, page 131.) Thus far was written and in print when the writer's attention was called to the Rev. George O Neill's little brochure, "Could Bacon have written the plays?" in which in a note to page 14 we find "Numeri" in Latin, "numbers" in English, applied to literature mean nothing else than verse, and even seem to exclude prose. Thus Tibullus writes, "*Numeris ille hic pede libero scribit*" (one writes in verse another in prose), and Shakespeare has the same antithesis in "Love's Labour Lost" (iv., 3), "These numbers I will tear and write in prose." Yet all this does not settle the matter, for "Numeri" is also used in the sense merely of "parts". Pliny speaks of a prose work as perfect in all its parts, "*Omnibus numeris absolutus*," and Cicero says of a plan of life, "*Omnes numeros virtutis continet*" (it contains every element of virtue). So that Jonson may have merely meant to say in slightly pedantic phrase that Bacon had passed away all parts fulfilled.

[6] Under what is now known as "Rask's law" the Roman F becomes B in the Teutonic languages: fero, bear; frater, brother; feru, brew; flo, blow, etc., etc., shewing that the Roman F was by no means really a mute.

[7] See Page 104.

[8] The number 33 too obviously represented Bacon, and therefore 53 which spells sow (S 18, O 14, W 21 = 53) was substituted for 33. Scores of examples can be found where on page 53 some reference is made to Bacon in books published under various names, especially in the Emblem Books. In many cases page 55 is *misprinted* as 53. In the Shakespeare Folio 1623 on the first page 53 we read "Hang Hog is latten for Bacon," and on the second page 53 we find "Gammon of Bacon." When the seven extra plays were added in thethird folio 1664 in each of the two new pages 53 appears "St. Albans." In the fifth edition, published by Kowe in 1709, on page 53 we read "deeper than did ever Plummet sound I'll drown my Book"; and on page 55 *misprinted* 53 (the only mispagination in the whole book of 3324 pages) we find "I do … require

My Dukedom of thee, which perforce I know Thou must restore." In Bacon's "Advancement of Learning," first English edition, 1640, on page 55 *misprinted* 53 in the margin in capital letters (the only name in capital letters in the whole book) we read "BACON." In Florio's "Second Frutes," 1591, on page 53, is "slice of bacon" and also "gammon of bakon," to shew that Bacon may be misspelled as it is in Drayton's "Polyolbion," 1622, where on page 53 we find *Becanus*. A whole book could be filled with similar instances.

[9] About A.D. 1300 benefit of clergy was extended to all males who could read. In 1487 it was enacted that mere laymen should have the benefit only once and should be branded on the thumb to shew they had once had it. *Whimsies*, 1623, p. 69, tells us: "If a prisoner, by help of a compassionate prompter, hack out his neck verse (Psalm li. *v*. i in Latin) and be admitted to his clergy, the jailors have a cold iron in store if his purse be hot, but if not, a hot iron that his fist may *Fiz*." Benefit of clergy was not totally abolished till 1827.

[10] In 1599 Sir John Hayward, LL.D., brought out "The Life and raigne of King Henrie IIII extending to the end of the first yeare of his raigne." This little book contains an account of the trial of Richard II., and was dedicated to the Earl of Essex in very encomiastic terms. It irritated Queen Elizabeth in the highest degree, and she clapped Hayward into prison and employed Sir Francis Bacon to search his book for treason. (Lowndes, Bohn, p. 1018). The story carefully read reveals the fact that it was really the play rather than the book which enraged Queen Elizabeth.

[11] The appearance of Shakespeare's name in the list of Actors in Ben Jonson's plays and in the plays known as Shakespeare's was, of course, part of the plot to place Shakespeare's name in a prominent position while the pseudonym had to be preserved.

[12] Facsimiles of law clerks' writing of the name "John Shakespeare," are given in Plate 40, Page 169. They are taken from Halliwell-Phillipps' "Outlines of the Life of Shakespeare," 1889, vol. 2, pp. 233 and 236. In the first two examples the name is written "Shakes," followed by an exactly similar scroll and dash to complete the name. In Saunders' "Ancient Handwriting," 1909, page 24, we are shown that such a "scroll and dash" represents "per" "par," and "por"; and in Wright's "Court Handwriting restored" we find that in the most perfectly formed script a "p" with a dash through the lower part similarly represented "per," "par," and "por," this is repeated in Thoyts' "How to decipher and study old documents," and the same information is given in numerous other works. There is therefore no possible excuse for Dr. Wallace's blundering.

[13] A facsimile example of the way in which the law clerk wrote "Shaxper" is shewn in the third line of Plate 40, Page 169, where it will be seen that the writer uses a similar "X".

[14] Holinshed's Chronicles (1557) state that "Montioy, king-at-arms, was sent to the King of England to defie him as the enemie of France, and to tell him that he should shortlie have battell." Moreover,

“Montioy” is not the personal name, but the official title of a Herald of France, just as “Norroy” is not a personal name, but the official title of one of the three chief Heralds of the College of Arms of England.

[15] He never was a manager.

[16] From the Introduction of “The Famous Historie of Troylus and Cresseid, by William Shakespeare,” 1609. This play as the above Introduction says was never acted.

[17] ‘well’ has been struck out.

[18] ‘Quin,’ this may be ‘quis.’

[19] This is difficult to read. It may be “faciunt et tedia funera.”

[20] This is difficult to read. It may be “fero danid es.”

[21] “Sedeant.” This word is doubtful. It may be “tedeant,” “te deum” is not an impossible reading.

[22] “Num” may by read as “Nunc.”

[23] “Validat” may be read “Validas”.

[24] “Swear,” this may be read “Sweat.”

[25] The side note “Direction generall” has been struck out in the MS.

[26] s. P. s. J. may be read s R s. f.

[27] “ante,” this may be read “aute” = “autem.” 2 “ipsa” this may be read “ipsu”— “ipsum”.

[28] “Timores” may be read “timoris”.

[29] “Institit” = insistit.

[30] “To frime (to Sp.” this line may read, “To trime) to Suse Sp.”

[31] [This is an endorsement across the page.]

[32] “balbe” may be read “balle.”

[33] For “Il n’est faut” may be read “Il n’en faut.”

PREFACE

It is with some hesitation that I give my husband's last book to the world. It was in type when he died, but he had no time to correct even the first proofs, and doubtless he would have made many changes, if not in his views at least in his expression of them. Mr. Bartram has verified the quotations and dates with infinite care, and for this he has my warmest thanks. For the rest I can but ask those who differ from the author to remember the circumstances in which the work has been published.

L. B. L.

INTRODUCTION

The theory that Francis Bacon was, in the main, the author of "Shakespeare's plays," has now been for fifty years before the learned world. Its advocates have met with less support than they had reason to expect. Their methods, their logic, and their hypotheses closely resemble those applied by many British and foreign scholars to Homer; and by critics of the very Highest School to Holy Writ. Yet the Baconian theory is universally rejected in England by the professors and historians of English literature; and generally by students who have no profession save that of Letters. The Baconians, however, do not lack the countenance and assistance of highly distinguished persons, whose names are famous where those of mere men of letters are unknown; and in circles where the title of "Professor" is not duly respected.

The partisans of Bacon aver (or one of them avers) that "Lord Penzance, Lord Beaconsfield, Lord Palmerston, Judge Webb, Judge Holmes (of Kentucky, U.S.), Prince Bismarck, John Bright, and innumerable most *thoughtful scholars eminent in many walks of life*, *and especially in the legal profession* . . . " have been Baconians, or, at least, opposed to Will Shakspere's authorship. To these names of scholars I must add that of my late friend, Samuel Clemens, D.Litt. of Oxford; better known to many as Mark Twain. Dr. Clemens was, indeed, no mean literary critic; witness his epoch-making study of Prof. Dowden's *Life of Shelley*, while his researches into the biography of Jeanne d'Arc were most conscientious.

With the deepest respect for the political wisdom and literary taste of Lord Palmerston, Prince Bismarck, Lord Beaconsfield, and the late Mr. John Bright; and with every desire to humble myself before the judicial verdicts of Judges Holmes, Webb, and Lord Penzance; with sincere admiration of my late friend, Dr. Clemens, I cannot regard them as, in the first place and professionally, trained students of literary history.

They were no more specially trained students of Elizabethan literature than myself; they were amateurs in this province, as I am an amateur, who differ from all of them in opinion. Difference of opinion concerning points of literary history ought not to make "our angry passions rise." Yet this controversy has been extremely bitter.

I abstain from quoting the "sweetmeats," in Captain MacTurk's phrase, which have been exchanged by the combatants. Charges of ignorance and monomania have been answered by charges of forgery, lying, "scandalous literary dishonesty," and even inaccuracy. Now no mortal is infallibly accurate, but we are all sane and "indifferent honest." There have been forgeries in matters Shakespearean, alas, but not in connection with the Baconian controversy.

It is an argument of the Baconians, and generally of the impugners of good Will's authorship of the plays vulgarly attributed to him, that the advocates of William Shakspere, Gent, as author of the plays, differ like the Kilkenny cats among themselves on many points. All do not believe, with Mr. J. C. Collins, that Will knew Sophocles, Euripides, and Æschylus (but not Aristophanes) as well as Mr. Swinburne did, or knew them at all — for that matter. Mr. Pollard differs very widely from Sir Sidney Lee on points concerning the First Folio and the Quartos: my sympathies are with Mr. Pollard. Few, if any, partisans of Will agree with Mrs. Stopes (herself no Baconian) about the history of the Stratford monument of the poet. About Will's authorship of *Titus Andronicus*, and *Henry VI*, Part I, the friends of Will, like the friends of Bacon, are at odds among themselves. These and other divergencies of opinion cause the Baconians to laugh, as if *they* were a harmonious circle . . . ! For the Baconian camp is not less divided against itself than the camp of the "Stratfordians." Not all Baconians hold that Bacon was the legitimate son of "that Imperial otaress" Queen Elizabeth. Not all believe in the Cryptogram of Mr. Ignatius Donnelly, or in any other cryptograms. Not all maintain that Bacon, in the Sonnets, was inspired by a passion for the Earl of Essex, for Queen Elizabeth, or for an early miniature of himself. Not all regard him as the author of the plays of Kit Marlowe. Not all suppose him to be a Rosicrucian, who possibly died at the age

of a hundred and six, or, perhaps, may be "still running." Not all aver that he wrote thirteen plays before 1593. But one party holds that, in the main, Will was the author of the plays, while the other party votes for Bacon — or for Bungay, a Great Unknown. I use Bungay as an endearing term for the mysterious being who was the Author if Francis Bacon was not. Friar Bungay was the rival of Friar Bacon, as the Unknown (if he was not Francis Bacon) is the rival of "the inventor of Inductive reasoning."

I could never have expected that I should take a part in this controversy; but acquaintance with *The Shakespeare Problem Restated* (503 pp.), (1908), and later works of Mr. G. G. Greenwood, M.P., has tempted me to enter the lists.

Mr. Greenwood is worth fighting; he is cunning of fence, is learned (and I cannot conceal my opinion that Mr. Donnelly and Judge Holmes were rather ignorant). He is not over "the threshold of Eld" (as were Judge Webb and Lord Penzance when they took up Shakespearean criticism). His knowledge of Elizabethan literature is vastly superior to mine, for I speak merely, in Matthew Arnold's words, as "a belletristic trifler."

Moreover, Mr. Greenwood, as a practising barrister, is a judge of legal evidence; and, being a man of sense, does not "hold a brief for Bacon" as the author of the Shakespearean plays and poems, and does not value Baconian cryptograms. In the following chapters I make endeavours, conscientious if fallible, to state the theory of Mr. Greenwood. It is a negative theory. He denies that Will Shakspere (or Shaxbere, or Shagspur, and so on) was the author of the plays and poems. Some other party was, *in the main*, with other hands, the author. Mr. Greenwood cannot, or does not, offer a guess as to who this ingenious Somebody was. He does not affirm, and he does not deny, that Bacon had a share, greater or less, in the undertaking.

In my brief tractate I have not room to consider every argument; to traverse every field. In philology I am all unlearned, and cannot pretend to discuss the language of Shakespeare, any more than I can analyse the language of Homer into proto-Arcadian and Cyprian, and so on. Again, I cannot pretend to have an opinion, based on internal evidence, about the genuine Shakespearean character

of such plays as *Titus Andronicus*, *Henry VI*, Part I, and *Troilus and Cressida*. About them different views are held *within* both camps.

I am no lawyer or naturalist (as Partridge said, *Non omnia possumus omnes*), and cannot imagine why our Author is so accurate in his frequent use of terms of law — if he be Will; and so totally at sea in natural history — if he be Francis, who "took all knowledge for his province."

How can a layman pretend to deal with Shakespeare's legal attainments, after he has read the work of the learned Recorder of Bristol, Mr. Castle, K.C.? To his legal mind it seems that in some of Will's plays he had the aid of an expert in law, and then his technicalities were correct. In other plays he had no such tutor, and then he was sadly to seek in his legal jargon. I understand Mr. Greenwood to disagree on this point. Mr. Castle says, "I think Shakespeare would have had no difficulty in getting aid from several sources. There is therefore no *prima facie* reason why we should suppose the information was supplied by Bacon."

Of course there is not!

"In fact, there are some reasons why one should attribute the legal assistance, say, to Coke, rather than to Bacon."

The truth is, that Bacon seems not to have been lawyer enough for Will's purposes. "We have no reason to believe that Bacon was particularly well read in the technicalities of our law; he never seems to have seriously followed his profession."

Now we have Mr. Greenwood's testimonial in favour of Mr. Castle, "Who really does know something about law." Mr. Castle thinks that Bacon really did not know enough about law, and suggests Sir Edward Coke, of all human beings, as conceivably Will's "coach" on legal technicalities. Perhaps Will consulted the Archbishop of Canterbury on theological niceties?

Que sçais je? In some plays, says Mr. Castle, Will's law is all right, in other plays it is all wrong. As to Will's law, when Mr. Greenwood and Mr. Castle differ, a layman dare not intervene.

Concerning legend and tradition about our Will, it seems that, in each case, we should do our best to trace the *Quellen*, to discover the original sources, and

the steps by which the tale arrived at its late recorders in print; and then each man's view as to the veracity of the story will rest on his sense of probability; and on his bias, his wish to believe or to disbelieve.

There exists, I believe, only one personal anecdote of Will, the actor, and on it the Baconians base an argument against the contemporary recognition of him as a dramatic author. I take the criticism of Mr. Greenwood (who is not a Baconian). One John Manningham, Barrister-at-Law, "a well-educated and cultured man," notes in his Diary (February 2, 1601) that "at our feast we had a play called Twelve Night or What you Will, much like the Comedy of Errors, or Menæchmi n Plautus, but most like and near to that in Italian called *Inganni*." He confides to his Diary the tricks played on Malvolio as "a good practice." That is all.

About the authorship he says nothing: perhaps he neither knew nor cared who the author was. In our day the majority of people who tell me about a play which they have seen, cannot tell me the name of the author. Yet it is usually printed on the playbill, though in modest type. The public does not care a straw about the author's name, unless he be deservedly famous for writing letters to the newspapers on things in general; for his genius as an orator; his enthusiasm as a moralist, or in any other extraneous way. Dr. Forman in his queer account of the plot of "Mack Beth" does not allude to the name of the author (April 20, 1610). *Twelfth Night* was not published till 1623, in the Folio: there was no quarto to enlighten Manningham about the author's name. We do not hear of printed playbills, with author's names inserted, at that period. It seems probable that occasional playgoers knew and cared no more about authors than they do at present. The world of the wits, the critics (such as Francis Meres), poets, playwrights, and players, did know and care about the authors; apparently Manningham did not. But he heard a piquant anecdote of two players and (March 13, 1601) inserted it in his Diary.

Shakespeare once anticipated Richard Burbage at an amorous tryst with a citizen's wife. Burbage had, by the way, been playing the part of Richard III. While Will was engaged in illicit dalliance, the message was brought (what a

moment for bringing messages!) that Richard III was at the door, and Will "caused return to be made that William the Conqueror was before Richard III. *Shakespeare's name William*." (My italics.) Mr. Greenwood argues that if "Shakspere the player was known to the world as the author of the plays of Shakespeare, it does seem extremely remarkable" that Manningham should have thought it needful to add "Shakespeare's name William."

But *was* "Shakspere," or any man, "known to the world as the author of the plays of Shakespeare"? No! for Mr. Greenwood writes, "nobody, outside a very small circle, troubled his head as to who the dramatist or dramatists might be." To that "very small circle" we have no reason to suppose that Manningham belonged, despite his remarkable opinion that *Twelfth Night* resembles the *Menæchmi*. Consequently, it is *not* "extremely remarkable" that Manningham wrote "Shakespeare's name William," to explain to posterity the joke about "William the Conqueror," instead of saying, "the brilliant author of the Twelfth Night play which so much amused me at our feast a few weeks ago." "Remarkable" out of all hooping it would have been had Manningham written in the style of Mr. Greenwood. But Manningham apparently did not "trouble his head as to who the dramatist or dramatists might be." "Nobody, outside a very small circle," *did* trouble his poor head about that point. Yet Mr. Greenwood thinks "it does seem extremely remarkable" that Manningham did not mention the author.

Later, on the publication of the Folio (1623), the world seems to have taken more interest in literary matters. Mr. Greenwood says that then while "the multitude" would take Ben Jonson's noble panegyric on Shakespeare as a poet "*au pied de la lettre*," "the enlightened few would recognise that it had an esoteric meaning." Then, it seems, "the world" — the "multitude" — regarded the actor as the author. Only "the enlightened few" were aware that when Ben *said* "Shakespeare," and "Swan of Avon," he *meant* — somebody else.

Quite different inferences are drawn from the same facts by persons of different mental conditions. For example, in 1635 or 1636, Cuthbert Burbage, brother of Richard, the famous actor, Will's comrade, petitioned Lord Pembroke,

then Lord Chamberlain, for consideration in a quarrel about certain theatres. Telling the history of the houses, he mentions that the Burbages "to ourselves joined those deserving men, Shakspere, Heminge, Condell, Phillips and others." Cuthbert is arguing his case solely from the point of the original owners or lease-holders of the houses, and of the well-known actors to whom they joined themselves. Judge Webb and Mr. Greenwood think that "it does indeed seem strange . . . that the proprietor[s] of the playhouses which had been made famous by the production of the Shakespearean plays, should, in 1635 — twelve years after the publication of the great Folio — describe their reputed author to the survivor of the Incomparable Pair, as merely a 'man-player' and 'a deserving man.'" Why did he not remind the Lord Chamberlain that this "deserving man" was the author of all these famous dramas? Was it because he was aware that the Earl of Pembroke "knew better than that"?

These arguments are regarded by some Baconians as proof positive of their case.

Cuthbert Burbage, in 1635 or 1636, did not remind the Earl of what the Earl knew very well, that the Folio had been dedicated, in 1623, to him and his brother, by Will's friends, Heminge and Condell, as they had been patrons of the late William Shakspere and admirers of his plays. The terms of this dedication are to be cited in the text, later. *We* all *now* would have reminded the Earl of what he very well knew. Cuthbert did not.

The intelligence of Cuthbert Burbage may be gauged by anyone who will read p–484 in *William Shakespeare*, *His Family and Friends*, by the late Mr. Charles Elton, Q.C., of White Staunton. Cuthbert was a puzzle-pated old boy. The silence as to Will's authorship on the part of this muddle-headed old Cuthbert, in 1635–36, cannot outweigh the explicit and positive public testimony to his authorship, signed by his friends and fellow-actors in 1623.

Men believe what they may; but I prefer positive evidence for the affirmative to negative evidence from silence, the silence of Cuthbert Burbage.

One may read through Mr. Greenwood's three books and note the engaging varieties of his views; they vary as suits his argument; but he is unaware of it, or

can justify his varyings. Thus, in 1610, one John Davies wrote rhymes in which he speaks of "our English Terence, Mr. Will Shakespeare"; "good Will." In his period patriotic English critics called a comic dramatist "the English Terence," or "the English Plautus," precisely as American critics used to call Mr. Bryant "the American Wordsworth," or Cooper "the American Scott"; and as Scots called the Rev. Mr. Thomson "the Scottish Turner." Somewhere, I believe, exists "the Belgian Shakespeare."

Following this practice, Davies had to call Will either "our English Terence," or "our English Plautus." Aristophanes would not have been generally recognised; and Will was no more like one of these ancient authors than another. Thus Davies was apt to choose either Plautus or Terence; it was even betting which he selected. But he chanced to choose Terence; and this is "curious," and suggests suspicions to Mr. Greenwood — and the Baconians. They are so very full of suspicions!

It does not suit the Baconians, or Mr. Greenwood, to find contemporary recognition of Will as an author. Consequently, Mr. Greenwood finds Davies's "curious, and at first sight, inappropriate comparison of 'Shakespeare' to Terence worthy of remark, for Terence is the very author whose name is alleged to have been used as a mask-name, or *nom de plume*, for the writings of great men who wished to keep the fact of their authorship concealed."

Now Davies felt bound to bring in *some* Roman parallel to Shakespeare; and had only the choice of Terence or Plautus. Meres (1598) used Plautus; Davies used Terence. Mr. Greenwood shows us that Plautus would not do. "Could *he*" (Shakespeare) "write only of courtesans and *cocottes*, and not of ladies highly born, cultured, and refined? . . ."

"The supposed parallel" (Plautus and Shakespeare) "breaks down at every point." Thus, on Mr. Greenwood's showing, Plautus could not serve Davies, or should not serve him, in his search for a Roman parallel to "good Will." But Mr. Greenwood also writes, "if he" (Shakespeare) "was to be likened to a Latin comedian, surely Plautus is the writer with whom he should have been compared." Yet Plautus was the very man who cannot be used as a parallel to

Shakespeare. Of course no Roman nor any other comic dramatist closely resembles the *author* of *As You Like It*. They who selected either Plautus or Terence meant no more than that both were celebrated comic dramatists. Plautus was no parallel to Will. Yet "surely Plautus is the author to whom he should have been compared" by Davies, says Mr. Greenwood. If Davies tried Plautus, the comparison was bad; if Terence, it was "curious," as Terence was absurdly accused of being the "*nom de plume*" of some great "concealed poets" of Rome. "From all the known facts about Terence," says a Baconian critic (who has consulted Smith's *Biographical Dictionary*), "it is an almost unavoidable inference that John Davies made the comparison to Shakspere because he knew of the point common to both cases." The common point is taken to be, not that both men were famous comic dramatists, but that Roman literary gossips said, and that Baconians and Mr. Greenwood say, that "Terence" was said to be a "mask-name," and that "Shakespeare" s a mask-name. Of the second opinion there is not a hint in literature of the time of good Will.

What surprises one most in this controversy is that men eminent in the legal profession should be "anti-Shakesperean," if not overtly Baconian. For the evidence for the contemporary faith in Will's authorship is all positive; from his own age comes not a whisper of doubt, not even a murmur of surprise. It is incredible to me that his fellow-actors and fellow-playwrights should have been deceived, especially when they were such men as Ben Jonson and Tom Heywood. One would expect lawyers, of all people, to have been most impatient of the surprising attempts made to explain away Ben Jonson's testimony, by aid, first, of quite a false analogy (Scott's denial of his own authorship of his novels), and, secondly, by the suppression of such a familiar fact as the constant inconsistency of Ben's judgments of his contemporaries in literature. Mr. Greenwood must have forgotten the many examples of this inconsistency; but I have met a Baconian author who knew nothing of the fact. Mr. Greenwood, it is proper to say, does not seem to be satisfied that he has solved what he calls "the Jonsonian riddle." Really, there is no riddle. About Will, as about other authors, his contemporaries and even his friends, on

occasion, Ben "spoke with two voices," now in terms of hyperbolical praise, now in carping tones of censure. That is the obvious solution of "the Jonsonian riddle."

I must apologise if I have in places spelled the name of the Swan of Avon "Shakespeare" where Mr. Greenwood would write "Shakspere," and *vice versa*. He uses "Shakespeare" where he means the Author; "Shakspere" where he means Will; and is vexed with some people who write the name of Will as "Shakespeare." As Will, in the opinion of a considerable portion of the human race, and of myself, *was* the Author, one is apt to write his name as "Shakespeare" in the usual way. But difficult cases occur, as in quotations, and in conditional sentences. By any spelling of the name I always mean the undivided personality of "Him who sleeps by Avon."

I. THE BACONIAN AND ANTI-WILLIAN POSITIONS

Till the years 1856–7 no voice was raised against the current belief about Shakespeare (1564–1616). He was the author in the main of the plays usually printed as his. In some cases other authors, one or more, may have had fingers in his dramas; in other cases, Shakespeare may have "written over" and transfigured earlier plays, of himself and of others; he may have contributed, more or less, to several plays mainly by other men. Separately printed dramas published during his time carry his name on their title-pages, but are not included in the first collected edition of his dramas, "The First Folio," put forth by two of his friends and fellow-actors, in 1623, seven years after his death.

On all these matters did commentators, critics, and antiquarians for long dispute; but none denied that the actor, Will Shakspere (spelled as heaven pleased), was in the main the author of most of the plays of 1623, and the sole author of *Venus and Adonis*, *Lucrece*, and the Sonnets.

Even now, in England at least, it would be perhaps impossible to find one special and professed student of Elizabethan literature, and of the classical and European literatures, who does not hold by the ancient belief, the belief of Shakespeare's contemporaries and intimates, the belief that he was, in the sense explained above, the author of the plays.

But ours is not a generation to be overawed by "Authority" (as it is called). A small but eager company of scholars have convinced themselves that Francis Bacon wrote the Shakespearean plays. That is the point of agreement among these enthusiasts: points of difference are numerous: some very wild little sects exist. Meanwhile multitudes of earnest and intelligent men and women, having read notices in newspapers of the Baconian books, or heard of them at lectures and tea-parties, disbelieve in the authorship of "the Stratford rustic," and look down on the faithful of Will Shakespere with extreme contempt.

From the Baconians we receive a plain straightforward theory, "Bacon wrote Shakespeare," as one of their own prophets has said. Since we have plenty of evidence for Bacon's life and occupations during the period of Shakespearean poetic activity, we can compare what he was doing as a man, a student, a Crown lawyer, a pleader in the Courts, a political pamphleteer, essayist, courtier, active member of Parliament, and so on, with what he is said to have been doing — by the Baconians; namely, writing two dramas yearly.

But there is another "Anti-Willian" theory, which would dethrone Will Shakspere, and put but a Shadow in his place. Conceive a "concealed poet," of high social position, contemporary with Bacon and Shakespeare. Let him be so fond of the Law that he cannot keep legal "shop" out of his love Sonnets even. Make him a courtier; a statesman; a philosopher; a scholar who does not blench even from the difficult Latin of Ovid and Plautus. Let this almost omniscient being possess supreme poetic genius, extensive classical attainments, and a tendency to make false quantities. Then conceive him to live through the reigns of "Eliza and our James," without leaving in history, in science, in society, in law, in politics or scholarship, a single trace of his existence. He left nothing but the poems and plays usually attributed to Will. As to the date of his decease, we only know that it must necessarily have been later than the composition of the last genuine Shakespearean play — for this paragon wrote it.

Such is the Being who occupies, in the theory of the non-Baconian, *but not Anti-Baconian*, Anti-Willians, the intellectual throne filled, in the Will Shakespeare theory, by Will; and in the Baconian, by Bacon — two kings of Brentford on one throne.

We are to be much engaged by the form of this theory which is held by Mr. G. G. Greenwood in his *The Shakespeare Problem Restated*. In attempting to explain what he means I feel that I am skating on very thin ice. Already, in two volumes (*In Re Shakespeare*, 1909, and *The Vindicators of Shakespeare*), Mr. Greenwood has accused his critics of frequently misconceiving and misrepresenting his ideas: wherefore I also tremble. I am perfectly confident in saying that he "holds no brief for the Baconians." He is *not* a Baconian. His

position is negative merely: Will of Stratford is *not* the author of the Shakespearean plays and poems. Then who is? Mr. Greenwood believes that work by an unknown number of hands exists in the plays first published all together in 1623. Here few will differ from him. But, setting aside this aspect of the case, Mr. Greenwood appears to me to believe in an entity named "Shakespeare," or "the Author," who is the predominating partner; though Mr. Greenwood does not credit him with all the plays in the Folio of 1623 (nor, perhaps, with the absolute entirety of any given play). "The Author" or "Shakespeare" is not a syndicate (like the Homer of many critics), but an individual human being, apparently of the male sex. As to the name by which he was called on earth, Mr. Greenwood is "agnostic." He himself is not Anti-Baconian. He does not oust Bacon and put the Unknown in his place. He neither affirms nor denies that Bacon may have contributed, more or less, to the bulk of Shakespearean work. To put it briefly: Mr. Greenwood backs the field against the favourite (our Will), and Bacon *may* be in the field. If he has any part in the whole I suspect that it is "the lion's part," but Mr. Greenwood does not commit himself to anything positive. We shall find (if I am not mistaken) that Mr. Greenwood regards the hypothesis of the Baconians as "an extremely reasonable one," and that for his purposes it would be an extremely serviceable one, if not even essential. For as Bacon was a genius to whose potentialities one can set no limit, he is something to stand by, whereas we cannot easily believe — I cannot believe — that the actual "Author," the "Shakespeare" lived and died and left no trace of his existence except his share in the works called Shakespearean.

However, the idea of the Great Unknown has, for its partisans, this advantage, that as the life of the august Shade is wholly unknown, we cannot, as in Bacon's case, show how he was occupied while the plays were being composed. He *must*, however, have been much at Court, we learn, and deep in the mysteries of legal terminology. Was he Sir Edward Coke? Was he James VI and I?

It is hard, indeed, to set forth the views of the Baconians and of the "Anti-Willians" in a shape which will satisfy them. The task, especially when

undertaken by an unsympathetic person, is perhaps impossible. I can only summarise their views in my own words as far as I presume to understand them. I conceive the Baconians to cry that "the world possesses a mass of transcendent literature, attributed to a man named William *Shakespeare*." Of a man named William *Shakspere* (there are many varieties of spelling) we certainly know that he was born (1564) and bred in Stratford-on-Avon, a peculiarly dirty, stagnant, and ignorant country town. There is absolutely no evidence that he (or any Stratford boy of his standing) ever went to Stratford school. His father, his mother, and his daughter could not write, but, in signing, made their marks; and if he could write, which some of us deny, he wrote a terribly bad hand. As far as late traditions of seventy or eighty years after his death inform us, he was a butcher's apprentice; and also a schoolmaster "who knew Latin pretty well"; and a poacher. He made, before he was nineteen, a marriage tainted with what Meg Dods calls "ante-nup." He early had three children, whom he deserted, as he deserted his wife. He came to London, we do not know when (about 1582, according to the "guess" of an antiquary of 1680); held horses at the door of a theatre (so tradition says), was promoted to the rank of "servitor" (whatever that may mean), became an actor (a vagabond under the Act), and by 1594 played before Queen Elizabeth. He put money in his pocket (heaven knows how), for by 1597 he was bargaining for the best house in his native *bourgade*. He obtained, by nefarious genealogical falsehoods (too common, alas, in heraldry), the right to bear arms; and went on acting. In 1610–11 (?) he retired to his native place. He never took any interest in his unprinted manuscript plays; though rapacious, he never troubled himself about his valuable copyrights; never dreamed of making a collected edition of his works. He died in 1616, probably of drink taken. Legal documents prove him to have been a lender of small sums, an avid creditor, a would-be encloser of commons. In his will he does not bequeath or mention any books, manuscripts, copyrights, and so forth. It is utterly incredible, then, that this man wrote the poems and plays, so rich in poetry, thought, scholarship, and knowledge, which are attributed to "William Shakespeare." These must be the works of "a concealed poet," a philosopher, a

courtier moving in the highest circles, a supreme legist, and, necessarily, a great poet, and student of the classics.

No known person of the age but one, Bacon, was a genius, a legist, a scholar, a great poet, and brilliant courtier, with all the other qualifications so the author of the plays either was Francis Bacon — or some person unknown, who was in all respects equally distinguished, but kept his light under a bushel. Consequently the name "William Shakespeare" is a pseudonym or "pen-name" wisely adopted by Bacon (or the other man) as early as 1593, at a time when William Shakspere was notoriously an actor in the company which produced the plays of the genius styling himself "William Shakespeare."

Let me repeat that, to the best of my powers of understanding and of expression, and in my own words, so as to misquote nobody, I have now summarised the views of the Baconians *sans phrase*, and of the more cautious or more credulous "Anti-Willians," as I may style the party who deny to Will the actor any share in the authorship of the plays, but do not overtly assign it to Francis Bacon.

Beyond all comparison the best work on the Anti-Willian side of the controversy is *The Shakespeare Problem Restated*, by Mr. G. G. Greenwood (see my Introduction). To this volume I turn for the exposition of the theory that "Will Shakspere" (with many other spellings) is an actor from the country — a man of very scanty education, in all probability, and wholly destitute of books; while "William Shakespeare," or with the hyphen, "Shakespeare," is a "*nom de plume*" adopted by the Great Unknown "concealed poet."

When I use the word "author" here, I understand Mr. Greenwood to mean that in the plays called "Shakespearean" there exists work from many pens: owing to the curious literary manners, methods, and ethics of dramatic writing in, say, 1589–1611. In my own poor opinion this is certainly true of several plays in the first collected edition, "The Folio," produced seven years after Will's death, namely in 1623. These curious "collective" methods of play-writing are to be considered later.

Matters become much more perplexing when we examine the theory that "William Shakespeare" (with or without the hyphen), on the title-pages of plays, or when signed to the dedications of poems, is the chosen pen-name, or "*nom de plume*," of Bacon or of the Unknown.

Here I must endeavour to summarise what Mr. Greenwood has written on the name of the actor, and the "*nom de plume*" of the unknown author who, by the theory, was not the actor. Let me first confess my firm belief that there is no cause for all the copious writing about the spellings "Shakespeare" or "Shakespeare" — as indicating the true but "concealed poet" — and "Shakspere" (&c.), as indicating the Warwickshire rustic. At Stratford and in Warwickshire the clan-name was spelled in scores of ways, was spelled in different ways within a single document. If the actor himself uniformly wrote "Shakspere" (it seems that we have but five signatures), he was accustomed to seeing the name spelled variously in documents concerning him and his affairs. In London the printers aimed at a kind of uniformity, "Shakespeare" or "Shakespeare": and even if he wrote his own name otherwise, to him it was indifferent. Lawyers and printers might choose their own mode of spelling — and there is no more in the matter.

I must now summarise briefly, in my own words, save where quotations are indicated in the usual way, the results of Mr. Greenwood's researches. "The family of William Shakspere of Stratford" (perhaps it were safer to say "the members of his name") "wrote their name in many different ways — some sixty, I believe, have been noted . . . but the form 'Shakespeare' seems never to have been employed by them"; and, according to Mr. Spedding, "Shakspere of Stratford never so wrote his name 'in any known case.'" (According to many Baconians he never wrote his name in his life.) On the other hand, the dedications of *Venus and Adonis* (1593) and of *Lucrece* (1594) are inscribed "William Shakespeare" (without the hyphen). In 1598, the title-page of *Love's Labour's Lost* "bore the name W. Shakespere," while in the same year *Richard II* and *Richard III* bear "William Shakespeare," with the hyphen (not without it, as in the two dedications by the Author). "The name which appears in the body

of the conveyance and of the mortgage bearing" (the actor's) "signature is 'Shakespeare,' while 'Shackspeare' appears in the will, prepared, as we must presume, by or under the directions of Francis Collyns, the Stratford solicitor, who was one of the witnesses thereto" (and received a legacy of £13, 6*s.* 8*d.*).

A

PLEASANT

Conceited Comedie

CALLED,

Loues labors loſt.

As it vvas preſented before her Highnes this laſt Chriſtmas.

Newly corrected and augmented *By W. Shakeſpere.*

Imprinted at London by *W.W.* for *Cutbert Burby.*

1598.

Thus, at Stratford even, the name was spelled, in legal papers, as it is spelled in the two dedications, and in most of the title-pages — and also is spelled otherwise, as "Shackspeare." In March 1594 the actor's name is spelled "Shakespeare" in Treasury accounts. The legal and the literary and Treasury spellings (and conveyances and mortgages and wills are *not* literature) are Shakespeare, Shackspeare, Shakespeare, Shakespere — all four are used, but we must regard the actor as never signing "Shakespeare" in any of these varieties of

spelling — if sign he ever did; at all events he is not known to have used the *a* in the last syllable.

I now give the essence of Mr. Greenwood's words concerning the *nom de plume* of the "concealed poet," whoever he was.

"And now a word upon the name 'Shakespeare.' That in this form, and more especially with a hyphen, Shakespeare, the word makes an excellent *nom de plume* is obvious. As old Thomas Fuller remarks, the name suggests *Martial* in its warlike sound, 'Hasti-vibrans or Shakespeare.' It is of course further suggestive of Pallas Minerva, the goddess of Wisdom, for Pallas also was a spear-shaker (Pallas ἀπὸ του πάλλειν τὸ δόρυ); and all will remember Ben Jonson's verses . . . " on Shakespeare's "true-filed lines" — "In each of which he seems to shake a lance,
As brandished at the eyes of ignorance."

There is more about Pallas in book-titles (to which additions can easily be made), and about "Jonson's Cri-spinus or Cri-spinas," but perhaps we have now the gist of Mr. Greenwood's remarks on the "excellent *nom de plume*" (*cf.* p–37. On the whole of this, *cf. The Shakespeare Problem Restated*, p–295; a *nom de plume* called a "pseudonym," p, 312; Shakespeare "a mask name," ; a "pseudonym," ; "*nom de plume*,").

Now why was the "*nom de plume*" or "pseudonym" "William Shakespeare" "an excellent *nom de plume*" for a concealed author, courtier, lawyer, scholar, and so forth? If "Shakespeare" suggested Pallas Athene, goddess of wisdom and of many other things, and so was appropriate, why add "William"?

In 1593, when the "pseudonym" first appears in *Venus and Adonis*, a country actor whose name, in legal documents — presumably drawn up by or for his friend, Francis Collyns at Stratford — is written "William Shakespeare," was before the town as an actor in the leading company, that of the Lord Chamberlain. This company produced the plays some of which, by 1598, bear "W. Shakespere," or "William Shakespeare" on their title-pages. Thus, even if the actor habitually spelled his name "Shakspere," "William Shakespeare" was, practically (on the Baconian theory), not only a pseudonym of one man, a poet,

but also the real name of another man, a well-known actor, who was *not* the "concealed poet."

"William Shakespeare" or "Shakespere" was thus, in my view, the ideally worst pseudonym which a poet who wished to be "concealed" could possibly have had the fatuity to select. His plays and poems would be, as they were, universally attributed to the actor, who is represented as a person conspicuously incapable of writing them. With Mr. Greenwood's arguments against the certainty of this attribution I deal later.

Had the actor been a man of rare wit, and of good education and wide reading, the choice of name might have been judicious. A "concealed poet" of high social standing, with a strange fancy for rewriting the plays of contemporary playwrights, might obtain the manuscript copies from their owners, the Lord Chamberlain's Company, through that knowledgeable, witty, and venal member of the company, Will Shakspere. He might then rewrite and improve them, more or less, as it was his whim to do. The actor might make fair copies in his own hand, give them to his company, and say that the improved works were from his own pen and genius. The lie might pass, but only if the actor, in his life and witty talk, seemed very capable of doing what he pretended to have done. But if the actor, according to some Baconians, could not write even his own name, he was impossible as a mask for the poet. He was also impossible, I think, if he were what Mr. Greenwood describes him to be.

Mr. Greenwood, in his view of the actor as he was when he came to London, does not deny to him the gift of being able to sign his name. But, if he were educated at Stratford Free School (of which there is no documentary record), according to Mr. Halliwell-Phillipps "he was removed from school long before the usual age," "in all probability" when "he was about thirteen" (an age at which some boys, later well known, went up to their universities). If we send him to school at seven or so, "it appears that he could only have enjoyed such advantages as it may be supposed to have provided for a period of five or six years at the outside. He was then withdrawn, and, as it seems, put to calf-slaughtering."

What the advantages may have been we try to estimate later.

Mr. Greenwood, with Mr. Halliwell-Phillipps, thinks that Will "could have learned but little there. No doubt boys at Elizabethan grammar schools, if they remained long enough, had a good deal of Latin driven into them. Latin, indeed, was the one subject that was taught; and an industrious boy who had gone through the course and attained to the higher classes would generally be able to write fair Latin prose. But he would learn very little else" (except to write fair Latin prose?). "What we now call 'culture' certainly did not enter into the 'curriculum,' nor 'English,' nor modern languages, nor 'literature.'" Mr. Halliwell-Phillipps says that "removed prematurely from school, residing with illiterate relatives in a bookless neighbourhood, thrown into the midst of occupations adverse to scholastic progress — it is difficult to believe that when he first left Stratford he was not all but destitute of polished accomplishments." Mr. Greenwood adds the apprenticeship to a butcher or draper, but doubts the poaching, and the frequent whippings and imprisonments, as in the story told by the Rev. R. Davies in 1708.

That this promising young man, "when he came to London, spoke the Warwickshire dialect or *patois* is, then, as certain as anything can be that is incapable of mathematical proof." "Here is the young Warwickshire provincial . . . " producing, apparently five or six years after his arrival in town, *Venus and Adonis* . . . "Is it conceivable that this was the work of the Stratford Player of whom we know so little, but of whom we know so much too much? If so we have here a veritable sixteenth-century miracle." Moreover, "our great supposed poet and dramatist had at his death neither book nor manuscript in his possession, or to which he was legally entitled, or in which he had any interest whatever."

If it be not conceivable now that the rustic speaking in a *patois* could write *Venus and Adonis*, manifestly it was inconceivable in 1593, when *Venus and Adonis* was signed "William Shakespeare." No man who knew the actor (as described) could believe that he was the author, but there does not exist the most shadowy hint proving that the faintest doubt was thrown on the actor's

authorship; ignorant as he was, bookless, and rude of speech. For such a Will as Mr. Greenwood describes to persuade the literary and dramatic world of his age that he *did* write the plays, would have been a miracle. Consequently Mr. Greenwood has to try to persuade us that there is no sufficient evidence that Will *did* persuade, say Ben Jonson, of his authorship and we shall see whether or not he works this twentieth-century miracle of persuasion.

Of course if Will were unable to write even his name, as an enthusiastic Baconian asserts, Mr. Greenwood sees that Will could not easily pass for the Author. But his own bookless actor with a *patois* seems to him, as author of *Venus and Adonis*, almost inconceivable. Yet, despite Will's bookless rusticity, this poem with *Lucrece*, which displays knowledge of a work of Ovid not translated into English by 1593, was regarded as his own. I must suppose, therefore, that Will was *not* manifestly so ignorant of Latin as Mr. Greenwood thinks. "I think it highly probable," says this critic, "that he attended the Grammar School at Stratford" (where nothing but Latin was taught) "for four or five years, and that, later in life, after some years in London, he was probably able to 'bumbast out a line,' and perhaps to pose as 'Poet-Ape that would be thought our chief.' Nay, I am not at all sure that he would not have been capable of collaborating with such a man as George Wilkins, and perhaps of writing quite as well as he, if not even better. But it does not follow from this that he was the author either of *Venus and Adonis* or of *Hamlet*."

Nothing follows from all this: we merely see that, in Mr. Greenwood's private opinion, the actor might write even better than George Wilkins, but could not write *Venus and Adonis*. Will, therefore, though bookless, is not debarred here from the pursuits of literature, in partnership with Wilkins. We have merely the critic's opinion that Will could not write *Hamlet*, even if, like Wordsworth, "he had the mind," even if the gods had made him more poetical than Wilkins.

Again, "he had had but little schooling; he had 'small Latin and less Greek'" (as Ben Jonson truly says), "but he was a good *Johannes Factotum*; he could arrange a scene, and, when necessary, 'bumbast out a blank verse.'"

The "*Johannes Factotum*," who could "bumbast out a blank verse," is taken from Robert Greene's hackneyed attack on an actor-poet, "Shake-scene," published in 1592. "Poet-Ape that would be thought our chief," is from an epigram on an actor-poet by Ben Jonson (1601–16?). If the allusions by Greene and Jonson are to our Will, he, by 1592, had a literary ambition so towering that he thought his own work in the new art of dramatic blank verse was equal to that of Marlowe (not to speak of Wilkins), and Greene reckoned him a dangerous rival to three of his playwright friends, of whom Marlowe is one, apparently.

If Jonson's "Poet-Ape" be meant for Will, by 1601 Will would fain "be thought the chief" of contemporary dramatists. His vanity soared far above George Wilkins! Greene's phrases and Jonson's are dictated by spite, jealousy, and envy; and from them a true view of the work of the man whom they envy, the actor-poet, cannot be obtained. We might as well judge Molière in the spirit of the author of *Elomire Hypocondre*, and of de Visé! The Anti-Willian arguments keep on appearing, going behind the scenes, and reappearing, like a stage army. To avoid this phenomenon I reserve what is to be said about "Shake-scene" and "Poet-Ape" for another place (p–145 *infra*). But I must give the reader a warning. Concerning "William Shakespeare" as a "*nom de plume*," or pseudonym, Mr. Greenwood says, "Some, indeed, would see through it, and roundly accuse the player of putting forth the works of others as his own. To such he would be a 'Poet-Ape,' or 'an upstart crow' (Shake-scene) 'beautified with the feathers of other writers.'"

If this be true, if "some would see through" (Mr. Greenwood, apparently, means *did* "see through") the "*nom de plume*," the case of the Anti-Willians is promising. But, in this matter, Mr. Greenwood *se trompe*. Neither Greene nor Jonson accused "Shake-scene" or "Poet-Ape" of "putting forth the works of others as his own." That is quite certain, as far as the scorns of Jonson and Greene have reached us. (See p–145 *infra*.) If an actor, obviously incapable of wit and poetry, were credited with the plays, the keenest curiosity would arise in "the profession," and among rival playwrights who envied the wealth and "glory" of the actors. This curiosity, prompting the wits and players to watch

and “shadow” Will, would, to put it mildly, most seriously imperil the secret of the concealed author who had the folly to sign himself “William Shakespeare.” Human nature could not rest under such a provocation as the “concealed poet” offered.

This is so obvious that had one desired to prove Bacon or the Unknown to be the concealed author, one must have credited his mask, Will, with abundance of wit and fancy, and, as for learning — with about as much as he probably possessed. But the Baconians make him an illiterate yokel, and we have quoted Mr. Greenwood’s estimate of the young Warwickshire provincial.

We all have our personal equations in the way of belief. That the plot of the “*nom de plume*” should have evaded discovery for a week, if the actor were the untutored countryman of the hypotheses, is to me, for one, absolutely incredible. A “concealed poet” looking about for a “*nom de plume*” and a mask behind which he could be hidden, would not have selected the name, or the nearest possible approach to the name, of an ignorant unread actor. As he was never suspected of not being the author of the plays and poems, Will cannot have been a country ignoramus, manifestly incapable of poetry, wit, and such learning as the plays exhibit. Every one must judge for himself. Mr. Greenwood fervently believes in what I disbelieve.

“Very few Englishmen . . . in Elizabethan times, concerned themselves at all, or cared one brass farthing, about the authorship of plays . . . “ says Mr. Greenwood.

Very few care now. They know the actors’ names: in vain, as a rule, do I ask playgoers for the name of the author of their entertainment. But in Elizabeth’s time the few who cared were apt to care very much, and they would inquire intensely when the Stratford actor, a bookless, untaught man, was announced as the author of plays which were among the most popular of their day. The seekers never found any other author. They left no hint that they suspected the existence of any other author. Hence I venture to infer that Will seemed to them no unread rustic, but a fellow of infinite fancy, — no scholar to be sure, but very capable of writing the pieces which he fathered.

They may all have been mistaken. Nobody can prove that Heywood and Ben Jonson, and the actors of the Company, were not mistaken. But certain it is that they thought the Will whom they knew capable of the works which were attributed to him. Therefore he cannot possibly have been the man who could not write, of the more impulsive Baconians; or the bookless, and probably all but Latinless, man of Mr. Greenwood's theory. The positions already seem to me to be untenable.

II. THE "SILENCE" ABOUT SHAKESPEARE

Before proceeding further to examine Mr. Greenwood's book, and the Baconian theories, with the careful attention which they deserve, we must clear the ground by explaining two points which appear to puzzle Baconians, though, to be sure, they have their own solutions of the problems.

The first question is: Why, considering that Shakespeare, by the consent of the learned of most of the polite foreign nations, was one of the world's very greatest poets, have we received so few and such brief notices of him from the pens of his contemporaries?

"It is wonderful," exclaims Mr. Crouch-Batchelor, "that hundreds of persons should not have left records of him. We know nearly as much about the most insignificant writer of the period as we know of him, but fifty times more about most of his contemporaries. It is senseless to try to account for this otherwise than by recognising that the man was not the author."

Mr. Crouch-Batchelor is too innocent. He sees the sixteenth century in the colours of the twentieth. We know nothing, except a few dates of birth, death, entrance at school, College, the Inns of Court, and so forth, concerning several of Shakespeare's illustrious contemporaries and successors in the art of dramatic poetry. The Baconians do not quite understand, or, at least, keep steadily before their minds, one immense difference between the Elizabethan age and later times. In 1590–1630, there was no public excitement about the characters, personalities, and anecdotage of merely literary men, poets, and playwrights, who held no position in public affairs, as Spenser did; or in Court, Society, and War, as Sidney did; who did not write about their own feuds and friendships, like Greene and Nash; who did not expand into prefaces and reminiscences, and satires, like Ben Jonson; who never killed anybody, as Ben did; nor were killed, like Marlowe; nor were involved, like him, in charges of atheism, and so forth; nor imprisoned with every chance of having their ears and noses slit, like Marston. Consequently, silence and night obscure the lives and personalities of

Kyd, Chapman, Beaumont, Fletcher, Dekker, Webster, and several others, as night and silence hide Shakespeare from our view.

He was popular on the stage; some of his plays were circulated separately in cheap and very perishable quartos. No collected edition of his plays appeared during his life; without that he could not be studied, and recognised in his greatness. He withdrew to the country and died. There was no enthusiastic curiosity about him; nobody Boswellised any playwright of his time. The Folio of 1623 gave the first opportunity of studying him as alone he can be studied. The Civil Wars and the Reign of the Saints distracted men's minds and depressed or destroyed the Stage.

Sir William Davenant, a boy when Shakespeare died, used to see the actor at his father's inn at Oxford, was interested in him, and cherished the embers of the drama, which were fading before the theatres were closed. Davenant collected what he could in the way of information from old people of the stage; he told Shakespearean anecdotes in conversation; a few reached the late day when uncritical inquiries began, say 1680–90 at earliest. The memories of ancient people of the theatre and clerks and sextons at Stratford were ransacked, to very little purpose.

As these things were so, how can we expect biographical materials about Shakespeare? As to the man, as to how his character impressed contemporaries, we have but the current epithets: "friendly," "gentle," and "sweet," the praise of his worth by two of the actors in his company (published in 1623), and the brief prose note of Ben Jonson, — this is more than we have for the then so widely admired Beaumont, Ben Jonson's friend, or Chapman, or the adored Fletcher. "Into the dark go one and all," Shakespeare and the others. To be puzzled by and found theories on the silence about Shakespeare is to show an innocence very odd in learned disputants.

The Baconians, as usual, make a puzzle and a mystery out of their own misappreciation of the literary and social conditions of Shakespeare's time. That world could not possibly appreciate his works as we do; the world, till 1623, possessed only a portion of his plays in cheap pamphlets, in several of these his

text was mangled and in places unintelligible. And in not a single instance were anecdotes and biographical traits of playwrights recorded, except when the men published matter about themselves, or when they became notorious in some way unconnected with their literary works. Drummond, in Scotland, made brief notes of Ben Jonson's talk; Shakespeare he never met.

That age was not widely and enthusiastically appreciative of literary merit in playwrights who were merely dramatists, and in no other way notorious or eminent. Mr. Greenwood justly says "the contemporary eulogies of the poet afford proof that there were some cultured critics of that day of sufficient taste and acumen to recognise, or partly recognise, his excellence . . . " (Here I omit some words, presently to be restored to the text.) From such critics the poet received such applause as has reached us. We also know that the plays were popular; but the audiences have not rushed to pen and ink to record their satisfaction. With them, as with all audiences, the actors and the *spectacle*, much more than the "cackle," were the attractions. When Dr. Ingleby says that "the bard of our admiration was unknown to the men of that age," he uses hyperbole, and means, I presume, that he was unknown, as all authors are, to the great majority; and that those who knew him in part made no modern fuss about him.

The second puzzle is, — Why did Shakespeare, conscious of his great powers, never secure for his collected plays the permanence of print and publication? We cannot be sure that he and his company, in fact, did not provide publishers with the copy for the better Quartos or pamphlets of separate plays, as Mr. Pollard argues on good grounds that they sometimes did. For the rest, no dramatic author edited a complete edition of his works before Ben Jonson, a scholarly man, set the example in the year of Shakespeare's, and of Beaumont's death (1616). Neither Beaumont nor Fletcher collected and published their works for the Stage. The idea was unheard of before Jonson set the example, and much of his work lay unprinted till years after his death. We must remember the conditions of play-writing in Shakespeare's time.

There were then many poets of no mean merit, all capable of admirable verse on occasion; and in various degrees possessed of the lofty, vigorous, and vivid style of that great age. The theatre, and writing for the theatre, afforded to many men of talent a means of livelihood analogous to that offered by journalism among ourselves. They were apt to work collectively, several hands hurrying out a single play; and in twos or threes, or fours or fives, they often collaborated.

As a general rule a play when finished was sold by the author or authors to a company of players, or to a speculator like the notorious Philip Henslowe, and the new owners, "the grand possessors," were usually averse to the publication of the work, lest other companies might act it. The plays were primarily written to be acted. The company in possession could have the play altered as they pleased by a literary man in their employment.

To follow Mr. Greenwood's summary of the situation "it would seem that an author could restrain any person from publishing his manuscript, or could bring an action against him for so doing, so long as he had not disposed of his right to it; and that the publisher could prevent any other publisher from issuing the work. At the same time it is clear that the law was frequently violated . . . whether because of the difficulty of enforcing it, or through the supineness of authors; and that in consequence authors were frequently defrauded by surreptitious copies of their works being issued by piratical publishers."

It may appear that to "authors" we should, in the case of plays, add "owners," such as theatrical companies, for no case is cited in which such a company brings an action against the publisher of a play which they own. The two players of Shakespeare's company who sign the preface to the first edition of his collected plays (1623, "The First Folio") complain that "divers stolen and surreptitious copies" of single plays have been put forth, "maimed and deformed by the frauds and stealths of injurious impostors." They speak as if they were unable to prevent, or had not the energy to prevent, these frauds. In the accounts of the aforesaid Henslowe, we find him paying forty shillings to a printer to stop or "stay" the printing of a play, *Patient Grizel*, by three of his hacks.

We perhaps come across an effort of the company to prevent or delay the publication of *The Merchant of Venice*, on July 17, 1598, in the *Stationers' Register*. James Robertes, and all other printers, are forbidden to print the book without previous permission from the Lord Chamberlain, the protector of Will Shakespeare's company. Two years passed before Robertes issued the book. As is well known, Heywood, a most prolific playwright, boasts that he never made a double sale of his pieces to the players and the press. Others occasionally did, which Heywood clearly thought less than honest.

As an author who was also an actor, and a shareholder in his company, Will's interests were the same as theirs. It is therefore curious that some of his pieces were early printed, in quartos, from very good copies; while others appeared in very bad copies, clearly surreptitious. Probably the company gave a good MS. copy, sometimes, to a printer who offered satisfactory terms, after the gloss of novelty was off the acted play. In any case, we see that the custom and interests of the owners of manuscript plays ran contrary to their early publication. In 1619 even Ben Jonson, who loved publication, told Drummond that half of his comedies were still unprinted.

These times were not as our own, and must not be judged by ours. Whoever wrote the plays, the actor, or Bacon, or the Man in the Moon; whoever legally owned the manuscripts, was equally incurious and negligent about the preservation of a correct text. As we shall see later, while Baconians urge without any evidence that Bacon himself edited, or gave to Ben Jonson the duty of editing, the first collected edition (1623), the work has been done in an indescribably negligent and reckless manner, and, as Mr. Greenwood repeatedly states, the edition, in his opinion, contains at least two plays not by his "Shakespeare" — that "concealed poet" — and masses of "non-Shakespearean" work.

How this could happen, if Bacon (as on one hypothesis) either revised the plays himself, or entrusted the task to so strict an Editor as Ben Jonson, I cannot imagine. This is also one of the difficulties in Mr. Greenwood's theory. Thus we cannot argue, "if the actor were the author, he must have been conscious of

his great powers. Therefore the actor cannot have been the author, for the actor wholly neglected to collect his printed and to print his manuscript works."

This argument is equally potent against the authorship of the plays by Bacon. He, too, left the manuscripts unpublished till 1623. "But he could not avow his authorship," cry Baconians, giving various exquisite reasons. Indeed, if Bacon were the author, he might not care to divulge his long association with "a cry of players," and a man like Will of Stratford. But he had no occasion to avow it. He had merely to suggest to the players, through any safe channel, that they should collect and publish the works of their old friend Will Shakspere.

Thus indifferent was the main author of the plays, whether he were actor or statesman; and the actor, at least, is not to blame for the chaos of the first collected edition, made while he was in his grave, and while Bacon was busy in revising and superintending Latin translations of his works on scientific subjects.

We now understand why there are so few contemporary records of Shakspere the man; and see that the neglect of his texts was extreme, whether or not he were the author. The neglect was characteristic of the playwrights of his own and the next generation. In those days it was no marvel; few cared. Nine years passed before a second edition of the collected plays appeared: thirty-two years went by before a third edition was issued — years of war and tumult, yet they saw the posthumous publication of the collected plays of Beaumont and Fletcher.

There remains one more mystery connected with publication. When the first collected edition of the plays appeared, it purported to contain "All His Comedies, Histories, and Tragedies." According to the postulate of the Baconians it was edited by the Author, or by Jonson acting for him. It contains several plays which, according to many critics, are not the author's. This, if true, is mysterious, and so is the fact that a few plays were published, as by Shakespeare, in the lifetime both of the actor and of Bacon; plays which neither acknowledged for his own, for we hear of no remonstrance from — whoever "William Shakespeare" was. It is impossible for me to say why there was no remonstrance.

Suppose that Will merely supplied Bacon's plays, under his own name, with a slight difference in spelling, to his company. It was as much his interest, in that case, to protest when Bacon's pen-name was taken in vain, as if he had spelled his own surname with an *a* in the second syllable.

There is another instance which Mr. Greenwood discusses twice. In 1599 Jaggard published "*The Passionate Pilgrim*; W. Shakespeare." Out of twenty poems, five only were by W. S. In 1612, Jaggard added two poems by Tom Heywood, retaining W. Shakespeare's name as sole author. "Heywood protested" in print, "and stated that *Shakespeare* was offended, and," says Mr. Greenwood, "very probably he was so; but as he was, so I conceive, 'a concealed poet,' writing under a *nom de plume*, he seems to have only made known his annoyance through the medium of Heywood."

If so, Heywood knew who the concealed poet was. Turning to p, 349, we find Mr. Greenwood repeating the same story, with this addition, that the author of the poems published by Jaggard, "to do himself right, hath since published them in his own name." That is, W. Shakespeare has since published under his own name such pieces of *The Passionate Pilgrim* as are his own. "The author, I know," adds Heywood, "was much offended with Mr. Jaggard that (altogether unknown to him) presumed to make so bold with his name."

Why was the author so slack when Jaggard, in 1599, published W. S.'s poems with others *not* by W. S.?

How can anyone explain, by any theory? It was as open to him in 1599 as in 1612 to publish his own pieces under his own name, or pen-name.

"Here we observe," says Mr. Greenwood, "that Heywood does nothing to identify 'the author with the player.'" This is, we shall see, the eternal argument. Why should Heywood, speaking of W. Shakespeare, explain what all the world knew? There was no other W. Shakespeare (with or without the *e* and *a*) but one, the actor, in the world of letters of Elizabeth and James. Who the author was Heywood himself has told us, elsewhere: the author was — Will!

But why Shakespeare was so indifferent to the use of his name, or, when he was moved, acted so mildly, it is not for me or anyone to explain. We do not

know the nature of the circumstances in detail; we do not know that the poet saw hopes of stopping the sale of the works falsely attributed to him. I do not even feel certain that he had not a finger in some of them. Knowing so little, a more soaring wit than mine might fly to the explanation that "Shakespeare" was the "*nom de plume*" of Bacon or his unknown equivalent, and that he preferred to "let sleeping dogs lie," or, as Mr. Greenwood might quote the Latin tag, said *ne moveas Camarinam*.

III. THAT IMPOSSIBLE HE — THE SCHOOLING OF SHAKESPEARE

The banner-cry of the Baconians is the word "Impossible!" It is impossible that the actor from Stratford (as they think of him, a bookless, untutored lad, speaking in *patois*) should have possessed the wide, deep, and accurate scholarship displayed by the author of the plays and poems. It is impossible that at the little Free School of Stratford (if he attended it), he should have gained his wide knowledge of the literatures of Greece and Rome. To these arguments, the orthodox Stratfordian is apt to reply, that he finds in the plays and poems plenty of inaccurate general information on classical subjects, information in which the whole literature of England then abounded. He also finds in the plays some knowledge of certain Latin authors, which cannot be proved to have been translated at the date when Shakespeare drew on them. How much Latin Shakespeare knew, in our opinion, will presently be explained.

But, in reply to the Baconians and the Anti-Willians, we must say that while the author of the plays had some lore which scholars also possessed, he did not use his knowledge like a scholar. We do not see how a scholar could make, as the scansion of his blank verse proves that the author did make, the second syllable of the name of Posthumus, in *Cymbeline*, *long*. He must have read a famous line in Horace thus,

"*Eheu fugaces Posthoome*, *Posthoome*!"

which could scarce 'scape whipping, even at Stratford Free School. In the same way he makes the penultimate syllable of Andronicus short, equally impossible.

Mr. Greenwood, we shall see, denies to him *Titus Andronicus*, but also appears to credit it to him, as one of the older plays which he "revised, improved, and dressed," and *that* is taken to have been all his "authorship" in several cases. A scholar would have corrected, not accepted, false quantities. In other cases, as when Greeks and Trojans cite Plato and Aristotle in *Troilus and*

Cressida, while Plato and Aristotle lived more than a thousand years after the latest conceivable date of the siege of Troy, I cannot possibly suppose that a scholar would have permitted to himself the freak, any more than that in *The Winter's Tale* he should have borrowed from an earlier novel the absurdity of calling Delphi "Delphos" (a non-existent word), of confusing "Delphos" with Delos, and placing the Delphian Oracle in an island. In the same play the author, quite needlessly, makes the artist Giulio Romano (1492–1546) contemporary with the flourishing age of the oracle of the Pythian Apollo. This, at least, would not be ignorance.

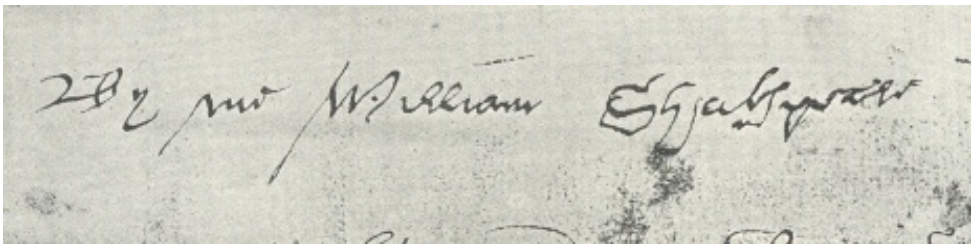
We have, I think, sufficient testimony to Ben's inability to refrain from gibes at Shakspere's want of scholarship. Rowe, who had traditions of Davenant's, tells how, in conversation with Suckling, Davenant, Endymion Porter, and Hales of Eton, Ben harped on Will's want of learning; and how Hales snubbed him. Indeed, Ben could have made mirth enough out of *The Winter's Tale*. For, granting to Mr. Greenwood that "the mention of Delphos suggests the Bohemia of a much earlier date, and under the reign of Ottocar (1255–78) Bohemia extended from the Adriatic to the shores of the Baltic," that only makes matters far worse. "Delphos" never was a place-name; there was no oracle on the isle of "Delphos"; there were no Oracles in 1255–78 (A.D.); and Perdita, who could have sat for her portrait to Giulio Romano, was contemporary with an Oracle at *Delphos*, but not with Ottocar.

There never was so mad a mixture, not even in *Ivanhoe*; not even in *Kenilworth*. Scott erred deliberately, as he says in his prefaces; but Will took the insular oracle of Delphos from Greene, inserted Giulio Romano "for his personal diversion," never heard of Ottocar (no more than I), and made a delightful congeries of errors in gaiety of heart. Nobody shall convince me that Francis Bacon was so charmingly irresponsible; but I cannot speak so confidently of Mr. Greenwood's Great Unknown, a severe scholar, but perhaps a frisky soul. There was no region called Bohemia when the Delphic oracle was in vigour; — this apology (apparently contrived by Sir Edward Sullivan) is the most comic of erudite reflections.

Some cruel critic has censured the lovely speech of Perdita, concerning the flowers which Proserpine let fall, when she was carried off by Dis. How could she, brought up in the hut of a Bohemian shepherd, know anything of the Rape of Proserpine? Why not, as she lived in the days of the Delphic Oracle — and Giulio Romano, and of printed ballads.

It is impossible, Baconians cry, that the rabbit-stealer, brought up among the Audreys and Jaquenettas of Warwickshire, should have created the noble and witty ladies of the Court; and known the style of his Armado; and understood how dukes and kings talk among themselves — usually in blank verse, it appears.

It is impossible that the home-keeping yokel should have heard of the "obscure" (*sic*!) Court of Navarre; and known that at Venice there was a place called the Rialto, and a "common ferry" called "the tranect." It is impossible that he should have had "an intimate knowledge of the castle of Elsinore," though an English *troupe* of actors visited Denmark in 1587. To Will all this knowledge was *impossible*; for these and many more exquisite reasons the yokel's authorship of the plays is a physical impossibility. But scholars neither invent nor tolerate such strange liberties with time and place, with history, geography, and common sense. Will Shakspere either did not know what was right, or, more probably, did not care, and supposed, like Fielding in the old anecdote, that the audience "would not find it out." How could a scholar do any of these things? He was as incapable of them as Ben Jonson. Such sins no scholar is inclined to; they have, for him, no temptations.



As to Shakspere's schooling, the Baconians point at the current ignorance of Stratford-on-Avon, where many topping burgesses, even aldermen, "made their marks," in place of signing their names to documents. Shakespeare's father, wife, and daughter "made their marks," in place of signing. So did Lady Jane Gordon, daughter of the Earl of Huntly, when she married the cultivated Earl of Bothwell (1566).

There is no evidence, from a roll of schoolboys at Stratford Free Grammar School, about 1564–77, that any given boy attended it; for no roll exists. Consequently there is no evidence that Will was a pupil.

"In the Appendix to Malone's *Life of Shakespeare* will be found two Latin letters, written by alumni of Stratford School contemporary with Shakespeare," says Mr. Collins. But though the writers were Stratford boys contemporary with Shakespeare, in later life his associates, as there is no roll of pupils' names how do we know, the Baconians may ask, that these men were educated at Stratford School? Why not at Winchester, Eton, St. Paul's, or anywhere? Need one reply?

Mr. Collins goes on, in his simple confiding way, to state that "one letter is by Abraham Sturley, afterwards an alderman of Stratford . . . " Pursuing the facts, we find that Sturley wrote in Latin to "Richard Quiney, Shakespeare's friend," who, if he could read Sturley's letter, could read Latin. Then *young* Richard Quiney, apparently aged eleven, wrote in Latin to his father. If young Richard Quiney be the son of Shakespeare's friend, Richard Quiney, then, of course, his Latin at the age of eleven would only prove that, if he were a schoolboy at Stratford, *one* Stratford boy could write Latin in the generation following that of Shakespeare. Thus may reason the Baconians.

Perhaps, however, we may say that if Stratford boys contemporary with Shakspere, in his own rank and known to him, learned Latin, which they retained

in manhood, Shakspere, if he went to school with them, may have done as much.

Concerning the school, a Free Grammar School, we know that during Shakespeare's boyhood the Mastership was not disdained by Walter Roche, perhaps a Fellow of what was then the most progressive College in learning of those at Oxford, namely, Corpus Christi. That Shakespeare could have been his pupil is uncertain; the dates are rather difficult. I think it probable that he was not, and we do not know the qualifications of the two or three succeeding Masters.

As to the methods of teaching and the books read at Grammar Schools, abundance of information has been collected. We know what the use was in one very good school, Ipswich, from 1528; in another in 1611; but as we do not possess any special information about Stratford School, Mr. Greenwood opposes the admission of evidence from other academies. A man might think that, however much the quality of the teaching varied in various free schools, the nominal curriculum would be fairly uniform.

As to the teacher, a good endowment would be apt to attract a capable man. What was the endowment of Stratford School? It was derived from the bequest of Thomas Jolyffe (died 1482), a bequest of lands in Stratford and Dodwell, and before the Reformation the Brethren of the Guild were "to find a priest fit and able in knowledge to teach grammar freely to all scholars coming to him, taking nothing for their teaching . . . " "The Founder's liberal endowment made it possible to secure an income for the Master by deed. Under the Reformation, Somerset's Commission found that the School Master had £10 yearly by patent; the school was well conducted, and was not confiscated."

Baconians can compare the yearly £20 (the salary in 1570–6, which then went much further than it does now) with the incomes of other masters of Grammar Schools, and thereby find out if the Head-Master was very cheap. Mr. Elton (who knew his subject intimately) calls the provision "liberal." The Head-Master of Westminster had £20 and a house.

As to the method of teaching, it was colloquial; questions were asked and answered in Latin. This method, according to Dr. Rouse of Perse School, brings

boys on much more rapidly than does our current fashion, as may readily be imagined; but experts vary in opinion. The method, I conceive, should give a pupil a vocabulary. Lilly's Latin Grammar was universally used, and was learned by rote, as by George Borrow, in the last century. See *Lavengro* for details. Conversation books, *Sententiæ Pueriles*, were in use; with easy books, such as Corderius's *Colloquia*, and so on, for boys were taught to *speak* Latin, the common language of the educated in Europe. Waifs of the Armada, Spaniards wrecked on the Irish coast, met "a savage who knew Latin," and thus could converse with him. The Eclogues of Mantuanus, a Latin poet of the Renaissance (the "Old Mantuan" of *Love's Labour's Lost*), were used, with Erasmus's *Colloquia*, and, says Mr. Collins, "such books as Ovid's Metamorphoses" (and other works of his), "the Æneid, selected comedies of Terence and Plautus, and portions of Cæsar, Sallust, Cicero, and Livy."

"Pro-di-gi-ous!" exclaims Mr. Greenwood, referring to what Mr. Collins says Will had read at school. But precocious Latinity was not thought "prodigious" in an age when nothing but Latin was taught to boys — not even cricket. Nor is it to be supposed that every boy read in all of these authors, still less read all of their works, but these were the works of which portions were read. It is not prodigious. I myself, according to my class-master, was "a bad and careless little boy" at thirteen, incurably idle, but I well remember reading in Ovid and Cæsar, and Sallust, while the rest of my time was devoted to the total neglect of the mathematics, English "as she was taught," History, and whatsoever else was expected from me. Shakespeare's time was not thus frittered away; Latin was all he learned (if he went to school), and, as he was (on my theory) a very clever, imaginative kind of boy, I can conceive that he was intensely interested in the stories told by Ovid, and in Catiline's Conspiracy (thrilling, if you know your Sallust); and if his interest were once aroused, he would make rapid progress. My own early hatred of Greek was hissing and malignant, but as soon as I opened Homer, all was changed. One was intensely interested!

Mr. Greenwood will not, in the matter of books, go beyond Mr. Halliwell-Phillipps, "Lilly's Grammar, and a few classical works chained to the desks of

the free schools." Mr. Collins himself gives but "a few classical books," of which *portions* were read. The chains were in all the free schools, if Mr. Halliwell-Phillipps is right. The chains, if authentic, do not count as objections.

Here it must be noted that Mr. Greenwood's opinion of Will's knowledge and attainments is not easily to be ascertained with precision. He sees, of course, that the pretension of the extreme Baconians — Will could not even write his name — is absurd. If he could not write, he could not pass as the author. Mr. Greenwood "fears that the arguments" (of a most extreme Baconian) "would drive many wandering sheep back to the Stratfordian fold."

He has therefore to find a *via media*, to present, as the pseudo-author, a Will who possessed neither books nor manuscripts when he made his Testament; a rustic, bookless Will, speaking a patois, who could none the less pass himself off as the author. So "I think it highly probable," says Mr. Greenwood, "that he attended the Grammar School at Stratford for four or five years, and that, later in life, after some years in London, he was probably able to 'bumbast out a line,' and perhaps to pose as 'Poet-Ape who would be thought our chief.'" Again, "He had had but little schooling; he had 'small Latin and less Greek'; but he was a good *Johannes Factotum*, he could arrange a scene, and, when necessary, 'bumbast out a blank verse.'"

But this is almost to abandon Mr. Greenwood's case. Will appears to me to be now perilously near acceptance as Greene's "Shake-scene," who was a formidable rival to Greene's three professional playwrights: and quite as near to Ben's Poet-Ape "that would be thought our chief," who began by re-making old plays; then won "some little wealth and credit on the scene," who had his "works" printed (for Ben expects them to reach posterity), and whom Ben accused of plagiarism from himself and his contemporaries. But this Shake-scene, this Poet-Ape, is merely our Will Shakespeare as described by bitterly jealous and envious rivals. Where are now the "works" of "Poet-Ape" if they are not the works of Shakespeare which Ben so nobly applauded later, if they are not in the blank verse of Greene's Shake-scene? "Shakespeare's plays" we call them.

When was it "necessary" for the "Stratford rustic" to "bumbast out a blank verse"? Where are the blank verses which he bumbasted out? For what purposes were they bumbasted? By 1592 "Shake-scene" was ambitious, and thought his blank verse as good as the best that Greene's friends, including Marlowe, could write. He had plenty of time to practise before the date when, as Ben wrote, "he would be thought our chief." He would not cease to do that in which he conceived himself to excel; to write for the stage.

When once Mr. Greenwood deems it "highly probable" that Will had four or five years of education at a Latin school, Will has as much of "grounding" in Latin, I think, as would account for all the knowledge of the Roman tongue which he displays. His amount of teaching at school would carry and tempt even a boy who was merely clever, and loved to read romantic tales and comic plays, into Ovid and Plautus — English books being to him not very accessible.

Here I may speak from my own memories, for though utterly idle where set school tasks were concerned, I tried very early to worry the sense out of Aristophanes — because he was said to contain good reading.

To this amount of taste and curiosity, nowise unexampled in an ordinary clever boy, add *Genius*, and I feel no difficulty as to Will's "learning," such as, at best, it was. "The Stratfordian," says Mr. Greenwood, "will ingeminate 'Genius! Genius!'" I *do* say "Genius," and stand by it. The ordinary clever boy, in the supposed circumstances, could read and admire his Ovid (though Shakespeare used cribs also), the man of genius could write *Venus and Adonis*.

Had I to maintain the Baconian hypothesis, I would not weigh heavily on bookless Will's rusticity and patois. Accepting Ben Jonson's account of his "excellent phantasy, brave notions, and gentle expressions, wherein he flowed with that facility . . . ," accepting the tradition of his lively wit; admitting that he had some Latin and literature, I would find in him a sufficiently plausible mask for that immense Unknown with a strange taste for furbishing up older plays. I would merely deny to Will his *genius*, and hand *that* over to Bacon — or Bungay. Believe me, Mr. Greenwood, this is your easiest way! — perhaps this *is* your way? — the plot of the unscrupulous Will, and of your astute Bungay,

might thus more conceivably escape detection from the pack of envious playwrights.

According to "all tradition," says Mr. Greenwood, Shakespeare was taken from school at the age of thirteen. Those late long-descended traditions of Shakespeare's youth are of little value as evidence; but, if it pleases Mr. Greenwood, I will, for the sake of argument, accept the whole of them. Assuredly I shall not arbitrarily choose among the traditions: all depends on the genealogical steps by which they reach us, as far as these can be discovered.

According to the tattle of Aubrey the antiquary, publishing in 1680, an opinion concerning Shakspere's education reached him. It came thus; there had been an actor in Shakspere's company, one Phillips, who, dying in 1605, left to Shakspere the usual thirty-shilling piece of gold; and the same "to my servant, Christopher Beeston." Christopher's son, William, in 1640, became deputy to Davenant in the management of "the King's and Queen's Young Company", and through Beeston, according to Aubrey, Davenant learned; through Beeston Aubrey learned, that Shakespeare "understood Latin pretty well, for he had been in his younger days a school-master in the country." Aubrey writes that "old Mr. Beeston, whom Mr. Dryden calls 'the chronicle of the stage,'" died in 1682.

This is a fair example of the genealogy of the traditions. Phillips, a friend of Shakspere, dies in 1605, leaving a servant, Christopher Beeston (he, too, was a versifier), whose son, William, dies in 1682; he is "the chronicle of the stage." Through him Davenant gets the story, through him Aubrey gets the story, that Shakspere "knew Latin pretty well," and had been a rural dominie. Mr. Greenwood devotes much space to disparaging Aubrey (and I do not think him a scientific authority, *moult s'en faut*), but Mr. Greenwood here says not a word as to the steps in the descent of the tradition. He frequently repeats himself, thereby forcing me to more iteration than I like. He had already disparaged Aubrey in note I to , but there he approached so closely to historical method as to say that "Aubrey quotes Beeston, a seventeenth-century actor, as his authority." On he dismisses the anecdote (which does not suit his book) as "a

mere myth." "*He* knows, *he* knows" which traditions are mythical, and which possess a certain historical value.

My own opinion is that Shakspere did "know Latin pretty well," and was no *scholar*, as his contemporaries reckoned scholarship. He left school, if tradition speak true, by a year later than the age, twelve, when Bacon went to Cambridge. Will, a clever kind of lad (on my theory), left school at an age when some other clever lads became freshmen. Why not? Gilbert Burnet (of whom you may have heard as Bishop of Salisbury under William III) took his degree at the age of fourteen.

Taking Shakspere as an extremely quick, imaginative boy, with nothing to learn but Latin, and by the readiest road, the colloquial, I conceive him to have discovered that, in Ovid especially, were to be found the most wonderful and delightful stories, and poetry which could not but please his "green unknowing youth." In the years before he left Stratford, and after he left school (1577–87?), I can easily suppose that he was not *always* butchering calves, poaching, and making love; and that, if he could get books in no other way, this graceless fellow might be detected on a summer evening, knitting his brows over the stories and jests of the chained Ovid and Plautus on his old schoolroom desk. *Moi qui parle*, I am no genius; but stories, romance, and humour would certainly have dragged me back to the old desks — if better might not be, and why not Shakspere? Put yourself in his place, if you have ever been a lad, and if, as a lad, you liked to steal away into the world of romance, into fairyland.

If Will wrote the plays, he (and indeed whoever wrote the plays) was a marvel of genius. But I am not here claiming for him genius, but merely stating my opinion that if he were fond of stories and romance, had no English books of poetry and romance, and had acquired as much power of reading Latin as a lively, curious boy could easily gain in four years of exclusively Latin education, he might continue his studies as he pleased, yet be, so far, no prodigy.

I am contemplating Will in the conditions on which the Baconians insist; if they will indeed let us assume that for a few years he was at a Latin school. I credit the graceless loon with the curiosity, the prompt acquisitiveness, the love

of poetry and romance, which the author of the plays must have possessed in youth. "Tradition says nothing of all that," the Baconian answers, and he may now, if he likes, turn to my reply in *The Traditional Shakespeare*. Meanwhile, how can you expect old clerks and sextons, a century after date, in a place where literature was *not* of supreme interest, to retain a tradition that Will used to read sometimes (if he did), in circumstances of privacy? As far as I am able to judge, had I been a boy at Stratford school for four years, had been taught nothing but Latin, and had little or no access to English books of poetry and romance, I should have acquired about the same amount of Latin as I suppose Shakspere to have possessed. Yet I could scarcely, like him, have made the second syllable in "Posthumus" long! Sir Walter Scott, however, was guilty of similar false quantities: he and Shakspere were about equally scholarly.

I suppose, then, that Shakspere's "small Latin" (as Jonson called it) enabled him to read in the works of the Roman clerks; to read sufficient for his uses. As a fact, he made use of English translations, and also of Latin texts. Scholars like Bacon do not use bad translations of easy Latin authors. If Bacon wanted Plutarch, he went to Plutarch in Greek, not to an English translation of a French translation of a Latin translation.

Some works of Shakespeare, the *Lucrece*, for example, and *The Comedy of Errors* (if he were not working over an earlier canvas from a more learned hand), and other passages, show knowledge of Latin texts which in his day had not appeared in published translations, or had not been translated at all as far as we know. In my opinion Will had Latin enough to puzzle out the sense of the Latin, never difficult, for himself. He could also "get a construe," when in London, or help in reading, from a more academic acquaintance: or buy a construe at no high ransom from some poor scholar. No contemporary calls him scholarly; the generation of men who were small boys when he died held him for no scholar. The current English literature of his day was saturated with every kind of classical information; its readers, even if Latinless, knew, or might know a world of lore with which the modern man is seldom acquainted. The ignorant

Baconian marvels: the classically educated Baconian who is not familiar with Elizabethan literature is amazed. Really there is nothing worthy of their wonder.

Does any contemporary literary allusion to Shakespeare call him "*learned*"? He is "sweet," "honey-tongued," "mellifluous," and so forth, but I ask for any contemporary who flattered him with the compliment of "learned." What Ben Jonson thought of his learning (but Ben's standard was very high), what Milton and Fuller, boys of eight when he died, thought of his learning, we know. They thought him "Fancy's child" (Milton) and with no claims to scholarship (Fuller), with "small Latin and less Greek" (Jonson). They speak of Shakespeare the author and actor; not yet had any man divided the persons.

Elizabethan and Jacobean scholarly poets were widely read in the classics. They were not usually, however, scholars in the same sense as our modern scholarly poets and men of letters; such as Mr. Swinburne among the dead, and Mr. Mackail and Sir Gilbert Murray — if I may be pardoned for mentioning contemporary names. But Elizabethan scholarly poets, and Milton, never regarded Shakespeare as learned. Perhaps few modern men of letters who are scholars differ from them. The opinion of Mr. Collins is to be discussed presently, but even he thought Shakespeare's scholarship "inexact," as we shall see.

I conceive that Shakspere "knew Latin pretty well," and, on Ben Jonson's evidence, he knew "less Greek." That he knew *any* Greek is surprising. Apparently he did, to judge from Ben's words. My attitude must, to the Baconians, seem frivolous, vexatious, and evasive. I cannot pretend to know what was Shakspere's precise amount of proficiency in Latin when he was writing the plays. That between his own knowledge, and construes given to him, he might easily get at the meaning of all the Latin, not yet translated, which he certainly knew, I believe.

Mr. Greenwood says "the amount of reading which the lad Shakspere must have done, and assimilated, during his brief sojourn at the Free School is positively amazing." But I have shown how an imaginative boy, with little or no access to English poetry and romances, might continue to read Latin "for

human pleasure" after he left school. As a professional writer, in a London where Latinists were as common as now they are rare in literary society, he might read more, and be helped in his reading. Any clever man might do as much, not to speak of a man of genius. "And yet, alas, there is no record or tradition of all this prodigious industry. . . . " I am not speaking of "prodigious industry," and of that — at school. In a region so non-literary as, by his account, was Stratford, Mr. Greenwood ought not to expect traditions of Will's early reading (even if he studied much more deeply than I have supposed) to exist, from fifty to seventy years after Will was dead, in the memories of the sons and grandsons of country people who cared for none of these things. The thing is not reasonable.

Let me take one example of what Mr. E. A. Sonnenschein is quoted as saying (somewhere) about Shakespeare's debt to Seneca's then untranslated paper *De Clementia* (1, 3, 3; I, 7, 2; I, 6, I). It inspires Portia's speech about Mercy. Here I give a version of the Latin.

"Clemency becometh, of all men, none more than the King or chief magistrate (*principem*) . . . No one can think of anything more becoming to a ruler than clemency . . . which will be confessed the fairer and more goodly in proportion as it is exhibited in the higher office . . . But if the placable and just gods punish not instantly with their thunderbolts the sins of the powerful, how much more just it is that a man set over men should gently exercise his power. What? Holds not he the place nearest to the gods, who, bearing himself like the gods, is kind, and generous, and uses his power for the better? . . . Think . . . what a lone desert and waste Rome would be, were nothing left, and none, save such as a severe judge would absolve."

The last sentence is fitted with this parallel in Portia's speech:

"Consider this
That in the course of Justice none of us
Should see salvation."

Here, at least, Protestant theology, not Seneca, inspires Portia's eloquence.

Now take Portia:

"The quality of Mercy is not strain'd;
It droppeth as the gentle rain from heaven
Upon the place beneath: it is twice blessed;
It blesseth him that gives and him that takes;"

(Not much Seneca, so far!)
"'Tis mightiest in the mightiest; it becomes
The thronèd monarch better than his crown;
His sceptre shows the force of temporal power,
The attribute to awe and majesty,
Wherein doth sit the dread and fear of kings;
But Mercy is above this sceptred sway,
It is enthronèd in the hearts of kings,
It is an attribute to God himself;
And earthly power doth then show likest God's,
When mercy seasons justice . . ."

There follows the passage about none of us seeing salvation, already cited, and theological in origin.

Whether Shakespeare could or could not have written these reflections, without having read Seneca's *De Clementia*, whether, if he could not conceive the ideas "out of his own head," he might not hear Seneca's words translated in a sermon, or in conversation, or read them cited in an English book, each reader must decide for himself. Nor do I doubt that Shakespeare could pick out what he wanted from the Latin if he cast his eye over the essay of the tutor of Nero.

My view of Shakespeare's Latinity is much like that of Sir Walter Raleigh. As far as I am aware, it is the opinion usually held by people who approach the

subject, and who have had a classical education. An exception was the late Mr. Churton Collins, whose ideas are discussed in the following chapter.

In his youth, and in the country, Will could do what Hogg and Burns did (and Hogg had no education at all; he was self-taught, even in writing). Will could pick up traditional, oral, popular literature. "His plays," says Sir Walter Raleigh, "are extraordinarily rich in the floating debris of popular literature, — scraps and tags and broken ends of songs and ballads and romances and proverbs. In this respect he is notable even among his contemporaries. . . . Edgar and Iago, Petruchio and Benedick, Sir Toby and Pistol, the Fool in *Lear* and the Grave-digger in *Hamlet*, even Ophelia and Desdemona, are all alike singers of old songs. . . . " He is rich in rural proverbs *not* recorded in Bacon's *Promus*.

Shakespeare in the country, like Scott in Liddesdale, "was making himself all the time."

The Baconian will exclaim that Bacon was familiar with many now obsolete rural words. Bacon, too, may have had a memory rich in all the tags of song, ballad, story, and *dicton*. But so may Shakespeare.

IV. MR. COLLINS ON SHAKESPEARE'S LEARNING

That Shakspere, whether "scholar" or not, had a very wide and deep knowledge both of Roman literature and, still more, of the whole field of the tragic literature of Athens, is a theory which Mr. Greenwood seems to admire in that "violent Stratfordian," Mr. Churton Collins. I think that Mr. Collins did not persuade classical scholars who have never given a thought to the Baconian belief, but who consider on their merits the questions: Does Shakespeare show wide classical knowledge? Does he use his knowledge as a scholar would use it?

My friend, Mr. Collins, as I may have to say again, was a very wide reader of poetry, with a memory like Macaulay's. It was his native tendency to find coincidences in poetic passages (which, to some, to me for example, did not often seem coincidental); and to explain coincidences by conscious or subconscious borrowing. One remarked in him these tendencies long before he wrote on the classical acquirements of Shakespeare.

While Mr. Collins tended to account for similarities in the work of authors by borrowing, my tendency was to explain them as undesigned coincidences. The question is of the widest range. Some inquirers explain the often minute coincidences in myths, popular tales, proverbs, and riddles, found all over the world, by diffusion from a single centre (usually India). Others, like myself, do not deny cases of transmission, but in other cases see spontaneous and independent, though coincident invention. I do not believe that the Arunta of Central Australia borrowed from Plutarch the central feature of the myth of Isis and Osiris.

It is not on Shakespeare's use, now and then, of Greek and Latin models and sources, but on coincidences detected by Mr. Collins himself, and not earlier remarked, that he bases his belief in the saturation of Shakespeare's mind with Roman and Athenian literature. Consequently we can only do justice to Mr. Collins's system, if we compare example after example of his supposed

instances of Shakespeare's borrowing. This is a long and irksome task; and the only fair plan is for the reader to peruse Mr. Collins's *Studies in Shakespeare*, compare the Greek and Roman texts, and weigh each example of supposed borrowing for himself. Baconians must delight in this labour.

I shall waive the question whether it were not possible for Shakespeare to obtain a view of the manuscript translation of plays of Plautus made by Warner for his unlearned friends, and so to use the *Menæchmi* as the model of *The Comedy of Errors*. He does not borrow phrases from it, as he does from North's *Plutarch*.

Venus and Adonis owes to Ovid, at most, but ideas for three purple patches, scattered in different parts of the *Metamorphoses*. *Lucrece* is based on the then untranslated *Fasti* of Ovid. I do not think Shakespeare incapable of reading such easy Latin for himself; or too proud to ask help from a friend, or buy it from some poor young University man in London. That is a simple and natural means by which he could help himself when in search of a subject for a play or poem; and ought not to be overlooked.

Mr. Collins, in his rapturous account of Shakespeare's wide and profound knowledge of the classics, opens with the remark: "Nothing which Shakespeare has left us warrants us in pronouncing with certainty that he read the Greek classics in the original, or even that he possessed enough Greek to follow the Latin versions of those classics in the Greek text." In that case, how did Shakespeare's English become contaminated, as Mr. Collins says it did, with Greek *idioms*, while he only knew the Greek plays through Latin translations?

However this is to be answered, Mr. Collins proceeds to prove Shakespeare's close familiarity with Latin and with Greek dramatic literature by a method of which he knows the perils— "it is always perilous to infer direct imitation from parallel passages which may be mere coincidences." Yet this method is what he practises throughout; with what amount of success every reader must judge for himself.

He thinks it "surely not unlikely" that Polonius's

("Neither a borrower nor a lender be

"Neither a borrower nor a lender be:
For loan oft loses both itself and friend,"

may be a terse reminiscence of seven lines in Plautus (*Trinummus*, iv. 3). Why, Polonius is a coiner of commonplaces, and if ever there were a well-known reflection from experience it is this of the borrowers and lenders.

Next, take this of Plautus (*Pseudolus*, I, iv. 7–10), "But just as the poet when he has taken up his tablets seeks what exists nowhere among men, and yet finds it, and makes that like truth which is mere fiction." We are to take this as the possible germ of Theseus's theory of the origin of the belief in fairies:

"And as imagination bodies forth
The *forms* of things unknown, the poet's pen
Turns them to *shapes*, and gives to airy nothing
A local habitation and a name."

The reasoning is odd; imagination bodies forth *forms*, and the poet's pen turns them to *shapes*. But to suppose that Shakespeare here borrowed from Plautus appears highly superfluous.

These are samples of Mr. Collins's methods throughout.

Of Terence there were translations — first in part; later, in 1598, of the whole. Of Seneca there was an English version (1581). Mr. Collins labours to show that one passage "almost certainly" implies Shakespeare's use of the Latin; but it was used "by an inexact scholar," — a terribly inexact scholar, if he thought that "*alienus*" ("what belongs to another") meant "slippery"!

Most of the passages are from plays (*Titus Andronicus* and *Henry VI*, i., ii., iii.), which Mr. Greenwood denies (usually) to *his* author, the Great Unknown. Throughout these early plays Mr. Collins takes Shakespeare's to resemble Seneca's *Latin* style: Shakespeare, then, took up Greek tragedy in later life; after the early period when he dealt with Seneca. Here is a sample of borrowing from Horace, "*Persicos odi puer apparatus*" (*Odes*. I, xxxviii. I). Mr. Collins quotes *Lear* (III, vi. 85) thus, "You will say they are *Persian attire*." Really, Lear in his

wild way says to Edgar, “I do not like the fashion of your garments: you will say they are Persian; but let them be changed.” Mr. Collins changes this into “you will say they are *Persian attire*,” a phrase “which could only have occurred to a classical scholar.” The phrase is not in Shakespeare, and Lear’s wandering mind might as easily select “Persian” as any other absurdity.

So it is throughout. Two great poets write on the fear of death, on the cries of new-born children, on dissolution and recombination in nature, on old age; they have ideas in common, obvious ideas, glorified by poetry, — and Shakespeare, we are told, is borrowing from Lucretius or Juvenal; while the critic leaves his reader to find out and study the Latin passages which he does not quote. So arbitrary is taste in these matters that Mr. Collins, like Mr. Grant White, but independently, finds Shakespeare putting a thought from the *Alcibiades I* of Plato into the mouth of Achilles in *Troilus and Cressida*, while Mr. J. M. Robertson suggests that the borrowing is from Seneca — where Mr. Collins does not find “the smallest parallel.” Mr. Collins is certainly right; the author of *Troilus* makes Ulysses quote Plato as “the author” of a remark, and makes Achilles take up the quotation, which Ulysses goes on to criticise.

Thus, in this play, not only Aristotle (as Hector says) but Plato are taken to have lived before the Trojan war, and to have been read by the Achæans!

There were Latin translations of Plato; the *Alcibiades I* was published apart, from Ficinus’ version, in 1560, with the sub-title, *Concerning the Nature of Man*. Who had read it? — Shakespeare, or one of the two authors (Dekker and Chettle) of another *Troilus and Cressida* (now lost), or Bacon, or Mr. Greenwood’s Unknown? Which of these Platonists chose to say that Plato and Aristotle lived long before Homer? Which of them followed the Ionic and mediæval anti-Achæan view of Homer’s heroes, as given in the Troy Books of the Middle Ages, and yet knew Iliad, Book VII, and admired Odysseus, whom the Ionian tradition abhors? *Troilus and Cressida* is indeed a mystery, but Somebody concerned in it had read Ficinus’ version of the *Alcibiades*; and yet made the monstrous anachronism of dating Aristotle and Plato before the Trojan war. “That was his fun,” as Charles Lamb said in another connection.

Mr. Collins, it is plain, goes much further than the "small Latin" with which his age (like myself) credited Shakespeare. He could read Latin, Mr. Collins thinks, as easily as an educated Briton reads French — that is, as easily as he reads English. Still further, Shakespeare, through Latin translations, was so saturated with the Greek drama "that the characteristics which differentiate his work from the work of his contemporaries and recall in essentials the work of the Greek dramatists are actually attributable to these dramatists."

Ben Jonson, and all the more or less well-taught University wits, as far as I remember, like Greene, Marlowe, and Lyly, do not show much acquaintance with Euripides, Æschylus, Sophocles, and do not often remind us of these masters. Shakespeare does remind us of them — the only question is, do the resemblances arise from his possession of a genius akin to that of Greece, or was his memory so stored with all the treasures of their art that the waters of Helicon kept bubbling up through the wells of Avon?

But does Mr. Collins prove (what, as he admits, *cannot* be demonstrated) that Shakespeare was familiar with the Attic tragedians? He begins by saying that he will not bottom his case "on the ground of parallels in sentiment and reflection, which, as they express commonplaces, are likely to be" (fortuitous) "coincidences." Three pages of such parallels, all from Sophocles, therefore follow. "Curiously close similarities of expression" are also barred. Four pages of examples therefore follow, from Sophocles and Æschylus, plays and fragments, Euripides, and Homer too (once!). Again, "identities of sentiment under similar circumstances" are not to be cited; two pages *are* cited; and "similarities, however striking they may be in metaphorical expression," cannot safely be used; several pages of them follow.

Finally, Mr. Collins chooses a single play, the *Aias* of Sophocles, and tests Shakespeare by that, unluckily in part from *Titus Andronicus*, which Mr. Greenwood regards (usually) as non-Shakespearean, or not by his unknown great author. *Troilus and Cressida*, whatever part Shakespeare may have had in it, does suggest to me that the author or authors knew of Homer no more than the few books of the Iliad, first translated by Chapman and published in 1598. But

he or they did know the *Aias* of Sophocles, according to Mr. Collins: so did the author of *Romeo and Juliet*.

Now all these sorts of parallels between Shakespeare and the Greeks are, Mr. Collins tells us, not to count as proofs that Shakespeare knew the Greek tragedians. "We have obviously to be on our guard" against three kinds of such parallels, which "may be mere coincidences," fortuitous coincidences. But these coincidences against which "we must be on our guard" fill sixteen pages (p–63). These pages must necessarily produce a considerable effect in the way of persuading the reader that Shakespeare knew the Greek tragedians as intimately as Mr. Collins did. Mr. Greenwood is obliged to leave these parallels to readers of Mr. Collins's essay. Indeed, what more can we do? Who would read through a criticism of each instance? Two or three may be given. The Queen in *Hamlet* reminds that prince, grieving for his father's death, that "all that live must die":

"That loss is common to the race,
And common is the commonplace."

The Greek Chorus offers the commonplace to Electra, — and here is a parallel! Again, two Greeks agree with Shakespeare that anxious expectation of evil is worse than actual experience thereof. Greece agrees with Shakespeare that ill-gotten gains do not thrive, or that it is not lucky to be "a corby messenger" of bad news; or that all goes ill when a man acts against his better nature; or that we suffer most from the harm which we bring on ourselves; or that there is strength in a righteous cause; or that blood calls for blood (an idea common to Semites, Greeks, and English readers of the Bible); or that, having lost a very good man, you will not soon see his like again, — and so on as long as you please. Of such wisdom are proverbs made, and savages and Europeans have many parallel proverbs. *Vestigia nulla retrorsum* is as well known to Bushmen as to Latinists. Manifestly nothing in this kind proves, or even suggests, that Shakespeare was saturated in Greek tragedy. But page on page of

such facts as that both Shakespeare and Sophocles talk, one of "the belly-pinched wolf," the other of "the empty-bellied wolf," are apt to impress the reader — and verily both Shakespeare and Æschylus talk of "the heart dancing for joy." Mr. Collins repeats that such things are no proof, but he keeps on piling them up. It was a theory of Shakespeare's time that the apparent ghost of a dead man might be an impersonation of him by the devil. Hamlet knows this —

"The spirit that I have seen may be the devil."

Orestes (*Electra*, Euripides) asks whether it may not be an avenging dæmon (*alastor*) in the shape of a god, that bids him avenge his father. Is Shakespeare borrowing from Euripides, or from a sermon, or any contemporary work on ghosts, such as that of Lavater?

A girl dies or is sacrificed before her marriage, and characters in *Romeo and Juliet*, and in Euripides, both say that Death is her bridegroom. Anyone might say that, anywhere, as in the Greek Anthology —

"For Death not for Love hast thou loosened thy zone."

One needs the space of a book wherein to consider such parallels. But confessedly, though a parade is made of them, they do not prove that Shakespeare constantly read Greek tragedies in Latin translations.

To let the truth out, the resemblances are mainly found in such commonplaces: as when both Aias and Antony address the Sun of their latest day in life; or when John of Gaunt and Aias both pun on their own names.

The situations, in *Hamlet* and the *Choephoræ* and *Electra*, are so close that resemblances in some passages must and do occur, and Mr. Collins does not comment specially upon the closest resemblance of all: the English case is here the murder of Duncan, the Greek is the murder of Agamemnon.

Now it would be easy for me to bring forward many close parallels between Homer and the old Irish epic story of Cuchulainn, between Homer and *Beowulf* and the Njal's saga, yet Norsemen and the early Irish were not students of Homer! The parallel passages in Homer, on one side, and the Old Irish *Tain Bo Cualgne*, and the Anglo-Saxon epics, are so numerous and close that the theory

of borrowing from Homer has actually occurred to a distinguished Greek scholar. But no student of Irish and Anglo-Saxon heroic poetry has been found, I think, to suggest that Early Irish and Anglo-Saxon Court minstrels knew Greek. The curious may consult Mr. Munro Chadwick's *The Heroic Age* (1912), especially Chapter XV, "The Common Characteristics of Teutonic and Greek Heroic Poetry," and to what Mr. Chadwick says much might be added.

But, to be short, Mr. Collins's case can only be judged by readers of his most interesting *Studies in Shakespeare*. To me, Hamlet's soliloquy on death resembles a fragment from the *Phœnix* of Euripides no more closely than two sets of reflections by great poets on the text that "of death we know nothing" are bound to do, — though Shakespeare's are infinitely the richer. For Shakespeare's reflections on death, save where Christians die in a Christian spirit, are as agnostic as those of the post-Æschylean Greek and early Anglo-Saxon poets. In many respects, as Mr. Collins proves, Shakespeare's highest and deepest musings are Greek in tone. But of all English poets he who came nearest to Greece in his art was Keats, who of Greek knew nothing. In the same way, a peculiar vein of Anglo-Saxon thought, in relation to Destiny and Death, is purely Homeric, though necessarily unborrowed; nor were a native Fijian poet's lines on old age, *sine amore jocisque*, borrowed from Mimnermus! There is such a thing as congruity of genius. Mr. Collins states the hypothesis — not his own— "that *by a certain natural affinity* Shakespeare caught also the accent and tone as well as some of the most striking characteristics of Greek tragedy."

Though far from accepting most of Mr. Collins's long array of Greek parallels, I do hold that by "natural affinity," by congruity of genius, Shakespeare approached and resembled the great Athenians.

One thing seems certain to me. If Shakspere read and borrowed from Greek poetry, he knew it as well (except Homer) as Mr. Collins knew it; and remembered what he knew with Mr. Collins's extraordinary tenacity of memory.

Now if "Shakespeare" did all that, he was not the actor. The author, on Mr. Collins's showing, must have been a very sedulous and diligent student of Greek

poetry, above all of the drama, down to its fragments. The Baconians assuredly ought to try to prove, from Bacon's works, that he was such a student.

Mr. Collins, "a violent Stratfordian," overproved his case. If his proofs be accepted, Shakspere the actor knew the Greek tragedians as well as did Mr. Swinburne. If the author of the plays were so learned, the actor was not the author, in my opinion — he *was*, in the opinion of Mr. Collins.

If Shakespeare's spirit and those of Sophocles and Æschylus meet, it is because they move on the same heights, and thence survey with "the poet's sad lucidity" the same "pageant of men's miseries." But how dissimilar in expression Shakespeare can be, how luxuriant and apart from the austerity of Greece, we observe in one of Mr. Collins's parallels.

Polynices, in the *Phœnissæ* of Euripides (504–506), exclaims:

"To the stars' risings, and the sun's I'd go,
And dive 'neath earth, — if I could do this thing, —
Possess Heaven's highest boon of sovereignty."

Then compare Hotspur:

"By Heaven, methinks it were an easy leap
To pluck bright honour from the pale faced moon,
Or dive into the bottom of the deep,
Where fathom-line could never touch the ground,
And pluck up drownèd honour by the locks,
So he that doth redeem her thence, might wear
Without corrival all her dignities."

What a hurrying crowd of pictures rush through Hotspur's mind! Is Shakespeare thinking of the *Phœnissæ*, or is he speaking only on the promptings of his genius?

V. SHAKESPEARE, GENIUS, AND SOCIETY

A phrase has been used to explain the Greek element in Shakespeare's work, namely, "congruity of genius," which is apt to be resented by Baconians. Perhaps they have a right to resent it, for "genius" is hard to define, and genius is invoked by some wild wits to explain feats of Shakespeare's which (to Baconians) appear "miracles." A "miracle" also is notoriously hard to define; but we may take it ("under all reserves") to stand for the occurrence of an event, or the performance of an action which, to the speaker who applies the word "miracle," seems "impossible." The speaker therefore says, "The event is impossible; miracles do not happen: therefore the reported event never occurred. The alleged performance, the writing of the plays by the actor, was impossible, was a miracle, therefore was done by some person or persons other than the actor." This idea of the *impossibility* of the player's authorship is the foundation of the Baconian edifice.

I have, to the best of my ability, tried to describe Mr. Greenwood's view of the young provincial from Warwickshire, Will Shakspere. If Will were what Mr. Greenwood thinks he was, then Will's authorship of the plays seems to me, "humanly speaking," impossible. But then Mr. Greenwood appeared to omit from his calculations the circumstance that Will *may* have been, not merely "a sharp boy" but a boy of great parts; and not without a love of stories and poetry: a passion which, in a bookless region, could only be gratified through folk-song, folk-tale, and such easy Latin as he might take the trouble to read. If we add to these very unusual but not wholly impossible tastes and abilities, that Will *may* have been a lad of genius, there is no more "miracle" in his case than in other supreme examples of genius. "But genius cannot work miracles, cannot do what is impossible." Do what is impossible to whom? To the critics, the men of common sense.

Alas, all this way of talking about "miracles," and "the impossible," and "genius" is quite vague and popular. What do we mean by "genius"? The Latin

term originally designates, not a man's everyday intellect, but a spirit from without which inspires him, like the "Dæmon," or, in Latin, "Genius" of Socrates, or the *lutin* which rode the pen of Molière. "Genius" is claimed for Shakespeare in an inscription on his Stratford monument, erected at latest some six years after his death. Following this path of thought we come to "inspiration": the notion of it, as familiar to Australian savages as to any modern minds, is that, to the poet, what he produces is *given* by some power greater than himself, by the *Boilyas* (spirits) or Pundjel, the Father of all. This palæolithic psychology, of course, is now quite discredited, yet the term "genius" is still (perhaps superstitiously) applied to the rare persons whose intellectual faculties lightly outrun those of ordinary mortals, and who do marvels with means apparently inadequate.

In recent times some philosophers, like Mr. F. W. H. Myers, put — in place of the Muses or the *Boilyas*, or the Genius — what they call the "Subliminal Self," something "far more deeply interfused than the everyday intellect." This subconscious self, capable of far more than the conscious intelligence, is genius.

On the other side, genius may fairly be regarded as faculty, only higher in degree, and not at all different in kind, from the everyday intellect which, for example, pens this page.

Thus as soon as we begin to speak of "genius," we are involved in speculations, psychological, psychical, physical, and metaphysical; in difficulties of all sorts not at present to be solved either by physiological science or experimental psychology, or by psychical research, or by the study of heredity. When I speak of "the genius of Shakespeare," of Jeanne d'Arc, of Bacon, even of Wellington, I possibly have a meaning which is not in all respects the meaning of Mr. Greenwood, when he uses the term "genius"; so we are apt to misunderstand each other. Yet we all glibly use the term "genius," without definition and without discussion.

At once, too, in this quest, we jostle against "that fool of a word," as Napoleon said, "impossible." At once, on either side, we assume that we know what is possible and what is impossible, — and so pretend to omniscience.

Thus some "Stratfordians," or defenders of the actor's authorship, profess to know — from all the signed work of Bacon, and from all that has reached us about Bacon's occupations and preoccupations, from 1590 to 1605 — that the theory of Bacon's authorship of the plays is "impossible." I, however, do not profess this omniscience.

On the other side the Baconian, arguing from all that *he* knows, or thinks he knows, or can imagine, of the actor's education, conditions of life, and opportunities, argues that the authorship of the actor is "impossible."

Both sides assume to be omniscient, but we incontestably know much more about Bacon, in his works, his aims, his inclinations, and in his life, than we know about the actor; while about "the potentialities of genius," we know — very little.

Thus, with all Bacon's occupations and preoccupations, he had, the Baconians will allow, *genius*. By the miracle of genius he *may* have found time and developed inclination, to begin by furbishing up older plays for a company of actors: he did it extremely well, but what a quaint taste for a courtier and scholar! The eccentricities of genius *may* account for his choice of a "*nom de plume*," which, if he desired concealment, was the last that was likely to serve his turn. He may also have divined all the Doll Tearsheets and Mrs. Quicklys and Pistols, whom, conceivably, he did not much frequent.

I am not one of those who deny that Bacon might have written *Hamlet* "if he had the mind," as Charles Lamb said of Wordsworth. Not at all; I am the last to limit the potentialities of genius.

But suppose, merely for the sake of argument, that Will Shakspere too had genius in that amazing degree which, in *Henry V*, the Bishop of Ely and the Archbishop of Canterbury describe and discuss in the case of the young king. In this passage we perceive that the poet had brooded over and been puzzled by the "miracle" (he uses the word) of genius. Says Canterbury speaking of the Prince's wild youth,

"Never was such a sudden scholar made."

One Baconian objection to Shakespeare's authorship is that during his early years in London (say 1587–92) he was "such a sudden scholar made" in various things.

The young king's

"addiction was to courses vain,
His companies unletter'd, rude, and shallow,"

precisely like Shakespeare's courses and companions at Stratford

"Had never noted in him any study."

Stratford tradition, a century after Shakespeare left the town, did not remember "any study" in him; none had been "noted," nor could have been remembered. To return to Henry, he shines in divinity, knowledge of "commonwealth affairs,"

"You would say, it hath been all in all his study."

He is as intimate with the art of war; to him "Gordian knots of policy" are "familiar as his garter." He *must* have

"The art and practic part of life,"

as "mistress to this theorie,"

"Which is a wonder how his Grace should glean it,"

as his youth was riotous, and was lived in all men's gaze,

"And never noted in him any study,
Any retirement, any sequestration
From open haunts and popularity."

The Bishop of Ely can only suggest that Henry's study or "contemplation"

"Grew like the summer grass, fastest by night,
Unseen,"

and Canterbury says

"It must be so, for miracles are ceased."

And thus the miracle of genius baffles the poet, for Henry's had been "noisy nights," notoriously noisy.

Now, as we shall later show, Bacon's rapid production of the plays, considering his other contemporary activities and varied but always absorbing interests, was as much a miracle as the sudden blossoming of Henry's knowledge and accomplishments; for all Bacon's known exertions and occupations, and his deepest and most absorbing interest, were remote from the art of tragedy and comedy. If we are to admit the marvel of genius in Bacon, of whose life and pursuits we know much, by parity of reasoning we may grant that the actor, of whom we know much less, may have had genius: had powers and could use opportunities in a way for which Baconians make no allowance.

We now turn to Mr. Greenwood's chapter, "Shakespeare and 'Genius.'" It opens with the accustomed list of poor Will's disqualifications, "a boy born of illiterate parents," but we need not rehearse the list. He "comes to town" (date unknown) "a needy adventurer"; in 1593 appeared the poem *Venus and Adonis*, author's name being printed as "W. Shakespeare." Then comes *Lucrece* (1594). In 1598 *Love's Labour's Lost*, printed as "corrected and augmented" by "W. Shakespere." And so on with all the rest. Criticism of the learning and splendour of the two poems follows. To *Love's Labour's Lost*, and the amusing things written about it by Baconians, I return; and to Shakespeare's "impossible" knowledge of courtly society, his "polish and urbanity," his familiar acquaintance with contemporary French politics, foreign proverbs, and "the gossip of the Court" of Elizabeth: these points are made by His Honour Judge Webb.

All this lore to Shakespeare is "impossible" — he could not read, say some Baconians, or had no Latin, or had next to none; on these points I have said my say. The omniscient Baconians know that all the early works ascribed to the actor were impossible, to a man of, say thirty — who *was* no more, and *knew* no more, than they know that the actor was and knew; and as for "Genius," it cannot work miracles. Genius "bestows upon no one a knowledge of facts,"

"Shakespeare, however favoured by nature, could impart only what he had learned."

Precisely, but genius as I understand it (and even cleverness) has a way of acquiring knowledge of facts where the ordinary "dull intelligent man" gains none. Keen interest, keen curiosity, swift observation, even the power of tearing out the things essential from a book, the gift of rapid reading; the faculty of being alive to the fingertips, — these, with a tenacious memory, may enable a small boy to know more facts of many sorts than his elders and betters and all the neighbours. They are puzzled, if they make the discovery of his knowledge. Scott was such a small boy; whether we think him a man of genius or not. Shakspere, even the actor, was, perhaps, a man of genius, and possessed this power of rapid acquisition and vivid retention of all manner of experience and information. To what I suppose to have been his opportunities in London, I shall return. Meanwhile, let the doubter take up any popular English books of Shakespeare's day: he will find them replete with much knowledge wholly new to him — which he will also find in Shakespeare.

A good example is this: Judge Webb proclaimed that in points of scientific lore (the lore of that age) Shakespeare and Bacon were much on a level. Professor Tyrrell, in a newspaper, said that the facts staggered him, as a "Stratfordian." A friend told me that he too was equally moved. I replied that these pseudoscientific "facts" had long been commonplaces. Pliny was a rich source of them. Professor Dowden took the matter up, with full knowledge, and reconverted Mr. Tyrrell, who wrote: "I am not versed in the literature of the Shakespearian era, and I assumed that the Baconians who put forward the parallelisms had satisfied themselves that the coincidences were peculiar to the writings of the philosopher and the poet. Professor Dowden has proved that this is not so."

Were I to enter seriously on this point of genius, I should begin by requesting my adversaries to read Mr. F. W. H. Myers's papers on "The Mechanism of Genius" (in his *Human Personality*), and to consider the humble problem of "Calculating Boys," which is touched on also by Cardinal Newman. How do

they, at the age of innocence, arrive at their amazing results? How did the child Pascal, ignorant of Euclid, work out the Euclidean propositions of "bars and rounds," as he called lines and circles? Science has no solution!

Transport the problem into the region of poetry and knowledge of human nature, take Will in place of Pascal and Gauss, and (in manners and matter of war) Jeanne d'Arc; — and science, I fancy, is much to seek for a reply.

Mr. Greenwood considers, among others, the case of Robert Burns. The parallel is very interesting, and does not, I think, turn so much to Mr. Greenwood's advantage as he supposes. The genius of Burns, of course, is far indeed below the level of that of the author of the Shakespearean plays. But that author and Burns have this in common with each other (and obviously with Homer), that their work arises from a basis of older materials, already manipulated by earlier artists. Burns almost always has a key-note already touched, as confessedly in the poems of his predecessor, Fergusson; of Hamilton of Gilbertfield; in songs, popular or artistic, and so forth. He "alchemised" his materials, as Mr. Greenwood says of his author of the plays; turned dross into gold, brick into marble. Notoriously much Shakespearean work is of the same nature.

The education of Burns he owed to his peasant father, to his parish school (in many such schools he might have acquired Latin and Greek; in fact he did not), to a tutor who read with him some English and French; and he knew a modernised version of Blind Harry's *Wallace*; Locke's *Essay*; *The Spectator*, novels of the day, and vernacular Scots poets of his century, with a world of old Scots songs. These things, and such as these, were Burns's given literary materials. He used them in the only way open to him, in poems written for a rural audience, and published for an Edinburgh public. No classical, no theatrical materials were given; or, if he read the old drama, he could not, in his rural conditions, and in a Scotland where the theatre was in a very small way, venture on producing plays, for which there was no demand, while he had no knowledge of the Stage. Burns found and filled the only channels open to him, in a printed book, and in music books for which he transmuted old songs.

The bookish materials offered to Will, in London, were crammed with reminiscences from the classics, were mainly romantic and theatrical; and, from his profession of actor, by far the best channel open to him was the theatre. Badly as it paid the outside author, there was nothing that paid better. *Venus and Adonis* brought "more praise than pudding," if one may venture a guess. With the freedom of the theatre Will could soar to all heights and plumb all depths. No such opportunity had Burns, even if he could have used it, and, owing to a variety of causes, his spirit soon ceased to soar high or wing wide.

I take Shakespeare, in London at least, to have read the current Elizabethan light literature — *Euphues*, Lyly's Court comedies, novels full of the classics and of social life; Spenser, Sidney — his *Defence of Poesy*, and *Arcadia* (1590) — with scores of tales translated from the Italian, French, and Spanish, all full of foreign society, and discourses of knights and ladies. He saw the plays of the day, perhaps as one of "the groundlings." He often beheld Society, from without, when acting before the Queen and at great houses. He had thus, if I am right, sufficient examples of style and manner, and knowledge of how the great were supposed (in books) to comport and conduct themselves. The books were cheap, and could be borrowed, and turned over at the booksellers' stalls. The Elizabethan style was omnipresent. Suppose that Shakespeare was a clever man, a lover of reading, a rapid reader with an excellent memory, easily influenced, like Burns, by what he read, and I really think that my conjectures are not too audacious. Not only "the man in the street," but "the reading public" (so loved by Coleridge), have not the beginning of a guess as to the way in which a quick man reads. Watch them poring for hours over a newspaper! Let me quote what Sir Walter Raleigh says: "Shakespeare was one of those swift and masterly readers who know what they want of a book; they scorn nothing that is dressed in print, but turn over the pages with a quick discernment of all that brings them new information, or jumps with their thought, or tickles their fancy. Such a reader will have done with a volume in a few minutes, yet what he has taken from it he keeps for years. He is a live man; and is sometimes judged by slower wits to be a learned man."

I am taking Shakespeare to have been a reader of this kind, as was Dr. Johnson, as are not a few men who have no pretensions to genius. The accomplishment is only a marvel to — well, I need not be particular about the kind of person to whom it is a marvel!

Here, in fairness, the reader should be asked to consider an eloquent passage of comparison between the knowledge of Burns and of Will, quoted by Mr. Greenwood from Mr. Morgan.

Genius, says Mr. Morgan, "did not guide Burns's untaught pen to write of Troy or Egypt, of Athens and Cyprus." No! that was not Burns's lay; nor would he have found a public had he emulated the contemporary St. Andrews professor, Mr. Wilkie, who wrote *The Epigoniad*, and sang of Cadmeian Thebes, to the delight of David Hume, his friend. The public of 1780–90 did not want new epics of heroic Greece from Mossgiel; nor was the literature accessible to Burns full of the mediæval legends of Troy and Athens. But the popular literature accessible to Will was full of the *mediæval* legends of Thebes, Troy, and Athens; and of these, *not* of Homer, Will made his market. Egypt he knew only in the new English version of Plutarch's *Lives*; of Homer, he (or the author of *Troilus and Cressida*) used only Iliad VII., in Chapman's new translation (1598). For the rest he had Lydgate (perhaps), and, certainly, Caxton's *Destruction of Troy*, still reprinted as a *popular* book as late as 1713. Will did not, as Mr. Morgan says, "reproduce the very counterfeit civilisations and manners of nations born and buried and passed into history a thousand years before he had been begotten. . . " He bestowed the manners of mediæval chivalrous romance on his Trojans and Greeks. He accommodated prehistoric Athens with a Duke. He gave Scotland cannon three hundred years too early; and made Cleopatra play at billiards. Look at his notion of "the very manners" of early post-Roman Britain in *Cymbeline* and *King Lear*! Concerning "the anomalous status of a King of Scotland under one of its primitive Kings" the author of *Macbeth* knew no more than what he read in Holinshed; of the actual truth concerning Duncan (that old prince was, in fact, a young man slain in a blacksmith's bothy), and of the whole affair, the author knew nothing but a

tissue of sophisticated legends. The author of the plays had no knowledge (as Mr. Morgan inexplicably declares that he had) of "matters of curious and occult research for antiquaries or dilettanti to dig out of old romances or treaties or statutes rather than for historians to treat of or schools to teach!"

Mon Dieu! do historians *not* treat of "matters of curious research" and of statutes and of treaties? As for "old romances," they were current and popular. The "occult" sources of *King Lear* are a popular tale attached to legendary "history" and a story in Sidney's *Arcadia*. Will, whom Mr. Morgan describes as "a letterless peasant lad," or the Author, whoever he was, is not "invested with all the love" (*sic*, *v.1.* "lore"), "which the ages behind him had shut up in clasped books and buried and forgotten."

"Our friend's style has flowery components," Mr. Greenwood adds to this deliciously eloquent passage from his American author, "and yet Shakespeare who did all this," *et cætera*. But Shakespeare did *not* do "all this"! We know the sources of the plays well enough: novels in one of which "Delphos" is the insular seat of an oracle of Apollo; Holinshed, with his contaminated legends; North's *Plutarch*, done out of the French; older plays, and the rest of it. Shakespeare does not go to Tighernach and the *Hennskringla* for Macbeth; or for Hamlet to the saga which is the source of Saxo; or for his English chronicle-plays to the State Papers. Shakespeare did not, like William of Deloraine, dig up "clasped books, buried and forgotten." There is no original research; the author uses the romances, novels, ballads, and popular books of uncritical history which were current in his day. Mr. Greenwood knows that; Mr. Morgan, perhaps, knew it, but forgot what he knew; hurried away by the Muse of Eloquence. And the common Baconian may believe Mr. Morgan.

But Mr. Greenwood asks "what was the poetic output?" in Burns's case. It was what we know, and *that* was what suited his age and his circumstances. It was lyric, idyll, song, and satire; it was not drama, for to the Stage he had no access, he who passed but one winter in Edinburgh, where the theatre was not the centre of literature.

Shakespeare came, with genius and with such materials as I have suggested, to an entirely different market, the Elizabethan theatre. I have tried to show how easily his mind might be steeped in the all-pervading classicism and foreign romance of the period, with the wide, sketchy, general information, the commonly known fragments from the great banquet of the classics, — with such history, wholly uncritical, as Holinshed and Stow, and other such English chroniclers, could copiously provide; with the courtly manners mirrored in scores of romances and Court plays; and in the current popular *Morte d'Arthur* and *Destruction of Troy*.

I can agree with Mr. Greenwood, when he says that "Genius is a potentiality, and whether it will ever become an actuality, and what it will produce, depends upon the moral qualities with which it is associated, and the opportunities that are open to it — in a word, on the circumstances of its environment."

Of course by "moral qualities," a character without spot or stain is not intended: we may take that for granted. Otherwise, I agree; and think that Shakespeare of Stratford had genius, and that what it produced was in accordance with the opportunities open to it, and with "the circumstances of its environment." Without the "environment," no Jeanne d'Arc, — without the environment, no Shakespeare.

To come to his own, Shakespeare needed the environment of "the light people," the crowd of wits living from hand to mouth by literature, like Greene and Nash; and he needed that pell-mell of the productions of their pens: the novels, the poems, the pamphlets, and, above all, the plays, and the wine, the wild talk, the wit, the travellers' tales, the seamen's company, the vision of the Court, the gallants, the beauties; and he needed the People, of whom he does not speak in the terms of such a philanthropist as Bacon professedly was. Not as an aristocrat, a courtier, but as a simple literary man, William does not like, though he thoroughly understands, the mob. Like Alceste (in *Le Misanthrope* of Poquelin), he might say,

"*L'Ami du genre humain n'est point du tout mon fait*."

In London, not in Stratford, he could and did find his mob. This reminds one to ask, how did the Court-haunting, or the study-haunting, or law-court, and chamber of criminal examination-rooms haunting Bacon make acquaintance with Mrs. Quickly, and Doll Tearsheet, and drawers, and carters, and Bardolph, and Pistol, and copper captains, and all Shakespeare's crowd of people hanging loose on the town?

It is much easier to discover how Shakespeare found the tone and manners of courtly society (which, by the way, are purely poetic and conventional), than to find out where Bacon got his immense knowledge of what is called "low life."

If you reply, as regards Bacon, "his genius divined the Costards and Audreys, the Doll Tearsheets and tapsters, and drawers, and Bardolphs, and carters, from a hint or two, a glance," I answer that Will had much better sources for *them* in his own experience of life, and had conventional poetic sources for his courtiers — of whom, in the quick, he saw quite as much as Molière did of his *Marquis*.

But one Baconian has found out a more excellent way of accounting for Bacon's pictures of rude rustic life, and he is backed by Lord Penzance, that aged Judge. The way is short. These pictures of rural life and character were interpolated into the plays of Bacon by his collaborator, William Shakspere, actor, "who prepared the plays for the stage." This brilliant suggestion is borrowed from Mr. Appleton Morgan.

Thus have these two Baconians perceived that it *is* difficult to see how Bacon obtained his knowledge of certain worlds and aspects of character which he could scarcely draw "from the life." I am willing to ascribe miracles to the genius of Bacon; but the Baconians cited give the honour to the actor, "who prepared the plays for the stage."

Take it as you please, my Baconian friends who do not believe as I believe in "Genius." Shakespeare and Molière did not live in "Society," though both rubbed shoulders with it, or looked at it over the invisible barrier between the actor and the great people in whose houses or palaces he takes the part of Entertainer. The rest they divined, by genius.

Bacon did not, perhaps, study the society of carters, drawers, Mrs. Quickly, and Doll Tearsheet; of copper captains and their boys; not at Court, not in the study, did he meet them. How then did he create his multitude of very low-lived persons? Rustics and rural constables he *may* have lovingly studied at Gorhambury, but for his collection of other very loose fish Bacon must have kept queer company. So you have to admit "Genius," — the miracle of "Genius" in your Bacon, — to an even greater extent than I need it in the case of my Will; or, like Lord Penzance, you may suggest that Will collaborated with Bacon.

Try to imagine that Will was a born poet, like Burns, but with a very different genius, education, and environment. Burns could easily get at the Press, and be published: that was impossible for Shakespeare at Stratford, if he had written any lyrics. Suppose him to be a poet, an observer, a wit, a humorist. Tradition at Stratford says something about the humorist, and tradition, *in similar circumstances*, would have remembered no more of Burns, after the lapse of seventy years.

Imagine Will, then, to have the nature of a poet (that much I am obliged to assume), and for nine or ten years, after leaving school at thirteen, to hang about Stratford, observing nature and man, flowers and foibles, with thoughts incommunicable to Sturley and Quiney. Some sorts of park-palings, as he was married at eighteen, he could not break so lightly as Burns did, — some outlying deer he could not so readily shoot at, perhaps, but I am not surprised if he assailed other deer, and was in troubles many. Unlike Burns, he had a keen eye for the main chance. Everything was going to ruin with his father; school-mastering, if he tried it (I merely follow tradition), was not satisfactory. His opinion of dominies, if he wrote the plays, was identical with that frequently expressed, in fiction and privately, by Sir Walter Scott.

Something must be done! Perhaps the straitest Baconian will not deny that companies of players visited Stratford, or even that he may have seen and talked with them, and been attracted. He was a practical man, and he made for London, and, by tradition, we first find him heading straight for the theatre, holding

horses at the door, and organising a small brigade of boys as his deputies. According to Ben Jonson he shone in conversation; he was good company, despite his rustic accent, that terrible bar! The actors find that out; he is admitted within the house as a "servitor" — a call-boy, if you like; an apprentice, if you please.

By 1592, when Greene wrote his *Groatsworth*, "Shakescene" thinks he can bombast out a blank verse with the best; he is an actor, he is also an author, or a furbisher of older plays, and, as a member of the company, is a rival to be dreaded by Greene's three author friends: whoever they were, they were professional University playwrights; the critics think that Marlowe, so near his death, was one of them.

Will, supposing him to come upon the town in 1587, has now had, say, five years of such opportunities as were open to a man connected with the stage. Among these, in that age, we may, perhaps, reckon a good deal of very mixed society — writing men, bookish young blades, young blades who haunt the theatre, and sit on the stage, as was the custom of the gallants.

What follows? Chaff follows, a kind of intimacy, a supper, perhaps, after the play, if an actor seems to be good company. This is quite natural; the most modish young gallants are not so very dainty as to stand aloof from any amusing company. They found it among prize-fighters, when Byron was young, and extremely conscious of the fact that he was a lord. Moreover there were no women on the stage to distract the attention of the gallants. The players, says Asinius Lupus, in Jonson's *Poetaster*, "corrupt young gentry very much, I know it." I take the quotation from Mr. Greenwood. They could not corrupt the young gentry, if they were not pretty intimate with them. From Ben's *Poetaster*, which bristles with envy of the players, Mr. Greenwood also quotes a railing address by a copper captain to Histrio, a poor actor, "There are some of you players honest, gentlemanlike scoundrels, and suspected to ha' some wit, as well as your poets, both at drinking and breaking of jests; *and are companions for gallants*. A man may skelder ye, now and then, of half a dozen shillings or so."

We think of Nigel Olifaunt in *The Fortunes of Nigel*; but better gallants might choose to have some acquaintance with Shakespeare.

To suppose that young men of position would not form a playhouse acquaintanceship with an amusing and interesting actor seems to me to show misunderstanding of human nature. The players were, when unprotected by men of rank, "vagabonds." The citizens of London, mainly Puritans, hated them mortally, but the young gallants were not Puritans. The Court patronised the actors who performed Masques in palaces and great houses. The wealth and splendid attire of the actors, their acquisition of land and of coats of arms infuriated the sweated playwrights. Envy of the actors appears in the Cambridge "Parnassus" plays of *c.* 1600–2. In the mouth of Will Kempe, who acted Dogberry in Shakespeare's company, and was in favour, says Heywood, with Queen Elizabeth, the Cambridge authors put this brag: "For Londoners, who of more report than Dick Burbage and Will Kempe? He is not counted a gentleman that knows not Dick Burbage and Will Kempe." It is not my opinion that Shakespeare was, as Ben Jonson came to be, as much "in Society" as is possible for a mere literary man. I do not, in fancy, see him wooing a Maid of Honour. He was a man's man, a peer might be interested in him as easily as in a jockey, a fencer, a tennis-player, a musician, *que sçais-je*? Southampton, discovering his qualities, may have been more interested, interested in a better way.

In such circumstances which are certainly in accordance with human nature, I suppose the actor to have been noticed by the young, handsome, popular Earl of Southampton; who found him interesting, and interested himself in the poet. There followed the dedication to the Earl of *Venus and Adonis*; a poem likely to please any young amorist (1693).

Mr. Greenwood cries out at the audacity of a player dedicating to an Earl, without even saying that he has asked leave to dedicate. The mere fact that the dedication was accepted, and followed by that of *Lucrece*, proves that the Earl did not share the surprise of Mr. Greenwood. He, conceivably, will argue that the Earl knew the real concealed author, and the secret of the pseudonym. But of the hypothesis of such a choice of a pseudonym, enough has been said.

Whatever happened, whatever the Earl knew, if it were discreditable to be dedicated to by an actor, Southampton was discredited; for we are to prove that all in the world of letters and theatre who have left any notice of Shakespeare identified the actor with the poet.

This appears to me to be the natural way of looking at the affair. But, says Mr. Greenwood, of this intimacy or "patronage" of Southampton "not a scrap of evidence exists." Where would Mr. Greenwood expect to find a scrap of evidence? In literary anecdote? Of contemporary literary anecdote about Shakespeare, as about Beaumont, Dekker, Chapman, Heywood, and Fletcher, there is none, or next to none. There is the tradition that Southampton gave the poet £1000 towards a purchase to which he had a mind. (Rowe seems to have got this from Davenant, — through Betterton.) In what documents would the critic expect to find a scrap of evidence? Perhaps in Southampton's book of his expenditure, and that does not exist. It is in the accounts of Prince Charlie that I find him, poor as he was, giving money to Jean Jacques Rousseau.

As to the chances of an actor's knowing "smart people," Heywood, who knew all that world, tells us that "Tarleton, in his time, was gracious with the Queen, his sovereign," Queen Elizabeth. "Will Kempe was in the favour of his sovereign."

They had advantages, they were not literary men, but low comedians. I am not pretending that, though his

"flights upon the banks of Thames
So did take Eliza and our James,"

Will Shakspere "was gracious with the Queen."

We may compare the dedication of the Folio of 1623; here two players address the Earls of Pembroke and Montgomery. They have the audacity to say nothing about having asked and received permission to dedicate. They say that the Earls "have prosecuted both the plays and their authour living" (while in life) "with much favour." They "have collected and published the works of 'the

dead' . . . only to keep alive the memory of so worthy a Friend, and Fellow" (associate) "as was our Shakespeare, 'your servant Shakespeare.'"

Nothing can possibly be more explicit, both as to the actor's authorship of the plays, and as to the favour in which the two Earls held him. Mr. Greenwood supposes that Jonson wrote the Preface, which contains an allusion to a well-known ode of Horace, and to a phrase of Pliny. Be that as it may, the Preface signed by the two players speaks to Pembroke and Montgomery. To *them* it cannot lie; *they* know whether they patronised the actor or not; whether they believed, or not, that the plays were their "servant's." How is Mr. Greenwood to overcome this certain testimony of the Actors, to the identity of their late "Fellow" the player, with the author; and to the patronage which the Earls bestowed on him and his compositions? Mr. Greenwood says nothing except that we may reasonably suppose Ben to have written the dedication which the players signed.

Whether or not the two Earls had a personal knowledge of Shakespeare, the dedication does not say in so many words. They had seen his plays and had "favoured" both him and them, with so much favour, had "used indulgence" to the author. That is not nearly explicit enough for the precise Baconians. But the Earls knew whether what was said were true or false. I am not sure whether the Baconians regard them as having been duped as to the authorship, or as fellow-conspirators with Ben in the great Baconian joke and mystery — that "William Shakespeare" the author is not the actor whose Stratford friend, Collyns, has his name written in legal documents as "William Shakespeare."

Anyone, however, may prefer to believe that, while William Shakspere was acting in a company (1592–3), Bacon, or who you please, wrote *Venus and Adonis*, and, signing "W. Shakspeare," dedicated it to his young friend, the Earl, promising to add "some graver labour," a promise fulfilled in *Lucrece*. In 1593, Bacon was chiefly occupied, we shall see, with the affairs of a young and beautiful Earl — the Earl of Essex, not of Southampton: to Essex he did not dedicate his two poems (if *Venus* and *Lucrece* were his). He "did nothing but

ruminate" (he tells the world) on Essex. How Mr. Greenwood's Unknown was occupied in 1593–4, of course we cannot possibly be aware.

I have thus tried to show that Will Shakspere, if he had as much schooling as I suggest; and if he had four or five years of life in London, about the theatre, and, above all, had genius, might, by 1592, be the rising player-author alluded to as "Shakescene." There remains a difficulty. By 1592 Will had not time to be guilty of *thirteen* plays, or even of six. But I have not credited him with the authorship, between, say, 1587 and 1593, of eleven plays, namely, *Hamlet*, *Romeo and Juliet*, *Midsummer Night's Dream*, *Titus Andronicus*, *Comedy of Errors*, *Love's Labour's Lost*, *King John*, the three plays of *Henry VI*, and *The Taming of the Shrew*. Mr. Greenwood cites Judge Webb for the fact that between the end of 1587 and the end of 1592 "some half-dozen Shakespearean dramas had been written," and for Dr. Furnivall's opinion that eleven had been composed.

If I believed that half a dozen, or eleven Shakespearean plays, as we have them, had been written or composed, between 1587 and 1592, I should be obliged to say that, in my opinion, they were not composed, in these five years, by Will. Mr. Greenwood writes, "Some of the dates are disputable"; and, for himself, would omit "*Titus Andronicus*, the three plays of *Henry VI*, and possibly also *The Taming of the Shrew*, while the reference to *Hamlet* also is, as I have elsewhere shown, of very doubtful force." This leaves us with six of Dr. Furnivall's list of earliest plays put out of action. The miracle is decomposing, but plays numerous enough to stagger my credulity remain.

I cannot believe that the author even of the five plays before 1592–3 was the ex-butcher's boy. Meanwhile these five plays, written by somebody before 1593, meet the reader on the threshold of Mr. Greenwood's book with Dr. Furnivall's eleven; and they fairly frighten him, if he be a "Stratfordian." "Will, even Will," says the Stratfordian, "could not have composed the five, much less the eleven, much less Mr. Edwin Reed's thirteen 'before 1592.'" But, at the close of his work Mr. Greenwood reviews and disbands that unlucky troop of thirteen Shakespearean plays "before 1592" as mustered by Mr. Reed, a

Baconian of whom Mr. Collins wrote in terms worthy of *feu* Mr. Bludyer of *The Tomahawk*.

From the five plays left to Shakespeare's account in , *King John* (as we know it) is now eliminated. "I find it impossible to believe that the same man was the author of the drama" (*The Troublesome Reign of King John*) "published in 1591, and that which, so far as we know, first saw the light in the Folio of 1623 . . . Hardly a single line of the original version reappears in the *King John* of Shakespeare." "I think it is a mistake to endeavour to fortify the argument against him" (my Will, *toi que j'aime*), "by ascribing to Shakespeare such old plays as the *King John* of 1591 or the primitive *Hamlet*."

I thought so too, when I read , and saw *King John* apparently still "coloured on the card" among "Shakespeare's lot." We are now left with *Love's Labour's Lost*, *Midsummer Night's Dream*, *Comedy of Errors*, and *Romeo and Juliet*, out of Dr. Furnivall's list of plays up to 1593. The phantom force of miraculously early plays is "following darkness like a dream." We do not know the date of *A Midsummer Night's Dream*, we do not know the date of *Romeo and Juliet*. Mr. Gollancz dates the former "about 1592," and the latter "at 1591." This is a mere personal speculation. Of *Love's Labour's Lost*, we only know that our version is one "corrected and augmented" by William Shakespeare in 1598. I dare say it is as early as 1591–2, in its older form. Of *The Comedy of Errors*, Mr. Collins wrote, "It is all but certain that it was written between 1589 and 1592, and it is quite certain that it was written before the end of 1594."

The legion of Shakespearean plays of date before 1593 has vanished. The miracle is very considerably abated. In place of introducing the airy hosts of plays before 1592, in , it would have been, perhaps, more instructive to write that, as far as we can calculate, Shakespeare's earliest trials of his pinions as a dramatist may be placed about 1591–3. There would then have been no specious appearance of miracles to be credited by Stratfordians to Will. But even so, we have sufficient to "give us pause," says Mr. Greenwood, with justice. It gives *me* "pause," if I am to believe that, between 1587 and 1592, Will wrote *Love's Labour's Lost*, *The Comedy of Errors*, *A Midsummer Night's Dream*, and *Romeo*

and Juliet. There is a limit even to my gullibility, and if anyone wrote all these plays, as we now possess them, before 1593, I do not suppose that Will was the man. But the dates, in fact, are unknown: the miracle is apocryphal.

VI. THE COURTLY PLAYS: "LOVE'S LABOUR'S LOST"

We now come to consider another "miracle" discovered in the plays, — a miracle if the actor be the author. The new portent is the courtliness and refinement (too often, alas! the noblest ladies make the coarsest jokes) and wit of the speeches of the noble gentlemen and ladies in the plays. To be sure the refinement in the jests is often conspicuously absent. How could the rude actor learn his quips and pretty phrases, and farfetched conceits? This question I have tried to answer already, — the whole of these fashions abound in the literature of the day.

Here let us get rid of the assumption that a poet could not make the ladies and gentlemen of his plays converse as they do converse, whether in quips and airs and graces, or in loftier style, unless he himself frequented their society. Marlowe did not frequent the best society; *he* was no courtier, but there is the high courtly style in the speeches of the great and noble in *Edward II*. Courtiers and kings never did speak in this manner, any more than they spoke in blank verse. The style is a poetical convention, while the quips and conceits, the airs and graces, ran riot through the literature of the age of Lyly and his *Euphues* and his comedies, the age of the *Arcadia*.

A cheap and probable source of Will's courtliness is to be found in the courtly comedies of John Lyly, five of which were separately printed between 1584 and 1592. Lyly's "real significance is that he was the first to bring together on the English stage the elements of high comedy, thereby preparing the way for Shakespeare's *Much Ado about Nothing* and *As You Like It*" (and *Love's Labour's Lost*, one may add). "Whoever knows his Shakespeare and his Lyly well can hardly miss the many evidences that Shakespeare had read Lyly's plays almost as closely as Lyly had read Pliny's *Natural History*. . . . One could hardly imagine *Love's Labour's Lost* as existent in the period from 1590 to 1600, had not Lyly's work just preceded it."

"It is to Lyly's plays," writes Dr. Landmann, "that Shakespeare owes so much in the liveliness of his dialogues, in smartness of expression, and especially in that predilection for witticisms, quibbles, and playing upon words which he shows in his comedies as well as in his tragedies." There follows a dissertation on the affected styles of Guevara and Gongora, of the *Pléiade* in France, and generally of the artificial manner in Europe, till in England we reach Lyly, "in whose comedies," says Dr. Furness, "I think we should look for motives which appeared later in Shakespeare."

The Baconians who think that a poet could not derive from books and court plays his knowledge of fashions far more prevalent in literature than at Court, decide that the poet of *Love's Labour's Lost* was not Will, but the courtly "concealed poet." No doubt Baconians may argue with Mr. R. M. Theobald that "Bacon wrote Marlowe," and, by parity of reasoning many urge, though Mr. Theobald does not, that Bacon wrote Lyly, pouring into Lyly's comedies the grace and wit, the quips and conceits of his own courtly youth. "What for no?" The hypothesis is as good as the other hypotheses, "Bacon wrote Marlowe," "Bacon wrote Shakespeare."

The less impulsive Baconians and the Anti-Willians appear to ignore the well-known affected novels which were open to all the world, and are noted even in short educational histories of English literature. Shakespeare, in London, had only to look at the books on the stalls, to read or, if he had the chance, to see Lyly's plays, and read the poems of the time. I am taking him not to be a dullard but a poet. It was not hard for him, if he were a poet of genius, not only to catch the manner of Lyly's Court comedies, and "Marlowe's mighty line" (Marlowe was not "brought up on the knees of Marchionesses"!), but to improve on them. People did not commonly talk in the poetical way, heaven knows; people did not write in the poetic convention. Certainly Queen Mary and Queen Elizabeth talked and wrote, as a rule (we have abundance of their letters), like women of this world. There is a curious exception in Letter VIII of the Casket Letters from Mary to Bothwell. In this (we have a copy of the original French), Mary plunges into the affected and figured style already practised by

Les Précieuses of her day; and expands into symbolisms in a fantastic jargon. If courtiers of both sexes conversed in the style of *Euphues* (which is improbable), they learned the trick of it from *Euphues*; not the author of *Euphues* from them. Lyly's most popular prose was accessible to Shakespeare. The whole convention as to how the great should speak and bear themselves was accessible in poetry and the drama. A man of genius naturally made his ladies and courtiers more witty, more "conceited," more eloquent, more gracious than any human beings ever were anywhere, in daily life.

It seems scarcely credible that one should be obliged to urge facts so obvious against the Baconian argument that only a Bacon, intimately familiar with the society of the great, could make the great speak as, in the plays, they do — and as in real life they probably did *not*!

We now look at *Love's Labour's Lost*, published in quarto, in 1598, as "corrected and augmented by W. Shakespere." The date of composition is unknown, but the many varieties of versification, with some allusions, mark it as among the earliest of the dramas. Supposing that Shakespeare obtained his knowledge of fine manners and speech, and of the tedious quips and conceits which he satirises, from the contemporary poems, plays, and novels which abounded in them, and from *précieux* and *précieuses* who imitated them, as I suggest, even then *Love's Labour's Lost* is an extremely eccentric piece. I cannot imagine how a man who knew the foreign politics of his age as Bacon did, could have dreamed of writing anything so eccentric, that is, if it has any connection with foreign politics of the time.

The scene is the Court of *Ferdinand*, King of Navarre. In 1589–93, the eyes of England were fixed on the Court of her ally, *Henri* of Navarre, in his struggle with the League and the Guises; the War of Religion. But the poet calls the King "Ferdinand," taking perhaps from some story this non-existent son of Charles III of Navarre (died 1425): to whom, according to Monstrelet, the Burgundian chronicler of that time, the French king owed 200,000 ducats of gold. This is a transaction of the early fifteenth century, and leads to the presence of the princess of France as an envoy at the Court of Navarre in the

play; the whole thing is quite unhistorical, and has the air of being borrowed from some lost story or brief novel. Bacon's brother, Anthony, was English minister at the Court of Navarre. What could tempt Bacon to pick out a non-historical King Ferdinand of Navarre, plant him in the distant days of Jeanne d'Arc, and make him, at that period, found an Academe for three years of austere study and absence of women? But, if Bacon did this, what could induce him to give to the non-existent Ferdinand, as companions, the Maréchal de Biron with de Longueville (both of them, in 1589–93, the chief adherents of Henri of Navarre), and add to them "Dumain," that is, the Duc de Mayenne, one of the Guises, the deadly foes of Henri and of the Huguenots? Even in the unhistorically minded Shakespeare, the freak is of the most eccentric, — but in Bacon this friskiness is indeed strange. I cannot, like Mr. Greenwood, find any "allusions to the Civil War of France." France and Navarre, in the play, are in full peace.

The actual date of the fabulous King Ferdinand would have been about 1430. By introducing Biron, Longueville, and the Duc de Mayenne, and Bankes's celebrated educated horse, the author shifts the date to 1591. But the Navarre of the play is a region "out of space, out of time," a fairy world of projected Academes (like that of the four young men in de la Primaudaye's *L'Académie Française*, Englished in 1586) and of peace, while the actual King of Navarre of 1591 was engaged in a struggle for life and faith; and in his ceaseless amours.

Many of Shakespeare's anachronisms are easily intelligible. He takes a novel or story about any remote period, or he chooses, as for the *Midsummer Night's Dream*, a period earlier than that of the Trojan war. He gives to the Athens contemporary with the "Late Minoan III" period (1600 B.C.?) a Duke, and his personages live like English nobles and rustics of his own day, among the fairies of English folk-lore. It is the manner of Chaucer and of the poets and painters of any age before the end of the eighteenth century. The resulting anachronisms are natural and intelligible. We do not expect war-chariots in *Troilus and Cressida*; it is when the author makes the bronze-clad Achæans familiar with Plato and Aristotle that we are surprised. In *Love's Labour's Lost* we do not

expect the author to introduce the manners of the early fifteenth century, the date of the affair of the 200,000 ducats. Let the play reflect the men and manners of 1589–93, — but why place Mayenne, a fanatical Catholic foe of Navarre, among the courtiers of the Huguenot King of Navarre?

As for de Mayenne (under the English spelling of the day Dumain) appearing as a courtier of his hated adversary Henri, Bacon, of all men, could not have made that absurd error. It was Shakespeare who took but an absent-minded interest in foreign politics. If Bacon is building his play on an affair, the ducats, of 1425–35 (roughly speaking), he should not bring in a performing horse, trained by Bankes, a Staffordshire man, which was performing its tricks at Shrewsbury — in 1591. Thus early we find that great scholar mixing up chronology in a way which, in Shakespeare even, surprises; but, in Bacon, seems quite out of keeping.

Shakespeare, as Sir Sidney Lee says, gives Mayenne as "Dumain," — Mayenne, "whose name was so frequently mentioned in popular accounts of French affairs in connection with Navarre's movements that Shakespeare was led to number him also among his supporters." Bacon would not have been so led! As Mayenne and Henri fought against each other at Ivry, in 1590, this was carrying nonsense far, even for Will, but for the earnestly instructive Bacon!

"The habits of the author could not have been more scholastic," so Judge Webb is quoted, "if he had, like Bacon, spent three years in the University of Cambridge . . . " Bacon, or whoever corrected the play in 1598, might have corrected "primater" into "pia mater," unless Bacon intended the blunder for a malapropism of "Nathaniel, a Curate." Either Will or Bacon, either in fun or ignorance, makes Nathaniel turn a common Italian proverb on Venice into gibberish. It was familiar in Florio's *Second Frutes* (1591), and *First Frutes* (1578), with the English translation. The books were as accessible to Shakspere as to Bacon. Either author might also draw from James Sandford's *Garden of Pleasure*, done out of the Italian in 1573–6.

Where the scholastic habits of Bacon at Cambridge are to be discovered in this play, I know not, unless it be in Biron's witty speech against study. If the
